Message from the Editor-in-Chief

Dear Colleagues,

We are very pleased to publish Special Issue for INTE-2017, ITICAM 2017 & IDEC 2017 conferences. This issue covers the papers presented at International Conference on New Horizons in Education, International Trends and Issues in Communication & Media Conference and International Distance Education Conference which were held in Freie Universität Berlin, Germany. These papers are about different research scopes and approaches of new developments and innovation in education, communication, media and technology.

Call for Papers

TOJET invites you article contributions. Submitted articles should be about all aspects of educational technology. The articles should be original, unpublished, and not in consideration for publication elsewhere at the time of submission to TOJET. Manuscripts must be submitted in English. TOJET is guided by its editors, guest editors and advisory boards. If you are interested in contributing to TOJET as an author, guest editor or reviewer, please send your CV to tojet.editor@gmail.com.

ABSTRACT

The article reflects the current situation in educational theory and practice, in which a significant disproportion between theory and educational reality in schools appeared so as the lack of methods complying with the requirements of the Framework Educational Program and gaps in the knowledge base of nursery and primary schools teachers, which stems from their ignorance of the curriculum and functional vocabulary. A study based on research and theoretical essay analysis identifies and seeks the causes of discrepancies between theory and practice. It looks at whether there is a direct correlation between changes in curriculum and practice, and whether the skew of theory and practice is also reflected in the training of future teachers. Results of the research have provided the basis for drafting the project OP RDE engaged in building a network of schools and creating a collegial peer training centres, ideological platforms that bring together practitioners and theorists.

Keywords: Curriculum, educational theory, Framework Educational Program, inclusion, pedagogical practice

INTRODUCTION

The relation between theory and practice is old but it becomes topical and more discussed in the current conditions of rapid social changes, information and communication technologies and also in curricular reforms and the transformation of education. The old adage *primum vivere, deinde philosophari* (first live, then philosophize), is still valid and applies to the educational process (cp. Falque, 2016; Adorno, 2008; Novák, 2010). Like in other areas of life, it is however necessary to analyze, measure, examine and compare the practical approaches and based on the results of these investigations to deduce generally valid theoretical conclusions. The impetus for the study of issues related to pedagogical theory and practice was the awareness of a growing and deepening tension between teachers-theorists (academia) and teachers-practitioners, which is enhanced due to the ongoing transformation of the current curriculum, the so called main educational pillars which also corresponds with the content of text books.

The most recent change affecting the practice in schools, at present, is mainly the correction of Framework Educational Program for Basic Education (FEP) due to the incoming joint (inclusive) learning trend (Janík, 2005; Vlčková, 2010). What most common shortcomings, contradictions in the relationship between educational theory and practice are seen by teachers-practitioners and teachers-theorists? What is the cause of theory and practice skew? Do the curricular changes affect the educational practice? Do the teachers consider inclusion, the so called joint education of pupils and pupils with special educational needs, just as theoretical and "modern" trend of curriculum reform or, according to them, is the inclusion applicable in practice? Do the frequent changes and adaptations of curricula derogate the theory from the practice even more? We did look in the research issues from the perspective of teacher-practitioners and teachers-theorists, academics.

Skalková (1984) states that an effective putting theory into practice cannot be founded on the simplified conception that the theory can be simply transferred into practice, which passively awaits what it will bring. According to Korthagen (2001; 2011), if this process between theory and practice should be carried out efficiently and promptly, presupposes mutual communication, constant mutual interest in public discussion and the flow of information between the realization sphere (educational practice) and researchers (institutions). Science is considering how to increase the quality, comprehensiveness, timelines of new knowledge, how to speak in clear language to the sphere of use (Korthagen, 2001; Korthagen et al., 2011; Janík, 2005). Practice should be able to benefit from the innovations, listen sensitively and receive and validate new information and provide feedback (cp. Janík, 2005). One of the criteria of the ability to implement the research results is the educational preparedness and the level of preparedness of teachers (Korthagen, 2001; Korthagen et al., 2011).

Maňák (2011) points out, that students of pedagogical faculties are also aware of deepening the skew of theory and practice as well as their constant mutual spacing and in contact with practice they argue for strengthening of practical and methodical readiness for the exercise of their profession.

The legacy of their view might be supported by the distress from their educational practice stemming from a lack of teaching experience and a low number of pedagogical practice tuition at pedagogical faculties or including the methodologies of field didactics, paradoxically, in upper classes (cp. Korthagen, 2001; Korthagen et al., 2011; Janík, 2005; Vlčková, 2010).

The study is based on the comparative analysis of theoretical studies and research surveys dealing with this issue. Deep analysis of educational theory and practice was carried by Shoemaker (2010), who wanted to contribute to the integration of both phenomena to improve the education. Smith (2000) focuses on theory and practice of the curriculum, which leads teachers to work with curriculum watching not only the final product but also the process leading to it and its practical application. The benefit for the concept of the teaching profession is the Terhart's (2001) manuscript. It criticizes the fact that teaching at universities is focused only on specialized subjects and emphasizes the need for practical training. He notes that teachers' professionalism is not in the traditionally strengthening of science skills, but besides that cognitive dimension, the area of social, personal and creative skills is equally important. Fresh impetus to the new solutions brings the publication of Korthagen (2001), in which the author thinks over the technical-rational model of the teaching profession, according to which the pedagogical theory should be included in the training program. Very inspiring is not only the author's conception, but also realization of teacher training, which aligns linking pedagogical theory and practice in a successful symbiosis between universities and training schools. This will return the preparation of teachers to the intentions of the former educational training institutes, to link preparation of teachers and ongoing school with the life.

INSIGHT INTO MUTUAL DETERMINATION OF THEORY AND PRACTICE

Conceptual separation of theory and practice seems according to Maňák (2011) as an accurate, clear and non-problematic. Maňák (2011) defines theory as a system of scientific principles generalizing empirical knowledge of reality, as collated knowledge, as a set of knowledge enabling to understand the context of real issues. Practice is referred to as a physical, sensory objectively purposeful activity, such as the negotiation process, act, activities that relate to various forms of human activity (cp. Korthagen, 2001, 2011; Janík, 2005 etc.). According to Maňák (2011) the importance of the information society increases demanding kinds of practices in connection with theoretical knowledge, the so called external communication, which increases the transfer of knowledge between the theoretical and the practical sphere. The relation between theory and practice in education accompanies the whole history of humanity (cp. Falque, 2016; Adorno, 2008). At the beginning (Korthagen et al. 2001), the practice aimed at survival was typically dominated.

Education took place spontaneously. The development of civilization was growing knowledge, theoretical knowledge which upgraded practical activities. With the advent of the information explosion the acceleration of knowledge and theoretical concepts increased. The school has been given an important role. Pupil started to adopt knowledge and skills by codified standards of behaviour and followed them (Janík, 2005; Vlčková, 2010). With enormous increasing of knowledge, the school focuses more on the acquisition of knowledge, so there was a lack of time for practical training in application of acquired knowledge (Janík, 2005). This will also increasingly create the gap between theory and practice. Czech authors (Janík 2005, Mandel, 1997, Slavík and Janík, 2005) conclude that the growing contradiction must be overcome by combining theoretical approaches and practical activities. Also, the current pedagogy solves the dilemma of theory and practice (it is eg. reflected in the framework programs).

CHRONIC RUPTURE OF THEORY AND PRACTICE

Variable conception of educational content and frequent theoretical controversy over the definition of subjects contribute to the tight relationship between theory and practice. Main reasons for this are the rapid pace of life, the impact of research and information and communication technologies (ICT), which ensures rapid transfer of knowledge into practice, which may not be ready to respond to them adequately. Many theorists are convinced of the necessity of certain practices in education and create a theoretical construction of what education should be like (Průcha, 2000). The drawback of these constructs is that there is no one to bring the ideal theories into practice. Theory can only get into practice when the practitioner takes the theory up and implements it (Slavík, 2003).

The practice and the theory are never consistent and departmental communication has therefore often the nature of practice criticism of and chastise of teachers. This criticism can be viewed (cp. Foucault, 1981, 1994) as an

exercise of theorist's power, as the representatives of the programming field and their institutions, the so called universities, research institutes, government agencies, school inspection and others. This type of communication is causing a deepening distrust between theory and practice and their mutual skew, reflected on the side of theories by highly sophisticated publishing of articles about confusing academic problems, and to the practice of searching for clues in the superficial methodologies with banal descriptions of manufacturing processes, easily administered, and therefore comprehensible and immediately applicable in practice (cp. Slavík, Dytrtová, & Fulková, 2010; Korthagen et al., 2011; Janík, 2005). "Chronic rupture of Practice and Theory" (Slavík, Dytrtová, & Fulková, 2010: 225) is a positive sign of dynamics of the field but also brings undesirable consequences.

The aims of this study (based on comparison of theoretical articles and simple research probe) are a) to confirm the existence of discrepancies between educational theory (curriculum) and practice; b) to identify the causes of discrepancies between theory (current curriculum) and educational practice; and c) to analyse the causes of this in the view of teacher-practitioners and teacher-theorists (academics).

Furthermore, to determine whether teachers understand the current inclusive curriculum changes and if, according to them, this "theory" is applicable in practice. Among others, we mapped the opinions of teachers-practitioners on how to evaluate the training of future teachers, the so called graduates of secondary pedagogical schools and pedagogical universities. The results will serve as material for piloting the project OP RDE "Schools as centres of peer support", which will be implemented from March 2017.

METHODOLOGY

C This research was conducted through a short questionnaire consisting of 10 closed-item questions with a choices and has been conducted in January 2017. Open items were included in order to justify choices of concrete answers. It is therefore a quantitative-qualitative research. Anonymous questionnaire of our own design was prepared for the teachers-practitioners and teachers-theorists, and distributed in hardcopy by educational institution ASTERIA, the educational centre, Ltd. as a part of the evaluation questionnaires for teacher-practitioners at the end of completed accredited educational programs for further education of teachers in Portal Publishing, Ltd. Prague. The total sample consists of 68 teachers from practice and theory. The questionnaires prepared for teacher-theorists were sent electronically and from 25 questionnaires 72% (18) returned back. Teacher-practitioners got the questionnaires on paper and the 100% (50) returned back, as they were provided personally at the training session.

Table 1: Respondents

		THE RESPONSE RATE	
GROUP A	nursery and basic school teachers	50	100%
GROUP B	university workers	18	72%

Table 1: The response rate, groups A, B, 2017

The research sample A, has been consisted of teacher-practitioners respondents (i.e. teachers in kindergarten and first grade of primary schools in the Czech Republic) aged 26-56 years, with the length of practice from 2 to 32 years. The research sample B has been consisted of teachers-theorists respondents (from various universities in the Czech Republic aged 30-75 years, with the length of practice from 2 to 40 years).

As a helping method we used the interview with teachers from both research samples. We needed to improve clarity and to specify views on the skew existence of theory and practice and on curriculum documents changes, which are mainly caused by the trend of inclusive education.

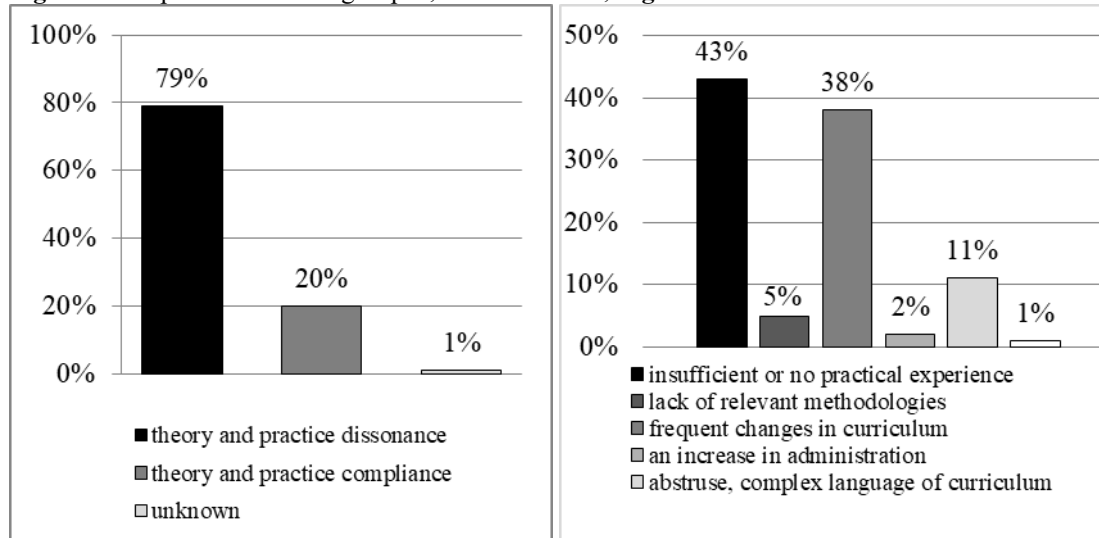

RESULTS

(In)consistency between theory and practice

According to the A group of respondents as seen in Figure 1, 20% of respondents says that the theory is consistent with the practice, 1% of respondents do not know and 79% of respondents feels that there is a mismatch between educational theory and practice. The cause of this statement they justify as follows (Figure 2):

- Inadequate or no practical experience of university teachers / theorists
- Lack of relevant methodologies suited to the needs of practice
- Frequent changes in the curriculum that cause chaos and poor orientation
- Increase of administration
- Unclear, too complex language of curriculum (where 60% of 50 respondents feel FEP as a sufficient support, but many times do not understand the terms)
- Inclusive trend causing a correction of Framework Educational Programs brings chaos and clutter to the curriculum (the idea of inclusion was supported by 51% of 50 respondents)

Figure 1: Respondent's views group A, skew existence; **Figure 2:** Skew causes A

Causes of the sciew between tehory and practice

It shows that the majority of respondents (teacher-theorists) from group B (almost 70% of the 25 respondents) believe that there is a skew (mismatch) between educational theory and practice. The cause of this statement they justify as follows:

- Education activities
- Lack of theoretical knowledge of practitioners
- Inadequate lifelong and further education of teachers
- Misunderstanding of educational terminology in Framework Educational Programs and failure to use a functional vocabulary
- Ignorance or disregarding of RVP, random selection of literature

Research study also showed that teachers-practitioners with educational experience up to 20 years, who constitute 65% of the total number of 50 respondents, consider the Framework educational program as educational support and mandatory curriculum document that allows the teacher to work freely and creatively, even though 80% of teachers in kindergartens and 1st stage of elementary schools use textbooks and methodologies according to their own discretion and not in accordance with the FEP recommendations. Only 2% of the 50 teachers-practitioners respondents emphasize earlier curriculum as they regard FEP to be an "abstract" and vague document. 82% of 50 teachers-practitioners respondents criticize constant changes in curriculum across the age spectrum. The idea of joint education of children and students with disabilities is welcomed by 71% of respondents from 50 teachers-practitioners, of which 58% determine the realization of joint education to be the subject for supporting measures, as adequate financial and material equipment with regard to the specific peculiarities of the educator and the necessary presence of an assistant teacher.

Figure 3: Respondent's views - group B skew existence; **Figure 4:** Skew causes

DISCUSSION

Research study provided us with information on the views of teachers-practitioners and teachers-theorists on the current relationship of educational theory (curriculum) and the practice and skew causes, relationship to the curriculum and its transformations, relationship to inclusion and its possible applicability in practice.

In the context of issues of theory and practice we do indicate complementary results of the survey realized by the College of European and Regional Studies, public service company in České Budějovice in order to produce an analysis of need for realisation of OPIC project for primary and secondary school teachers "New teaching methods and use of information technologies in the realization of school education program in primary and secondary schools in the Central Region", reg. no. CZ.1.07 / 1 March 04 / 01.0027 - (2009-2012) and the project "New teaching methods and use of information technologies in the realization of school education program in primary and secondary schools in the South Bohemian region," Reg. No.: CZ.1.07 / March 1, 06 / 01.0026 - (2012).

Research has shown that 84% of respondents of 100% surveyed teachers from elementary and secondary schools collectively in both regions see the biggest positives in the methodological and mainly practical training of secondary pedagogical schools graduates and emphasize their better linkage to teacher's practice than the graduates of pedagogical faculties. 73% of respondents of 100 surveyed teachers from primary and secondary schools notes, that graduates of pedagogical faculties have broader theoretical overview than graduates from secondary pedagogical schools, but practical skills are lower. Therefore, graduates of pedagogical faculties attend seminars within DVPP with methodological and experiential content more often than graduates of secondary pedagogical schools. Almost 70% of respondents of 100% surveyed teachers from elementary and secondary schools see the greatest deficiency of pedagogical faculties graduates in the absence of practice. Although graduates of secondary pedagogical schools are praised for their practical skills by almost 82% of the 100 respondents, 18% of respondents criticize them for their emotional immaturity and the difficulties in communication with parents.

Based on our findings, the majority of respondents from both theoreticians and practitioners confirm the existence of theory and practice skew, which is according to practitioners caused mostly by insufficient practical experience of university teacher trainers and insufficient practical training of pedagogical faculties graduates. Another cause is the lack of relevant methodologies, increase administration, the constant changes in the curriculum, specialized terminology incomprehensibility that is unnecessarily complicated and does not meet the needs of the practice. Inclusive education is considered to be necessary by teachers, but in terms of the Czech educational system difficult to implement, and if so, then only with strong material, financial and personnel support. These results coincide with a survey conducted by Agency for Market Research and Public Opinion IPSOS, which took place in August 2015 and involved 4,000 teachers. Respondents-theorists see the causes of theory and practice skew in underestimating of pedagogical research activity, in lack of theoretical and methodological knowledge of teachers in practice and in misunderstanding the content and language of educational programs. They also criticize the random selection of scientific literature that is recommended by FEP.

Almost identical results are presented in a study carried out by Šobánková (2011) analyzing the problem of the teacher and his knowledge of the curriculum. Exaggerated disproportion between educational theory and practice in schools is mainly caused by the lack of knowledge of curriculum, terminology and functional vocabulary. This is also confirmed by Bruckner (2011) who argues that teachers do not read FEP and do not use it. Moreover, both also point out to the lack of using literature recommended by FEP. In line with Hazuková (2005), our results suggest that teachers perceive and use the RVP as educational support, but they collect literature at their own discretion. sees the current problem in poor implementation of theoretical knowledge into practice and related skew of both areas, and gaps in the knowledge base for teacher's training. Although there is no great amount of research related to the survey yet, we can still use the comparative survey of a wider range of curricular reform at grammar schools, which, among other things, examine the familiarity with the curriculum (Janík et al., 2010: 28). The research has included all of approbation and the differences between them have been proved as relatively small. According to respondents' subjective estimation, the level of their familiarity with reform plans appeared to be slightly above average. The authors point out that the answers might certainly be distorted by the so-called social desirability of a positive response. As a positive they consider the effort to implement inclusive education.

CONCLUSION

The aim of this contribution was to identify and analyse the discrepancies between theory and practice (and their causes) in the view of teachers-theorists and teachers-practitioners. Results of the research will be used for implementation of the project "Schools as centres of peer support" within the calls OP RDE, which encourages mutual learning and exchange of experiences. Formation of methodological materials and their piloting verification will become the basis for subsequent correction of FEP. Research surveys, realization of discussion platforms, workshops and meetings of theorists, methodologists and practitioners, as well as analysis of theory and practice separation causes are becoming major issues in the educational environment and will help approximation of theory and practice.

ABSTRACT

Web 2.0 tools have become ubiquitous in many university classrooms. These tools support collaboration and community building, enhance media sharing, and improve collective knowledge constructions- features that are valuable to learning. Many studies have in fact found that the inclusion of these tools into the teaching and learning processes creates positive learning experiences with many reported preferences of using these tools over traditional methods of learning. This small-scale study which involved 37 undergraduate students, investigated students’ perceptions on the use of a web 2.0 tool, namely Padlet, as an educational tool and students’ frequency of use of and their engagement with it to support their learning of communication concepts. The study, which employed a qualitative approach used two data collection tools: a qualitative questionnaire and analyses of students’ activities on the virtual walls. The study found that even though a small number of students had some negative perceptions of Padlet use, disclosing technical issues, lack of notification and reward, and preference over paper to technology, most of the students perceived Padlet use very positively. Despite this, the study found that most students were only actively engaged with Padlet activities on case-study-related tasks and only prior to assessments but not for independent learning tasks. The study also shows that students’ positive perception of Padlet as a learning tool did not influence students’ frequency of use. Pedagogical strategies are shared to improve the use of Padlet as an educational tool to support students’ learning.

INTRODUCTION

Integration of web 2.0 tools and their impact on learning in higher education has been documented in many studies. Many of these studies have uncovered the benefits of incorporating web 2.0 tools into teaching. Blogging, for example has been found to be a good tool to trigger reflection and promote learning in collective environment (Baird & Fisher, 2005). Findings from a study by Farmer and Bartlett-Bragg (2005) support these findings as they found that blogging improved learners’ ability to regulate and personalise their learning. The use of Twitter, on the other hand, because of its functionality, encouraged participants to produce concise but critical reflections and created a sense of connections between users (Ruckert et al., 2014, p. 17). Similarly, Gilbert, Morton & Rowley, (2007) reported that discussion boards and peer collaborative support were the highlighted aspects of an e-learning module investigated. A study by Leow and Neo (2014) who analysed 182 students’ interactions when using web 2.00 tools also found that peer interactions on this platform “stimulated students to actively use internet resources” and encouraged peer evaluation to avoid misunderstanding and to reduce mistakes (p. 192). A study by Wood and Ryan (2010) supported these findings when it found that web 2.0 tools like blogs and social bookmarking services had a positive effect on students’ learning of History as they generated significant interactions between students and their peers as well as with their tutors (p. 195).

Studies on students’ perceptions on the use of web 2.0 tools as educational tools, however, often report mixed results. The assumption that students who are digital natives would embrace the use of these tools for learning has been challenged and proven erroneous in many studies. A study by Wynn (2013), for example, found that even though students wanted and anticipated technological tools in their classroom, they did not welcome these tools to be part of their learning. In many cases, students were reluctant to use ICTs to interact with each other for academic purposes (Veira, Leacock & Warrican, 2014) and they showed reservation about mixing academic and social spheres when tools like Twitter and Facebook were adopted as learning tools (Osgerby & Rush, 2015). In fact, it was found that students often feel “disempowered, disenchanted and alienated when it comes to technology-related activities” (Veira, Leacock & Warrican, 2014, p. 229). This could be because many students are unfamiliar with their use and functions (Edirisingha et al., 2007) as they are not intentionally designed for learning. It would be a waste of an academic’s time and effort if his or her students refuse to engage with a specific technology simply because they dislike it.

It is thus important to understand students’ perception on the use of web 2.0 tools to support their learning. Investigating students’ perceptions on the use of a web 2.0 tool for learning would also bridge the research gap in the area as many past studies focused on the effectiveness of technological endeavours within the classroom

but not on the investigation of student perceptions on the varied use of technological innovations introduced into the classroom (Wynn, 2013).

It is also important to understand whether students' perceptions of a web tool that is used for educational purposes has any effect on students' engagement with it. Logically, it can be assumed that if students have a negative perception of a web 2.0 tool, they will not use it often enough or perhaps would engage with it only superficially. A study by Ferreira and Santoso (2008) for example shows that student's positive perceptions of Accounting has a positive impact on students' engagement and performance in the subject. Past studies have reported that students' engagement with technological tools were influenced by the nature of the activities (Whitton, 2009), external pressures (Sharpe and Benfield, 2005), and relevance and needs (Eridisingha et al., 2007). There have been limited reports which link students' perceptions to participation in and engagement with web 2.0 tools. Findings from such studies contribute significantly to the understanding of the impact of students' perceptions of a technological tool on their use or engagement with it as a tool to support their learning.

This study attempted to gather understanding on students' perceptions of a web 2.0 tool, namely Padlet. The study also sought to understand whether students' perceptions of Padlet has an impact on the frequency of Padlet use. Its other objective is to understand students' perception of sharing on Padlet and identify whether students' perception on sharing on Padlet has an impact on their engagement with it. This is because past studies have reported that students distanced themselves from using 2.0 tools because of issues with openness (An, Aworua, Ballard & Williams, 2009) or fear of open communication (Ahmed, Almunim and Mbuh, 2016; An and Williams, 2010).

The current study thus has three important research questions:

1. What were students' perceptions of Padlet as an educational tool?
2. What were their perceptions of sharing on Padlet?
3. Did their perception of Padlet affect frequency of Padlet use?

THE STUDY

The Context of Padlet Use in the Current Study

Padlet is a web 2.0 tool that enables the creation of virtual walls. On these walls, users can post files in different format (audio, pictures, video etc.). In the current study, Padlet was used as an educational tool to support students' learning of communication concepts for Communication Skills module and prepare students for summative assessments.

After the completion of a topic, students would be given a Padlet task to complete as part of their revision of the topic. Most of the questions in these revision exercises were past year examination questions. Most of the time, revision exercises were done as part of independent learning. Prior to students' case study test, Padlet activities containing past year case study questions were also prepared. Some of case study-test-related Padlet tasks were done as part of classroom activity but some due to time limitation were done as part of independent learning.

Students were asked to immediately respond to Padlet exercises when they were done as part of classroom activities and their answers were marked and commented on often before the class ended. Often, answers that students submitted on Padlet walls during these in-class sessions became a source of discussion. When Padlet activities were done as part of independent learning, the teacher commented on or marked students' answers within 7 days.

As Padlet walls functions like a virtual (white)board, students could view and read each other's contributions to the wall. In this way, Padlet enabled collective knowledge sharing. Students could also read comments given by the teacher and view how answers were graded and in this way Padlet supported interactivity between students and the teacher particularly when the teacher reacted to students' answers and students reacted to teacher's comments and the grading of their work. This also somehow made teacher's comments formative as sometimes students worked on teachers' comments, and resubmitted their improved answers for a second round of marking. To ensure privacy and to encourage sharing some 'security measures' were imposed for example, the Padlet exercises were password protected and the links and the passwords were only made available for her students.

METHODOLOGY

The study adopted a classroom action research model and its main objective was to improve practice. Employing a qualitative approach, the study used two data collection tools: a survey (qualitative) questionnaire which comprised of 5 open-ended questions, and analyses of students' responses to the Padlet exercises. Even though analysis of open-ended responses is more tedious, the adoption of a qualitative survey questionnaire was

pertinent because open-ended responses have more “nuance, depth, and substance than open-ended responses” (Ruel, Wagner III & Gillespie, 2016, p. 68).

The qualitative questionnaire sought to get students’ responses on the following 1) their perception of the use of Padlet as an educational tool, 2) their perception on sharing on Padlet, 3) frequency of visits to Padlet walls, 4) reasons for visiting Padlet walls, and 5) suggestions for further improvement. Analyses of content of Padlet walls recorded 1) number of contributors per Padlet activity/wall, 2) students’ reactions to Padlet activities and teacher’s feedback, 3) number of viewers per padlet wall and, 4) peaked time for visits to Padlet walls. Out of 47 students, 37 Hospitality/Accounting and Finance students completed the qualitative survey questionnaire.

Data analyses for the qualitative survey questionnaire involved survey coding which was a process of categorising open-ended responses into groups (Popping, 2012). To understand students’ general perceptions of Padlet as an educational tool and the idea of sharing on Padlet, frequency counts of recurring items were also done.

Analyses of students’ responses or activities on Padlet wall were done once the semester was over. The teacher visited the walls and recorded the number of students’ responses to the question on each wall, the number of times students resubmitted their work to be remarked, and whether students remained anonymous or revealed their identity when they shared their answers. As Padlet also recorded the number of visitors to the Padlet walls throughout the semester, the teacher also analysed the graph which recorded number of visits to Padlet walls (provided by Padlet) to get an overview of when visits to Padlet walls peaked and when it was at its lowest points.

FINDINGS

What were students’ perceptions of Padlet as an educational tool?

The number of qualitative responses recorded on students’ perception of Padlet was 38 statements and out of these, 29 were positive and 9 were negative. There were 6 categories of positive statements: ‘ease of use’, ‘ease of access’, ‘perceived usefulness’ (alternative source, platform for sharing, viewing others’ work, feedback, source of reference, testing ground), - ‘stress-free’ (anonymity, flexibility), ‘new medium of learning’ and ‘preferred learning medium’. Five categories of negative statements were identified: ‘accessibility issues’ (time-lag, require internet connection, not hassle free), ‘readability issues’, ‘unfamiliar tool’, ‘not preferred learning method’, and ‘no clear guidelines’.

Positive statements made by students were clearly related to how Padlet assisted them in their learning of the module. Most importantly, students could identify the perceived usefulness of Padlet. Students mentioned that Padlet provided them with a platform to share their answers, view others’ responses, and get feedback. Students also valued the function of Padlet as a place where resources were stored. It served as another source of reference. As an educational tool, students also found Padlet easy to use and access. The other aspects of Padlet use which students appreciated was closely related to the way the teacher has designed its use which promoted flexibility and anonymity.

As for negative statements, students’ main grouses were generally concerned with technical factors (accessibility and readability) and the way Padlet was used. As most activities on Padlet was designed as part of students’ independent learning, some might have felt lost and felt that more guidelines were necessary. These were reflected in the suggestions students gave to improve Padlet use in Communication Skills classrooms as some requested that more guidance is provided, and reminders are given to complete the tasks on Padlet walls. Some of the other suggestions given also showed that students prefer more teacher-controlled environment as some requested that the Padlet activities were completed during class time, and all the activities were made compulsory for all students to complete.

What were students’ perception on sharing on Padlet?

Thirty-three statements were recorded when students were asked about their perceptions on sharing on Padlet and out of these, 31 were positive statements and two were negative. Students were appreciative of Padlet’s ease of access and use, and the way it was used which fostered anonymity and flexibility. One student also mentioned that sharing on Padlet evoked positive feelings.

Despite the measures taken to ensure anonymity, one student found that sharing answers on Padlet as a threatening experience. Another student who responded negatively to sharing on Padlet simply did not favour the use of technology for teaching and preferred the traditional pen and paper to answer questions.

Analyses of students' responses to Padlet tasks also showed that students generally preferred to respond to the tasks individually. Most students who contributed to the walls used pseudonyms with only four students who constantly used their real names.

Did students' perception of Padlet affect frequency of Padlet use?

Data from the qualitative questionnaire found that only six students were active users of Padlet as they always visited the walls 1) "to see how answers are marked and look at how other people answered the questions", 2) as "... "the only way I can test myself".

Thirty-one students admitted that they visited the walls 'sometimes' or 'rarely'. Students reported of having other commitments and this seemed to become a barrier for them to be active on Padlet. Students for example mentioned that they were "busy with other subjects that I rarely have time" and that their "focus was on other subjects". Others highlighted that they did not receive enough prompting or clear guidelines. One student for example explained his inactivity on Padlet wall because he/she "was not a self-learner" and required "guidelines from my lecturer before I use something". Some protested that "there is no notification when lecturer update/upload new questions" and that they will "forget unless people around me inform me". There is a possibility that some students found the independent learning tasks difficult to handle as they were not autonomous as reflected in some of the reasons students provided for visits to the walls: "Because the teacher said so"/ "when teacher asks us... to do work on it".

Students also highlighted the fact that they did not feel motivated because of lack of reward (no marks were given when Padlet exercises were completed), technology was not the preferred method of learning, and Padlet was not used by many thus "there's not much post in them" and was not their preferred tool for learning- "Less opportunity to think about Padlet unlike Facebook".

However, it was found that the number of visitors to Padlet walls peaked prior to assessments and there were clearly more number of contributors to Padlet walls containing case study questions. The number of contributors to case-study-test-related tasks, was 14 (the lowest) and 33 (the highest). Contributors to revision exercises, on the other hand, fluctuated between 2 and 5 students (even though these revision exercises comprised of past year examination questions). One possible reason for students' fluctuating pattern of Padlet use was because most of the revision tasks were done as part of independent learning. The higher recorded student contributors to the walls with case study questions could be because some of these were attempted in class. Having said that, the number of contributors to case-study-test-related activities remained higher than the number of contributors to the walls with revision exercises.

Also, it was interesting to note that the number of visitors to the walls peaked at 503 (the highest), recorded on October 2nd; and 278 (second highest), recorded on Dec 6th. Unsurprisingly, these dates coincided with students' preparation for two assessments, a case study test and a final examination respectively. At other times, students' collective number of visits to the walls was between 34 and 76 visits. Students' activity or inactivity on Padlet seemed to be influenced by assessments as found in some of the reasons given for visiting the walls: "because of exam and midterm test" and to "get a glimpse of how the exam question would actually look like".

It was also interesting to mention that only 5 students out of the 37 who mentioned that their main reason for visiting Padlet walls was to improve their understanding of lesson learnt: "To try to answer in Padlet... so that I can improve the level of my understanding". Most of the students mentioned that their main reasons for visiting the walls were to read teacher's feedback and view other students' answers: "To check my classmates' answers and comments from Ms. (the teacher)". This shows that even though students were not active contributors to Padlet walls, they were actively reading others contribution and teacher's comments.

DISCUSSIONS

The study found that students' perceptions of Padlet were generally positive. Many perceived Padlet as having values for learning. However, some students had some negative perceptions of Padlet use and these were found to be related to internal and external factors. Students' differences (Miller, 2009) relating to preference over method and tool for learning, lack of autonomy and low motivation were identified to be factors within students which resulted in negative perceptions of Padlet as an educational tool. The last two factors were not clearly related to Padlet as a tool for learning but more to how Padlet was pedagogically embedded within teaching and used as a learning tool. As some Padlet activities were designed as part of independent learning, students who were not self-regulated or lack autonomy struggled. Furthermore, as Padlet activities were more formative than summative (thus there were no concrete rewards in term of marks), some students were not motivated to be active on Padlet walls.

The other identified factors were external and were related to the technical aspects (Ng, 2007; An, Aworuwa, Ballard & Williams, 2009): issues of accessibility and ease of Padlet use, and time constraint (An, Aworuwa,

Ballard & Williams, 2009) due to workload from other modules. The teacher's pedagogical decisions to improve students' privacy had resulted in only one student feeling threatened and the rest feeling safe. Issues with openness, in other words, did not seem to inhibit participation on Padlet as observed in other studies (An, Aworwu, Ballard & Williams, 2009). This was perhaps due to the layers of 'security measures' to protect students' identity and privacy. However, doing so created another barrier for Padlet use.

The study also found that positive perceptions of Padlet as an educational tool did not have a positive impact on students' Padlet use. Furthermore, the study showed that despite perceiving the use of Padlet as having learning values, which have been proven as the motivating factor for students' use of technological tools (Hardy et al., 2005; Cole, 2009), students' use of Padlet to support their learning was inconsistent. This shows that positive perceptions of Padlet was inadequate to sustain or encourage students to use Padlet for learning, particularly when external factors became main inhibitors. This also shows students' use of technological tool was very much context-dependent. It is also interesting to note that even though many students were not posting answers on the walls, except for case-study-related tasks, many of them mentioned that they visited Padlet walls to check and read others' submission and to read teachers' comments. In other words, these students were 'lurking' around, not being active contributors but still perhaps 'learning' from reading the responses and comments given (Slevin, 2008).

The findings of this study also show that students' participation on Padlet were assessment- driven, judging from the number of contributors and number of visitors to the walls. This shows that students' use of Padlet was purposive and this supports findings of other studies (Yaakop, 2015; Cole, 2009; Hardy et al., 2005).

From the suggestions given by the students to improve Padlet activities, it was also obvious that for some students having too much flexibility did not work for them. Some required more support, guidelines, and reminders from the teacher. Perhaps flexibility reduced students' sense of urgency and as they were not held accountable, not being active contributors on Padlet did not matter. This shows that technology does not guarantee participation as participation often requires prompting (Whitton, 2009).

The study also shows that pedagogical decisions involving the use of a specific web or technological tool can influence students' use of the tool, their perception and their motivation to use it for learning. This shows that at times, it is not the tool but the way the tool is used to support learning which influences its use.

IMPLICATIONS FOR TEACHING

The findings of this study have several pedagogical implications. It is important that a teacher identifies how students feel about a technological tool but what is also vital is to check on students' use of the tool to support their learning. This means that a quick survey to investigate how they feel about the tool (in this case, Padlet) and how they are managing their use of it could have signalled to the teacher and raised red flags if she needs to adjust her instructions to improve students' learning experiences. The study also found that students appreciated flexibility; however, too much flexibility held some of the students back in their participation on Padlet thus their learning. It is therefore important to reconsider flexibility. Perhaps, students should be gradually introduced to autonomy by providing clear guidance and scaffolding, and structuring the use of Padlet as part of classroom activities before introducing them as independent learning tasks. Students also want to be held accountable for completing their preparatory work (Ruckert et al., 2014) thus some work done on Padlet should perhaps be made compulsory and discussions are carried out on the answers that are posted on Padlet during classroom activities.

The study also finds that protecting students' privacy results in them having low inhibition about sharing on Padlet. However, to be inclusive, students need to also be given options to complete Padlet tasks on students' preferred medium of learning or of choice. To increase students' participation and use of technological tool for learning, it is also important to design activities that are closely related to assessments as students use of these tools are often found to be purposive.

The study also suggested that students' perceptions of Padlet were affected by Padlet as a tool and by how it was pedagogically embedded in the teaching and learning processes. In investigating perceptions on a technological tool, students' perceptions of the tool and how it is used to support learning should be made distinct.

CONCLUSION

This study found that students' positive perceptions of Padlet did not have a positive impact on students' use of Padlet. However, as a tool, despite some rejection from students, Padlet has been found to be supportive of students' learning of communication skills concept. To use the tool more effectively, teachers need to consider students' perceptions of the tool and its pedagogical design to support students' learning. It is also important for teacher to consistently monitor their students' engagement with the activities on Padlet. As students are diverse,

it is also crucial that pedagogical decisions made about Padlet use (or any other technological tool) are constantly revised or readjusted to ensure inclusivity.

INTRODUCTION

The necessity and goal of cultivating and expanding imagination is the content shared by all of us living in a rapidly changing society, therefore, I believe it will be not too much to emphasize. 2009/2015 In Korea, elementary education curriculum is promoting imagination as a way to realize the human image pursued by educators. However, there is no definite definition of the concept of imagination. Education is defined in many ways, but it is usually referred as 'an intentional and systematic process to form desirable humans'. The process of this sort of education is also to form the value or idea of life that the learner should aim the concept through knowledge. Therefore, when imagination is applied in education, it should start by establishing a clear concept. Thus, the purpose of this study is to contribute the concept of imagination that leads to the foundation of education practices for cultivating creativity. To this end, this study explores particularly in the imaginations of Kant and Dewey.

Imagination of Kant

Kant argues for the independence of mind as a subject through knowledge. For this reason, he is generally referred to as a reason-centered philosopher or ideologist. However, on the other hand, he maintains the position that the mind can not know any knowledge by its structure and concept except experience, and it sets a step to overcome the confrontation between rationalism and empiricism. At this time, imagination is the most important mediator to overcome the confrontation between reason and experience. In other words, Kant divides the source of cognition into two axes of reason (intellect) or experience (emotion), and by insisting that imagination integrates the two, it provides an opportunity to distinguish the roles and functions of imagination from before and after modern times .

1) Kant's epistemology: experience as a necessary condition and reason as a sufficient condition

In *critique of pure reason*, Kant calls the structures and forms that are the sources of perception. 'transcendental elements', which claims that they are at the center of human recognition of a given object. But the transcendental element is only a condition that makes the recognition possible.

Kant calls intuition as the sensuous perception about the object of recognition, which is the ability to accept a given representation. It can be said that the recognition object is accepted through the various sensory organs of the recognition subject. Without this intuition, it is obvious that no perception can arise. However, this intuition comes to us by thinking that given representations are conceptualized.

In Kant's epistemology, intuition and concept are notions corresponding to emotion and intelligence. It is because the object of recognition is given to intuition through the action of emotion, and because the intuitive object is thought according to the concept through the action of intelligence. But why we recognize a specific object among many objects? This is because we get something from the object through senses, for example, seeing or touching objects. In other words, because the subject stimulates our emotions. Thus, Kant explains that cognition has two lines of emotion or intellect, when emotions convey to us an object, the intelligence recognizes what have been given to us by thinking of it, finally we can come to the cognition(Kant, 1781: 236; 273). Therefore, it is the key to the establishment of recognition that how the two sources of perception (i. e. intuition and concept, emotion and intellect) are related to each other.

2) Imagination as the key to recognition by linking experience and reason.

Kant defines imagination as "an activity that binds various representations together and grasps the various things within them" (Kant, 1781: 296), and suggests a solution that synthesizes the two sources of recognition. If imagination achieves comprehensive unification, it will lead to judgment and thinking. Therefore, imagination is the ability to make judgment, and imagination and judgment are closely related to each other.

Kant distinguishes judgment as both formal and reflective. Firstly, regulatory judgment is a synthesis according to the concept. This is a function that is concerned with examining whether a particularity conforms to the universal concept. In other words, regulatory judgment is merely submerged under the universal and transcendental laws of intellect(Kant, 1790: 163; 168). At this time, the imagination constructs a unified experience by unifying and linking the representations (combining them under certain rules without the subject's present). Kant calls the imagination of this function as a regenerative imagination. Regenerative imagination does not function alone, but requires productive imagination as an objective basis. In short, it is a productive imagination to create an objective basis to unify representations, and it is a regenerative imagination to unite representations based on the productive imagination.

Thus, Kant argues that the interaction between emotion and intellect with the action of these imaginations leads to the recognition. In this way, imagination is an important factor that provides us a meaningful and unified experience. But on the other hand, there can be no objective experience that does not rely on (productive) imagination. Productive imagination (even if it is a transcendent function, and comes from our senses), which limits our ability to create new sensory representations that our senses have not experienced (Cho, 1993: 11). Ultimately, the imagination-productive and regenerative imagination-associated within regulatory judgment can not go beyond empirical perspectives. Therefore, it can be seen that it means only a coordinated and common sense union.

Secondly, reflective judgment plays a role in discovering the universal within which only specific things are given. However, in order to reflective judgment for performing its role, it must rely on the principle given from the inside. In other words, while we have to contemplate the possibilities of infinitely diverse empirical laws in nature, and recognize the various things, judgment must include the rule of lawful unity that can be combined into a possible experience by itself (Kant, 1790: 168-169). Kant calls this lawful unity purposiveness of nature. In other words, reflective judgment does not conceptualize a given object, but determine its purposiveness based on a given material. (Hwang, 2006: 82). Reflective judgment forms a new concept by organizing what our mind receives through senses according to its purposiveness. The imagination that acts at this time can be said to play a role in creating new order and meaning.

Judgement of taste as a representative example of reflective judgment, which Kant derives from a free play of imagination by reflecting the possible structuring of the subject being experienced. A free play can be said to mean that the object or phenomenon being judged is not guided by any definitional concept or rule but the imagination functions freely. In this sense, imagination in judgement of taste is characterized by being independent, active, infinitely creative beyond the simple mediating role. In short, Kant's imagination in epistemology based on the ability is to make judgment and thinking possible by combining and integrating a given object as it develops, and the imagination in reflective judgment - especially hobby judgment - It is an unique and active ability to form or capture forms. When we look at the relationship between imagination and intellect, the former seems to be a vertical relationship in which imagination is subordinated to intellect, and the latter is in a position similar to intellect, and maintains a horizontal relationship as a more central role (Kim, 2010: 305). Although there are big and small differences in roles, characteristics, and degrees, it is clear that these imaginations play a bridge between thoroughly separated 'experiences and reason' and 'subjectivity and objectivity'. Kant thus overcame the confrontation between rationalism and empiricism. And, on the other hand, raised the position(image) of imagination that was considered to be inferior to reason.

3) Criticism of Ambiguity About the Location of Imagination

To Kant, imagination is necessary to bring recognition to the mind by mediating intuition and concept, as well as intelligence and emotion, but the formal possibility or unification of all phenomena is possible through intelligence. According to this, imagination is inevitably included under intelligence and reason. Kant, however, raised both the importance of emotion and the spontaneity and creativity of imagination through discussion of judgment of taste. Nonetheless, creative imagination is limited to specific areas, such as arts. Moreover, the question remains as to somewhere to set the position of imagination. As pointed out by Johnson (2000), the ambiguity about the location of imagination seems to be a fundamental problem in Kant's metaphysics in which he thoroughly distinguishes between emotion and intellect, experience and reason. I would like to find out the possibility of overcoming this limitation from Dewey.

Imagination of Dewey

In this chapter, we explore the concept and role of imagination through the possibility of aesthetic sublimation of human experience, focusing on Dewey's late authoring *art as experience*.

1) Dewey's epistemology: An experience and quality.

Dewey, in the process of exploring nature, has established a philosophical framework in which experience continues as a process of constant change. Especially, Dewey's experience is not a mere external change but an overall process in which everything in a specific situation affects each other, and all internal personalities and temperaments change all the time. From the perspective of Dewey's experience, there is no absolute truth, and knowledge is constituted, reconstructed, changed, and developed through experience. Moreover, recognizing something to construct knowledge can be said to refer to both "the perception of an object and the state in which the result of such perception composes the mind"(Park, 2016(1): 114). In other words, Dewey is based on a philosophical basis that everything we perceive can not be distinguished between subject and object, as well as reason and emotion. And the ideal model which overcomes this distinction realized the possibility of integration, which is called "aesthetic experience"(Yang, 2004: 114). Because the inherent and most important feature of aesthetic experience is that there is no longer any distinction between the self and the world(Dewey, 1934: 254). 'An experience' is accomplished by capturing the particular nature of a subject-it can link the situation into a context- in a transactional situation. This particular nature includes some energy or feelings that create(s) a context. Therefore, it is impossible to make a conceptual definition. Because an experience has its own storyline, hence it has the beginning, the process, and the end. The process, in particular, is a process of organic and rhythmic change, and development that has a unique 'quality' that can not be found in any other experience(Dewey, 1934: 43).

This unique quality can never be revealed unless the contents and processes which make up the experience are continuous and integrated very closely and naturally. In other words, the quality of experience depends on the degree to which all interactions penetrate and integrate with each other within the experience. It is the moment of the aesthetic experience that Dewey tells when the end of one experience that is interpenetrated and completed this way (Dewey, 1934: 24-25).

In Dewey's view, subjects and objects exist in a changing context, and they become aware of each other or something in the context. Therefore, it is not a real problem to have what is unchanged or to figure it out. When the situation in which the experience occurs is concluded in any way, it is important to capture the conclusion, the meaning or value that it gains from it. To Dewey, therefore, perception is not to grasp objective facts or truth but to realize the integrated meaning and value including it.

2) The Key to the Systematization of Quality and the Establishment of Aesthetic Experiences: Imagination

Dewey believes that one experience with qualities must be cumulatively integrated in order for it to be completed, and that this process must include aesthetic elements. (Dewey, 1934: 45). The intellectual experience, which we consider to be far from emotional and aesthetic, is accompanied by an emotional nature in the process of being systematically structured and finalized. For example, the sense of accomplishment, mistake, and insufficiency that we feel after solving difficult mathematical problems. In addition, when we see an art work or listen to an instrument, we have an immediate feeling about it. In such a case like arts, emotional and aesthetic qualities directly appear in the materials. In the end, any experience has the qualities to characterize and distinguish it as an experience if its meaning expands and accumulates through successive actions taking place in the process of the experience. And by taking these qualities, the experience becomes an aesthetic experience. Thus, understanding the qualities in experience is an important key to establishing an experience (that is an aesthetic experience).

Dewey defines an aesthetic experience as an experience through the action of imagination (Dewey, 1934: 276). As mentioned earlier, experience can be an aesthetic experience by having meaning and value depending on the degree to which all the elements in it are harmonized and integrated. In light of these facts, imagination plays a role in harmonizing and integrating elements in experience. So Dewey defines the imagination as "a characteristic that is prevalent in all the processes of experience and makes the process vital" or "a way to see and feel things or events so that things or events can make one unified whole" (Dewey, 1934: 271). This imagination can never be purely intellectual or purely emotional in that it makes it a conscious experience by forming the overall union of elements in experience and finding meaning. Therefore, the experience as a result of working with imagination can not be classified as intellectual or emotional. Dewey saw that imagination provided a way for a thoughtful type of thinking before such thought to occur (Dewey, 1910: 6). In other words, imagination and thinking are closely related and characterize the nature of experience. And they combine the past meaning with the present to create a new meaning, thereby ensuring the continuity of experience.

According to Dewey, “thinking is the intentional endeavor to discover specific connections between something which we do and the consequences which result, so that the two become continuous”(Dewey, 1916: 229), and “the act of thinking upon a sense of sharing in the consequences of what goes on”(Dewey, 1916: 232). Through this argument, we can see that the close relationship between action and result is important. The relationship between them can also be said to unify the qualities flowing through the experience process. In this way, it can be seen that thinking must involve the ability to imagine concepts and form orderly relationships in response to the change, that is, imagination. In short, the key to discovering qualities and forming aesthetic sentiments is to understand the relevance of everything and to create a sense of unity in experience, in this sense, imagination plays this role.

3) Imagination to expand the horizon of experience

Imagination is the most important factor that enables an aesthetic experience to be made, so all aesthetic experience can be recognized as an imaginative experience. In other words, when our daily experience becomes "events filled with imaginative mediations" (Jeong, 2001: 399), it becomes aesthetic experience. Thus, the basis of Dewey's philosophy is that daily experience is not different from the aesthetic experience, which means that the source of aesthetic experience is the activity of creature. Creature interacts with the environment and maintains life. And it tries to overcome this process of life that has resulted in constant conflict with the environment, and to maintain balance. In this process, Creature grows in a more desirable direction and adapts to the environment. This balance state is not maintained continuously, but repeats the process of harmony. And balance restored through the active adaptation of creature. This is the way creature is maintained, and the basic pattern in which life and the environment relate to each other, and Dewey calls it "rhythm" (Dewey, 1934: 154). In other words, rhythm is a structure in which creature forms the order in change. When one cycle of rhythm is completed, creature and environment are integrated, and a process is completed. At this time, “fulfillment punctuate experience with rhythmically enjoyed intervals” will be take placed, such as joy, sorrow, hopes and despair (Dewey, 1934: 23). At the moment of aesthetic experience, the distinction disappears between experience subject and environment, and also each element is uniquely integrated. Through these facts, Dewey criticizes the dualism of the traditional philosophy which thoroughly distinguishes between the “mind and substance”, “reason and emotion”, or “mind and body”. In Dewey's philosophy, imagination brings an aesthetic character by allowing the ego. And the environment in experience to be mutually integrated and connects the artist's inner vision with outers. It also plays a role in integrating past, present and future by finding meaning and value in the completed experience. As an expression of this imagination, works of art enable humans to emerge and communicate with each other so that they can move away from separation and isolation. The power of art of engaging and uniting humans comes from the imagination that breaks the boundaries and bridges the connections. The imagination which reveals through the aesthetic experience plays a role in raising the quality of human life by revealing the meanings of experience or spreading horizons as the foundation of all life actions.

Educational Discussion

1) Limitations of Kant's imagination in terms of Dewey

In Dewey's view, the integration of imagination in Kant's epistemology combines external sensory qualities with internal priori reasons (Dewey, 1928: 136-137). At this time, imagination plays a role in helping the intelligence to order the given representation under the rule of reason. In other words, Imagination of Kant's epistemology, for Dewey, is limited to passive ability to conceptualize experiences or to help shape ideas.

Of course, In Kant's aesthetic judgment, imagination reveals a more advanced aspect to form and capture an aesthetic form through its own and proactive ability by triggering emotions of pleasure. Kant is regarded as contributing to the opening of the new horizon by bringing the imagination, which was inferior in comparison with the reason until the pre-modern period, as an unique and imaginative function of active and free imagination, however, Kant equated contemplation with the sense of aesthetic form through an aesthetic judgment based on or not targeting concepts. Kant believes that the judgment of a beautiful thing presupposes a mind that is in a 'stationary contemplation' (Kant, 1790: 252). In Dewey's view, if the moment when Kant's aesthetic judgment occurs is the same as the moment of 'stationary contemplation', beauty is irrelevant to desire, action, and emotional excitement, and contemplation is a result of aesthetic perception about the content of rational thought (Dewey, 1934: 258). To Dewey, contemplation is the balance and internal equilibrium of impulses, such as desires and affection for the sensuous qualities that can be found in cognitive activities. (Dewey, 1934: 261). In other words, it means that various minds-impulses of the object have been brought into equilibrium by being well integrated with each other, thereby emphasizing that the mind which faces the object can not be separated. And Dewey's imagination always plays a role in expanding the experience at the center of this integration.

Kant upgraded imagination to the ability to make aesthetic judgments as a free play. Nonetheless, "genius" within the ability for performing these imaginary functions is a natural ability, and this genius limits the area in which it is exercised to art. This would allow a class with a particular ability to be applied, and if applied to an educational situation, it might close the door of hope for learning or the possibility of achievement. Especially, from past to present, I believe that it does not help to overcome the disadvantages of rationalism which has stigmatized the education loser through the result of test. In Kant's epistemology and aesthetic judgment, imagination is considered to be dependent on or independent of reason, and the difficulty of establishing this position can be difficult to clarify the concept of imagination.

2) New possibilities of Dewey's imagination concept

There are some differences, but Kant and Dewey both see the imagination as the ability to make the processes of human thinking not to be confined to the realm of reason, and to emphasize or harmonize the realm of emotion to make it more balanced and rich in thought. Imagination for Kant proves that human beings can practice objective truth by mediating experience and reason, while imagination for Dewey allows to grasp the aesthetic qualities of experience so that it can be continuously reconstructed. Ultimately, they place the value of imagination in order for humans to lead a more desirable life, which is highly suggestive of the concept of educational imagination. However, from the viewpoint of Dewey, Kant has the limitation of restricting the function and location of imagination from his basic ideas that thoroughly distinguish reason and emotion, as well as objectivity and subjectivity.

Dewey laments that there are no words that can express both artistic and aesthetic at the same time. Because his ideas are ultimately based on the fact that nothing is separated, but an integrated interaction itself. Thus, the importance of the medium that leads to the integration and harmony is bound to be emphasized, and the imagination is the foundation or the core power to create and reconstruct the medium of integration and harmony. When we approach education from this point of view, imaginative education can not stay in interesting activities that draw what we have not experienced in our mind or create and reflect on new and exciting things simply. When educational activities such as making, speaking, experiencing, and so on are made and their outputs are produced, they are not merely outcomes or end results, but It should be a medium to influence and to have relationships with learners, the environment, and other subjects. Imagination should not be treated simply as a capacity to nurture, but as a nutrient that can be harmonized and melted to make everything grow in abundance. Also, to Dewey, who deals with art as daily experience, imagination is not limited to artistic values or special superiority. Rather, it is characterized by 'universality' that insights and connects the values and visions of whole human life. In other words, Dewey's imagination is a function of translating, integrating and expanding meaning so that art can become a daily experience. Nowadays, there is a lot of criticism that the real education is collapsing. It is because of the phenomenon that hierarchy is separated and humanity disappears. Imagination within this function allows the meaning of the things that humans experience together to have a different meaning for the individual, or to translate and communicate as a common meaning towards others. This allows the minds of people within a group to be integrated, translated or expanded to mean that the mind is communicated to other groups. I believe this imagination is a concept that opens up the possibility, that is, the life itself can become a sort of education.

ABSTRACT

The purpose of this paper is to analyze the motivations and the personality traits that characterize tourists who choose religious travels versus cruises. Participating in the research were 683 Italian tourists (345 males and 338 females, age range 18–63 years); 483 who went to a pilgrimage travel and 200 who chose a cruise ship in the Mediterranean Sea. Both groups of tourists completed the Travel Motivation Scale and the Big Five Questionnaire. Results show that different motivations and personality traits characterize the different types of tourists and, further, that motivations for traveling are predicted by specific —some similar, other divergent— personality traits.

INTRODUCTION

According to the definition of the World Tourism Organization, tourism comprises the activities of persons who are traveling to and staying in places outside of their usual environments for not more than one consecutive year, for leisure, business and other purposes. Different types of tourists correspond to different types of tourism. The types of tourists include those who are interested in visiting architectures and/or cultural and historical aspects of unknown regions; those who are mainly aiming to a rest and relax; and those who are traveling for special purposes (e.g., educational, sportive, or religious events). Social and psychological analyses are needed in order to understand the specific characteristics of these categories of travelers. Among these different types of tourists, two seem to be very different regarding aims and modalities of travelling: religious tourists and cruise ship tourists.

Religious tourism involves traveling to holy sites for pilgrimages, spiritual journeys, and conventions. According to estimates from the World Tourism Organization, more than 300 million travelers move about for religious reasons. However, up to 18 billion of dollars every year swell the coffers of what could be called a full-fledged religious tourism industry (UNWTO 2013). In Europe, with some exceptions such as Rome and Santiago de Compostela, the most popular destinations are represented by Marian shrines, e.g., Lourdes, Fatima, Czestochowa, Medjougorje, and Pompei.

With very different aims and modalities, cruise ship tourism is also making its mark in the tourism industry with its dynamic development of the peculiar, arousing more interests and providing specialized operators. It is a business that sources identify as the fastest growing of all of tourism businesses by virtue of its lower costs, which make it accessible to even larger segments of the market and favor a decisive seasonal adjustment of tourist flows.

The cruise may be perceived as an all-inclusive holiday, engaging in an experience very different from everyday routine, in a microcosm perfectly structured and planned in detail, protecting from any problem. In this sense, the cruise ship can be defined a “non-place” i.e. a typical product of postmodern society - such as resorts, airports and hypermarkets - with all the structural and functional characteristics outlined by Augé (1992): standard spaces and facilities where nothing is random, each particular is programmed, e.g. meal times, path lengths, internal and external events. Defined as the collective experience more comfortable and reassuring from a psychological point of view, the cruise has become a growing tourism product not only in terms of social expectations, but also on the economic dimension. The latest estimates of the World Tourism Organization set cruises as 1,8% of the global tourism, with a significant growth potential that can predict achieving a total of 30 million cruise passengers in 2020 (UNWTO 2013).

These two types of tourism have some elements in common because both are popular and represent accessible, reasonably priced travel. At the same time, both are supposed to symbolize different meanings: reflective and contemplative for religious tourism, and comfort and levity for cruise tourism.

The objective of this research is to point out and to compare the central motivations that underlie religious and cruise ship travel and to investigate the personality traits that characterize the two types of tourists associated with both types of travel.

The substantial importance of the motivation for tourism research and management can be exemplified by the fact that researchers, when defining a “tourist,” commonly refer to the person’s motives for travel (Leiper 1979). In travel-motivation studies, the underlying idea is that specific psychological needs and motivations qualify travel behavior and that a traveler chooses a type of travel to satisfy his or her internal requests (Dann 1977; Meng and Uysal 2008). Thus, push motivations can drive the tourist to search for destinations, situations, and events that assure his/her psychological needs, i.e., escaping from a daily routine, rest and relaxation, prestige, health and fitness, adventure and social interaction, family togetherness, and excitement. Pull factors, such as a destination’s attractiveness—art, beaches, facilities, cultural attractions, entertainment, natural scenery—can also motivate people to travel.

The past decades have produced noteworthy advancements in interpreting and understanding tourist motivation (Crompton 1979; Moscardo and Pearce 2004; Plog 1994; Prentice 2004), as by evaluating motivation, researchers can classify types of tourists (McIntosh and Goeldner 1990) and better decide their corresponding travel and behavioral patterns (Crompton 1979). Furthermore, findings that are derived from tourist motivation research can be useful to tourism marketers for the development and evaluation of services, brand image, promotional activities, and destination positioning.

A number of studies empirically identify the motivations of travelers (e.g. Crompton 1979; Jamrozky and Uysal 1994; Hoyer and Lillis 2008; Lee and Pearce 2002; Pearce and Lee 2005; Yuan and McDonald, 1990) but very sparsely with regard to religious tourism or cruise ship tourism (Kerstetter et al. 2005).

A review of religious travel motivation literature suggests that deciding on this kind of travel is related to numerous factors. Timothy and Olsen (2006) emphasized how some people travel in order to maintain certain identities, others to satisfy the feelings of nostalgia, some to experience the transcendent, and some to fulfill the requirements of particular faith-based groups. MacCannell (1976) referred to these tourists as “pilgrims of modernity,” choosing holy sites for reasons other than religious ones, specifying that many different motivations—not all of a religious nature—drive people to engage in pilgrimages, particularly in the context of the worries and concerns that are typical of the modern world. A question has arisen in scientific debates concerning the tourist who searches for modernity or authenticity. Sharpley (2008) has pointed out the spiritual dimension of tourism by examining the relationship between authenticity and tourism and by considering the ways in which tourists look to their heritages and histories in searching for the authentic roots of their identities. Religious travel may be an occasion for meditation and may also provide experiences that afford individuals the

potential to reconstruct meanings related to identity. Indeed, Cohen (1979) proposed that tourists often choose elective spiritual centers that are external to the mainstream of their native societies and cultures.

With regard to cruise ship tourism, Hung and Petrick (2011) analyzed the role of motivation regarding the intention to go on a cruise by developing a measurement scale for cruise motivation. Their findings suggested that relaxation, enhancing kinship, relationships, or friendships, and convenience were the major motivations for taking a cruise. Both Petrick (2004) and Petrick and Sirakaya (2004) found that fidelity and being a satisfied first-time cruiser had a great impact on intentions to go on a cruise. Further, Petrick (2004) suggested that less loyal or first-time cruisers are less price-sensitive and spend more. Li and Petrick (2008) found that a cruise passenger's fidelity is a function of his or her satisfaction with earlier cruises, the quality of the alternatives offered, and the size of the investment made in the relationship. Petrick, Li and Park (2007), using Crompton's (1992) choice set model, more deeply analyzed cruise passengers' decision-making processes and found that loyalty, familiarity, and social influences were the main motives for a passenger's decision to go on a cruise. Finally, Teye and Leclerc (2003) examined the motivations for going on a cruise on the basis of tourists' ethnicities and observed that the most important motives for Caucasians were dimensions that referred to social aspects, such as cultural discovery or family and kinship, whereas for ethnic minorities, they were the opportunity for uninhibited pursuits and entertainment.

Another area of interest that has received much relevance in tourism research has been the connection between personality traits and touristic choices (e.g. Crouch, Perdue, Timmermans and Uysal 2004; Berno and Ward 2005; Landers and Lounsbury 2006; Leung and Law 2010). In fact, personality has often been taken into consideration for market segmentation purposes; for example, Plog's (1974) delineation of *travel personality* types along an allocentrism-psychocentrism continuum received considerable interest. The motivational concepts of *strangeness-familiarity* (Cohen 1972) and *travel career ladder* (Pearce 1988) are pertinent also to personality traits. Personality has also been associated with the choice of travel destinations, of leisure activities engaged during the vacation, and of other travel-related decisions (Madrigal 1995; Nickerson and Ellis 1991). In addition, classifying a tourist's personality has been established as appropriate in order to direct a client to a destination in the course of travel agent-client contact (Griffith and Albanese 1996).

Several studies have analyzed the personality profile of religious tourist traveling to different religious destinations. Religious tourism in general is changing, so today, it should not be described in a stereotypical way (Ambrosio 2001; Collins-Kreiner and Kliot 2000; Lanquar 2008). Scaffidi Abbate and Di Nuovo (2013) explored motivations for choosing travel to Medjugorje and the relationship between such motivations and personality traits. The authors found that that both gender and age differentiate religious travelers along certain psychological variables. In synthesis, male travelers to Medjugorje seemed to be characterized primarily by a motivation focused on the need for discovery, while women showed a greater desire for socialization and openness to other people.

THE STUDY

This study aims to assess the differences in motivations and in personality traits for people who choose religious travel and people who choose to take cruises.

METHOD

Participants

Participants were Italian tourists who had chosen a travel package for the Marian Sanctuary of Medjugorje and others who had chosen to take a cruise in the Mediterranean Sea. The participants were selected with the help of a specialized travel agency; data were collected before the travel. The sample was composed of 683 subjects, 345 males, and 338 females. The age range was 18–63 years (Mean = 40.23; s.d. = 13.96). Religious tourists totaled 483 (244 males, 239 females), and cruisers totaled 200 (101 males, 99 females). Preliminary statistical analyses were carried out to ensure that the two groups were matched on all of the main variables: age (religious tourists Mean = 40.35, s.d. = 12.82; cruisers Mean = 40.11, s.d. = 15.10; $t = 0.21$, $p = 0.83$); level of education (chi-square between groups = 2.55, $p = 0.64$); and gender (chi-square = 0.06, $p = 0.94$).

Instruments

The instruments used were:

1) The *Travel Motivation Survey* developed by Figler, Weinstein, Sollers and Devan (1992) and adapted in Italian by Maeran (2000). The questionnaire explores, by means of 35 items on a five-point Likert scale, seven motivational categories: Culture, Self-seeking, Sensation-seeking, Status, Sociality, Relaxation, and Nature. In a previous principal components factor analysis using a Varimax rotation, the items of the scale loaded on three main factors that accounted for 40% of the total variance, and were labeled *Curiosity and discovery*, *Out-of-routine*, and *Self and sociality*. The *curiosity and discovery* factor includes items that measure a wish to see unknown sites and a curiosity for different cultural experiences. The *out-of-routine* factor includes items that measure a wish to have unusual experiences and to escape from one's daily routines. The third factor, *self and sociality*, includes items that measure the extent to which travel is seen as a means of rediscovering one's self through socialization. Cronbach alphas for the three factor scores were .82, .64, and .68, respectively.

2. The *Big Five Questionnaire* (BFQ, Costa and McCrae 1992) aimed to measure five personality factors, summarized as follows:

Energy/Activity: tendency to show assertiveness, active behaviors, and positive emotions.

Agreeableness/Cooperation: tendency to behave friendly and cooperatively rather than showing antagonism in interpersonal relations.

Conscientiousness: tendency to show planned, self-disciplined behavior and to control, regulate, and direct impulses.

Emotional stability: tendency to avoid unpleasant emotions and excessive sensitivity as well as to be calm and free from persistent negative feelings.

Openness to experience: tendency to appreciate new emotions, unconventional beliefs, adventure, curiosity, and a variety of experiences.

The Italian edition of BFQ, adapted by Caprara, Barbaranelli and Borgogni (1993), was used for our study.

RESULTS

Preliminary analyses on the whole sample (Table 1) show significant differences between genders in one out of three motivational factors (self and sociality), and in three out of five personality factors: energy/activity and emotional stability are higher in females, and conscientiousness is higher in males, as expected on the basis of the general standardization of the test. Therefore, subsequent analyses were performed while taking into account the gender variable.

Table 1: Gender differences in motivation and personality factors.

	<i>M</i>		<i>F</i>		<i>t</i>
	<i>Mean</i>	<i>s.d.</i>	<i>Mean</i>	<i>s.d.</i>

Openness to experience	80.60	8.58	79.20	10.53	1.98

* $p < 0.05$, after Bonferroni's correction

Independent sample t tests were conducted to examine whether tourist motivations differed significantly by group of tourists (tables 2 and 3). Significant differences in all three motivational variables were found between the two groups. In particular, cruise ship passengers compared with religious tourists have significantly higher scores in curiosity/discovery, out-of-routine, and self/sociality factors. These differences are found for both males and females.

Regarding personality factors, significant differences were found between the two groups divided by gender. In fact, as Table 2 shows, male cruisers have higher scores in the BFQ energy factor than do male religious tourists, while male religious tourists have higher scores in the agreeableness factor. Comparing the two groups of male tourists, no difference was found in the other personality factors.

A similar pattern of differences occurs in the female sample (Table 3), in which cruise tourists have higher scores in energy (as is the case with males) and also in the openness-to-experience factor. As do males, female religious tourists have higher scores in the agreeableness factor.

Table 2: Differences in motivation and personality factors in different types of male tourists.

	<i>Religious Tourists</i>		<i>Cruise Tourists</i>		<i>t</i>
	<i>Mean</i>	<i>s.d.</i>	<i>Mean</i>	<i>s.d.</i>	
Curiosity and discovery	3.33	0.86	3.53	0.51	-2.23*

* $p < 0.05$, after Bonferroni's correction

A discriminant analysis performed on the whole sample confirmed the utility of the motivational and personality variables in differentiating the two groups. For motivational factors, the analysis obtained a Wilks' Lambda =

0.38, $F = 413.76$ ($p < 0.001$), canonical correlation = 0.79. The classification matrix yields a satisfying total percentage of correct classification (0.90). The most discriminant factor is out-of-routine (F -to-remove = 985.81), and the less discriminant is curiosity/discovery ($F = 0.02$).

For personality traits, an analogous analysis obtained a Wilks' Lambda = 0.64, $F = 83.81$ ($p < 0.001$), canonical correlation = 0.60, total percentage of correct classification = 0.84. The most discriminant factor is agreeableness (F -to-remove = 377.87), and the less discriminant is conscientiousness ($F = 0.92$).

A multiple regression analysis separated by group of tourists was carried out to explore what personality traits, measured by BFQ scores, significantly predict the motivations for travel in each group.

Table 4 shows that in the religious tourists group, the openness trait (positively) and agreeableness (negatively) are predictive for motivation to curiosity and discovery. The agreeableness and conscientiousness traits, both negatively, are also predictive of out-of-routine motivation. Finally, the openness-to-experience trait is negatively linked to self-and-sociality factor scores.

In the cruiser group, the regression analysis (Table 5) shows a different pattern. Curiosity motivation is positively predicted both by openness (as in the other group) and agreeableness; in the religious group, this predictor was in the opposite direction. Curiosity is also predicted inversely by conscientiousness. Conscientiousness and emotional stability predict, both negatively, out-of-routine motivation. While for the religious tourist group the openness-to-experience trait negatively predicts self-and-sociality motivation, for the cruisers, the trait is positively linked to this motivation, which is also predicted by the energy and conscientiousness traits.

Table 4: Multiple regression analysis of personality traits on motivational variables for religious tourists.

DISCUSSION

The purpose of this study was to explore motivations for choosing different types of travel—in particular, religious tourism and cruise ship tourism—and the relationship between such motivation and personality traits.

Data show that cruisers, compared with religious tourists, seem to be characterized by the strongest motivations, showing significantly higher scores in curiosity-and-discovery, out-of-routine, and self-and-sociality factors. We can hypothesize that, in the experience of religious tourism, the travel generates less curiosity to see new things and to be willing to meet new people, with the spirit of inquiry and adventure or a willingness to change the previous outlook on life being less prevalent. Religious tourists, probably driven mainly by reasons of faith, do not start to feel out of their routines, as the people's religious sentiment creates a continuum between everyday life and travel. Compared with the cruise ship tourists, religious tourists have a less marked dynamic personality—i.e., a confident and enthusiastic approach to the various circumstances of life; they are less openness to experience—a willingness to accept new ideas and others' values and feelings. According to the principles of their faiths, religious travelers are more cooperative and empathic and have a friendlier attitude.

Moreover, the findings of our research indicate that motivations to travel are predicted by specific personality traits, some similar and other divergent, in different types of tourists.

Openness to experience, i.e. a willingness to understand new ideas and to appreciate others' values, positively predict curiosity for discovery both in religious and cruiser tourists; in both groups, conscientiousness (i.e., the tendency to control and to regulate impulses and show self-discipline) is a negative predictor of out-of-routine motivation.

Some personality traits are predictors that differentiate motivations in the religious and cruise travelers. Agreeableness (i.e., predisposition to friendliness) predicts curiosity negatively in religious tourists, while the opposite case exists for cruisers, who are more driven by relational aspects and expectations in search for discovery. Openness to experience is a positive predictor of the motivation for traveling, linked to self and sociality in cruisers, who are more open to variety in emotional experiences, while the opposite happens in religious tourists, who tend to prefer familiarity over novelty. Out-of-routine motivation is negatively predicted by agreeableness in religious tourists and by emotional stability in cruisers. This signifies that travelers for religious reasons tend to preserve usual routines when they are more disposed to friendliness, while those who choose cruise ship travel tend to maintain routines depending on their emotional instability, i.e., their tendency to experience unpleasant emotions easily. Finally, motivations that are pertinent to self and sociality are negatively predicted in cruisers by energy and conscientiousness, i.e., characteristics such as surgency and assertiveness and preference for planned rather than spontaneous behaviors.

The complexity of the experience of each type of tourism, the inherent heterogeneity of motivational components and content, and the difficulty with ordering them in a unified theory are all evident. For this reason, we think that trying to capture the motivations—also on the basis of personality traits—of specific categories of tourists can be a useful tool for designing appropriate marketing campaigns and for supporting a choice of the trip.

To know specific tourists' attitudes, perceptions, motivations is relevant for promoting their satisfaction (Ryan 1995), and for developing more suitable services and promotional activities by tourism marketers. Also, personality traits could be predictors of satisfaction both during and after traveling differentiating the genders.

Tour operators and guides should pay attention to participants' specific personality traits to ensure optimal treatment in organizing and monitoring different types of touristic experiences.

ABSTRACT

The paper is based on the results achieved in the common project concerning quality assurance processes in Portugal and Slovakia. Over the past decades, countries all over the world have become increasingly concerned about the level of education of their citizens. Quality of primary and lower secondary education can significantly influence the life of young people, particularly the approach of learners to further education, either formal or informal. Results from PISA show educators and policy makers the quality and equity of learning outcomes achieved in different countries, and allow them to learn from the policies and practices applied in diverse contexts. The quality assurance processes in Slovakia and Portugal as well as PISA results achieved by young people in these countries will be analysed and discussed.

Key words: quality assurance, self-evaluation processes, policies and practices in Slovakia and Portugal

INTRODUCTION

Most educators and teachers would like to offer education of high quality to their learners as they consider them followers of what they have achieved. In general, teachers want their students to reach more than they have achieved as teachers are ones that inspire, guide, enlighten and motivate. While fifty years ago, education was based on knowledge, later skills, currently, the focus is on competences. However, it is not possible to develop our competencies without being knowledgeable and skilful. A 21st century market place challenges educational institutions since the changing environments require different approaches to education from ones that used to be sufficient. The labour market demands higher-level skills, such as several information-processing skills. According to frameworks from European Skills, Competences, Qualifications and Occupations (ESCO), three broad categories are presented: foundational literacies, competencies and character qualities. The category of literacies includes literacy and numeracy that are globally assessed, but also scientific literacy, ICT literacy, financial literacy and cultural and civic literacy that are considered core skills to everyday tasks. Since the abilities concerning identifying, analysing and evaluating situations and information in order to formulate responses to problems are in demand, critical thinking or problem solving is the way of approaching complex challenges, apart from creativity, communication and collaboration. The 21st century requires character qualities such as curiosity, initiative, persistence, adaptability, leadership, and social and cultural awareness (World Economic Forum, 2015).

Some of the above-mentioned key competences and skills are assessed through performances of learners as well as employed people across countries. The comparison of the results reveals how variably certain literacies and

competencies are perceived in different local contexts due to culture, experiences and open-mindedness. On the other hand, it is important to mention that countries have developed differently and some of them can respond more slowly to changing societies, innovation-driven economy and more challenging demands of the labour market.

THE STUDY

Within the common project called ‘Self-evaluation Relevant for Primary and Secondary Schools as a Process Towards Improvements and Quality Assurance’ that has been carried out since 2016 in cooperation between Trnava University and Porto University within the grant scheme of Portuguese and Slovak Research and Development Agencies, researchers from Porto University and Trnava University focused on the changes in their societies, comparing the system of quality assurance, prevalently self-evaluation processes. During research, three researchers from Porto University visited primary and secondary schools in Slovakia in May 2016 and three university teachers from Trnava University visited primary and secondary schools in Portugal, observing self-evaluation processes in different local contexts and analyzing them. Therefore, several studies have been conducted so far. This study focuses on comparing scores in literacies and competences achieved by respondents from both Portugal and Slovakia.

THE STUDY ON COMPETENCIES OF ADULTS

The Programme for the International Assessment of Adult Competencies (PIAAC) is the first international survey of skills used by adults in their work. This survey of adult skills or competences measures adults’ proficiency in key information-processing skills - literacy, numeracy and problem solving in technology-rich environments – and gathers information and data on how adults use their skills at home, at work and in the wider community. This programme is supported by the European Union as life-long education is one of 16 key indicators that are important to meet Lisbon goals in the domain of education. The programme focuses on literacies of adults such as reading, mathematical and problem-solving in technology-rich environments and how adults develop these literacies, how they use them and what benefits they can get from using them. The gathered information reveals how these literacies influence adults’ participation in the labour market, income, health, social and political engagement. What is more it can provide information about effectiveness of education and technical preparation and help adjust tools of educational policies for development of key competencies that enable adults to fit the labour market and society in general. The survey was conducted in 2011-2012, using data from 157,000 adults at the age 16-65 from 24 countries (22 OECD member states and two partner countries). The survey in Slovakia was conducted on the sample of 5,702 adults (2,697 males and 3,005 females). The survey of adults’ competencies (PIAAC) measures the effectiveness of the educational system and can be considered an independent external system of evaluation of the level of education in the country and the effectiveness of secondary schools and higher education institutions. The results of Slovak adults in reading literacy show that the Slovak system of education focuses on average reading skills achievements and the number of graduates with a higher level of reading literacy is lower than in other countries such as Poland and Ireland. A lower level of mathematical literacy of young Slovak adults might result from the loss of position mathematics used to have as one of the main general subjects by decreasing the number of lessons per week, reduction of subject content and exclusion of maths from the list of obligatory subjects in the school-leaving examinations. According to the results (PIAAC, 2016), a long-term decrease of mathematical literacy was not compensated by a significant increase of reading literacy. The interventions into the system of education in the previous years led to the decline of mathematical literacy and did not mean the growth of reading literacy.

Problem solving in technology-rich environments is based on a combination of computer literacy (the ability to use ICT tools) and cognitive skills that are necessary while solving problems. The goal of testing was not to measure an isolated skill of using ICT applications but to judge the ability of adults to use ICT meaningfully and systematically to get, retrieve and analyse information. The difficulty of tasks is linked with cognitive demands and tasks complexity as well as the character of equipment and applications necessary for achieving the results. For example, a more demanding task requires information transfer from one application to another, subsequently transformed into the procedures that lead to reaching the goal, while using several steps and tackling the obstacles (Bunčák et al., 2013).

As 22% of Slovak respondents did not have previous experience with using a computer, 2.2% of respondents did not take a basic test of computer literacy and 12.2% decided to be tested in paper form. The proficiency test in solving problems in technically-developed environments was done by 63.6% of computer-literate respondents. Out of 36.4% of those who did not take part in this test, two-thirds were not able to sit such a test at all. In this case, Slovakia alongside with Italy, Poland, Korea and Spain is a country in which one-fourth of population is computer illiterate. From the present-day perspective, these people are in a similar situation as people in the half of the last century were, when they could not read and write (Bunčák et al., 2013).

In an international comparison of inhabitants' abilities to solve problems in technology-rich environments, Slovakia lags behind the OECD average. In contrast with reading and mathematical literacies, the level of abilities to solve problems in technically-developed environment matches the level of achieved education in a lesser extent. Reading and mathematical literacies are mutually linked by a strong correlation, a higher level in one literacy correlates with a higher level in another one in the OECD countries, despite the fact they are based on two different types of literacies. The correlation coefficient in the OECD countries is 0.867 and in Slovakia 0.855 (OECD Skills Outlook, 2013).

On the contrary such a strong correlation does not exist between reading and mathematical literacies on one side and ICT literacy in a technology-rich environment on the other side. It is natural that more and more people can achieve a higher level of reading and mathematics, however, they are ICT illiterate as the former literacies are traditionally supported literacies, while the latter is completely new for an older generation.

Average	Reading literacy	Mathematical literacy	ICT literacy
OECD countries	273	269	34
Slovakia	274	276	26

Table 1 A comparison of averages in reading, mathematics and ICT literacy in Slovakia and OECD countries

Due to the character of these three literacies, there are significant differences between the levels achieved by inhabitants in each of OECD countries. In an international comparison with other OECD countries, the representatives from Slovakia have achieved average reading literacy, above-average mathematical literacy, and a below-average level of ability to solve problems in technology-rich environments (Table 1). In the Slovak Republic, more than 20% of the most proficient adults are out of the labour force, which represents a relatively large pool of skills that could be activated and Slovakia should make greater economic use of their highly skilled talent pool (OECD, 2013).

STUDIES OF COMPETENCES OF 15-YEAR OLDS

The Programme for International Student Assessment (PISA) is a worldwide study, organised by the Organisation for Economic Co-operation and Development (OECD) conducted in member and non-member countries of 15-year-old school pupils' scholastic performances on mathematics, science, and reading. It was first performed in 2000 and then repeated every three years. Its aim is to provide comparable data with a view to enabling countries to improve their education policies and outcomes. It measures problem solving and cognition in daily life situations, focusing on what 15-year-old students know and what they can do with what they know, having acquired knowledge and skills that should enable them to actively participate in changing societies (OECD, 2014).

As it has been mentioned in the article Quality Assurance – Myth or Reality (Béřešová, 2017), Slovakia is more and more concerned in external measurements of students' performances, introducing external school-leaving examinations in 2000, later followed by Monitor 9 and Monitor 5. The school-leaving examinations are taken by secondary-school leavers obligatorily in the mother tongues and target languages, and voluntarily in mathematics. However, the results achieved by students are still not accepted by universities as they are autonomous bodies and can claim their own requirements for admission processes. Monitor 9 is obligatory for students who complete their primary school education and the results from the external part can influence their admission at secondary schools, prevailing at secondary grammar schools. Monitor 5 was piloted last year by those who voluntarily wanted to participate in the external measurement process. The idea behind the introduction of external measurement was to ensure validity, reliability and objectivity.

On the contrary, the Portuguese society emphasises internal evaluation through self-evaluation processes. The emphasis is placed on the operation of primary and secondary schools as a whole. Good learning environments promote students' involvement in learning processes, parents' engagements in school functioning and teachers' initiatives in improving their teaching. The role of school management resulted from the programme called "New Opportunities" that enabled to introduce "school clusters" bridging together several schools in a single educational project. Professionally managed school activities remain therefore of high priority.

The changing conditions in both countries have had an impact on education. For the comparison of different approaches to evaluation processes, it seemed to be logical to use data based on officially-conducted assessment of those who are affected by the introduced changes. In the following analysis the scores of 15-year-old students from both countries are compared. The data chosen for a detailed examination are the students' achievements in PISA 2012 and PISA 2015.

In each of their cycles, PISA examines three areas of functional literacy of students – mathematical, scientific and reading literacies. Approximately half of the test items are devoted to the tasks of the main domain. 512,343 students from 65 countries, out of which 34 were OECD countries and 31 so called partner countries took part in PISA measurements in 2012. Slovakia had taken part in PISA measurements for the fourth time and Slovak students from 231 schools (4,678 in paper and 1,059 in electronic forms) were tested in mathematical, reading, scientific and financial literacies. The number of girls (2,748) was higher than the number of boys (2,654).

Focusing on an analysis of two countries, Portugal and Slovakia, it is necessary to conclude that students from both countries reached a mean score in mathematics lower than the mean score of OECD countries (494). Despite the fact that both countries did not reach the mean score of OECD countries (496) in reading literacy, the mean score of Portuguese students is much higher than that of Slovak students. Quite a big difference between Portuguese and Slovak students is recognisable in scientific literacy the OECD mean score of which was 501 (Table 2).

Countries	Science	Mathematics	Reading
OECD countries	501	494	496
Portugal	489	487	488
Slovakia	471	482	463

Table 2 Mean Scores in PISA 2012

In 2015, the main testing domain was scientific literacy. The rest of the tasks were distributed between two other domains, supplemented by team problem-solving, the results of which will be presented in October/November 2017. Pisa study 2015 went through significant changes in testing as the countries could join the electronic way of measurement. The total number of countries that participated in the last measurement cycle was 72 countries and 25 regions of the world (35 OECD countries and 62 so called partner countries and regions) with a total number of test-takers – 540,000 students. In Slovakia, 292 schools holding 6,350 students (3,035 girls and 3,315 boys) took part in PISA measurements in 2015.

Countries	Science	Mathematics	Reading
OECD countries	493	490	493
Portugal	501	492	498
Slovakia	461	475	453

Table 3 Mean Scores in PISA 2015

Despite the fact that the average performance of the OECD countries in scientific literacy decreases on the value of 493 points, Slovakia achieved the average score that is below the average of the participated countries of the OECD. The performance of Slovak students reached the level of 461 points. On the other hand, the average score of Portuguese students is higher than the average score of the OECD countries. Very similar conclusions can be made about other literacies. In mathematic literacy, Slovakia reached 475 points that is significantly lower than the average of the OECD countries (490 points). As for reading literacy, Slovak students achieved the average performance at the level of 453 points that is 40 points lower than the OECD average (Table 3). In all literacies, Portuguese students reached above-average scores. Comparing surveys PISA from 2012 and 2015, Portugal achieved plus scored differences, while Slovak students achieved minus score differences.

CONCLUSIONS

Both external evaluations presented above (PIAAC and PISA) might be a basis for several conclusions for presenting strengths and weaknesses of the system of education in Slovakia, using the data from assessed

literacies of its population. The strength of Slovakia is an ability to ensure an average level of reading and mathematical literacies of those who have completed a secondary level of education. Weaknesses include a long-term stagnation of developing reading literacy, long-term decrease of supporting to increase mathematical literacy and a lack of ensuring an average level of inhabitants' ICT literacy – the ability to solve problems in a technically-developed environment.

In this piece of research that examines literacies, it was not possible to compare the adults' competences in Portugal and Slovakia as the former did not take part in the PIAAC the survey of which gathers a lot of information about reading and mathematical literacies, and strategies related to using information communication technologies at work and in everyday life, as well as general competencies such as an ability to co-operate with others. Respondents were expected to answer the questions concerning the matching of their skills and qualifications to working requirements, their autonomy to carry out key activities of their work.

On the other hand, both compared countries participated in PISA surveys that try to find the ways of better educational conditions to enable students to learn better, teachers to teach better and schools to become more effective in activities they provide (OECD, 2014). Despite the fact that external evaluation in Portugal is not introduced, their system of self-evaluation seems to work effectively as the results of their 15-year-old students from two different measurements (PISA 2012 and PISA 2015) proved that they had been better prepared for using their strategies and could better develop reading, mathematical and scientific literacies during their years of schooling.

Despite the fact that PIAAC surveys confirmed a quite satisfactory level of reading and mathematical literacies in Slovakia, it revealed big problems with using ICT by current working power in the country. On the other hand, PISA surveys confirmed stagnation of the effectiveness of the educational system. The unsatisfactory results of Slovak 15-year-olds are a challenge for the country to change education in order to improve literacies of their students. The previously conducted changes such as prolonging formal education or increasing the number of secondary-school leavers and university graduates did not improve learning outcomes of students and a current system of education in Slovakia is not able to meet the requirements of modern societies.

ABSTRACT

The paper deals with using ICT in home learning while preparing for any class at school. Within the project related to self-evaluation processes, the article focuses on a comparison of students' self-evaluation, measured by a questionnaire, and real data achieved in practical tasks. The indicators are based on the national educational programme for ICT learning outcomes to get objective measurement of learners' skills. The data will be analysed and discussed, providing a set of recommendations.

INTRODUCTION

Each process of human activity is closely related to evaluation, more precisely, assessment. Nowadays there is a profound belief that the process of learning as such depends on the ways and forms of evaluation. The aim of evaluation is to contribute to the success of education as well as the development of pupils' knowledge, skills and competences during their years of schooling. The ultimate user of assessment information that is elicited in order to improve learning is the pupil as assessment information can affect the motivation and self-esteem of pupils (Black & Wiliam, 1998). Many successful innovations have developed self-assessment by pupils as ways of enhancing formative assessment. The pupils can assess themselves when they have a sufficiently clear picture of objectives their learning is meant to attain. Their assessments should be discussed with their teachers and peers as it promotes the reflection on their own thinking that is important for good learning. According to Black and Wiliam (1998), it seems to be important for learners to be able to recognise the desired goal, to be aware of evidence about present situation, and to understand, to some degree, a way to close the gap between the two in order to improve learning.

Life in modern society is based on the use of ICT tools. The ICT tools are omnipresent and their users face significant demands. With the rise of the so-called information society, the views on the contemporary education system and its significance are changing. ICT tools contributing to effective education represent innovation trends. Their proper use and implementation contribute to the whole process of education. As a result of this, the users of ICT tools, e. g. computers, face higher and higher requirements. This was the main motivation to carry out a study, based on a comparison of real computer skills of students with the skills assessed by themselves in their self-evaluation sheets. These sheets contained the criteria relevant for competent computer users. For the purposes of this study, secondary-school students were addressed and asked to participate.

Picture 1 Success and self-evaluation

SELF-EVALUATION

Each human activity leads towards achieving a specific goal. The way to achieve the goals consists of several mutually conditioned stages. It is necessary to set the desired goal correctly, be it a need, a wish, an idea or a formulation of a goal, followed by the recognition of its state. A crucial stage in the achieving of the goal is

design of activities necessary to the most effective achievement of the goal, followed by the stage of achieving the plan, evaluation of the results and, above all, the comparison of the achieved goal with the initial idea. As a conclusion, evaluation is an organic part of all human activities.

Evaluation is closely related to self-evaluation, which is one of the most important competences for life. Knowing the weaknesses and strengths moves an individual forwards. The main reason for self-evaluation is to learn, which skills and knowledge an individual has in a specific area.

The foundation of self-evaluation is the complete acceptance of the self-evaluation results. Self-evaluation becomes successful primarily when an individual can set realistic goals, putting a maximum effort to their completion, followed by setting new goals. Speaking of self-evaluation, a specific feedback is the crucial factor. Self-evaluation can lead the students to the ability to judge the quality of their own work and consequently they can determine and plan the ways of their own self-improvement. It leads to students' independence and autonomy that allow them to recognize their own knowledge and skills, their strengths and weaknesses, and create the space for making a real picture of the self. Self-evaluation can have several forms and in educational context, its orientation depends on the decision of the school, or the teacher.

It is inappropriate to reduce self-evaluation to bipolar scales, e. g. I know – I don't know or I can – I can't. Such self-evaluation is not sufficiently holistic; it is simplistic and leads to schematization in evaluation, and finally, to typecasting. That is not the purpose of self-evaluation. It is always necessary to analyse the causes, to accept development strategies and to highlight the positives. The areas of students' assessment should be as varied as possible to make enough room for expressing their strengths and to allow them to experience success and the feel of personal freedom.

INFORMATION AND COMMUNICATION TECHNOLOGY

For the purposes of this study, it is necessary to distinguish technologies from information and communication technology. The term "technologies" refers to technical tools, procedures and skills used for achieving specific goals that should bring practical results. The expression "information and communication technology" refers to computer and communication technology that supports, in their unique way, teaching, learning and other education activities. These technologies are used for collecting, retrieving and exchanging information. For these purposes, traditional media, such as television, radio, personal computers with multimedia support, input and output devices are used (Suchý, 2007). Using ICT tools in education brings directly various positive aspects, such as the **individualisation** of education process, the development of **self-reliance** and **creativity** of students or individual tempo of learning of the students themselves.

THE IMPACT OF STUDENTS' HOME PREPARATION FOR USING ICT TOOLS

The process of home preparation of students has its meaning and purpose. While practising at home, students are expected to learn new material to be able achieve goals stated in the curriculum. Teachers perceive home preparation and homework as a natural part of students' preparation for school (Petlák & Komora, 2003).

RESEARCH

The aim of this study was to compare the real competence of students using the ICT with the answers the students provided in the presented self-evaluation sheets. Each sheet contained 10 evaluation criteria, resulted from basic to more complex tasks. Consequently, students were given tasks, based on the criteria from the sheet, and were expected to solve them using a personal computer. The gathered data were analysed and evaluated. The study sample consisted of 55 selected secondary-school students who have achieved varied results so far. The aim of the presented study was to identify the differences in self-evaluation of students in a common secondary-school class and their ability to use ICT tools.

CRITERIA OF RESEARCH

The presented self-evaluation sheet contained the criteria listed below and the participating students were expected to assess their knowledge on the 1–5 rating scale in Table 1 below, which corresponds to the marking schemes used by their teachers. The formulation of the criteria was based on the required knowledge of the students. As it has been already written, the tasks were ranging from basic to more complex.

Self-evaluation sheet criteria:

- 1) **To look up specific information on the Internet** – the task was to search for information on the Internet and process it appropriately. This task focused on the use of the Internet, searching engines as well as applying logical thinking when formulating the search command.

- 2) **To edit a picture according to the instructions** – the task was to edit a picture in a software product of students' choice (to resize, to cut, to add an object, a text, etc.).
- 3) **To connect a computer with a specific output device** – the task was to connect a personal computer with an output device, e. g. a printer, a projector, a scanner, etc. The criterion for completing this task was the functionality of the devices.
- 4) **To edit a text document according to the instructions** – the task was to edit the given text document in a selected software tool (to resize the font, to change its size, colour; text margins, spacing, heading, paragraphs).
- 5) **To edit a table** – the task was to make a table according to the given variables with specific values. Then the students had to use different software functions to calculate the average scores, total scores, and the maximum and minimum scores. The achieved results were supposed to be expressed in graphs.
- 6) **To edit a presentation** – the task was to edit the given presentation according to the instructions (to change the layout, size and colour of headings, to add a picture, a video, and a graph).
- 7) **To edit a video file** – the task was to cut out the required sequence, to add subtitles, a sound signal and to save the new file in a required format in software of their choice.
- 8) **To identify individual hardware elements of ICT tools** – the task was to identify the presented hardware elements and to match them with the relevant descriptions of their functions.
- 9) **To install and uninstall a specific software product** – the task was to install and uninstall the given software products correctly.
- 10) **To identify the IP address of a computer** – the task was to identify the correct IP address of a personal computer.

Table 1 presents the rating scale designed for students' self-evaluation of their knowledge and skills. These criteria were presented to the respondents with self-evaluation sheets.

	Levels of proficiency	Skills
1	Excellent knowledge	The level of knowledge is excellent. Students can use theoretical knowledge in practical tasks promptly, independently and creatively; they can apply knowledge practically and accomplish practical tasks promptly. They can follow procedures.
2	Very good knowledge (above average)	The knowledge is of a very good quality, with small gaps. Students use theoretical knowledge, but with less creativity and less certainty in practical tasks that they accomplish independently. The results of their work have small deficiencies, showing room for partial improvement of their knowledge.
3	Good knowledge	The knowledge is of a lesser quality with some deficiencies. Students apply theoretical knowledge in practical tasks with problems. They cannot always complete the task. There is more room for improvement and it is necessary to build up strengths and to minimize weaknesses.
4	Satisfactory knowledge (below average)	There are significant gaps in the complexity of theoretical knowledge. Students make bigger mistakes in accomplishing tasks and the results of their work show significant deficiencies. It is necessary to systematically support the acquisition of necessary knowledge.
5	Unsatisfactory knowledge (a minimum of knowledge)	None or unsatisfactory, minimal knowledge at hand. Students cannot apply their theoretical knowledge in practical tasks. The results show unacceptable deficiencies as they are incomplete, inaccurate. Students do not reach the lowest score of required indicators.

Table 1 Self-evaluation rating scale

After filling out the self-evaluation sheets the respondents were given ten tasks based on the self-evaluation criteria on the form. The total time for the tasks was 50 minutes. The tasks were assessed by the students' teachers and the performances were compared with self-evaluation sheets that the students filled out before accomplishing the tasks. These results are presented in Table 2 below and two graphs.

RESULTS OF THE RESEARCH

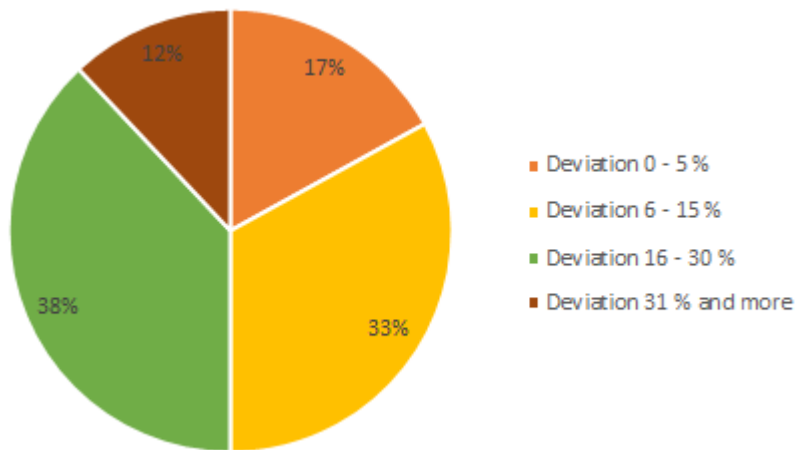

Table 2 presents the achieved scores of students with their self-evaluation indicated in the self-evaluation sheets. The final column contains the difference between these two values in percentage. The overestimated answers of students are in red, the underestimated answers are in green. The final line in the table summarizes the average

scores of individual columns. The table confirms that the students overestimated their knowledge and skills in eight tasks and underestimated their knowledge and skills only twice. The conclusion of this part of the study is that students exude a great degree of self-confidence.

	Self-evaluation criteria	Students' self-evaluation	Achieved scores	The difference in percentage
1	To look up specific information on the Internet	58	40	23,2 %
2	To edit a picture according to the instructions	62	49	30,38 %
3	To connect a computer with a specific output device	60	48	28,8 %
4	To edit a text document according to the instructions	35	39	13,65 %
5	To edit a table	78	54	42,12 %
6	To edit a presentation	55	46	25,3 %
7	To edit a video file	64	52	33,28 %
8	To identify individual hardware elements of ICT tools	42	46	19,32 %
9	To install and uninstall a specific software product	55	45	24,75 %
10	To identify the IP address of a computer	72	52	37,44 %
	The average scores	58,1	47,1	27,82

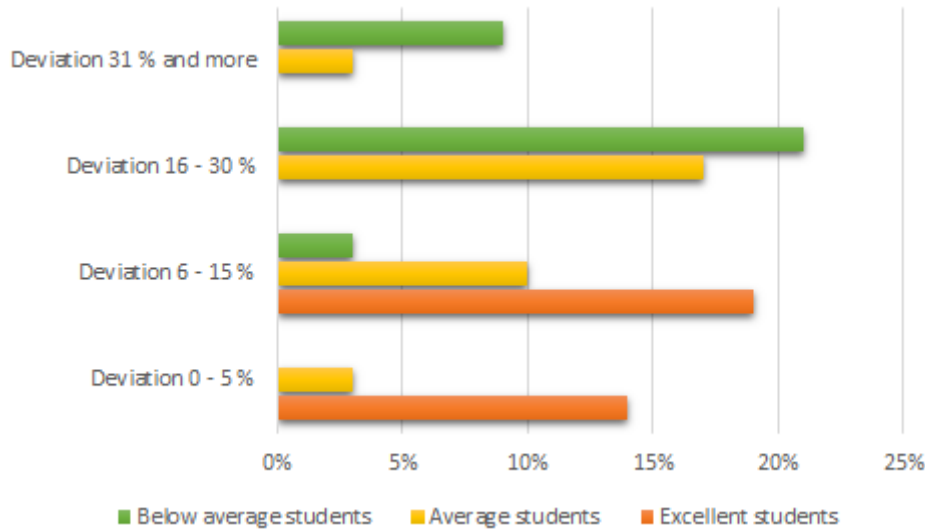

Table 2 Result of research

Graph 1 depicts the results of students' self-evaluation of knowledge. The first group consists of students who assessed their knowledge as excellent with the deviation of 0-5%. The graph shows that 17% of respondents assessed their knowledge correctly. One third of respondents assessed their knowledge with a deviation of 6 to 15%. It can be concluded that these students assessed their knowledge at an appropriate level. Thirty-eight percent of students assessed their knowledge with a deviation 15-30%. In most cases, the students overestimated their knowledge and skills. These students cannot assess their knowledge objectively. The last group consists of the students who assessed their knowledge with a deviation of more than 30%. This group makes up only 12% of all respondents.

Picture 2 Assessment of students' knowledge with specific deviations

The following graph depicts students' self-evaluation distributed to groups according to their scores: students with excellent study results, students with average study mean and students with results below and above the average.

Picture 3 Self-evaluation according to individual groups of students

The results presented in the graphs above definitely prove, that self-evaluation is an important part of life. A fair assessment of skills and abilities enables the people to achieve the best results in all spheres of life.

CONCLUSIONS

The submitted paper presents the results of a study in secondary-school students' of their knowledge and skills. This study was aimed at the use of the ICT tools because nowadays they are an inseparable part of the educational process. These modern devices are used by students in their home preparation for lessons. The study revealed that the students cannot assess their knowledge at the desired level. In most cases these students overestimated their skills. The students with excellent study results were able to evaluate their ICT knowledge and skills best. The students with the average results and results below the average proved their inability to assess their knowledge and skills objectively. The study revealed the importance of self-assessment, because if individuals are able to assess themselves objectively, they can reach their goals and move forwards, whether in their career or personal life.

ABSTRACT

The main aim of the writing education is to reveal the individual's feelings and thoughts. In other words, writing is one of ways to communicate with others and to express oneself. In today's education system, writing studies have a very important place. When the writing studies in the learning and teaching process are supported by the activities of interpretation and evaluation, it seems that the targeted achievement is reached much earlier. Technology is an indispensable fact of life in almost every field in the 21st century. Almost every student has a tablet, a smart phone and a computer depending on the fact we are talking about in this century called technology age. The students constantly communicate with their friends through messages thanks to the programs such as WhatsApp and Messenger that they downloaded with the technological tools. In the study, it is aimed to compare the writing skills between the students frequently and rarely using the programs such as WhatsApp and Messenger. Our study group consists of 60 students receiving education in the secondary education institutions under the Ministry of Education in TRNC. The students were assigned to write a composition for the purpose of data collection. The content analysis, percentage and frequencies were used in the analysis of the data.

Keywords: Technology, Education, Messenger, WhatsApp, Writing.

INTRODUCTION

Writing is the process of transferring the feelings, thoughts and dreams in our mind to the paper in accordance with certain rules. Writing that emerges from various needs is an effective and lasting communication way. Today, it is possible to see the patriotism of Turkish people symbolized by the flag in the Turkish national anthem of Akif and the life of Anatolian people in the past in the works of Yakup Kadri and Halide Edip. Therefore, we can say that writing has played an important role in transferring the intergenerational culture. The skills of reading, writing, speaking and listening involved in the basic language skills are based on four basic activities. Among these activities that show complementary qualities each other, the writing skill is the most challenging field for the students compared to the others: "Writing skill is one of the language skills students have the most difficulty due to the psychological, grammatical and cognitive problems faced by the students in writing process (Byrne, 1988, refer Maltepe, 2006)."

Because writing skill is not acquired innately, good education is needed to be able to write effectively and successfully. "Everyone who speaks a natural language gets the first language, or mother tongue, in the first five years after coming into the world. S/he can speak in that language even if s/he does not receive a private or regular education. However, s/he may not learn to write. Even in a language we can speak, we learn how the language is shown in writing, what it is written in a school (Keçik&Uzun, 2001: 63)." As it is known, the students were instructed to make writing studies from the beginning of primary education in order to avoid difficulties in this regard. Thanks to the texts in the Turkish and literature lessons taught in our schools, it is aimed both to be improved the writing skills of the students and to be enjoyed the works of art value due to the perfection of the narration in these works.

In our country, it is observed that the students are insensitive to composition studies. Unfortunately, the insensitivity we are talking about is also accompanied by failure. The fact that examinations in our country, especially university entrance examinations are performed in a test form are one of the main factors affecting this insensitivity. "One of the most important elements affecting the development of writing skills in Turkey is the student selection examination. This examination that is based on the test method and aims to measure whether students understand the text or not dulls the students' ability to write and deprives them of thinking and producing by restricting them into five options. Educating the students with test logic starting from primary

school until the end of high school directs them to a test technique rather than thinking and producing, so that it constitutes the greatest obstacle to the development of writing (Ungan, 2007: 468)." Nevertheless, one of the main factors affecting failure in written narration studies is the restriction of the students by teachers in terms of subject and time. The teacher should carefully adjust the time according to the subject and guide the students during the writing studies. Almost half (46.6%) of the Turkish teachers want students to explain a proverb or saying in their composition studies according to a study conducted by Zorbaz in 2005 (Zorbaz, 2005, refer Ungan, 2007). Because of this situation, the creative writing skills of the students are also damaged. The students should be given freedom, especially in the selection of subjects, and they should be allowed to set their goals. "Determining the goals ensures that students are willing to write. Determination of the written expression must take place in the direction of the student's own request and more than one subject option that will work their imagination and reveal their creativity should be offered to the students (Aktan, 2013: 708)."

The development of information technologies has directly affected the educational life as it is in almost every field. It is an undeniable fact that technology will positively affect education and training if used correctly and on the spot. Today, thanks to technology and the excellent use of technology by the teachers and students, it is known that the educational environments are made more efficient. Today, almost every student has smartphones and tablets and these make it easier for students to access information. However, it is worth noting that which point the students using frequently and careless the programs such as WhatsApp and Messenger installed on computers, tablets and smartphones can be at especially in terms of writing skills. Because it was observed that people using these programs installed on phones and tablets intensively and uncontrollably do not pay any attention to the rules of writing especially when they message each other.

THE PURPOSE OF THE STUDY

The purpose of this study is to identify and compare the mistakes done in the writing studies by students receiving the education in the twelfth grade of high school and frequently and rarely using the programs such as WhatsApp and Messenger. For this purpose, the students receiving the education in the twelfth grade of high school were instructed to write composition.

METHOD

The Universe and The Sampling

The study's universe consists of twelfth grade students studying in high schools and colleges in the TRNC. The sampling is composed of 60 twelfth grade students studying in high school and college in 2016-2017 academic year. We preferred twelfth grade students because we thought they were at a certain level of writing skills. However, we chose students from both colleges and high schools in order to obtain healthy results.

Data Collection Tools

A Data Form and Written Expression Assessment Scale were used as data collection tool. The Written Expression Assessment Scale was prepared by using the studies of Ağca (Ağca, 1999) and Demirel and Şahinel (Demirel & Şahinel, 2006), Turkish Program, Ministry of Education. Writing subjects are usually left to students. The composition papers collected from the students were examined and evaluated. In the "Data Form" we mentioned, the students were asked how many hours a day they use the programs such as WhatsApp and Messenger.

Analysis of Data

The compositions were classified considering how many hours a day students use the programs such as WhatsApp and Messenger. In this direction, 3 headings including "The Compositions Written By Those Who Use The Programs Such As WhatsApp And Messenger For 1-3 Hours A Day", "The Compositions Written By Those Who Use The Programs Such As WhatsApp And Messenger For 4-6 Hours A Day", "The Compositions Written By Those Who Use The Programs Such As WhatsApp And Messenger Over 7 Hours A Day" were created and 20 composition studies were collected under each heading. The data were analyzed by descriptive statistics and content analysis. The collected data in this process were evaluated by spelling mistake, word, main idea, sentence, punctuation, page layout and title.

Findings and Comments

The results of this study to identify the mistakes in the composition writing by those who frequently and rarely use the programs such as WhatsApp and Messenger are present below:

Table-I

Distribution of mistakes by those who use the programs such as WhatsApp and Messenger for 1-3 hours a day	F	%	Mistake Number
Title	7	35	7
Page Layout	5	25	5
Main Idea	6	30	6
Sentence	9	45	26
Word	10	50	39
Punctuation Mistakes	10	50	45
Spelling Mistakes	14	70	105

When we examine Table-I, it is seen that the most spelling mistakes made by the students who use the programs such as WhatsApp and Messenger for 1-3 hours a day. It was observed that the 14 of the 20 students made 105 spelling mistakes in total. It was seen that the students had a great difficulty in writing the words "something (bir şey), everything (her şey), nothing (hiçbir) etc.". Nevertheless, it was observed that the mistakes were substantially made especially in the writing of "ki" conjunction in Turkish. It is possible to link the fact that students made so many spelling mistakes to the inadequacy of their composition studies in the past. Apart from this, we observed that half of the students (50%) made punctuation and word mistakes, and 45% made sentence mistakes. While 30% of the students could not gather up what they wrote around a main idea, 25% of them did not care about the page layout and 35% of them did not put a title in the composition or preferred the meaningless title. It is possible to link the fact that students had difficulty in putting a title in the composition and the other mistakes they made to their lack of information on this subject and not doing enough writing study. Apart from this, individuals who want to succeed in their writing activities should pay great attention to each writing study without exception and make it a habit. Unfortunately, it was observed that people were often careless in internet correspondence and made especially similar spelling mistakes.

Table-II

Distribution of mistakes by those who use the programs such as WhatsApp and Messenger for 4-6 hours a day	F	%	Mistake Number
Title	3	15	3
Page Layout	7	35	7
Main Idea	6	30	6
Sentence	12	60	38
Word	11	55	42
Punctuation Mistakes	16	80	65
Spelling Mistakes	18	90	145

It was seen that there are too many spelling and punctuation mistakes in the compositions of the students who use the programs such as WhatsApp and Messenger for minimum 4 and maximum 6 hours a day. While the 18 of 20 students made spelling mistakes, the 16 students made punctuation mistakes. When we examined the composition papers, we observed that the spelling mistakes were mostly related to the conjunctions. The students had difficulty in writing separate "de" and "ki" conjunctions in Turkish and made 145 mistakes in total. It was found that they confused especially comma with semicolon in terms of punctuation marks or that they failed to use these in the suitable place. A total of 65 punctuation mistakes were detected in the students' composition papers. Although the lack of a good educational background is effective in the given mistakes of the students, we also think that using the programs such as WhatsApp and Messenger intensively triggers these kinds of mistakes. Especially, when we look at the writing of students who send messages to each other continuously, we think that the above mentioned spelling and punctuation mistakes will be seen intensely.

It was also seen that the 11 of the students in this group made word mistakes and 12 of them made sentence mistakes. When all of the papers were examined 42 word mistakes and 38 sentence mistakes in total were found. Especially, we think that the lack of letters made while writing the words can be explained by the intensive use of such programs. The fact that meaningful and meaningless abbreviations are used intensively in the written messages is remarkable. The 6 of the students in the same group could not succeed in forming their writings around a certain main idea. We observed that 3 students did not put a title in the composition, and 7 students did not have a page layout. It was seen that the students did not keep their papers clean and they had difficulty in

writing on a paper without lines. It is possible to link the fact that students did not pay attention to page layout to not paying enough attention when writing. As mentioned above, students usually do not take care to write in their correspondence with the programs they use, and they make it a habit in time.

Table-III

Distribution of mistakes by those who use the programs such as WhatsApp and Messenger for 7 hours and over a day	F	%	Mistake Number
Title	11	55	11
Page Layout	11	55	11
Main Idea	15	75	15
Sentence	14	70	48
Word	19	95	103
Punctuation Mistakes	19	95	94
Spelling Mistakes	19	95	152

When we looked at Table 3, we observed that there were a lot of mistakes in the compositions written by the students who use the programs such as WhatsApp and Messenger for 7 hours and over a day. We can say that especially spelling, punctuation and word mistakes were very common in the compositions. When we carefully examined the papers, we observed that the students had difficulty in noticing "de" and "ki" conjunctions in Turkish, could not write "mi" interrogative particle in Turkish correctly, misspelled the words such as "something (bir şey), everything (her şey)" especially, experienced difficulty with capitalization, did not know how to write some words (Maalesef-Malesef-unfortunately / Hastane-Hastahane-hospital / Çiçekçi-Çicekci-florist / Ücret-Üçret-fee etc.) and did not use even dot, the simplest punctuation mark, in many places.

Additionally, while 70% of the students were found to make the wrong sentences, 75% of them were found to experience difficulty in forming the main idea. These students who stated that they used the programs such as WhatsApp and Messenger very frequently and intensely were found to experience difficulties in keeping a certain level in composition writing (55%) and in putting a title (55%).

CONCLUSIONS AND RECOMMENDATIONS

Interesting results obtained in this study aimed to compare the mistakes made in written narration by the students frequently and rarely using the programs such as WhatsApp and Messenger. In this study conducted on 60 students, the students were divided into the groups of 20 people according to the frequency of use of such programs and their mistakes were evaluated. Although it was observed that those who use less the programs such as WhatsApp and Messenger made also too many mistakes, it was seen that the writing mistakes of the students generally increase according to the frequency of use of such programs. According to this evaluation, we can say that the mistakes made by those who use the program for 7 hours and over a day among the students reached the 12th grade by receiving a similar education program were more than the others.

Based on this study we conducted, it is possible to say that the intensive and careless use of the technological tools and the programs which we talked about is also effective in the case of especially the spelling, punctuation and word mistakes. In order to minimize these writing mistakes which we mentioned above, it is possible to list what to do as follows:

- The writing studies should be given great importance starting from primary education and feedbacks should be given to students by checking the texts of the students in detail.
- A particular emphasis should be placed on the subject that students usually made the mistakes and similar mistakes should be avoided.
- Writing and reading exercises should be carried out together. One of the most important problems in our country is that the rate of reading books is low. It is known that even the students who came from the departments of Turkish Language Teaching and Turkish Language and Literature of universities did not read enough in the past and that even some of them finished secondary education without reading any books. It is clear that it is not possible to expect an message without a mistake from the students in this situation.
- The examination system should be reviewed. It can be said that the composition studies that will be given during the entrance exams to the university especially will increase the motivation of the students in this sense.
- The students can be helped more by doing writing exercises on special courses to be opened outside the classroom particularly in primary and secondary education.

- Families and teachers should constantly monitor children's writing and ensure that they write everywhere in a beautiful and proper manner. It is an indisputable fact that technology will benefit if it is used correctly. It is clear that these mistakes will be diminished or even lost over time if the mistakes in the correspondences on the internet are constantly corrected and ensure that the students are able to write properly.
- Correcting the said writing mistakes should not only be the task of teachers of Turkish or Turkish Language and Literature. Teachers who work in other fields should also warn students in this context and correct their mistakes.
- Unfortunately, educated adults also make similar mistakes when writing messages using the programs such as WhatsApp and Messenger because they do not care. Writing on the internet should not mean that we will not comply with the rules. Especially we should pay attention to what we write on this platform and be an example to children.

A Conceptual Model to Educate Open Access for Improving the Quality of Research

YANIASIH

*Center for Scientific Documentation and Information, Indonesian Institute of Sciences
Jakarta, Indonesia*

Email: yani.asih@gmail.com

ABSTRACT

Open access grows fast in higher education and becomes a new trend in scholarly communication. Open access is indicated to give several benefits among other to disseminate research outputs, promote researcher and institution, preserve the intellectual property as well as encouraged innovations. The primary barrier to the success of open access is the low of knowledge, awareness and participation of faculty as both the author and user of the scientific articles. The aim of this study is to analyze and propose a conceptual model to educate faculty about open access to improve the quality of research in higher education. The model consists of concept, syllabus as well as teaching methods and target participants. Education concept adopts knowledge sharing model that involves all stakeholders related, i.e. researcher, academics, student, library/librarian, donor, policy maker and publisher. Knowledge sharing is chosen as two-way learning for stakeholders to share their knowledge and perception then build collective understanding and action. The knowledge sharing model is realized through some teaching methods, i.e. class, focus group discussion, workshop, seminar, social media network and consultation services. The syllabus focus on the OA concept, self-archiving in the repository, publishing process in OA journal, digital copyright, open access licensing, and the usage of open access resources in teaching and research. The proposed model expected can be endorsed by higher education especially in developing countries which still in a new stage of developing open access.

Keyword: open access; knowledge sharing; teaching method; higher education

INTRODUCTION

Open access (OA) becomes a trend of scholarly communication for higher educations and research institutions. Almost all universities develop an open-access institutional repository (IR) to collect and disseminate their scientific outputs. They also publish some number of open access journals (OAJ) replacing subscribed journal. This condition is affected by the increasing of awareness of institution leaders and faculty about the benefits of open access. Open access in many studies proves to have some advantages include promoting institutions and authors, disseminating and preserving the intellectual property as well as evaluating the development of science and technology (Cheng & Ren, 2008)(Xia, 2008)(Krishnamurthy & Kemparaju, 2011)(McCabe & Snyder, 2014).

Although the number of IR and OAJ continues to increase, this number is still far from the OA potential based on the number of higher education in many countries. Several efforts to increasing knowledge and awareness of OA are still needed among others through the education of open access in higher educations. In some developing countries like Indonesia, the teaching of OA is crucial because Indonesia is still far behind compared to other nations, especially in Southeast Asia in the number of scientific publications in various global indexes. The existence of OA is expected to increase the visibility of publications and the amount of its utilization seen from the number of citations. Moreover, OA also can help scientific works that are only stored in libraries with limited access becoming accessible to anyone, anytime and anywhere. Thus, the increase of OA in Indonesia is necessary to increase the visibility and citation as one of the global indicators of science and technology.

Study about the appropriate model to improve the education of OA to various stakeholders has not been widely reviewed. Since being echoed in the early 2000s, there have been many studies on OA, but most of them discuss the concept of OA and the development related to technologies for OA. The topic of how the teaching of the technical knowledge that must be owned by the relevant stakeholders in the implementation of OA is still rarely discussed (Osswald, Schoepfel, & Jacquemin, 2016). This paper focuses on the open access teaching model in higher education to improve the quality of research. The problem question in this article is how to educate OA to various stakeholders in higher education in Indonesia. The objective of the paper is to develop conceptual models in teaching open access not only to students but also to all relevant parties. The limitation of this article

is that the model has not been tested yet so that a more in-depth research is needed to understand the OA in the context of higher education in Indonesia. This concept may also be reviewed for application in other developing countries where OA is not yet well developed and has conditions such as Indonesia.

THE STUDY

In Indonesia, the study of OA is more about aspects of the system. Though there are three variables in OA namely human cooperation, repository process and technological functions. But the human dimension has not been much discussed (Farida, Tjakraatmadja, Firman, & Sulistyo-Basuki, 2015). The process of teaching about open access includes a part of the social aspects (human cooperation) that need to be studied. This paper uses several methods of data collection to study and formulate an appropriate open access teaching model for higher education in Indonesia. The method used is as follows:

- Study documents about policy and regulation related to OA in national level as well as at institutional level in some higher education in Indonesia
- Observation to some leading IR website in some higher education in Indonesia
- Literature review about OA concept worldwide and OA practice in Indonesia

Based on data collected, I argue a conceptual model to educate OA in higher education particularly in Indonesia, which is also enabled to be implemented in other developing countries.

FINDINGS

Indonesia as one of the most populous countries in the world (population of 2016 was 257,912,349), has a large number of universities. There are currently 4,445 higher educations in Indonesia. Associated with open access, Indonesia keeps the potential of producing scientific works as well as a huge user of OA resources. However, the number of repositories and open access journals is still small. There are 55 institutional repositories (IR) in Indonesia. The number of open access journals (OAJ) is 368 title. Most of those IR and OAJ are developed by universities in the major cities. The condition reveals that the knowledge of OA is not evenly distributed in higher education in the vast territory of Indonesia.

In Indonesia, the increase of OA content in IR is more from students because there is an obligation to deposit final assignment as a graduation requirement. But the work of lecturers for example publication in international journals cannot be collected all in the IR. There are also some institutions that already have policies that encourage staff to deposit works in the IR and publish in OAJ, but there is no penalty for them who do not engage with the policy. Raising awareness is crucial because it may not rely on policy alone to increase the amount of participation in OA.

Education about OA can be one of the solutions. Nowadays, education of OA is divided into classroom teaching given to LIS students and promotional activities through seminars and other events with more general targets such as faculty and students at all levels and majors. In some countries the material on OA has been included in the curriculum but is still part of other topics such as acquisitions and collections, IT related OAI-PMH, etc. OA content is invisible in the bachelor as well as master curriculum or hidden in topics such as scientific information, information tracking, information legislation (Osswald et al., 2016). Similar in Indonesia, very rare specialized curriculum about OA is made thoroughly and integrated so as students can easily understand and implement it. Therefore it is necessary to refresh the library school curriculum by incorporating material on the principles of OA, repository, copyright (Mercer, 2011). In general, some existing model to educate and promote OA were listed below:

- OA has become a part of other course topics in LIS program.
- OA training for IT staff and librarian. Topics given are more about OA software and management.
- Provide manual/guideline of OA: poster, flowchart, infographic
- OA event: OA week, seminar, workshop, training to specific target (PhD student)
- Online promotion: information in library website and social media.

Propose new model to educate OA using knowledge sharing

The open access movement involves many stakeholders, among others, the government and donor agencies as research grants; universities/research institutes as affiliates of authors; publishers who have distribution rights;

and libraries as units for managing and promoting OA. All parties have a significant role and shall collaborate in open access movement (Johnson, 2014). The role of each stakeholder in open access is presented in Table 1. About the number of stakeholders involved, the teaching model shall be able to provide knowledge to each stakeholder regarding their respective roles. Teaching is also expected not only to occur one transfer of information from teachers to participants but also to exchange ideas and experiences related to OA by all stakeholders. The proposed model is knowledge sharing. Knowledge sharing is broad, and the process is more interactive than the one-way knowledge transfer process (Edwards, 2016). In this model, knowledge sharing became substantial because teaching objectives are not only to increase knowledge and awareness, but there is a more important goal in building consensus from all stakeholders to participate in open access (Emmett, Stratton, Peterson, Church-Duran, & Haricombe, 2011).

Table 1. Stakeholder and their roles in open access

Method	Participant
Higher education/research institution	Develop OA policies Build IR and OAJ Provide open access funds
Faculty/researcher	Deposit in IR Publish in OAJ Use OA resources
Government	Establish policies that strengthen OA Provide open access funds
Donor	Provide research funding and OA policies
Publisher	Provide publishing policies that support OA
Library	Develop library content Manage IR Promote OA

Syllabus in the open access teaching modules

The accuracy of syllabus selection becomes an important component in educating open access. The syllabus organization intend participants not only understand the theory/concept but also learn how to engage and actively participate in the success of open access in their institution. Some studies of faculty behavior in OA in some countries showed that faculty were still unfamiliar and asked about why and what open access, what about legal aspects such as copyright and licenses, and how to archive in repositories and publish in OAJ. Misconception on above matters became an obstacle for academics to participate in open access (Kim, 2011)(Yaniasih, Ardiansyah, & Sulisty-Basuki, 2015) (Yang & Li, 2015). Thus, the syllabus shall be able to answer faculty's queries about know-what, know-why and know-how of OA.

The material in the syllabus which is also very important to be taught is policies at the institutional level as well as the national policies. Institutional policy, whether mandatory or voluntary in open access affects academic behavior (Xia, 2007). Understanding of the policy becomes crucial so that the policy should be thoroughly socialized and implemented by scholars (Keane, 2012). Furthermore, the syllabus shall also pay attention to the process in research so that education can improve the quality of research in higher education. Mamtara (2013) argued four elements in research cycle: idea discovery, funding/approval, experimentation, results dissemination (Figure 1). Each part of the cycle required knowledge of open access. Idea discover will increase its quality with the knowledge of how to utilize OA resources in preparation of literature for both research and writing purposes. Funding elements require knowledge of open access policies by donors so that the research team understand the copyright of their research outputs. The experimentation and result dissemination components require knowledge of copyright and publishing of data and publication. Below is the content of the syllabus in the open access teaching curriculum:

- OA concept
- National and institutional policy

- Copyright and intellectual property
- OA in Library and HE
- Self-archiving in the repositories
- Publishing in OA journals
- Usage of OA resources

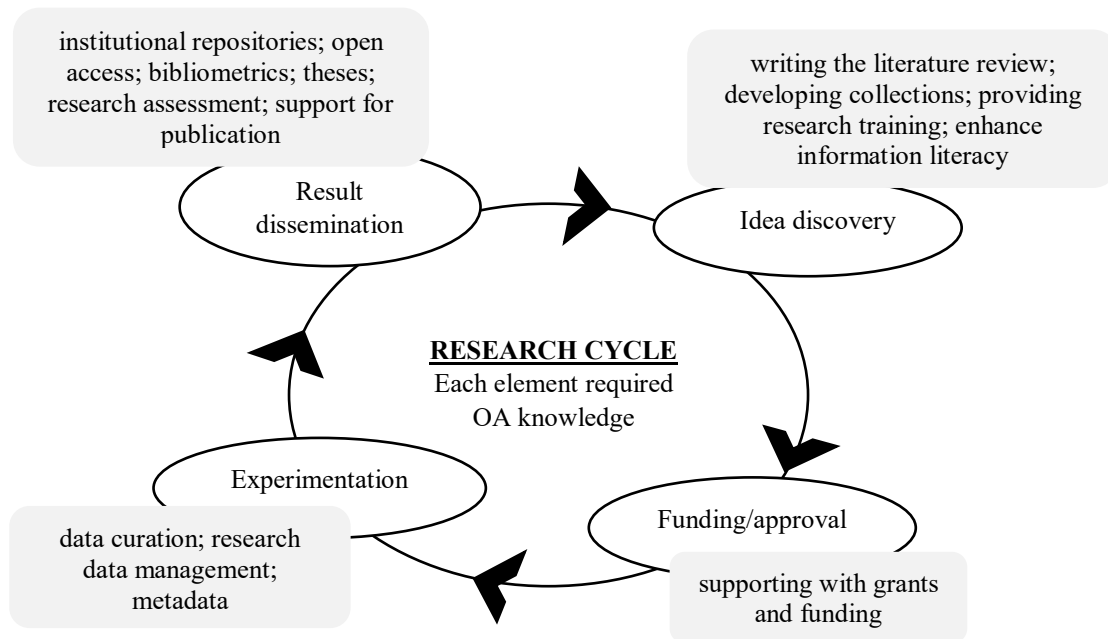

Figure 1. Elements in research cycle
[illustrated from Momtara (2013)]

Teaching methods

Efforts to improve knowledge and awareness of open access may be made through education in the classroom and outside the classroom. Events such as seminars, workshops, exhibitions, provision of information via the Internet as well as supporting activities, such as the system in college that encourages academics to participate in open access may be held (Keane, 2012). The selection of teaching method needs to be tailored to the target participants. For example, students will be better suited for education in the classroom. Meanwhile, another user such as leader is more appropriate when using the teaching through workshops and focus group discussion. Students participant who becomes the primary target OA teaching is library and information science (LIS) students. LIS students shall have access to OA syllabus as they will become librarians and information managers who are the primary professions that have been the most active promoting OA. In addition to student, teaching OA needs to be done to the leaders of the higher education. The leader's role is essential for the success of OA both in approving the policy as well as a role model with an active role in OA such as in archiving their work in the IR (Mercer, 2011). Likewise, other users need to be made teaching methods that suit their needs and roles in open access. Table 2 shows the OA teaching methods and its particular target participants.

Table 2. OA teaching methods and its particular target participants

Method	Participant
Class	Student
Seminar, workshop	Manager, leader Faculty
Focus group discussion	Involved different sector: faculty member, HE-government, HE-publisher-library, etc.
Exhibition	All stakeholders
Consultation services	All stakeholders
Website and social media network	All stakeholders

CONCLUSIONS

OA has potential to increase the quality of research if OA stakeholders know how to take the benefits. There are many stakeholders involved in open access including faculty, leaders, librarians, donor agencies and publishers. Stakeholders in HE institutions, especially in developing countries where the number of OA still low, need to be educated about OA to increase their knowledge and awareness. Knowledge sharing can be chosen as the education concept because knowledge sharing will build consensus and active participation among stakeholders. The model also consists of syllabus and teaching methods for sharing knowledge. This model needs to be further studied by the context of higher education in developing countries so that it can be used and evaluated its usefulness.

ABSTRACT

‘*Historias de vida poliédricas*’ (‘Poliedric Life Stories’) is a cross-disciplinary and collaborative learning project between the UIB and the EASDIB. Disciplines involved in this collaborative project were Music, Visual & Plastic Arts, Literature, Graphic Design, and participants studied Childhood Education, Primary Education and Graphic Design. The main aims of this experience were to promote the teaching-learning aspects of emotions through intergenerational life stories, and to develop students’ creativity by using project-based methodology. Students translated research into practice through life story experiences linked with emotions. This is a GRAiE educational innovation project is funded by the IRIE-UIB. The EASDIB participation is 50% co-funded by the European Union within the ERDF Operational Program 2014-2020 at the Balearic Islands.

INTRODUCTION

‘*Historias de vida poliédricas*’ (‘Poliedric Life Stories’) is a cross-disciplinary and collaborative learning project between two higher education institution at the Balearic Islands: the Universitat de les Illes Balears (UIB) and the Escola d’Art i Superior de Disseny de les Illes Balears (EASDIB). The main aims of this experience were to promote the teaching-learning aspects of emotions through intergenerational Life Stories, and to develop students’ creativity by using project-based methodology.

Life Stories allows researchers to work with a symbolic reconstruction of reality by narratives, and focus on narrators’ emotions, that is, what is behind the told story. It is also necessary to say that the Narrated Life Stories approach is a particular procedure based on Biographical Research, which is a wide field of different approaches and research strategies with blurred borders and overlapping areas, situated under a general umbrella of Narrative Research (Zinn, 2004: 3-4).

When it comes to emotion, Strongman (2003: 296) canvassed about 150 theories of emotion, inside and outside psychology, but he didn’t conclude with any emotion list. On the other hand, according to Ekman findings (2016: 32), there is high agreement about five emotions (all of which were described in Darwin works): anger, fear, disgust, sadness and happiness. These were emotions used to develop the Life Stories Experience.

The project was developed during the first semester of the 2016-2017 academic year, and disciplines involved in this collaborative project were:

- Music Education (third year students of Primary Education),
- Language Resources (third year students of Graphic Design),
- Artistic and Aesthetic Education (second year students in Early Childhood Education), and
- Universal and Catalan Literature (fourth year students of Early Childhood Education).

The project focused on emotions that the person interviewed felt but not really told.

THE LIFE STORIES EXPERIENCE

Working emotions is important for a number of professions such as teacher or graphic designer, and developing different activities while studying to identify emotions is important too. In this project, professors from different background worked with emotions with students, to better understand their own feelings and to approach them to

other people's emotions, but also to separate themselves from the individuality and to better understand what is going on in collective situations.

The first aim of this experience were to promote the teaching-learning aspects of emotions through intergenerational Life Stories. So, for the purpose of this project, anonymous participants (from 4 years to 85 years) were asked to record a one-minute Life Story (only audio). It could be an Experienced Life History (past experiences) or a Narrated Life Story (life from the current point of view) (Zinn, 2004: 37).

After that, students from both institutions interpreted Life Stories with regard to the whole interview, trying to identify the emotion under the surface of each Life Story. Proposed basic emotions to work with were: anger, fear, disgust, sadness and happiness.

Despite the majority of emotion's researches focus on facial expression, the added difficult was to identify emotions from participant's voice. If you know how to identify emotions it will be much easier to understand a situation and promote communication through nonverbal language, because emotions are a tool that enhances students' future career (Childhood Education, Primary Education and Graphic Design).

The second aim of this experience were to develop students' creativity by using project-based methodology, so during the project, students translated research into practice, under the close supervision of professors involved in the project: Noemy Berbel-Gómez (*Music Education*), Pilar Rovira (*Language Resources*), Magdalena Jaime (*Artistic and Aesthetic Education*) and Antoni Artigues (*Universal and Catalan Literature*).

- a) *Music Education*. About 68 third year students of Primary Education recorded a number of one-minute Life Stories, from anonymous people of different age groups (4 to 85 years). After that, students had to identify the emotions that each Life Story transmitted. During the second part of the project, professor encourage students to compose original music in groups, related to each recorded life history. They had to use emotions previously identified from recorded experience to create a soundtrack. Some technological skills were required as students had to use 'SoundCool' (<http://soundcool.org/>), an open source software to develop the task. Technology allowed students to compose music in real-time through a mobile device (cell phone or tablet), in a collaborative way.
- b) *Language Resources*. About 22 Graphic Design students worked in team with Primary Education Students, and basically they were in touch on-line (Facebook, email and else). As mates from the UIB did, third year students of Graphic Design also identified emotions, prepared a video from a selection of recorded life stories using 'Adobe Premiere' (<http://www.adobe.com/es/products/premiere.html>), and included the musical composition inspired by the emotion identified.
- c) *Artistic and Aesthetic Education*. About 63 second year students in Early Childhood Education developed artistic productions based on recorded life histories. These art work reinterpreted the works of Kurt Schwitters (German artist, 1887-1948), well known for his Dadaism collages made by waste materials, and Joseph Cornell (American artist and experimental film maker, 1903-1972), influenced by the Surrealists and well known for his boxed assemblages made by found discarded objects. Students interpreted emotions from recorded Life Stories by creating their own boxed assemblages filled with reused and waste material.
- d) *Universal and Catalan Literature*. About 63 fourth year students of Early Childhood Education wrote poems ('dècimes', 10 verses of 7 syllables that rhyme ABBAACCDDC) from recorded Life Stories. After that, students sang poems by using folkloric tunes from Majorca (Balearic Islands, Spain), transmitting the identified emotions.

RESULTS AND CONCLUSIONS

In order to assess results of the project, there has been a qualitative evaluation of the cross-disciplinary and collaborative learning project based on the observation the experience and during the public expositions of the final works. No major incidents were reported, just some initial communications problems between UIB students and EASDIB students. Despite students showed great social media skills, they were very selective with their virtual contacts, so a first face-to-face contact will be needed in future experiences. Then, on December 21st, 2016 music were played, artworks were exhibited and poems were sung at the UIB events hall. Later, on January 19th, 2017 videos were played at the EASDIB conference hall. Both events were fully booked with students, family and friends.

On the other hand, there has been a quantitative-qualitative evaluation of the students' experience based on an anonymous on-line survey, in order to get some students' feedback. Data showed that students gave a medium score to the questions related to the interest of the activity for their academic future (6.7/10.0) and for their

professional future (6.8/10.0). However, the degree of overall satisfaction is remarkable (7.2/10.0) and a one hundred per cent of the students would repeat the experience. It is necessary to say that students are not aware of its importance as they are not used to work with project-based methodology which includes a reflexive practice.

Last but not least, students were asked to write down a micro-narrative such as highlighted below:

- ‘It has been interesting to make visual the experiences of other people’ (Graphic Design).
- ‘It has been very interesting to be able to work on this project that involved different points of view, based on creativity as an important issue in education’ (Primary Education).
- ‘Getting into the everyday life of a stranger (...). Learning to value a moment, an interest and a passion. Facing my own weaknesses and finding resources to get out of a difficulty, and asking for help and get the project through. Why not trusting from the beginning? Why not trusting in the creative capacity that maybe every human being has because of being a ‘human being’?’ (Early Childhood Education).
- ‘The word that defines my personal experience is enrichment. Although difficulties faced, it is possible to work in a team and compose a melody without being musicians. Listening to an audio, thinking about the music that fits the best and composing is a long process, sometimes complex but very rewarding’ (Primary Education).
- ‘It was nice to meet the people who had made the music and to be able to communicate with them to create a better video’ (Graphic Design).

To sum up, ‘*Historias de vida poliédricas*’ (‘Poliedric Life Stories’) has been developed as cross-disciplinary and collaborative learning project between the UIB and the EASDIB in order to promote the teaching-learning aspects of emotions through intergenerational Life Stories, and to develop students creativity by using project-based methodology. According to experience observation, artworks, data and students’ feedback, both objectives have been fulfilled.

Life Stories Experiences took into account that future teachers applied knowledge in real projects and acquire a specialized knowledge of the discipline they are enrolled. Also, students developed other skills that professors considered useful, such as research skills, problem resolutions skills, design thinking, and team working.

Working emotions in class by using project-based methodology is an original and innovative way to provide useful tools for students’ academic and professional future, especially in those professions involving people from different ages, different sociocultural background and different interests, such as teacher or graphic designer.

ABSTRACT

This research aims to develop 3D animation learning on the traffic laws and driver's license. The objective of this research is to advice and support user to learn and test traffic laws and driving rules in Thailand based on web application. Learner can learn and take the exams on the traffic laws and driver's license test. In this project, it was divided the result by the research purposes into 2 parts; the first was presented the result of developing the web application for learning and testing the traffic laws and driver's license and the last was described the result of evaluating the satisfaction of the system. Questionnaires and Black box approaches were used to measure user satisfaction and system performance of the application. Participants consisted of 5 specialists and 30 users. The results were satisfactory as followed: Means for specialists and users were 4.15 and 4.37, and standard deviation for specialists and users were 0.583 and 0.644 respectively.

INTRODUCTION

A traffic accident is one of the significant public problems in Thailand and there are many potential dangers affected to loss a large amount of life and property. Even though there are many organizations cooperate with promoting the campaign to protect car accident, the problem is still increasing. Thailand is ranked the second dangerous country on road and the report of Bureau of Non Communicable Disease, Ministry of Public Health, Thailand, from 2010 to 2012, road accident killed 41,858 people. Hence, the better way to reduce the cost of accident problem is to educate and improve the skills and attitudes of drivers. In recent years, initiatives have been taken from Thai Government to provide and promote the knowledge of safety driving by taking use of Information and communication technologies.

Recently, with no longer barrier by space and time, a web-based educational system plays the important rule to support students and teachers. There are many advantages for information sharing and collaboration between students and teachers in a course because students can study their interested courses though a web-based class so as to enhance their knowledge at any time and any place. According to department of land transport, the driver's license is adjusted the new assessment on January 2017. To apply for a driver license in Thailand, examiner also must clear and comprehensive information on the Thai traffic laws, the Thai driving rules & regulations, the license requirements in Thailand. However, the related media is not in the up-to-date forms. This research aims to develop 3D animation learning on the traffic laws and driver's license application to provide knowledge of safety driving and traffic signs and driving rules in Thailand.

The rest of this paper is organized as follows. Section 2 reviews the related methodologies used in this work. Section 3 presents the implementation based on the purposed data mining techniques. In section 4 the result and discussion is presented. Finally, we conclude the paper with future research issues in section 5.

OBJECTIVE

The research aims to develop 3D animation learning on the traffic laws and driver's license application to provide knowledge of safety driving and traffic signs and driving rules in Thailand.

RESEARCH METHODOLOGIES

In this section, we illustrate the literature search and the research methodologies used in this project. The 3D animation learning on the traffic laws and driver's license application was designed to provide knowledge in how to driving safety and advice user to learn and test traffic signs and driving rules in Thailand. To implement the project, user's requirements were applied in the design and development of this application to meet the user's requirement. The information was used as a source of significant information for implement 3D animation learning application and database management and internet network technology were applied in order to make the system fast and easily work. A study of related knowledge (K Kularbphetong, N Limphoemsuk, 2017) and theories was conducted and the system contains three following components as shown in Fig.1.

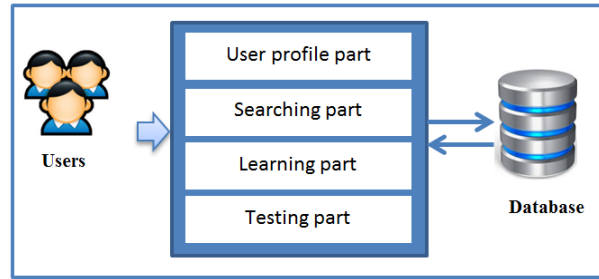

Fig.1 The system framework

In the user profile module, user registers and edits his/her profile like personnel information, email address, username and password, and etc. In searching part, users can search what information and knowledge about traffic sign and driving rules in Thailand he/she needs to learn. Users can learn the means of traffic signs and how to drive correctly in Thailand in learning part. The contents of learning part include 7 lessons from introduction to driving situation and the presentation is a 3D animation with voice and subtitles and after finished learning each lesson. Also, in testing part, users can take driving exams and know results from the testing module of this application and the application provide post- tests and score results. To test and evaluate the performance of this application, the processes were divided into two sections: Black box testing technique was used to assess the performance of the system (Laurie Williams, 2006) and the satisfaction of this system was evaluated by questionnaires. To evaluate the quality assessment system, Mean (x) and standard deviation (SD) were used to evaluate the abilities of the project.

EXPERIMENTAL RESULTS

The results of this research are separated by the research objectives into 2 parts: Developing the 3D animation learning on traffic sign knowledge application and testing and evaluating the system.

Developing the 3D animation learning on traffic sign knowledge application

The experiment of this research was conduct to explore the effectiveness of the traffic laws and driver's license knowledge application. Fig 2 and Fig 4 were shown the results of the example pages.

Fig.2 the first page of application

Figure 2 was shown the first page of this application and the pretest page and the case study in other driving situations was displayed in figure 3.

Fig.3 The case study in other driving situations

Also, figure 4 was presented the results of score test after user finished the exam.

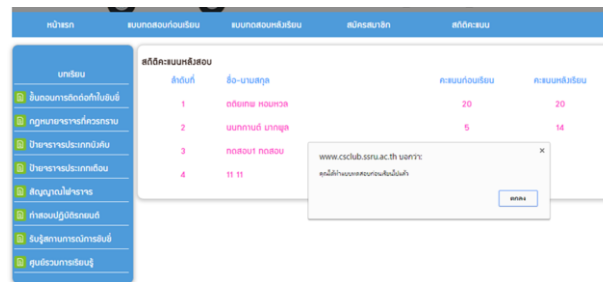

Fig.4 the result page of score test

Testing and evaluating the system

Questionnaires were assessed in this project. Black box testing was used to test the performances of the system and the errors of the system. To evaluate the quality assessment system, Mean (\bar{x}) and standard deviation (SD) were used to evaluate the abilities of the project.

TABLE I THE EXPERIMENT RESULTS OF BLACK BOX TESTING APPROACH

	Users		Rank
	\bar{x}	SD	
1.Function Requirement Test	4.12	0.33	5
2. Functional Test	4.45	0.42	1
3. Usability Test	4.35	0.39	3
4. Performance Test	4.26	0.35	4
5. Security Test	4.41	0.4	2

Black box testing focuses on determining whether or not a program does what it is supposed to do based on its functional requirements. Black box testing attempts to assess in four areas: Functional Requirement Test; Functional Test; Usability Test; and Security Test. The findings of this study revealed that the most importance factor for evaluation the performance of this application was functional test section.

Fig 5. The results of Black Box Testing

The mean for functional test was 4.45 with 0.42 SD, the mean for security test was 4.41 with 0.40 SD, and the mean usability test was 4.35 with 0.39 SD. The overall results of the research showed that the efficiency ratio of the 3D animation on the traffic law and driver's license was at very good level of the learning achievement of the experimental group. The results were satisfactory as followed: Means was 4.31 and standard deviation was 0.38 respectively.

TABLE 2 THE EXPERIMENT RESULTS OF SATISFACTORY BY QUESTIONNAIRE

	Average	Level
1. Appropriate form of this application	4.45	Good
2. Easy usage of the program	4.35	Good
3. Display of the screen	4.25	Good
4. Compatible match between pictures	4.3	Good
5. Practical application of knowledge	4.25	Good
6. Easy to understand context in the web site	4.4	Good
7. Suitable size of context quantity on the screen	4.12	Good

The finding of the user's satisfaction was at good level in appropriate form of this application with 4.45 and the second was easy usage of the program with 4.35. Compatible match between pictures was 4.3 in average score and display of the screen and practical application of knowledge was the same score with 4.25 as well.

CONCLUSION AND FUTURE WORK

In conclusion, the significant objective of this study was to present the preliminary result for the ongoing improvement project of the 3D animation traffic-sign knowledge application. Also this project can be beneficial to support and suggest user for driving safety information. Nevertheless, the main limitation of this research came from sampling of 30 respondents, not included the population who are interested in learning traffic law knowledge. Therefore, the future experiments will be required other new media techniques to enhance this project.

ABSTRACT

Mathematical analysis is the branch of mathematics that deals with the properties emerging from the infinite partition of a dense object. It is based on the infinitesimal calculus, which studies the local behavior of functions by using the tools of differential and integral calculus. During years mathematical analysis has become fundamental in almost all fields of mathematics, physics and science, from natural sciences to engineering, from computer science to economy. In this paper I consider a historical path (concepts and people) on the development of the key concepts related to analysis; starting with the fundamental concept of limit, I look at the birth of the concepts of derivative and integral.

Keywords: Mathematical analysis, Infinitesimal calculus, Limit, Derivative, Integral, Infinite, Infinitesimal, History of mathematics, History of logic, Education.

INTRODUCTION

One of the most important periods of the history of mathematics has been the centuries during which the basics of infinitesimal calculus were created, i.e. from the end of 1500 (with the first attempts to continue the Archimede's work) to the editing of the independent writings of Newton and Leibniz (17th and 18th centuries). The infinitesimal calculus is a fundamental part of mathematical analysis, which studies the local behavior of a function through the concepts of continuity and limit; it is used in almost all fields of mathematics, physics and science.

The 17th century has marked the beginning of scientific research according to a new method, i.e. the study of Nature in a systematic way, using mathematics and its progress. The development of mathematics was closely linked to some unresolved problems, considered to be of great cultural and economic interest. Mathematical advances provided answers to problems, but at the same time the open problems stimulated the emergence and development of new computing techniques and new mathematical concepts.

In every field of natural philosophy it began an accurate analysis of phenomena, so as an attempt to bring them back to general mathematical models, as simple as possible. The best results were obtained in the field of mechanical and astronomical phenomena, considering the relative simplicity of their observation and the reproducibility in laboratory.

In the same way scientists of 17th century tried to explain the problem of earthly motions, in particular “why objects thrown in the air fell on the earth”, if it was no longer the center of the universe. Another big problem was “the motion of bullets”; in particular the bullets trajectories, their range, heights they could reach, the effect of the initial speed. Wealthy people were willing to spend large sums of money for finding the solutions, because in such a way they could have benefits for navigation and improve military techniques. In this context mathematical analysis is progressively born.

THE CONCEPT OF LIMIT

The concept of limit is already present, though not explicitly, in Greek mathematics, because many results on the calculations of areas and volumes derived by Greek mathematicians (such as Eudoxus of Cnidus and Archimedes) were essentially based on the use of limit. However, many centuries passed for arriving to Euler, who in 1755 gave a fairly definitive definition of limit, even if he did not use that and did not develop the theory of limits.

Also D'Alembert (1717-1783), French mathematician, physicist, philosopher and astronomer, gave a formulation of the concept of limit (D'Alembert, 1995). In the article “*Limit*”, written for the Encyclopédie (Diderot, & D'Alembert, 1994) (Fig. 1), he called a particular quantity the “limit” of a second quantity, the “variable”, if this second quantity approached the former “so much” that the difference was “less” than any given quantity, “without coinciding” on fact with it. The apparent inaccuracy of this definition made it unacceptable to contemporaries, because the authors of continental European mathematical manuals still used at that time the Euler's language and concepts.

A rigorous definition of limit and, through this, a rigorous construction of mathematical analysis has been work of Augustin-Louis Cauchy (1789-1857), French mathematician and engineer (Grabiner, 2011; Belhoste, 1991), and to the subsequent formalization of Karl Theodor Wilhelm Weierstrass (1815-1897), German mathematician, also called “the father of modern analysis” (Weierstrass, & Hettner, 2016).

Cauchy assumed as fundamental the limit concept of D'Alembert, but gave to it more precision. He formulated a relatively precise definition of limit:

“When the successive values attributed to a variable approach indefinitely to a fixed value, so that they end up with a deviation from this for a small difference as desired, this latter is called the limit of all other”.

Figure 1. The first page of the “Encyclopédie” of D’Alembert and Diderot ((a) [wikimedia.org](https://commons.wikimedia.org/wiki/File:Encyclop%C3%A9die_diderot_1751.jpg)).

As we read, Cauchy's definition uses expressions like “successive values”, “approaching indefinitely”, “small as desired”, which, though suggestive, they still lack the precision required in mathematics.

Weierstrass defined the limit of a function $f(x)$ in the point x_0 practically in the same way as currently used. It is often considered as birth date of the concept of limit the year 1821, because in that year Cauchy published the work “*Cours d'Analyse*”, work that collects his lessons of analysis held at the École Polytechnique in Paris. He also defined the notion of “infinitesimal”: “a variable that has zero as *limit*”, and that of “infinity”: “a variable whose successive numeric values *grow more and more*, so that to exceed each given number”.

He also considered the limit of “successions”, especially for the succession of the partial sums of “series”. Cauchy undoubtedly deserves to have rigorously accommodated a concept that has been long since dealt with and used by mathematicians. D'Alembert supported the need to put *the limit theory at the basis of differential calculus*. The so-called “first and last reasons” of Newton's work “*Philosophiae naturalis Principia mathematica*” (1687) are de facto a somewhat smoky way of expressing that two ratios tend to the same limit.

The Italian mathematician Pietro Mengoli (1626-1686), who studied with Bonaventura Cavalieri and then took up the teaching of mathematics at the University of Bologna, in his work “*Geometriae speciosae elementa*” (1659) devoted a chapter to the theory of limits, providing many properties and theorems, showing to have a clear idea of a quantity that tends to infinity (*almost infinite*), that tends to zero (*almost null*), and of two quantities that tend to the same limit (*almost “aequales”*).

Let us not forget that Greeks had already calculated some limits of successions using a process that is now termed *exhaustion method*. This method, conceived by Eudoxus, consists in the construction of a succession of polygons converging to a given figure; the area of the figure is therefore the limit of the polygons areas (Smith, 1958). Thanks to this method, Eudoxus showed that a pyramid is the third part of the prism having the same basis and the same height, as well as a cone with respect to the cylinder with the same basis and the same height.

Euclides used it to show that the ratio between the circle area and the square of the diameter is constant, as well as between the volume of the sphere and the cube of diameter.

Archimedes, with the same method, obtained the current formulas for determining the circle area, the surface and the volume of a sphere, as well as other interesting results, approximating the circle with “regular inscribed and circumscribed polygons”, starting from the square and doubling away the number of sides. In doing that, he proved that the areas of such polygons (those circumscribed by *excess* and those inscribed by *defect*) tend to the same quantity, which is the circle area.

It is therefore possible to state that the first applications of the limit concept were used to calculate areas and volumes. But the limit is also the only tool with which *it is possible to safely handle both infinitesimals and infinites*. To date, it is the *foundation of all differential and integral calculus*, whose applications are a lot, not only in mathematics and physics, but in all scientific disciplines.

THE CONCEPT OF DERIVATIVE

Galileo Galilei (1564-1642) (Kline, 1999), Italian physicist, philosopher, astronomer and mathematician, is considered the *father of modern science*. He described the Nature as simple and well-ordered, with regular behavior, acting in accordance with “perfect and immutable mathematical laws”. Science must therefore follow the example of mathematics, i.e. it must proceed by identifying axioms and fundamental principles, then proceeding in a deductive way to establish new truths (Geymonat, 1981). The Galileo's radical innovation was dictated by the fact that, contrarily to what was done for mathematics, the basic principles of physics had to derive from “experience and experimentation”, and that axioms should be of a quantitative nature, giving values of quantities without worrying about the latest causes, as happened in ancient time.

Galileo obtained important results by studying the motion of metal balls along inclined planes and freely falling objects; this field of research continued to affect men of science even in the following decades. He provided the “general basis of the method”, but limited himself to the analysis of straight and parabolic motion, however without being able to build a general model.

One of the main open problems was the explanation of the motion of planets, in order to improve the calculation of their positions. The interest in astronomical problems was also linked to the need of navigation along routes far from coasts, in sea areas where precise determination of latitude and longitude was of fundamental importance and could occur only through astronomical observation.

At that time one of the used methods was to observe the moon's position with respect to the stars at a given time, and comparing the result with measured values in a known reference location. The problem was delicate, because of the need of a watch on board and a good knowledge of the moon's motion. Even a small mistake in determining the position could lead to a mistake of several degrees of longitude; it was therefore essential to have a better understanding of the moon's orbit.

Also the interest in determining *the tangent line to a curve* is born both as a purely geometric problem and for applications in the field of optics. Optics was one of the main interests of 17th century and the design of lenses of direct interest for the most important thinkers of the time, from Fermat to Descartes, from Huygens to Newton. To study the passage of light through a lens, it is necessary to know the angle of incidence between the beam and the perpendicular to the surface of the lens, in order to apply the laws of refraction. Some ancient methods were already known to determine the tangents to some particular curves, but there was no general method.

A further general problem was the determination of the *maximum and minimum value of a function*, with a lot of applications, for example the determination of the angle at which the output of a gun is maximum; this problem could in fact bring military benefits. In addition to that, there were other debated problems, that required the calculation of the *maximum of a function*, such as the determination of the maximum and minimum distance of a planet by the Sun.

THE WORK OF NEWTON

Starting from the fundamental problems of kinematics, Isaac Newton (1642-1727) (Fig. 2), English mathematician, physicist, natural philosopher, astronomer, theologian and alchemist, introduced a *calculation method valid in general for all curves*, that over time found various applications, even in very different fields with respect to the study of motion.

Figure 2. Isaac Newton ((a) wikipedia.org).

In the study of motion, the first major difficulty was the fact that the speed of objects varies every moment and is not easy to calculate; if one calculates the instantaneous speed, he cannot divide the space for the time (as do you do for an

“average” speed), since at a given time both quantities will be zero, giving therefore the 0/0 ratio. However, it is also true that moving objects have a speed at any moment, otherwise they will be stopped. Galileo determined a law that expresses the instantaneous speed as a function of time for moving objects on an inclined plane and for those in free fall, but not a general method valid for any trajectory and motion. In his treatise “*Methodus fluxionum serie infinitarum*” Newton summarizes the fundamental problems in these terms (Newton, 1999; Newton, 2017):

“All difficulties can be reduced only to two problems that I will propose regarding the space described by the local motion, however it is accelerated or delayed: continuously giving the length of the described space (i.e. at every time), to find the speed of the motion at any given time. Continuously giving the speed of the motion, to find the length of the described space at any given time. In the following I consider quantities as generated by a continuous increase in the same way of the space by a moving object”.

The first of the two proposed problems could be expressed today in the following terms: “Having the relation that links the travelled space and the used time to travel it, determine the speed at any moment”.

In the general treatment, Newton said “flowings” the quantities that vary over time and “fluxions” the respective speeds of variation:

“From now on, these quantities that I consider to grow gradually and indefinitely, I will call flowing quantities, and I will represent them with the last letters u, y, x, and z, in order to distinguish them from the other quantities that in the equations are considered known and determined, and that therefore will be indicated with the first letters of the alphabet a, b, c, etc. The speeds with which the flowings increase for the movement that generates them (speeds that I call fluxions or simply speeds) I will represent with the same letters with a dot above, then \dot{v} , \dot{y} , \dot{x} and \dot{z} ”.

So in the considered problem the flowing is the *travelled space*, while its fluxion is the *instantaneous velocity*. Newton considered an infinitely small quantity of time and called it “o”. Then also the quantities x and y will have *infinitesimal increments*, that Newton called *moments*; therefore, after a moment, the quantities x and y will have a new value, given by the initial value plus the increment.

Summarizing:

x, y : variables in time (flowings);

\dot{x}, \dot{y} : speeds of variation (fluxions);

$\alpha x, \alpha y$: increments after a time o.

Then: $y \rightarrow y + \alpha y$.

“Fluxions are speeds of evanescent increments”; he wrote the relation:

$$\dot{y} = \frac{f(x+\alpha) - f(x)}{\alpha} \quad (1)$$

which is the *ancestor of the current definition of derivative*. All the properties by him analyzed for the fluxions are valid also for the derivative, defined by Cauchy in 1821.

MAXIMUM AND MINIMUM OF A FUNCTION AND TANGENT TO A CURVE

About the problem of the maximum and minimum of a function, in the work “*Methodus fluxionum serie infinitarum*” he wrote:

“When a quantity assumes the greatest value it can have at a given moment, it will not flow either backwards or forwards. Flowing forward or, in other words, increasing its value, it would prove that it had not reached the maximum value and that it would be greater immediately afterwards. On the contrary, if it was flowing back or decreasing; if this happens, it means that at a given time before to that given, it would have higher value, proving that it is not the maximum value. So it is only to find its fluxion and assume that it is nothing”.

Newton proposed examples of calculation for some functions and some problems that can be solved with his method. The method was appreciated by most of the scientific community, even if criticisms were not lacking, because it had some dark points. Newton gave several versions of such method in successive works, always trying to clarify his concepts and to express them in a theory without defects. To get that, he tried to get back as much as possible to the geometry, on a hand because demonstrations could be more comprehensible to his contemporaries, on the other one because at that time the value of *geometry* was considered clearly superior to that of *algebra*.

In the 3rd edition of “*Principia Mathematica*” this process of appealing to geometry is evident; Newton eliminated even fluxions for working with the “*first and last rapports*” between curves and segments (when they are generated or vanished) but, despite the made efforts, the dark sides of the method remained. Various mathematicians tried to give answers and justifications, but they did not fully succeed in their intent; the fundamental concept of limit was missing, that is “*the evanescent quantities are not null, but they tend to decrease continuously in infinitely way*”.

Despite all the criticisms, the results produced by the differential calculus encouraged its use and stimulated the research of a complete and rigorous theory that justified its validity.

The problem of drawing the *tangent to a curve* had been considered and solved by Archimedes for some particular curves; however, each curve provided a *different procedure* for calculating the tangent and a *general method* was *totally missing*.

Descartes, Fermat, Newton and Leibniz (Fig. 3) elaborated different methods to solve this problem; the *most general and effective methods* were those of Newton and Leibniz. Their work had very different points of view, but at the same time presented similar traits; a diatribe on the priority of the method was born with the consequent division of mathematicians of the time.

Figure 3. Gottfried Wilhelm von Leibniz ((b) wikipedia.org).

The interesting aspect of the Newtonian point of view is that he uses again the fluxions method; this computational system, born to solve kinematic problems, was also applied to solve purely mathematical problems such as that of tangents. The starting idea is that *a curve can be thought as the result of the motion of a point, i.e. a trajectory*. In this way the mechanical curves, as the spiral of Archimedes, were introduced. Galileo had shown that the parabola was the trajectory of a bullet, fired in the air with some inclination with respect to the ground.

Through the work of Gilles Personne de Roberval (1602-1675), French mathematician and physicist, Isaac Barrow (1630-1677), English mathematician and theologian, and Newton (who was a Barrow's pupil), the concept of *curve as trajectory of a moving point* has been accepted and consistently used; thinking to a curve in kinematic terms became thus a valid artifice. In Newton's "*Methodus fluxionum et serierum infinitarum*" it is written:

"The fluxions method assumes that quantities are generated by local motion, but this generation does not necessarily have to be tied to the nature of the generated things. They may have an existence independent by these motions and can be produced in many other ways and will still have the same properties. However this conception, that quantities are generated by local motion, is a very fertile notion and an excellent artifice to discover their properties".

THE CONCEPT OF INTEGRAL

The origins of the integral calculus date back to the Greek geometers that, in the search for determining *areas* and *volumes*, achieved remarkable results. Now we *integrate functions*, but in ancient times functions did not exist and integrating problems were *purely geometric problems*.

Archimedes of Syracuse (287 BC - 212 BC) (Fig. 4) was among the first ones to consider geometric problems by applying notions of mechanics and statics, even succeeding in building a *method* that anticipated for eighteen centuries the integral calculus (Archimedes, 1974; Heiberg, 1972).

The procedure adopted in ancient time started by an infinitesimal analysis system called *exhaustion method*. This method was invented by Eudoxus and consisted of covering an area with known figures so that their sum approximated the sought area in the best possible way.

Archimedes perfected the method by inserting the concept of static moment of figures, and applied it for determining the area to the circle. In modern terms, this method consists in showing that two quantities (whether they are lengths, areas or volumes) are the same because it is absurd that their difference is different from zero. This result is not obtained by direct comparison of the two quantities, but by the comparison between two classes of quantities (said *contiguous classes*) that are separate, i.e. each quantity belonging to the first class is less than each one belonging to the second class. It is always possible to find two quantities, one in the first and one in the second class, which have a smaller difference than any small number chosen at will. The method of exhaustion is on fact the method of contiguous classes.

The idea of limit of two converging successions was replaced by the similar idea of limit to fill with known quantities. The area of the parabolic segment, for example, was calculated by Archimedes filling it with ever smaller triangles, until to cover the disposal space.

The Greek mathematicians before Eudoxus had suggested the idea of *inscribing* and *circumscribing* figures inside and around the curved figure, continuing to *increase indefinitely* the number of sides of these figures, but failed to conclude reasoning because the *concept of limit* was unknown (Kline, 1999).

It is attributed to Eudoxus the *lemma* (currently having the name of *lemma of Archimedes-Eudoxus*), which served as basis for the exhaustion method.

Figure 4. Archimedes of Syracuse ((b) [wikimedia.org](#)).

Such lemma is given in the work “*Elements*” of Euclides as a definition (definition 4, book V) (Euclides, 2002) and tells:

“*It is said that have rapport between them those quantites that are capable, if multiplied, to overcome each other*”, i.e. in equivalent terms: “Given two quantities with some ratio, it is possible to find a multiple of one that exceeds the other”.

Starting by this axiom, Euclides demonstrated a proposition (proposition 1, book X) that forms the *basis* of the exhaustion method:

“*Given two unequal quantities, if from the major it is removed a part which is greater than its half, and from what remains a greater part than its half, and if this procedure is repeated continuously, then at end it will remain a quantity that will be less than the smaller of the given quantities*”.

Euclides observed that this reasoning scheme continued to be valid even if “the subtracted parts are the half”. He used it to show that a circle can be *exhausted* by inscribed regular polygons, with a growing number of sides (Fig. 5).

Figure 5. The exhaustion method ((c) [wikipedia.org](#)).

From what said, we see the *power of this method* and the importance of Eudoxus. The ancient geometers suggested the idea that a curved figure can be filled with regular inscribed polygons, only intuiting the concept of “limit”; Eudoxus, for the first time, *made the procedure rigorous*, avoiding to apply the concept of limit itself. In modern terms, the exhaustion method is still used in integral calculus, although today is no longer called “exhaustion method of Eudoxus”, but “calculation of a simple integral”. The infinitesimal calculus moved the field of action *from geometry to analysis*, enriching it in *precision and rapidity*. Eudoxus was the first to develop a calculus that can be defined as *the key of modern infinitesimal analysis*.

The exhaustion method represents a *method of approximation from the bottom to the top*. The same idea will be used later in various areas:

- a) the *introduction of real numbers (Dedekind's method)*, introducing the separate and contiguous sets and the separation elements;
- b) the *Riemann's integral* (upper and lower sums);
- c) the *Perron's method* for the Dirichlet's problem (harmonic functions as separation's elements among sub-harmonic and super-harmonic functions).

FROM THE EXHAUSTION METHOD TO THE INTEGRAL CALCULUS

The birth of infinitesimal analysis and of integral calculus is related to *geometry* and *ancient mechanics*. Greeks used the method of exhaustion, but without the conceptual pillars of modern infinitesimal calculus, such as the concept of limit, of infinity, etc., then unknown in their deeper meaning. The method was intuitively convenient and clear, but it could work only as *empirical method*, not as a *rigorous proof*.

In the time interval between the death of Archimedes (212 BC) and the fall of Alexandria under Caesar (48-47 BC), the western mathematical progress began a deceleration period up to about year 470. In the 17th century there was a scientific rebirth; together with mathematics, it grew also the logic and rigorous reasoning, that led to the criticism of empirical principles and to their rigorous proof. Thanks to the new concepts of “limit” and “series”, it was possible to understand the method of Eudoxus and to interpret it in strictly logic way.

Bonaventura Cavalieri (1598-1647), Italian mathematician, one of the greatest mathematicians of his time, elaborated the “indivisibles method”, used to determine areas and volumes, a fundamental method for the future elaboration of “infinitesimal calculus” (Smith, 1958).

THE METHOD OF INDIVISIBLES

Cavalieri developed his method starting from 1627 (Fig. 6). The work “*Geometry of the indivisibles*” was published in 1635 after rewrites and various obstacles, in particular the fact that an “area could be considered as being formed by an indefinite number of parallel, equidistant and very thin (“indivisible”) segments”, and that a “volume could be considered as being composed of an indefinite number of parallel flat areas”, the “indivisibles of area” and “indivisibles of volume” respectively. Cavalieri realized that the number of indivisibles constituting an area or a volume had to be *indefinitely big*, but did not deepen this fact, nor did try to give a precise explanation.

Figure 6. Bonaventura Cavalieri ((d) wikipedia.org).

About the surfaces, Cavalieri speaks of them as being formed of the “totality of all lines” and about solids as formed by the “totality of all planes”. This allowed him to introduce a principle known today as the “Principle of Cavalieri”, with which he developed a powerful and new tool for the determination of areas and volumes. The principle states that:

“If two solids have equal height and if the sections cutted by parallel planes and equally distant from them are always in a given ratio, even the volumes of solids are in this ratio”.

In the first two books of the work, he showed the lemmas on which his method is based; he introduced the concept of “all the lines” of a flat figure and “all the planes” of a solid figure, establishing that “all lines of flat figures” (and likewise “all planes of solid figures”) are *quantities that have a ratio between them*, fundamental result to be able to work with them. In following books he showed results about flat and solid figures originated from *conic sections and spirals*.

The principle of Cavalieri is easy to demonstrate *using the tools of the current integral calculus*; on fact, it is equal to say that: “Two defined integrals, among the same extremes of integration, having same integrating functions, are the same”.

Cavalieri knew the method of exhaustion, but he was convinced of the *superiority of the indivisibles method* in comparison to it. There were also *logical reasons*: the exhaustion essentially uses the “demonstration by reducing to absurd”, while the indivisibles method leads to “constructive proofs”. The method of exhaustion cannot be used for the search of a result, but only for the proof of a thesis; this was a heavy, non-sustainable limitation for a scientific community always more oriented towards the “clarification of new procedures” and the “mathematization” of the areas of human knowledge (Baron, 1969).

Cavalieri introduced the indivisibles into two different treatises; in 1635 they appear as “actual infinitesimals”, in 1647 as “potential infinitesimals”. However they are not the potential infinitesimals on which the infinitesimal calculus is based, but they are invariable, very small but not null to be regarded as actual infinitesimals.

Cavalieri has had however the great merit of bravely examining *in a strictly logic and mathematical way the concept of infinity and infinitesimal* and for this reason he must be considered one of the initiators of infinitesimal calculus.

His work was not accepted with good favor, but with criticisms, in particular by Paolo Guldino (1577-1643), Swiss mathematician and astronomer, and by geometers supporting the thought and work of Archimedes. One of the most recurring objection of the supporters of Archimedes was the structure of continuous geometric quantities (lines, surfaces, solids), about which they sustained the impossibility that they could be constructed by unifying quantities having different dimensions.

Guldino, in his critique to Cavalieri, wrote:

“... that such surface may be, and in the geometric language can be called all lines of that figure, in my opinion will be granted by nobody; never many lines, or all the lines, can be called “surface”, since the multitude of lines, no matter how great it is, can compose neither the smallest surface”.

The Guldino's thesis connects to the *problem of infinity in the geometric thought*:

“... I say that the continuous is endlessly divisible, but it does not consist of infinite parts in act, but only in power, which can never be exhausted”.

His conclusions on each single Cavalieri's theorem were always the same:

“... let us conclude, therefore, from the things we have argued, that this proposition on the flat figures has in no way validly proved”.

The target of geometers criticism is precisely *the concept of endless proximity*, that escapes by any attempt of serious geometric definition, and overall it *goes in the opposite direction* to the Archimedes exhaustion method.

The long controversy ended up focusing on philosophical issues and it is significant that to the Cavalieri's method is opposed by Guldino just the method of exhaustion, indicated as a strictness method. The practical applications of Cavalieri's intuitions on indivisibles exceed however the limited potentialities of the exhaustion method; however, having been not supported by an appropriate conceptual and formal framework, it ended up forming an intuitive and not entirely rigorous theory.

The method of indivisibles spread in Italy and Europe and welcomed by the most important mathematicians of time. In addition to criticism, there were further developments, especially thanks to Evangelista Torricelli (1608-1647), Italian mathematician and physicist. With the application of the indivisibles method he calculated the *volume of the hyperbolic solid*, a problem that the geometers of time considered extremely difficult or impossible.

Torricelli spoke of the “*Geometry of the indivisibles*” as of “a true scientific way to demonstrate, direct and natural”; and still:

“I am compassionate about the old geometry which, not knowing or not admitting the indivisibles, in the study of solids discovered so few truths that a painful poverty of ideas is perpetuated until our age. In fact, the theorems of ancients that compose the doctrine of solids represent only a part of the speculations that, in our age, the admirable Cavalieri, for not mentioning others, made around a number of solids, abundant in large numbers”.

In 1653, however, the method was considered aged and hard, and was abandoned following the spread of new and powerful computing tools.

Leibniz and Newton were the first mathematicians to introduce differential and integral calculus. The use of mathematical symbols introduced by Leibniz led to more modern theories and inspired the development of the theory of infinitesimals and infinities. Newton had addressed the problem of the calculation of the “primitives” of a given function (*indefinite integral*), linking it to the problem of areas, considering particular classes of functions (power functions and polynomials).

About notation and terminology, the *integral symbol* was introduced by Leibniz as a stretched “S” (abbreviation of the word *sum*) (Fig. 7).

$$\int f(x) dx$$

Figure 7. The current symbol of (indefinite) integral of a function $f(x)$.

The term “integral” was introduced later by Daniel Bernoulli (1700-1782), a Swiss mathematician, one of the most important mathematicians of the Bernoulli's family, which also contributed greatly to mechanics, particularly to fluid dynamics, probability, statistics, and whose works are still being studied world-wide (Rouse Ball, 2003).

The subsequent formulation of the theory of integration by Georg Friedrich Bernhard Riemann (1826-1866), German mathematician and physicist, is based on a hand on the work of Leibniz and Newton, on the other one by the method of exhaustion; this last was also used in the same period for the *construction of real numbers* by Julius Wilhelm Richard Dedekind (1831-1916), German mathematician, and for the *measure theory* by Camille Jordan (1838-1922), French mathematician (Ewald, 1996; *britannica.com*).

Together with the development of integral calculus, the study of *quadrature formulas*, which provide *approximate values* (useful for the *numerical approximation*) of a defined integral, was also developed (Di Sia, 2013; Di Sia, 2014).

CONCLUSIONS

The history of mathematical analysis is a fascinating adventure born over time, in particular by the contributions of the ancient Greeks and not yet completed. His “official birth” is considered during the second half of the 17th century, thanks to the work of Isaac Newton and Gottfried Leibniz, who independently introduced the fundamental concepts of infinitesimal calculus.

Initially it was based on geometric aspects in an attempt to answer questions about the calculus of areas and geometric features of a curve. Its development was strongly motivated by physics, leading to the development and elaboration of rational mechanics.

The concept of function is crucial for the purposes of mathematical analysis. Through advanced operations, a number of fundamental properties of considerable utility are identified in theoretical developments and practical applications: the continuity, the derivability, the differentiation.

The concept of limit, fundamental in analysis, was intuitively understood by mathematicians of the importance of Wallis, Euler, Bernoulli, Newton, Leibniz, and also Archimedes had intuitively understood it. The concepts of derivative and integral occupy a fundamental role in infinitesimal calculus and in all mathematical analysis; they are fundamental tools for studying a function.

The infinitesimal calculus, foundation of mathematical analysis, defines and studies the notions of convergence of a succession or series, continuity, derivation, and integration. It is a powerful instrument used in almost all fields of mathematics, physics and science.

ABSTRACT

This research aimed to investigate linear structural relationship model of ethical leadership and good governance of administrators under the Secondary Educational Service Area 30, Thailand. Researchers utilized quantitative survey design using questionnaire as instrument. A total of 450 samples including 79 school administrators and 336 teachers were selected from a population of 1,907. Result showed that the linear structural relationship model between ethical leadership and good governance found to be consistent with empirical data, with $\beta = 0.760$, $\chi^2 = 40.220$, $df = 29$, $\chi^2/df = 1.387$, CFI = 0.998, TLI = 0.995, RMSEA = 0.031, SRMR = 0.016.

Key Words: Ethic, Leadership, Governance

INTRODUCTION

Since the 1997 Financial Crisis, the concept of good corporate governance has gained popularity in Thailand. Good governance means that an organization has efficient, transparent, and auditable management structures and processes in place that promote trust and confidence between stakeholders. These structures and processes also stimulate competitiveness, boost long-term stakeholder value, and present excellent opportunities for sustainable growth. Therefore good governance contributes significantly to an organizational value, stakeholder confidence and overall sustainable growth. The moral and ethics of the society are deteriorating to a critical situation whereby dishonesty and corruptions in the workplace had become a common issue (Government Public Relations Department, 2014). Population growth has brought about competition for limited resources in the society thus people become more attached to materials than goodness. Ethics is a concept about moral values and rules. The school administrators' ethical leadership is of great importance regarding the educational organizations. The most important responsibility of school administrators is to have an ethical perception of school administration.

Today many professional communities have developed a code of ethics to make more specific the moral code that specifically applies to their situation. Currently, ethical leadership is essential to every organization of all types and in all corners of society. School administrators particularly play a significant role in society as leaders and role models for today's students but future's leaders. An ethical leader not only endeavors to do the right things but also to do things right. Therefore school administrator whose behavior is consistent acts morally and he or she values social justice (Glanz, 2006). Ethics is part of the administrators' job. Indeed, it is an essential part of the job. School administrators have to deal with fairness, equality, justice and democracy as much as they deal with test scores, teachers' work performance, parents, and budgets (Strike, Emil, Jonas, 2005). School administrators have a key role in managing schools because they are main decision makers, they are school leaders, and they have more responsibilities than the other staffs have. Hence school administrators' ethical behaviors and decisions directly affect school climate positively. In such an ethical school environment success is a definite success is a definite outcome of the educational process.

In 2003, Thai government issued the Royal decree on Principles and Methods of Good Governance to all governmental organizations. Therefore education reform has to follow the good governance or good administration so as to meet the existing problems and requirements of the globalized world. As a result educational institutions will be expected to be efficient and effective by ensuring the success of management and administration (Runcharoen, 2007).

The past national development in Thailand showed several significant and rapid changes in the local economic, social and political systems, thereby overwhelming the existing management system. The management system evidently was unfit for such changes. Moreover social changes are taking place on the global front as a result of

globalization and the advent of the new economy, thanks to modern information technology and communications, trade liberalization, regionalization, localization, as well as democratic movements and more calls for human rights. These have led to changes in ways of living, values, and culture in the global community. A major objective of the Ninth Plan (Thailand's National Economic and Social Development Board, NESDB, n.d.), there are six key factors of good governance will be pursued. First is the principle of accountability, which emphasizes recognizing legitimate duties, public awareness, political awareness, and the courage to accept the consequences of actions. Ethic is the second key factor. Attention will be given to righteousness, honesty, diligence, tolerance, and discipline. Popular participation will encourage people from all walks of life to take part in the decision making processes for national development. Fourthly, attention will be given to efficiency, particularly in terms of the optimization and prudent management of limited resources of the country, based on a sustainable development approach. Transparency will provide people with easy access to information, so that they can effectively participate in monitoring the fairness and effectiveness of operations. The Rule of Law will also be important, as laws will need to be continuously updated, to be fair and socially acceptable. The development of good governance in Thai society is seen as a vital condition for success of the Ninth Plan implementation (Thailand's National Economic and Social Development Board, NESDB, n.d.). It will be a key driving force for all other development strategies. These six key factors, based on the Philosophy of Sufficiency Economy, will become fundamental elements for all levels of management, from the family and community to the government, in order to immediately restore economic and social health and lay down solid foundations for long-term, sustainable economic and social development.

School leaders may often be faced with choices that require them to make decisions. All these decisions may not have any clear cut resolution and are likely to be problematic. That is why school administrators may frequently face with ethical dilemmas. In other word, an ethical dilemma comes out from a situation that requires a choice among competing sets of principles, values, beliefs, perspectives (Cranston, Ehrich, Kimber, 2003). At ethical dilemma is not a choice between wrong and right. It is a choice between two rights as it was stated by Rushworth Kidder (1995 in Ibrahim & Turgut, 2009). For example, deciding whether scarce resources should go to a gifted curriculum or a dropout-prevention program would constitute a dilemma and this is very challenging for school administrators (Lashway, 1996).

Thai educational administration faces the similar problem as they should not seek benefits for themselves and overlook moral and ethics which will lead the organization to sustainable success and growth (Watcharamethee, 2006). As such, school administrators must be knowledgeable, capable, skillful, having expertise, experiences, broad vision, ethics and moral, and are respectful and trustworthy to administer their organizations. Moral and ethics are the major qualities that enhance school administrators to possess the self-ruling, people-ruling, and task-ruling characteristic (Pongsriwat, 2007).

LITERATURE REVIEWS

Michael and Linda (2006) reviewed the emerging construct of ethical leadership and compared this construct with related concepts that share a common concern for a moral dimension of leadership namely spiritual, authentic, and transformational leadership. Drawing broadly from the intersection of the ethics and leadership literatures, Michael and Linda offer propositions about the antecedents and outcomes of ethical leadership. In addition, they also identify issues and questions to be addressed in the future and discuss their implications for research and practice. Their review indicates that ethical leadership remains largely unexplored offering researches opportunities for new discoveries and leaders opportunities to improve their effectiveness.

Poohongthong, Surat, and Sutipan (2014) studied on the relationship between ethical leadership, work-life balance, organizational socialization, and organizational citizenship of teachers in Northern Thailand. The results showed that work-life balance and organizational socialization had significant positive correlations with the organizational citizenship behavior ($r = 0.187$, $p < .05$ and $r = 0.353$, $p < .01$) respectively. Moreover, ethical leadership, work-life balance, and organizational socialization together, could account for 14.3 percent predictive power of teachers' organizational citizenship behavior. Only organizational socialization had a significant and positive effect on the organizational citizenship behavior ($\beta = 0.378$, $t = 3.81$, $p < .01$). Thus ethical leadership was proved to be able to strengthen organizational socialization and morality. Consequently, processing of organizational socialization in ethical way will promote being a good citizenship and work effectiveness in the organizations. In short, if employees are happy and success at their work, their work-life balance can be positively and effectively managed as well.

Karakose (2007) carried out a study to determine to what extent principals demonstrate ethical leadership behavior in Turkey. Karakose utilized Ethical Leadership Scale (ELS) developed by Yilmaz (2006) to evaluate

teachers' perceptions. Findings of Karakose's study revealed that principals adequately perform their ethical responsibilities like treating their staff justly and encouraging them, being fair, understanding, patient and humble, traits which all exist in the communicative ethics, climate ethics, and ethics in decision making levels at the state high schools in the city of Kutahya, Turkey. Moreover respondents have clearly admitted that their principals engaged in such ethical behavioral ethics level as self-evaluation, not lying and protecting individual rights poorly. Aliyu (2013) overviewed and highlighted the basic concepts and contemporary issues of ethical leadership and good governance. According to Aliyu, leadership is a means of direction, but when it exists without ethics it is absolutely directionless and worthless. Aliyu also seeks to find out the relationship between ethical leadership and good governance, using some selected public and private organizations as case study. On top of that, a conclusion has made that leaders in both public and private sectors should embrace in totality ethics in discharging their responsibilities.

RESEARCH OBJECTIVES

The main objective was to study the linear structural relationship model of the ethical leadership and good governance of the school administrators under the Secondary Educational Service Area 30.

METHOD

Researchers employed survey questionnaire as a method to collect quantitative data. Target group were 1,907 school administrators and teachers who worked in the schools under the Office of Secondary Educational Service Area 30. Multistage sampling technique followed by stratified random sampling technique was administered to select samples according to school size. The required sample size was 415 samples according to Krejcie and Morgan's Table at 95 percent confident level. These 97 secondary schools consisted of 10 small sized schools, 47 medium sized schools, 17 large sized schools and 23 extra-large sized schools. A total of 415 samples were comprised of 336 teachers and 79 school administrators. Table 1 shows the distribution of samples.

Table 1. Distribution of samples

Types of schools	Administrators		Teachers		Total	
	N	n	N	n	N	n
Small size	10	8	307	57	317	65
Medium size	47	38	679	126	726	164
Large size	17	14	264	49	281	63
Extra-large size	23	19	560	104	583	123
	97	79	1810	336	1907	415

Rules of thumb for determining adequate sample size (N) are known to be of limited use in achieving an acceptable likelihood for desirable empirical outcomes (e.g., model convergence, statistical precision, statistical power) for a particular application of confirmatory factor analysis (CFA) with real data (Marsh, Hau, Balla, & Grayson, 1998). Common rules of thumb for determining adequate N for a particular application of CFA include, but are not limited to: $N \geq 200$, ratio of N to the number of variables in a model (p), $N/p \geq 10$; the ratio of N to the number of model parameters (q), $N/q \geq 5$; and an inverse relationship between construct reliability and adequate N. Even when model-data assumptions are made that are rarely observed in practice and simulated data are analyzed, the performance of these rules of thumb has limited the ability of methodologists to offer definitive guidelines for adequate N across the myriad of model-data conditions observed in practice (Gagné & Hancock, 2006; Jackson 2001). The core problem with these rules of thumb is that adequate N for CFA depends on many factors that typically vary across any two studies using real data and inexact theoretical models (e.g., distribution of variables, reliability of indicators, size of the model, degree of model misspecification).

Structural Equation Modelling (SEM) is utilized in this study in order to fit the Model. SEM is a combination of factor analysis and regression or path analysis. The interest in SEM is often on theoretical constructs, which are represented by the latent factor. The relationships between the theoretical construct are represented by regression or path coefficients between the factors. The structural equation model implies a structure for the covariance between the observed variables. Nowadays structural equation models need not be linear, and possibilities of SEM extend well beyond the original LISREL program or Mplus program. SEM provides a very general and convenient framework for statistical analysis that includes several traditional multivariate procedures, for example factor analysis, regression analysis, discriminant analysis, and canonical correlation, as special case. Structural equation models are often visualized by a graphical path diagram. The statistical model is usually represented in a set of matrix equation. Mplus which is utilized in this study allows the model to be specified in a

graphical way, by letting the user draw the path diagram directly in an interactive command window.

Confirmatory factor analysis (CFA) is a powerful statistical tool for examining the nature and relations among latent construct. CFA explicitly tests a prior hypothesis about relations between observed variables and latent variables or factors. CFA is part of SEM and plays an essential role in measurement model validation in path or structural analyses (Brown, 2006; MacCallum & Austin, 2000). Researchers evaluate the measurement model first whether the measured variables accurately reflect the desired constructs or factors before assessing the structural model. In this study, the purpose of SEM is twofold. Firstly, it aims to obtain estimates of the parameters of the model, for example, the factor loading, the variances and covariance of the factor, and the residual error variances of the observed variables. The second purpose is to assess the fit of model, for example to assess whether the model itself provides a good fit to the data.

Absolute fit indices determine how well a prior model fits the sample data (McDonald & Ho, 2002) and demonstrates which proposed model has the most superior fit. These measures provide the most fundamental indication of how well the proposed theory fits the data. Unlike incremental fit indices, their calculation does not rely on comparison with a baseline model but is instead a measure of how well the model fits in comparison to no model at all (Jöreskog & Sörbom, 1993). Included in this category are the Chi-Squared test, RMSEA, GFI, AGFI, the RMR and the SRMR. The Chi-Square value is the traditional measure for evaluating overall model fit and, ‘assesses the magnitude of discrepancy between the sample and fitted co-variances matrices’ (Hu and Bentler, 1999: 2). A good model fit would provide an insignificant result at a 0.05 threshold (Barrett, 2007). While the Chi-Squared test retains its popularity as a fit statistic, there exist a number of severe limitations in its use. Firstly, this test assumes multivariate normality and severe deviations from normality may result in model rejections even when the model is properly specified (McIntosh, 2006). Secondly, because the Chi-Square statistic is in essence a statistical significance test it is sensitive to sample size which means that the Chi-Square statistic nearly always rejects the model when large samples are used (Bentler and Bonnet, 1980; Jöreskog and Sörbom, 1993).

On the other hand, where small samples are used, the Chi-Square statistic lacks power and because of this may not discriminate between good fitting models and poor fitting models (Kenny & McCoach, 2003). Due to the restrictiveness of the Model Chi-Square, researchers have sought alternative indices to assess model fit. One example of a statistic that minimizes the impact of sample size on the Model Chi-Square is Wheaton, Muthen, Alwin and Summers’s (1977) relative/normed chi-square (χ^2/df). Although there is no consensus regarding an acceptable ratio for this statistic, recommendations range from as high as 5.0 (Wheaton et al., 1977) to as low as 2.0 (Tabachnick & Fidell, 2007). The Root Mean Square Error of Approximation (RMSEA) is the second fit statistic reported in the LISREL and Mplus program and was first developed by Steiger and Lind (1980, cited in Steiger, 1990). The RMSEA tells us how well the model, with unknown but optimally chosen parameter estimates would fit the population covariance matrix (Byrne, 1998). Recommendations for RMSEA cut-off points have been reduced considerably in the last fifteen years. Up until the early nineties, an RMSEA in the range of 0.05 to 0.10 was considered an indication of fair fit and values above 0.10 indicated poor fit (MacCallum, Browne, & Sugawara, 1996). It was then thought that an RMSEA of between 0.08 to 0.10 provides a mediocre fit and below 0.08 shows a good fit (MacCallum et al, 1996).

However, more recently, a cut-off value close to .06 (Hu and Bentler, 1999) or a stringent upper limit of 0.07 (Steiger, 2007) seems to be the general consensus amongst authorities in this area. One of the greatest advantages of the RMSEA is its ability for a confidence interval to be calculated around its value (MacCallum et al, 1996). This is possible due to the known distribution values of the statistic and subsequently allows for the null hypothesis (poor fit) to be tested more precisely (McQuitty, 2004). It is generally reported in conjunction with the RMSEA and in a well-fitting model the lower limit is close to 0 while the upper limit should be less than 0.08. The Goodness-of-Fit statistic (GFI) was created by Jöreskog and Sorbom as an alternative to the Chi-Square test and calculates the proportion of variance that is accounted for by the estimated population covariance (Tabachnick & Fidell, 2007). This statistic ranges from 0 to 1 with larger samples increasing its value. When there are a large number of degrees of freedom in comparison to sample size, the GFI has a downward bias (Sharma, Mukherjee, Kumar, & Dillon, 2005). Related to the GFI is the Adjust Goodness-of-Fit statistic (AGFI) which adjusts the GFI based upon degrees of freedom, with more saturated models reducing fit (Tabachnick & Fidell, 2007). In addition to this, AGFI tends to increase with sample size. As with the GFI, values for the AGFI also range between 0 and 1 and it is generally accepted that values of 0.90 or greater indicate well-fitting models. Given the often detrimental effect of sample size on these two fit indices they are not relied upon as a stand-alone index, however given their historical importance they are often reported in covariance structure analyses.

The Root Mean square Residual (RMR) and the Standardized root mean square residual (SRMR) are the square root of the difference between the residuals of the sample covariance matrix and the hypothesized covariance model. The range of the RMR is calculated based upon the scales of each indicator. The standardized RMR (SRMR) resolves this problem and is therefore much more meaningful to interpret. Values for the SRMR range from zero to 1.0 with well-fitting models obtaining values less than .05 (Byrne, 1998; Diamantopoulos & Siguaw, 2000), however values as high as 0.08 are deemed acceptable (Hu & Bentler, 1999). The Comparative Fit Index (CFI: Bentler, 1990) is introduced by Bentler (1992) and subsequently included as part of the fit indices in his EQS program (Kline, 2005). This statistic assumes that all latent variables are uncorrelated (null/independence model) and compares the sample covariance matrix with this null model. A cut-off criterion of $CFI \geq 0.90$ was initially advanced however, recent studies have shown that a value greater than 0.90 is needed in order to ensure that miss-specified models are not accepted (Hu & Bentler, 1999). From this, a value of $CFI \geq 0.95$ is presently recognized as indicative of good fit (Hu & Bentler, 1999).

This questionnaire was then sent to a panel of three experts for comments and feedbacks. The panel of experts was selected using the criteria based on their expertise. Validate the quality of the instrument based on the content validity by finding the index of item according to objective congruence (IOC) ≥ 0.6 . From the feedbacks returned by the panel, some modifications were made to the original instrument. Pilot testing of the instrument was carried out to 5 school administrators and 25 teachers in the Secondary Educational Service Area Office 25 but they were not the samples of the actual study. They were chosen as their structure and population are the same as the actual study. To improve the quality of the items in the instrument, they were also asked to give suggestions and comments on the items in the instrument. Revisions were made based on the suggestions and feedback from the 30 participants. It could be concluded that the instruments were reliable and good to use as the Cronbach alpha value indicated that all the research variables had higher Cronbach alpha values ranging from 0.992 to 0.991 for ethical leadership and good governance respectively.

RESULTS

Factor loading and validity of observable variables in the relationship model

As indicated in Table 2 below, factor loading values of all ethical leadership attributes ranged from 0.823 to 0.958 are statistically significant at 0.01. Factor loading is the importance of standard factors of each attribute in the relationship model of ethical leadership and good governance of the school administrators that had been taken into consideration. The co-variance with ethical leadership was from 66.70 to 91.80 percent. The attribute with the highest factor loading was fairness. This is followed by responsibility, good citizenship, trust, and caring respectively. The attribute that had the lowest factor loading was respect. As a result all the factors are found to be important construct of ethical leadership. On the other hand, as for constructs of good governance showed the factor loading values from 0.789 to 0.920 and are statistically significant at 0.01. The co-variance with good governance was from 62.20 to 84.60 percent. The attribute with the highest factor loading was participation, followed by responsibility, worthiness, and ethics respectively. The attribute receiving the lowest factor loading was the principle of laws. All constructs were important as the attributes of good governance of the school administrators.

Table 2. Factor loading and validity of observable variable in the relationship model

Components of measuring model	Factor loading			
	β	SE	t	R^2
ETH Trust (TRU)	0.891**	0.023	38.117	0.793
ETH Respect (RPC)	0.823**	0.019	44.044	0.667
ETH Responsibility (RPN)	0.928**	0.017	56.150	0.862
ETH Fairness (FAI)	0.958**	0.013	71.028	0.918
ETH Caring (CAR)	0.834**	0.018	45.741	0.695
ETH Citizenship (CIT)	0.908**	0.019	48.690	0.825
GOV Law (LAW)	0.789**	0.024	33.191	0.622

GOV Transparency (TRA)	0.897**	0.012	74.987	0.804
GOV Participation (PAR)	0.920**	0.010	90.971	0.846
GOV Accountability (ACC)	0.897**	0.012	75.840	0.805
GOV Value worthiness (VAL)	0.869**	0.014	60.540	0.756
Ethical Leadership (ETH)	0.760**	0.024	31.951	

** $p < 0.01$

Based on Figure 1 below, the correlations between ethical leadership and good governance can be assessed in the standard component score (β) as 0.760 which shows significantly high and positive correlations at 0.01. This means that if ethical leadership is high, good governance value will be high too. Besides, it was found that the relationship model of ethical leadership and good governance has goodness fit with evident data, with $\chi^2 = 40.220$, $df = 29$, $\chi^2/df = 1.387$, CFI = 0.998, TLI = 0.995, RMSEA = 0.031, and SRMR = 0.016 as illustrated in Figure 1. Figure 1 shows the degree of correlation between ethical leadership and good governance can be indicated by standard factor loading (β) = 0.760 which is statistically significant at 0.01. In addition it was found that the relationship model of ethical leadership and good governance agreed with empirical data.

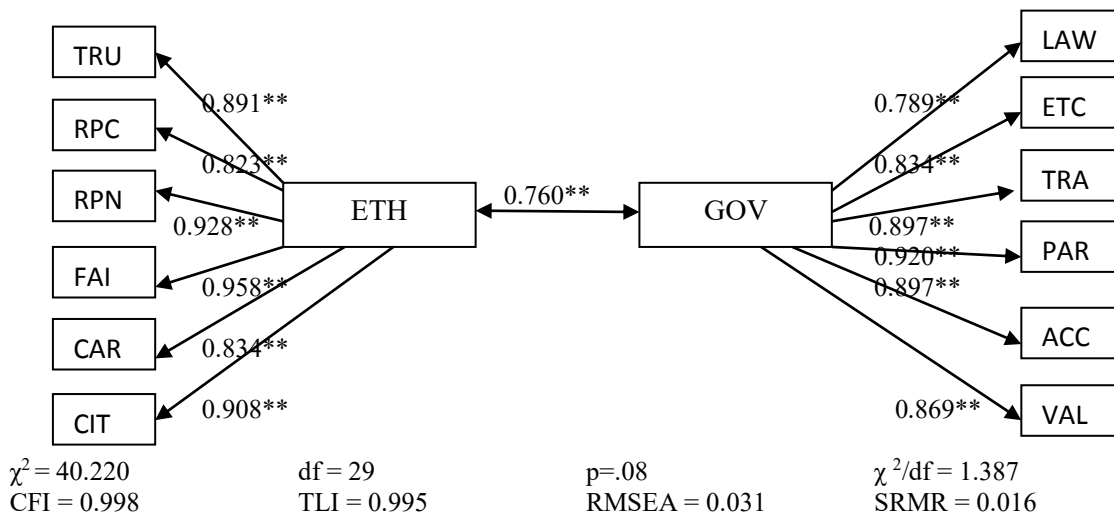

Figure 1. Coefficient of standard factor loading of the relationship model

DISCUSSION

The major focus of this study was on the importance of standard factor loading of each variable in the relationship model of ethical leadership and good governance of the school administrators under the Secondary Educational Service Area 30. Findings revealed that all the attributes of ethical leadership show the factor loading values from 0.823 to 0.958, with statistically significant at 0.01. The co-variance with ethical leadership was from 66.70 to 91.80 percent. This shows that all of the synthesized factors of ethical leadership correlate well with the empirical data with statistical significance (Tuksino, 2009). Hence findings also indicated that all the six attributes of ethical leadership namely fairness, responsibility, citizenship, trust, caring, and respect are important for ethical leadership practiced by school administrators. As a result, finding seems to be in accordance with theories and previous research studies.

On the other hand, all the attributes of good governance had the factor loading values from 0.789 to 0.920, with statistical significance at 0.01 ($p < 0.01$). The co-variance with good governance was from 62.20 to 84.60 percent, showing that all of the synthesized factors of good governance correlate very well with the empirical data (Tuksino, 2009). As a result, researchers obtained all the six attributes of good governance namely participation, responsibility, transparency, value worthiness, ethics, and law respectively and considered as important variables of good governance. As a conclusion this finding is in line with concepts, theories and past research works to the attributes of good governance.

The degree of correlation between ethical leadership and good governance was indicated by the standard factor loading ($\beta = 0.760$), which was high and positive with statistical significance at 0.01. Moreover, it was found that the relationship model of ethical leadership and good governance correlated very well with the empirical data with statistical significance. This shows that the ethical leadership and good governance of the school administrators under the Secondary Educational Service Area 30 correlated in the same direction. If school administrators have high ethical leadership, their good governance degree will be high. Nevertheless finding revealed that this model of relationship between ethical leadership and good governance was found to be consistent with empirical data with $\beta = 0.760$, $\chi^2 = 40.220$, $df = 29$, $\chi^2/df = 1.387$, CFI = 0.998, TLI = 0.995, RMSEA = 0.031, SRMR = 0.016 as what has been proposed by researchers. As a result, this means that ethical leadership and good governance relationship model may explain the relationship between ethical leadership and good governance.

Result of this study is parallel with the assumption, concepts, theories, and the past research studies. For example, Pawawong, Pamsupawachara and Pengsawat (2012) stated that efficient school administration and their success do not depend on any best theory or principle that can be applied in all schools. However, if school administrators are professional and able to use good governance, knowledge, and expertise in integrating various techniques, theories and principles as appropriate to situations, places, time, and the environmental factors; then they will be successful and efficient. Another study which was conducted by Wachiramethee (2009) found that ethical leadership of school administrators is important since it will link towards ethics in the institution and a good example for teachers, students, and educators. It will bring about good culture and moral which lead to happiness of people in the society and hence the expectation of the Education Act will be met. The finding also agrees with the research work of Okechukwu (2012), who studied ethical leadership and good governance in a local government in Nigeria and found that the potential pattern of ethical leadership would help control the situations in developing socio-economic resources in Nigeria, and will improve the quality of administration. Similarly, Othman (2014), conducted a study on characteristics of leaders with good governance, using businessmen in Malaysia as the sample group. This study shows that ethical leadership is necessary for organizational good governance.

CONCLUSION

This study found to have the above mentioned attributes of ethical leadership supported the proposition that ethical leadership associated with good governance practices. Ethical leadership attributes emerged as supporting the process of good governance practices in the context of this study. The overall findings of this study are useful for the policy maker, educational administrators, educators and practitioners. Empirical development in the school organizations largely neglects to recognize ethics as an element of good governance. This study provides empirical justification that ethics particularly ethical leadership is crucial in the construction of good governance practices. Such findings establish school organization as a social process rather than as economic logic. The richness and justification of data reveals its valuable contribution of knowledge from an academic perspective. This study also contributes to the work of school administrators in several ways. The findings highlighted the important of ethics, and thus acknowledge the managerial implications of incorporating ethical based governance into the educational administration system. There were several limitations noted. The general limitation is the scope of the study. As ethics is a sensitive issue, an in depth description of practice, through case research, was impossible. However, in order to enrich the findings, a case study as well as comparative study would be recommended for future research. Researchers would like to recommend an objective view of the research that would provide a causal effect of the attributes of ethical leadership and good governance practices. In addition, researchers predict future research could build an insight into explaining the relationship between ethical leadership and good governance.

ABSTRACT

The aim of this research was to investigate the linear structural relationship model between organizational factors and teachers' learning innovation. Quantitative survey design and multi-stage sampling were employed and data was analyzed using structural equation modeling. Results revealed that the relationship model was found to be consistent with empirical data, with $\chi^2 = 123.540$, $df = 76$, $\chi^2/df = 1.625$, CFI = .989, TLI = .976, RMSEA = .001, SRMR = .017. The overall effect of organizational factors were school leadership ($\beta = .729$, .683), school policy ($\beta = .233$) and professional learning community ($\beta = .166$) on teachers' learning innovation.

Keywords: Learning innovation; organizational factors; professional learning community; school leadership

INTRODUCTION

Teachers are supposed to be experts in learning and the most important agents in shaping education for students in regard to bring about change and innovation in educational practices (Bakkenes, Vermunt & Wubbels, 2010). Educational innovations have regularly failed because they did not recognize the need for teachers' learning innovation (Lieberman & Pointer Mace, 2008). Currently, there is a growing awareness of the necessity of assisting teachers in their professional development particularly in Thailand whereby the country is directed to reform innovatively in order to cope with the opportunities and threats in the 21 century. Shalley and Zhuo (2008) emphasized the key success factors of an innovative and creative educational system are focusing on learners' learning skills and their creativity to promote innovation for future sustainable economic growth.

With regard to organizational factors, Jurasaitė-Harbison (2009) who had carried out a study in the United States and Lithuania, found that there are three features of the school culture providing or failing to provide opportunities for teachers' innovative learning in informal contexts namely school leadership, teachers' professional relationships, and their individual stances as learners. School leadership is one of the major components of organizational factors because school leader must instill passion in teachers and provide effective leadership to motivate teachers' learning to engage and energize students (Barret & Breyer, 2014). Barret and Breyer primarily determined on how school leadership is able to modelling instructional strategies to influence teachers' learning innovation that promote greater students' engagement and learning. They further suggested that sustaining teachers' passion for innovative learning and providing teachers with motivation to engage students in lessons through effective leadership and modelling.

School policy is another component of organizational factors that hypothesized to influence teachers' learning innovation. This is because the patterns of teaching practices and participation in professional practice are strongly influenced by the specific interaction between traditions, culture, and educational policy in an educational system (Vieluf, Kaplan, Klieme & Bayer, 2012). It is clear that high quality teaching must exceed teachers' learning innovation in order to stimulate and challenge students. Vieluf et al. further highlighted that student motivation is enhanced by autonomy and social relatedness, as well as structured teaching and good classroom management. They reported that the main driver for advancement in teachers' learning innovation lies with developing a large range of school policy and granting autonomy and isolation to co-operatively reflect pedagogical practice.

Thailand's basic education depends on a growing number of effective organizational factors to promote professional learning community as one of the shared responsibilities and collaborative actions for both teachers and students according to the report made by the Office of National Education Commission of Thailand (2002). According to Somprach, Tang and Popoonsak (2017), the rolling adoption across schools and teachers offer the potential to observe variation in schools' and teachers' adoption of the professional learning community approach in Thailand. Somprach et al. found that school leaders should utilize suitable leadership styles to foster and manage school cultures that develop collaborative working relationships and support ongoing learning innovation for teachers.

RESEARCH OBJECTIVES

The main objective was to study the linear structural relationship model of the organizational factors consisted of school policy, school leadership, and professional learning community toward learning innovation of the teachers.

METHOD

A survey quantitative method was employed as a single method to collect data. Sample size was determined based on Thompson (2004) and Meyers, Gamst, and Guarino (2006)'s rules of thumb. Thompson proposed that at least 200 respondents must be tested in order to achieve an established solution through factor analysis. Likewise, Meyers et al. proposed that suitable sample sizes depend upon the numbers of items available for factor analysis. On this line of reasoning, target group were school directors and teachers from 780 schools under the Office of Basic Education Commission, with the ratio 1 to 1. The unit of analysis of this study was school. A multi-stage sampling was employed and teachers and school directors were randomly selected. A 108-items questionnaire was used as mode of data collection.

Structural Equation Modelling (SEM) was utilized in this study in order to fit the model with empirical data. According to Hoyle (1995), SEM is a comprehensive statistical modeling tool for analyzing multivariate data involving complex relationships between and among variables. Besides, SEM is a powerful technique that can combine complex path models with latent variables (factors). Using SEM can specify the relationships between variables using two main sets of equations namely measurement equations and structural equations. Measurement equations are used to examine the accuracy of proposed measurement by considering relationships between latent variables and their respective indicators. The structural equations are used to drive the assessment of the hypothesized relationships between the latent variables, which permit testing the statistical hypotheses of the study (Byrne, 2010). In addition, SEM considers the modeling of interactions, nonlinearities, correlated independents, measurement error, correlated error terms, and multiple latent independents each measured by multiple indicators.

SEM was found to be suitable to use in this study because of this two reasons. Firstly, SEM validates the measurement model in terms of assessing the relationship between hypothetic latent constructs and clusters of observed variables underlying each construct. Therefore, Confirmatory Factor Analysis (CFA) is used to validate the measurement model. Secondly, SEM directs around fitting the structural model by measuring the significance of the relationship between latent variables, which is accomplished through path analysis (Hoyle, 1995; Kaplan, 2000). CFA was used as a desirable validation stage preliminary to the main use of SEM to identify the causal relations among latent variables (Schumacker & Lomax, 2004)

Absolute fit indices attain how well a preceding model fits the sample data (McDonald and Ho, 2002) and creates which proposed model has the greatest fit. These measures offer the most dynamic suggestion of how well the proposed theory fits the data. Unlike incremental fit indices, their intention does not depend on comparison with a baseline model but is instead a measure of how well the model fits in comparison to no model at all (Jöreskog & Sörbom, 1993). Included in this category are the Chi-Squared test, RMSEA, GFI, AGFI, the RMR and the SRMR.

When the sample size is small, the Chi-Square statistic lack of power because it may not be able to discriminate between good fitting models and poor fitting models (Kenny & McCoach, 2003). As a result, the relative/normal chi-square (χ^2/df) will be used to minimize the impact of sample size (Wheaton, Muthen, Alwin, & Summers, 1977). The Root Mean Square Error of Approximation (RMSEA) is the second fit statistic used to identify how well the model with unknown but optimally chosen parameter estimates would fit the population covariance matrix (Byrne, 1998).

The Root Mean square Residual (RMR) and the Standardized root mean square residual (SRMR) are the square root of the difference between the residuals of the sample covariance matrix and the hypothesized covariance model. The standardized RMR (SRMR) resolves this problem and is therefore much more meaningful to interpret. Values for the SRMR range from zero to 1.0 with well-fitting models obtaining values less than .05 (Byrne, 1998; Diamantopoulos & Siguaw, 2000), however values as high as 0.08 are deemed acceptable (Hu & Bentler, 1999). The Comparative Fit Index (CFI: Bentler, 1990) is introduced by Bentler (1992) and subsequently included as part of the fit indices in his EQS program (Kline, 2005). This statistic assumes that all latent variables are uncorrelated (null/independence model) and compares the sample covariance matrix with this null model. A cut-off criterion of $CFI \geq 0.90$ was initially advanced however, recent studies have shown that a value greater than 0.90 is needed in order to ensure that miss-specified models are not accepted (Hu & Bentler, 1999). From this, a value of $CFI \geq 0.95$ is presently recognized as indicative of good fit (Hu & Bentler, 1999).

RESULTS

Factor loading and validity of teachers' learning innovation (observable variable) in the relationship model

Based on the linear structural relationship of learning innovation model, there were four primary factors: innovation novelty, innovation value, innovation development process, and innovative application; 15 secondary factors including level of newness, creative, problem-solving or learning quality, professional value, cost benefit, value creation for learning and well-being, and 48 indicators. CFA was used to validate at the preliminary stage to identify the causal relationships among the latent variables.

As indicated in Table 1 below, factor loading values of all learning innovation ranged from 0.787 to 0.948 are statistically significant at 0.01. Factor loading is the importance of standard factors of each observable variable in the relationship model of organizational factors and learning innovation of the teachers that had been taken into consideration. The co-variance with learning innovations was from 66.10 to 83.60 percent. The factor with the highest factor loading was media. This is followed by design, strategies or techniques, instrument or tool, implement and evaluation, creating and construction, creative, professional value, cost benefit, value creation for learning and well-being, problem-solving or learning quality, level of newness, can be utilizing, and objectives respectively. The indicator that had the lowest factor loading was distribution and acceptance. As a result all the factors are found to be important construct of learning innovations.

Table 1. Factor loading and validity of observable variable in the measurement model of teachers' learning innovations

Factors	Matrix of Factor loading				
	β	SE	t	Factor score	R ²
Innovation novelty					
-Level of newness	.821**	.011	72.213	.248	.673
-Creative	.886**	.010	87.557	.401	.785
Innovation value					
-Problem-solving or learning quality	.838**	.009	97.495	.157	.702
-Professional value	.877**	.007	123.772	.198	.769
-Cost benefit	.862**	.008	113.215	.172	.743
-Value creation for learning & well-being	.844**	.008	101.033	.144	.712
Innovation development process					
-Objectives	.813**	.009	88.770	.090	.661
-Design	.915**	.005	182.619	.221	.836
-Creating & construction	.889**	.006	148.138	.154	.791
-Implement & evaluation	.897**	.006	157.706	.184	.805
-Distribution & acceptance	.787**	.010	77.142	.068	.619
Innovation application					
-Can be utilizing	.815**	.012	65.932	.154	.749
-Instrument or tool	.906**	.008	120.671	.171	.765
-Media	.948**	.006	168.173	.259	.836
-Strategies or techniques	.913**	.007	137.778	.211	.798

**p<.01

Results from Table 1 shows that the correction between the factors of learning innovations can be assessed in the standard component score (β) which indicated significantly high and positive correlations at 0.01. Besides, it was found that the measurement model of teachers' learning innovations factors has goodness fit with evident data, with $\chi^2 = 56.567$, $df = 39$, $p = .008$, $\chi^2/df = 1.450$, CFI = .996, TLI = .989, RMSEA = .012, and SRMR = 0.006. Result show that not only the degree of correlation between the learning innovations factors was statistically high at significant level of 0.01 but also the relationship model of learning innovation factors agreed with empirical data.

Factor loading and validity of school policy (observable variable) in the relationship model

School policy acts as one of the components of organizational factors. According to the linear structural relationship of school policy model, there were three primary factors: policy objectives, policy means and policy mechanisms as well as eight secondary factors including vision, mission, goals, strategic issue, strategies, indicators, mechanisms, and monitoring and assessment. CFA was used to validate at the preliminary stage to identify the causal relationships among the latent variables.

As indicated in Table 2 below, factor loading values of all school policy ranged from 0.849 to 0.946 were statistically significant at 0.01. Factor loading is the importance of standard factors of each observable variable in the relationship model of organizational factors and learning innovation of the teachers that had been taken into consideration. The co-variance with school policy was from 72.10 to 89.50 percent. The factor with the highest factor loading was mechanism. This is followed by mission, strategies, vision, monitoring and assessment, strategic issue, and goals respectively. The factor that had the lowest factor loading was indicators. Results indicate that all the factors were found to be important construct of school policy.

Table 2. Factor loading and validity of observable variable in the measurement model of school policy

Factors	Matrix of Factor loading				
	β	SE	t	Factor score	R ²
Policy objectives					
-Vision	.880**	.009	96.671	.218	.775
-Mission	.907**	.008	107.853	.279	.823
-Goals	.860**	.014	61.639	.184	.739
Policy means					
-Strategic issue	.871**	.011	80.505	.148	.759
-Strategies	.907**	.008	109.188	.213	.823
-Indicators	.849**	.011	78.344	.123	.721
Policy mechanism					
-Mechanism	.946**	.007	126.400	.505	.895
-Monitoring & assessment	.879**	.009	102.386	.199	.772

**p<.01

Results from Table 2 reveals that the correlation between the factors of school policy could be assessed in the standard component score (β) which indicated significantly high and positive correlations at 0.01. Besides, it was found that the measurement model of school policy factors has goodness fit with evident data, with $\chi^2 = 23.524$, $df = 15$, $p = .009$, $\chi^2/df = 1.568$, CFI = .995, TLI = .985, RMSEA = .011, and SRMR = 0.003. Result show that not only the degree of correlation between the school policy factors was statistically high at significant level of 0.01 but also the relationship model of school policy factors agreed with empirical data.

Factor loading and validity of school leadership (observable variable) in the relationship model

The next organizational factor that researcher studied is school leadership. Correspond to the linear structural relationship of school leadership model, researcher found four primary factors namely learning leadership, learning-centered leadership, constructivist leadership, and creative leadership. Out of these four primary factors, there were 17 secondary factors which were powerful environment, creativity and courage, self-directed learning, transformation process and tailor making, research and development, high standard for student learning, rigorous curriculum, quality instruction, culture of learning and professional behavior, connections to external community, vision for learning, knowledge management, culture creating to exchange the knowledge, networking for learning, creative opened environment, imagination, and flexibility. CFA was used to validate at the preliminary stage to identify the causal relationships among the latent variables.

As shown in Table 3 below, factor loading values of all school leadership varied from 0.783 to 0.920 were statistically significant at 0.01. Factor loading is the importance of standard factors of each observable variable in the relationship model of organizational factors and learning innovation of the teachers that had been taken into consideration. The co-variance with school leadership was from 61.30 to 84.60 percent. The factor with the highest factor loading was creating opened environment. This is followed by self-directed learning, imagination, creating culture to exchange the knowledge, powerful environment, transformation process and tailor making, knowledge management, flexibility, vision for learning, connections to external community, networking for learning, culture of learning and professional behavior, high standard for student learning, quality instruction, and rigorous curriculum respectively. The factor that had the lowest factor loading was research and development. Results indicate that all the factors were found to be important construct of school leadership.

Table 3. Factor loading and validity of observable variable in the measurement model of school leadership

Factors	Matrix of Factor loading				
	β	SE	t	Factor score	R ²
Learning leadership					
-Powerful environment	.839**	.012	70.860	.110	.703
-Creativity & courage	.891**	.007	122.061	.169	.795
-Self-directed learning	.901**	.007	139.362	.191	.812
-Transformation process & tailor making	.890**	.009	95.930	.167	.793
-Research & development	.783**	.041	19.178	.074	.613
Learning-centered leadership					
-High standard for student learning	.854**	.010	87.279	.118	.729
-Rigorous curriculum	.802**	.013	62.695	.079	.643
-Quality instruction	.846**	.012	69.150	.109	.716
-Culture of learning & professional behavior	.867**	.009	93.761	.135	.752
-Connections to external community	.874**	.009	93.454	.137	.764
Constructivist leadership					
-Vision for learning	.881**	.009	98.384	.176	.776
-Knowledge management	.889**	.009	99.982	.182	.791
-Creating culture to exchange the knowledge	.892**	.009	104.174	.190	.795
-Networking for learning	.868**	.012	74.367	.157	.753
Creative leadership					
-Creating opened environment	.920**	.007	136.393	.318	.846
-Imagination	.898**	.009	102.650	.243	.807
-Flexibility	.888**	.012	75.330	.220	.789

**p<.01

Results from Table 3 indicates that the correlation between the factors of school leadership could be assessed in the standard component score (β) which indicated significantly high and positive correlations at 0.01. Besides, it was found that the measurement model of school leadership factors has goodness fit with evident data, with $\chi^2 = 40.423$, $df = 25$, $p = .007$, $\chi^2/df = 1.617$ CFI = .995, TLI = .983, RMSEA = .018, and SRMR = 0.013. Result show that not only the degree of correlation between the school leadership factors was statistically high at significant level of 0.01 but also the relationship model of school leadership factors was consistent with empirical data.

Factor loading and validity of professional learning community (observable variable) in the relationship model

The final component of organizational factors in this study was professional learning community. In accordance to the linear structural relationship of professional learning community model, there were four primary factors covered shared value and vision, exchange practice, support and shared leadership, and collaborative while the eight secondary factors encompassing shared value and vision of student learning, shared value and vision for personnel collaboration, exchange good practice and research, reflection for professional development, distributed power and shared decision making, contribution and supporting leadership, working as a team, and foster and friendly community. CFA was used to validate at the preliminary stage to identify the causal relationships among the latent variables.

The following Table 4 shows that factor loading values of all professional learning community varied from 0.877 to 0.948 were statistically significant at 0.01. Factor loading is the importance of standard factors of each observable variable in the relationship model of organizational factors and learning innovation of the teachers that had been taken into consideration. The co-variance with professional learning community was from 76.90 to 89.80 percent. The factor with the highest factor loading was contribution and supporting leadership. This is followed by shared value and vision for personnel collaboration, working as a team, distributed power and shared decision making, foster and friendly community, shared value and vision of student learning, and exchange good practice and research, in that order. The factor that had the lowest factor loading was reflection for professional development. Results indicate that all the factors were found to be important construct of professional learning community.

Table 4. Factor loading and validity of observable variable in the measurement model of professional learning community

Factors	Matrix of Factor loading				
	β	SE	t	Factor score	R ²
Shared value and vision					
-Shared value & vision of student learning	.901**	.009	103.143	.266	.811
-Shared value & vision for personnel collaboration	.937**	.007	125.615	.430	.878
Exchange practice					
-Exchange good practice and research	.886**	.009	95.103	.207	.784
-Reflection for professional development	.877**	.011	76.918	.195	.769
Support and shared leadership					
-Distributed power & shared decision making	.911**	.007	138.605	.219	.831
-Contribution & supporting leadership	.948**	.006	166.545	.402	.898
Collaboration team					
-Working as a team	.934**	.007	127.539	.388	.872
-Foster & friendly community	.903**	.010	90.235	.249	.816

**p<.01

Findings from Table 4 reveals that the correlation between the factors of professional learning community could be assessed in the standard component score (β) which indicated significantly high and positive correlations at 0.01. Besides, it was found that the measurement model of professional learning community factors has goodness fit with evident data, with $\chi^2 = 22.323$, $df = 14$, $p = .009$, $\chi^2/df = 1.595$ CFI = .992, TLI = .974, RMSEA = .012, and SRMR = 0.007. Result show that not only the degree of correlation between the professional learning community factors was statistically high at significant level of 0.01 but also the relationship model of professional learning community factors were consistent with empirical data.

Results of assessing of model fit

Results of assessment of model fit indexes would be used to explain the relationship among the latent variables which were the defined variables from the measurement models as correlations, means, and standard deviations among the latent variables. Subsequently, predicted correlations or covariances were compared to the observed correlations or covariances and if fit statistics are poor the model should be re-specified and modification indices should be followed. The final modified model with acceptable model fit statistics should be used for testing the hypotheses related to the statistical significance of the structure coefficient or path in the model. A careful assessment of the structure coefficient, standard error, t-value, and p-value will indicate if the null hypotheses should be rejected or not (Carvalho & Chima, 2014).

Table 5 below shows the causal relationship of examined variables. Results showed that the linear structural relationship of organizational factors and learning innovations model of teachers under the Office of Basic Education Commission in Thailand were fit with empirical data and in relation with structure as $\chi^2 = 123.540$, $df = 76$, $p = .008$, $\chi^2/df = 1.625$ CFI = .989, TLI = .976, RMSEA = .001, and SRMR = 0.017. It is concluded the null hypotheses should be significantly rejected at significant level as 0.01. Figure 1 below shows the results of the linear structural relationship model has goodness of fit with evident data.

Table 5. Factor loading and reliability of observable variable in the SEM of teachers' learning innovations

**p<.01

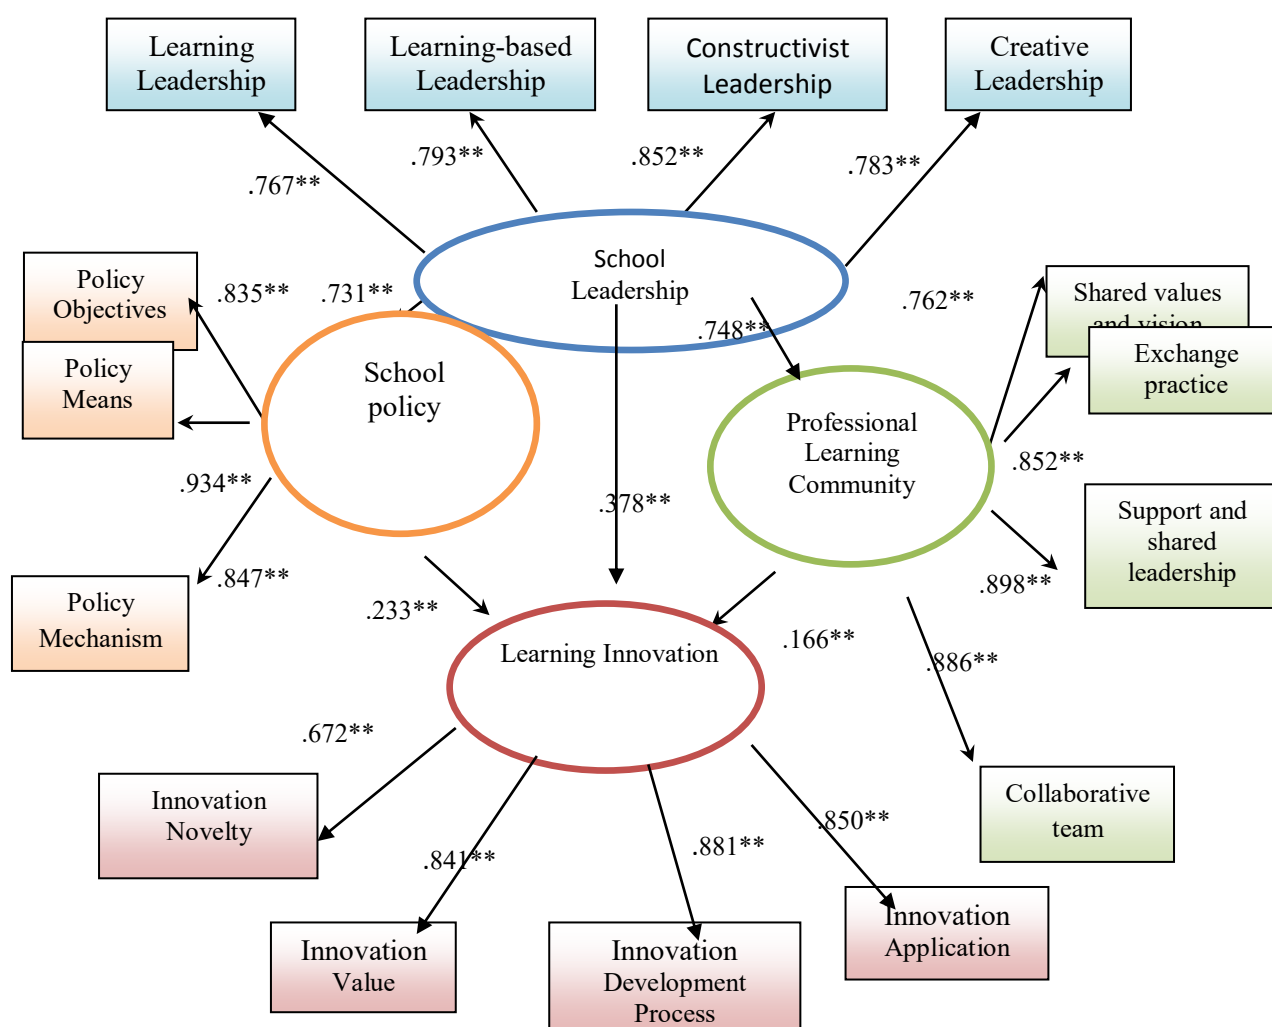

Figure 1. A Linear Structural Relationship Model of Organizational Factors and Teachers' Learning Innovation

Referring to causal relationship as shown in Table 6, results show that latent variables of school leadership were affecting the latent variables of teachers' learning innovations in two ways. Firstly, school leadership affected teachers' learning innovations through school policy as the total effect, direct effect, and indirect effect were at .729, .559, and .170 respectively at significant level of 0.01. Secondly, school leadership also affected teachers' learning innovation through professional learning community as the total effect, direct effect, and indirect effect were at .683, .559, and .124, in that order and statistically significant at 0.01. In addition, these latent variables had only direct effect as a total effect between each other as follows. Firstly, school policy was found affecting teachers' learning innovation had a direct effect as .233 at significant level of 0.01. Secondly, school leadership affected professional learning community directly as .748 statistically significant at 0.01. Finally, school leadership affected school policy as .731 and statistically significant at 0.01.

Table 6. Effect of the linear structural relationship model

Variables	Learning innovation			School policy			Professional learning Community		
	TE	DE	IE	TE	DE	IE	TE	DE	IE
School leadership	.729**	.559**	.170**	.731**	.731**	-	-	-	-
School policy	.683**	.559**	.124**	-	-	-	.748**	.748**	-
Professional learning Community	.233**	.233**	-	-	-	-	-	-	-

**p<.01

DISCUSSION

The results of the current study have significant implication of educational practice. They contribute to our understanding of how teachers learn and this knowledge can be crucial for designing powerful environments to foster teacher learning with the support of the organizational factors namely school policy, school leadership, and professional learning community. As in the field of teacher learning innovation, researcher is convinced that this linear structural relationship model of fostering teacher learning and professional development should be based on research evidence on how teachers learn.

A Multiple Intelligence Scale for Investigating the Multiple Intelligence Profiles of Students in the Faculties of Education and Engineering

Hüseyin YARATAN

hyaratan@ciu.edu.tr

Mutlu KALE

mutlu.kale@emu.edu.tr

ABSTRACT

In order to choose the right area of study, high school students should know about their potentials and also know the requirements of the areas of study they are planning to enroll. In this respect, Multiple Intelligences can be used to guide learners to choose the suitable area of study which will in turn lead them to their career. School counsellors and teachers should not only be aware of the MI principles but also encourage learners to explore their intelligence strengths to better understand themselves. This current study aims to develop a Multiple Intelligence Scale (MIS) which can be administered to Turkish high school senior students for specifying their multiple intelligence profiles. Another aim is to use the MIS and find out the Multiple Intelligence strengths of students studying in the Faculty of Education and in the Faculty of Engineering at Eastern Mediterranean University.

Key words: Intelligence, multiple intelligence profile, career.

INTRODUCTION

To choose the right area of study, high school students should be aware of their potentials and know the requirements of the areas of study they are planning to enroll. However, many high school students face difficulty of choosing an area or field to study (Yorke, 2004) and obtaining a university diploma and having a successful transition to a career is a problem for many young students (Shearer, 2009). Students with no clear career goals will be unclear about their career choices and will probably display low confidence, and poor academic performance and will likely drop out of schools (Hull-Banks, et al., 2005; Shearer & Luzzo, 2009). A study by Akıntuğ and Birol (2011) in North Cyprus has revealed that taking responsibility is not at the desired level for high school students and their low maturity level can be considered as an important negative factor in choosing the right area of study and choosing the right career.

According to Germeijs and Verschueren (2006), students' low maturity level can raise three items to consider: (1) whether or not students registered to an area of study which they intended to choose, (2) commitment to the area of study they are registered to, and (3) academic adjustment which includes learner motivation, effort, and efficacy.

Shearer (2009) recommends to use students Multiple Intelligences profiles for academic and career counseling to guide them into suitable career tracks which will in turn lessen career confused students resulting a decrease in school drop-out rates. Similarly, Wu (2004) advises teachers and counselors to use a process approach which uses a Multiple Intelligence inspired career assessment not only for undecided students but also for the indecisive students for more intensive and personalized assistance. Wu (2004) also suggests school counsellors and instructors to use students MI strengths both to increase academic performance and help students select an area of study, in terms of higher education, which will in turn lead to a successful shift into the career of student preference.

PURPOSE OF THE STUDY

There were two aims of this study. The first one was to develop a Multiple Intelligence Scale for Adult Students. Although there are Several Multiple Intelligence Developers of Instruments like Teele Inventory of Multiple Intelligences (TIMI) and Multiple Intelligence Development Assessment Scales (MIDAS) which can be purchased online, still validity and reliability control of these instruments are needed if they are to be used in different settings. Instead of assuring validity and reliability for some other instruments, this current study aimed to develop a Multiple Intelligence Scale (MIS) which can be administered to high school students for eliciting their multiple intelligence profiles. The second aim was to use the MIS to find out the dominant intelligence types of students studying in the Faculty of Education and in the Faculty Engineering at Eastern Mediterranean University.

DEVELOPING THE MULTIPLE INTELLIGENCE SCALE

The Multiple Intelligence Scale for the student participants consisted of two parts. The first part aimed to gather demographic data about the student participants and included questions about participants' faculty/department, student number, gender, age, the semester they were studying, and nationality.

For the second part of the inventory, items from a Multiple Intelligence Inventory prepared by McKenzie (2005) was used to identify the dominant intelligence profiles of student participants. McKenzie's instrument was also used by some other researchers (Hashemian & Adibpour, 2012; Oskooei & Salahshoor, 2014; Ramadan, 2014; & Razmjoo, Sahragard & Sadri, 2009) and it was found to be reliable. There were ten items for each intelligence type, total 90 items within the inventory. The original inventory was in English and because it was going to be used in a Turkish setting, Translation-Back-Translation method was used and first the questionnaire was translated into Turkish. Then it was translated back to English from Turkish and the final translated version was compared with the original version to see whether or not the items in both versions had the same meaning. For the content and face validity of the inventory, several checks and modifications were made. First, three English Language Teachers whose native language was Turkish were asked to examine whether there were any unclear items for the Turkish version of the inventory. Then two experts in the area of Multiple Intelligences were asked to examine the items for each intelligence area. Following the review of the experts, some rewording was made. At the next stage, 47 students were asked to examine the understandability of the scale and based on their feedback, final modifications were made. The original version of the Multiple Intelligence Inventory consisted of ten items for each intelligence area, total 90 items. However, after validity and reliability analyses and after exploratory and confirmatory factor analyses, some items were deleted and the final version of the Multiple Intelligence Inventory remained with 40 items. The items in the inventory were presented on a 5 point Likert scale ranging as (a) totally agree, (b) agree, (c) undecided, (d) disagree, and (e) totally disagree.

METHODOLOGY AND PARTICIPANTS

The research design of this study is quantitative and cross-sectional survey method was used to collect the data so that some conclusions could be drawn from the sample and later some generalizations for the populations could be made (Cohen, et al., 2007). In this current study, there were two different populations from which the samples were drawn:

- 1) all students studying at the Faculty of Education at EMU,
- 2) all students studying at the Faculty of Engineering at EMU.

For the student participants, a subset of probability sampling which is a random sampling procedure was employed. Out of 965 participants, 909 student participant's records were found to be valid and 513 student participants were from the Faculty of Education and 396 student participants were from the Faculty of Engineering. The characteristics of the student sample studying at the Faculty of Education are shown in Table 1. and the characteristics of the student sample studying at the Faculty of Engineering are shown in Table. 2.

Table 1. Characteristics of the student participants studying at the Faculty of Education (N=513)

Faculty of Education		N	%
Gender	Male	203	39.6
	Female	310	60.4
Semester Studying	1-2	241	47.0
	3-4	123	24.0
	5-6	59	11.5
	7-8	86	16.8
	9 and above	4	0.8
Age	17-18	18	3.5
	19-20	212	41.3
	21-22	189	36.6
	23-24	70	13.6
	25 and above	24	4.7

As can be seen in Table 2, 203 (%39.6) of the student participants studying at the Faculty of Education were male and 310 (%60.4) of the participants were female. Regarding the semester they were studying, 241 (%47.0) of them were in their 1-2, 123 (%24.0) of them were in their 3-4, 59 (%11.5) of them were in their 5-6, 86 (%16.8) of them were in their 7-8 and 4 (%0.8) of them were in their 9 and above semesters.

Table 2. Characteristics of the student participants studying at the Faculty of Engineering (N=396)

Faculty of Engineering		N	%
Gender	Male	345	87.1
	Female	51	12.9
Semester Studying	1-2	149	37.6
	3-4	87	22.0
	5-6	83	21.0
	7-8	68	17.2
	9 and above	9	2.3
Age	17-18	109	27.5
	19-20	120	30.3
	21-22	71	17.9
	23-24	59	14.9
	25 and above	37	9.3

As can be seen in Table 2, 345 (%87.1) of the student participants studying at the Faculty of Engineering were male and 51 (%12.9) of the participants were female. Regarding the semester they were studying, 149 (%37.6) of them were in their 1-2, 87 (%22.0) of them were in their 3-4, 83 (%21.0) of them were in their 5-6, 68 (%17.2) of them were in their 7-8 and 9 (%2.3) of them were in their 9 and above semesters.

RESULTS

To find out the dominant intelligence types of students studying in the Faculty of Education and in the Faculty Engineering at Eastern Mediterranean University, data analysis was done using the SPSS. For the analysis of the data, first the arithmetic mean of the respondents' data was computed for each of the Multiple Intelligence area. Next, the mean for each of the intelligence area was calculated for the respondents from both faculties separately. For each of the Multiple Intelligence areas Mean, Mode, Median and Standard Deviation were calculated.

The Multiple Intelligence profiles of the students studying at the Faculty of Education

For the analysis of the data, the mean of each intelligence area for each respondent was calculated. Next, the mean of each intelligence area was calculated for all the respondents from the Faculty of Education. Analysis was done to obtain descriptive statistics for the data. For each of the Multiple Intelligence areas Mean, Mode, Median, and Standard Deviation were calculated. Descriptive statistics, as a result of the analyses can be seen in Table 3.

Table 3. Faculty of Education Descriptive Statistics for Each Intelligence Area (N=513)

Faculty of Education	Mean	Mode	Median	Std. Deviation
Intrapersonal	4.52	5.00	4.60	.486
Bodily/Kinesthetic	4.35	4.75	4.50	.559
Naturalistic	4.17	4.60	4.20	.616
Logical/Mathematical	4.16	5.00	4.25	.720
Existential	3.96	4.00	4.00	.666
Musical	3.88	4.00	4.00	.787
Visual/Spatial	3.68	3.67	3.67	.811
Interpersonal	3.05	3.00	3.00	.785
Verbal/Linguistic	2.99	3.67	3.00	.930

As can be seen from the Table 3, the mean of the intrapersonal intelligence is 4.52, bodily/kinesthetic intelligence is 4.35, naturalistic intelligence is 4.17, logical/mathematical intelligence is 4.16, existential intelligence is 3.96, musical intelligence is 3.88, visual/spatial is 3.68, interpersonal intelligence is 3.05, and verbal/linguistic intelligence is 2.99. Considering the results, intrapersonal, bodily/kinesthetic, naturalistic and logical/mathematic intelligences of students who are studying at the Faculty of Education are the most developed areas. Existential, musical, visual/spatial, and interpersonal intelligences students from the faculty of education are moderately developed. As a surprising result it is found that verbal/linguistic intelligence area is not so developed.

Multiple Intelligence profiles of the students studying at the Faculty of Engineering

For the analysis of the data, the mean of each intelligence area for each respondents was computed. Next, the mean of each of the intelligence area was calculated for all the respondents from the Faculty of Engineering. Analysis was done to obtain descriptive statistics for the data. For each of the Multiple Intelligence areas Mean, Mode, Median, and Standard Deviation were computed. Descriptive statistics as a result of these analyses can be seen in Table 4.

Table4. Faculty of Engineering Descriptive Statistics for Each Intelligence Area (N=396)

Faculty of Engineering	Mean	Mode	Median	Std. Deviation
Intrapersonal	4.16	3.80	4.20	.537
Logical/Mathematical	4.03	4.00	4.00	.588
Bodily/Kinesthetic	3.97	4.00	4.00	.543
Existential	3.95	3.86	3.86	.571
Naturalistic	3.93	4.40	4.00	.581
Musical	3.72	3.75	3.75	.661
Visual/Spatial	3.67	3.00	3.67	.659
Interpersonal	3.17	3.00	3.00	.633
Verbal/Linguistic	3.14	2.33	3.00	.889

As can be seen from the Table 4, the mean of the intrapersonal intelligence is 4.16, logical/mathematical intelligence is 4.03, bodily/kinesthetic intelligence is 3.97, existential intelligence is 3.95, naturalistic intelligence is 3.93, musical intelligence is 3.72, visual/spatial is 3.67, interpersonal intelligence is 3.17, and verbal/linguistic intelligence is 3.14. Considering the results, it can be seen that intrapersonal and logical/mathematic intelligence of students who are studying at the Faculty of Engineering are the most developed intelligence areas. Bodily/kinesthetic, existential, naturalistic, musical, and visual/spatial intelligences of the engineering students are moderately developed. Interpersonal and verbal/linguistic intelligence areas are not so developed.

CONCLUSION

As a result of the study it can be depicted that students from both faculties have intrapersonal intelligence as their dominant intelligence. As it is expected engineering students have logical/mathematical intelligence as their second highest intelligence. On the other hand, verbal/linguistic intelligence of teacher candidates of the faculty of education is expected to be high but however the results show that it is not so developed. Interpersonal intelligences of students from the faculty of education is also expected to be high but turned out to be only moderately high. Visual/spatial intelligences of the engineering students was also expected to be high but it turned out to be only moderately developed.

Shearer (2009) suggested to do research on how universities can develop intrapersonal understanding, thereby enabling students to select a major course of study that leads naturally into a career that is well-matched to students' unique strengths. Shearer and Luzzo (2009) also invited researchers, counsellors, and teachers to do studies on the usefulness of the MI theory to design a framework for career counseling and educational planning. The Multiple Intelligence Scale will be a tool for Turkish adult students that they can use to increase their internal understanding for the Multiple Intelligence strengths.

As some researchers have already associated some intelligence areas with some professions (Armstrong, 2000; Demirel, et al., 2006; Gardner, 1999; Fogarty & Stoehr, 2008; McKenzie, 2005), students internal understanding for their Multiple Intelligence strengths may help them to choose the right area of study and also their counsellors might guide them according to their Multiple Intelligence strengths.

Finally, it can be concluded that the Multiple Intelligence Scale is a valid and reliable tool for senior students of high school and can be used as a self-check tool to find out their multiple intelligence profiles. Alternatively, teachers and counsellors can use it for their senior students in high school to find out their multiple intelligence profiles.

A Paradox in the Cognitive Space

Eszter GOMBOS

University of Debrecen

Hungary

gombos.eszter@kossuth-gimn.unideb.hu

ABSTRACT

The present education system is faced with the following dilemma: We inherited a school system which teachers were able to control but the one we are in now is primarily about teachers try to understand it and get familiar with. Let us start with the common knowledge that the aim and the meaning of teaching are the children.

The paradox of the situation is that those whose responsibility is to prepare the students for the digital future, they are rather drift with the current instead of being the ones who change its course. The key to this is the institute of the school, which is a very conservative formation, in general, they think and work in a subject based 'cast system', only renewed on paper, primarily holding on to the methods and approaches of the past. The aims of the teaching contents and the teaching materials are rather l'art pour l'art, mainly focusing on cognitive knowledge, they hardly allow entry to fundamentally different approaches, and do not concentrate on developable strategies. However, it is proudly announced that they prepare their students for Life Long Learning and its importance is continuously emphasized.

Following the stream of my thought, in the consideration of the paradox of the cognitive space, my intention is to present classroom practices, proved efficient and effective through the years, that provide examples on how this paradox can be solved and how the teachers of the future can be transformed being competent with the requirements of the digital world.

INTRODUCTION

As humans, we are all part of larger communities, in which we evolve into a socialized human being, and as such we live our everyday lives. An important feature of our present and future social life is what the future generations become. All these, throughout the previous centuries, had not caused serious problems: the teachers taught and their students learned what they were meant to, and when students learned in a more slave like way the better acceptance and grades they got. However, when their everyday life experiences and what they learnt in school did not match, fundamental changes were undertaken in education and in the school system. Such intersections come into existence when new ideas and/or technologies influence our lives in ways which are more promising and would follow the changes more consequently.

CHANGES AND CHANGE MANAGEMENT

Nowadays, the ever biggest gap exists between the participants of education. The education systems, the schools, and the education policy are the slaves of the old rules and organizations, and mostly project the reality according to their norms, believes, and intentions, by giving direct instructions on that to whom and what should be taught. In the previous centuries this approach worked accordingly to the aims of the active participants and was widely accepted.

However, the most demanding challenge of the 21st century, the information boom– the handling of huge amount of data and information and even their retrieval –, does not respect the clearly distinguished sciences, defined in the previous centuries, but declared new sciences and the knowledge-networks of the already existing ones. This integration process – both as phenomenon and approach –, is adapted and clearly present in the novel curricula. The surveying of the new teaching-learning methods also indicates the intention for changes, which cannot be separated from the fact that due to the high amount of available information the concept of knowledge should also be reevaluated and redefined (Bárdossy, 2011). This need for change in concept is clear and various attempts have been made for its acceptance in the teachers' community (Grotlüschen, 2005; Ausubel, 1963).

However, the problem arises that this change cannot be applied, directed, and handled with the old methods and approaches. On the one hand, although students spend a considerable time in school, even during this period, they step outside as they communicate through the Internet or collect information that concerns them. They live in the cyberspace by continuously connected to it. They communicate through these networks, use it for data and

information retrieval, however, hardly use it for sharing real, non-duplicated contents. The mobile phone is like one of their extended neurons, which keep them chained to the community of knowledge and of information. It substitutes their laptops and workstations while they are away from home. Their concept of community-self is fundamentally different from any of the previously known forms of relations and connections and, in a similar way, from the forms of knowledge, which are required in this conception.

TAUGHT AND ACQUIRED KNOWLEDGE

One of the consequences of this paradox is that we have to change our point of view if we want to pass knowledge on to the students and we also have to rethink the content of this knowledge.

Let us give a thought of the classical concept of planned and scheduled teaching materials and contents, which, according to Bárdossy's definition, "consists the knowledge and activities (along with the skills and abilities connected to the activities) and their order of presentation in the specific curriculum at the different levels of the teaching-learning process." (Bárdossy, 2011; Holzkamp, 1992, 1996).

In the acquisition of the teaching materials most of the schools still firmly stick to coursebooks, which form well defined frames to the teaching-learning process. In better cases the leaders of the schools and the education policy give teachers the liberty to use the coursebook of their choice, while in others the selection of coursebooks are highly centralized and influenced by outer decisions, which concern is however beyond the scope of the present paper.

The obligatory use of coursebooks and of centralized teaching materials, however, in the long term do not support the novel concepts of teaching, since these printed materials are difficult to change, the content is presented through the view point of the authors, through which the presented content is double forced on the students. Beyond this, the expectations of the 'coursebooks' and the students and/or their community can also be different. This gap is usually filled in either by the teachers or the students.

If these are teachers who fill in this gap, as it is expected from the expert teachers (Hattie, 2012), they focus on the needs of their students, and the content is formed to their demands and expectations. In the meantime, more often than before they use digital teaching materials and profit from the possibilities of the digital era in general. Let us use the example when students start studying a foreign language in an environment where there is no direct connection to native speakers of the language in question, there is a 'sterile' second language classroom, the students have to gain the real life communication skills and abilities in an isolated environment. In these cases, even the most well written coursebooks cannot fully serve their purposes and cannot be used effectively, even in those cases when the intended and the target students match. The worst scenario takes places when the two groups do not have anything in common. In these cases the use of the authentic materials, such as videos, songs, texts, pictures, emails, chatrooms, blogs, oral messages, etc., function as virtual substitutes for real world situations, as if they were part of it. Through these data retrieval and communication forms the students can consequently not only acquire the lexical items but the context as well, which helps the students (Prensky, 2001) in storing these pieces in the long term memory, and also in their retrieval.

THE DIRECT LINK IS THE TEACHER

The ultimate goal of the teaching-learning process is to help students to learn, and guide them to do it effectively. In institutionalized teaching this link for the students is represented by the teacher. It is the teacher's responsibility to consider and decide on the methods and approaches which lead to long term stored and extensible knowledge which can serve as bases to build up further concepts (Skemp, 1971). At this stage, we face several fundamental questions and concerns from the point of view of new pedagogy (Fullan, 2013).

Based on the effectiveness of the teachers, Hattie came to the conclusion that all the teachers have to have a well-defined goal- and tool-map accompanied with a mind-net of plans, based on which the teaching process is carried out. Hattie declared that this approach is highly affected by the teachers' way of thinking (Hattie, 2012). An expert teacher continuously evaluates their roles as a teacher, using both inert and outer evaluation methods, to be aware of how they influence their students and considering the results of the students whether they have the necessary tools for changes and for selecting and applying more effective methods. Whether they have the necessary theoretical background and whether they would be able to transform this knowledge to everyday practice. As a criterion of being successful we must mention the maximization of the effectiveness of the learning process, where not only the knowledge gained and stored is exclusively matters, but the development of the

personality and the character of the students, their problem solving skills and abilities, their approaches to the surrounding world, and their self-contained way of thinking. These abilities would help the students become responsible citizens and ambitious and self-demanding adults (Life Long Learning).

However, within the scope of this paper, we do not have the opportunity to go into details either considering the teachers' involvement in the motivation or evaluating the conditions and the circumstances which would tell apart teachers. Let us focus on those who want and know how to use IT tools – both hardware and software tools are meant here – of the digital era.

DIGITAL TEACHING MATERIALS AND THE TEACHERS' APPROACHES

According to the depths of teachers' approaches to digital tools, different groups can be defined.

- 'Integrated usage' is when the teacher consciously uses IT tools for explaining certain contents and concepts, for supporting better understanding, for developing certain skills, for increasing students' activities. Teachers are able to select the proper tools, find the suitable forms of activities, and integrate the IT-usage into certain classes.
- 'Developing or value-added usage' is when the teacher uses IT tools as an innovative presentation to help students with the understanding of new topics.
- 'Accessory usage' is when with motivational purposes or in order to increase effectiveness, students are asked to prepare e-notes, to send emails to their teachers with their completed assignments, or to prepare their home works using word processors (Kárpáti & Hunya, 2009).

All the three usages support the understanding, consequently the efficiency of the learning process, however, the integrated usage is the most challenging and demanding on the one hand, on the other this is the most value-added form of IT tool usage (Kárpáti & Hunya, 2009).

- 'Cooperative usage' can be added to the list, as it is found recently, since the technical support is sufficient enough to create virtual communities and contents in these groups.

The different usage of IT tools would allow us concluding that it is not only the 'usage' of these tools that matter, but whether or not in the process of the usage of these digital tools, the schools, the class is transformed into another world. Until now the school meant the place to learn and the afternoon spent on preparing home works and getting ready for the class of the following day(s). However, in the digital era, the cooperative work would be in the focus, when the students play the role of the 'teacher', someone in leading position, someone who can decide on the learning material, content, if they and the educational community fulfill the following requirements:

- the system is open to novel contents, materials, and forms which suit the interest of the students,
- students would help and teach each other through the Internet, using shared platforms, emails, virtual communities, blogs, etc.,
- there is place and openness for 'reciprocate-teaching', when students introduce their teachers to new subject matters, contents, and forms with which they are more familiar, for short, students teach their teachers. This change of roles, even if it may seem so, does not weaken the principium of knowledge. Being ignorant does not mean not knowing something, but rather that the person does not show any intention for accepting and revealing their lack of knowledge and does not do anything for changing this shameful state (Kruger & Dunning, 1999).

STUDENTS AS KNOWLEDGE MANAGERS

Another option is that the students suggest and force changes. This is the case of non-realized necessity. There are several examples of teachers' reaction to this which are annoying and disturbing. Teachers in these cases, instead of integrating the suggestions and ideas of the students, they sanction and punish them. Teachers often use tests, most of which they prepare themselves. Both students and teachers often lose these paper based tests, however, if these tests were available on mobile phones, then they could be retrieved regardless of space and time. (On further advantage of online testing is the protection of environment). The same is true, if students in a language class use online dictionaries. Along the application, teachers can help students understand the critical usage of online tools and the proper and legal usage of software.

Along the collective building of knowledge, students willingly present novel ideas, thoughts, subjects, contents which they are interested in. If students learn in CS/IT (Computer Sciences and/or Informatics) classes and within the frame of subject oriented classes how to build and how to handle digital schemata with real world contents (Csernoch, 2017), they would gain the core of concept based computer problem solving. By the time they leave schools they would learn openness and critical thinking, and the belief in the 'incremental' nature of science would be obvious for them. The knowledge can never be a constant state, but a station in a long process, where the closer

we think the terminus, the further we are (Chen, 2015; Gombos & Biró, 2016).

THE NECESSITY OF COMPLEX APPROACHES

Along with the positive effects of the digital world, we cannot forget dangers within its frame. The digitally shaped learning processes influence the students' physical conditions, their certain motoric skills, their concentration, their attention, etc., and most importantly, their shared attention (Dani, 2016). To reveal these negative effects of the digital world and the digital tools, along with their positive effects, certainly, further researches and analyses are required.

IN A DECISION MAKING SITUATIONS

As a feature, the effectiveness can allow teachers to utilize specific methods, approaches, and tools, including digital ones, after having taken into consideration their advantages and disadvantages – considered both the direct and the indirect consequences. The teachers' evaluation value of Hattie seems to be a reliable measurement, which can be accepted and used in the process of evaluating the effectiveness of the teaching-learning process (Prensky, 2001) in (Gombos et al., 2015). Since this value can be predicted, based on the decisions of teachers, it is worth applying.

Example: It should be the decision of the teachers which methods they apply, and which is the most efficient and effective. One of the most important practices is that teaching becomes limitless, both in time and space. This phenomenon can be exemplified by the reality based language teaching, where the teaching-learning process is based on the different levels of the everyday lives of students – their reality, through what they advance on every abstraction level. Starting with the oral reality of the very early childhood, where all the experiences are based on the events of the close environment then knowing more and more about the surrounding reality, each and every level has its own higher level of language abstraction (Skemp, 1971). In the meanwhile, influenced by both the existing and the oral world, students experience the expansive concentric levels and understand more and more of the substantial processes and their rules, which lead them to continuously enjoyable achievements, so their motivation is sustainable. During this process there is need for a better understanding of the different cultures, the dialog between the participants of these cultures, for which the teacher have to have Internet and/or digital network based curricula, teaching materials, and contents.

CONCLUSIONS

In education the ever largest scale of different approaches is invented which all point in the same direction and try to answer the same question. However, the formulated hypothesis requires different paths and answers. Being familiar with the methods and approaches of others has a great advantage of adapting ideas, concepts arisen which can lead to the recognition that teachers are one of the greatest innovators.

ABSTRACT

It can be considered that the success in the field of education only remaining in theory and literature, the situation that produced information is not being shared and not being realized and/or the situation that it just benefits the progress in the field of science pragmatically would be wrong for a scientist.

Here, it can be said that the lack to turn technical, electronical, physical and experimental progress processes of our age, which never stop and whose progress cannot be stopped, into a utilitarian structure is not logical. İşman (2001), in this context, insists in his study that it is necessary for education institutions to make use of computer technologies widely and teaching-learning techniques should be cleaned up from memorized learning.

“As education level improves, the usage percentage of Information and Communication Technologies (ICT) increases. People who benefit the most from the ICT are individuals who are at the level of college, faculty and the more advanced education level.” (Alaca & Yılmaz, 2016). As said, ICT is a course which includes important achievements of the age, which is being used by colleges and more advanced educational units. According to this, it is evaluated that the importance of Basic Computer Skills Modules (BCSM) given at universities is too high to be debated.

In the light of these data, the formation of a common perspective among all BCSM teaching staff and students and the formation of a realistic education system with a high functionality can be which is in life and cooperation is high is common denominator, within the light of these information. Overcoming the problem where BCSM is considered only as a module by students, teaching it in correlation with all curriculum modules, integrating it into the content of other modules and making it multidisciplinary can be set as objectives. It is believed that the usage of technology and computers should not be limited to only certain modules but also integrating it into other modules would be beneficial. It can be also considered that taking education out of amphitheatres and concentrating in laboratories will bring together significant gains.

Observation and interview technique, as qualitative research methods, were used in this research. The study was conducted on 30 students, who took modules, and on 5 instructors, who taught, in Near East University in the 2016-2017 education year.

Keywords: Computer, Education, Computer education, Student, Information society.

INTRODUCTION

In present day expressed as the information age, very quick developments take place in the field of technology, information technologies and education due to information and consequently science. Universities stand out as institutions which closely follow and contribute to these developments. Universities hold heavy responsibilities in order to render this mission sustainable in the field of education.

Both improvement of education quality and using knowledge in creating new information as well as transfer of information to future generations have a great importance at this point. Keser (1995, p.249) expresses this situation as *“While information quantity to be given to individuals increases day by day, content becomes more complex. The demand for education rises and individuals want to benefit more from education opportunities”*. In this context, information emerges as the most basic requirement at universities in order to provide education. The concept of information arises from the Latin word *“informatio”* (Öğüt, 2001, p.9). Barutçugil (2002, p.10) defines the concept of information as *“Personalized information which allows people to comprehend and understand what happens around them completely and correctly”*. Turan and Çolakoğlu (2008) express the

current status of information as “*Nowadays, information is the basic key of economic, cultural and social progression.*”

“The incredible developments in information and communication technologies result in having a large amount of information produced and ready for human usage. Another field in which information technologies are being used is higher education and information technologies in higher education currently change the way and content of education and teaching highly.” Turan and Çolakoğlu (2008). From this point of view, education sociology, which is always in an evolving state, should know how to integrate itself into the fast development. Otherwise, it is obligated to stay away from technological developments and changing and evolving education world.

Education on accessing information should be considered as one of the primary duties of universities as much as information transfer, which must be seen among the basic missions of universities. The basic computer skills are considered to be the fact in order to enable the use of computers during the transfer of information, the interactivity of information for information to be widespread and utile. *“One of the purposes of education is to raise individuals in line with the demands of the society; based on this perspective, the requirement to raise students convenient with the age of communication arises by taking into the features of the characteristics of information society. It is a necessity for this individuals to be equipped with the skills of accessing information, organizing information, presenting information and communication.”* (Şimşek, 2002, p.9, Arat, 2011). It can be said that the position of universities and computers in education and teaching is unquestionable in terms of obtaining information, using information, sharing information and producing information in this content based on the book of Şimşek and doctoral dissertation of Arat. Barutçugil (2002, p.58) expresses the production process of information as *“Flow of information among people by communication provides the production of information”*. Universities should work in order to make this information sharing and integration accessible to students in a more widespread and massive way in the basic content.

It has been expressed that universities in Turkey and the Ministry of Education were integrated to the computer technology in the 1960s (Keser, 1995). After this date, for computers with a usage growing at a high pace each year compared to the previous year among teaching- education programs, Keser (1995, p.250) used the expression *“Knowing how to use computers which are used as both tool and purpose in the education is considered as basic knowledge and skill that every individual should acquire.”* Societies consisting of individuals who have the skills mentioned by Keser are called Information Society. Alaca and Yılmaz (2016, p.514) explain this case as follows: *“The way to become an information society would be possible by using information and communication technologies effectively and by dominating on information.”* In the light of these information, it is clearly expressed why BCSM provided at foundation and undergraduate levels at academic education institutions today. BCSM provided to students in all faculties and programs of university is at the position of being one of the basic modules in curriculums of every faculty and department. The content of the module aims that students acquire the basics in computer usage while being *“Information Literate”* and *“Computer Literate”* (Murray, 2008). Seferoğlu and Şenel (2009) contribute as follows: *“There are compulsory information modules particularly at first year level undergraduate programs in many universities in our country. While the modules are named differently, their content consists of basic computer skills.”* Based on these, it can be said that universities intend to improve the rate of computer literates and to form the aims of creating an information society with the BCSM.

The content of BCSM consists of some basic topics. In this context, basic concepts of information technology, structure of computer, basic parts, the purpose of these parts, how and why computer is used in the daily life, how information safety is provided, hardware and software qualities, description of the information webs and the way how computer affects health are covered. As the other main topic, Windows and its practical application are covered as the most common operating system. Microsoft Word program, a word processor program which helps with the homework, thesis and article needs of individuals, is handled comprehensively as the next topic. Microsoft Excel is one of the basic computer education. Here, the usage of chart of accounts, formulas and calculations are handled with graphics topics and it is reinforced with the example implementations. Microsoft PowerPoint program, which is one of the main topics in order to perform effective and interactive presentations, is expressed to individuals. After the basic computer usage doctrines, the information and communication topic is seen as the topic which improves the motivation of students the most. In terms of the information part, points that should be considered while searching, protection from the detrimental content are provided while topics such as the usage of e-mail, etc. are provided in the communication part practically.

Having said that, individuals who acquire the skills mentioned above are considered as computer literates (Korkmaz & Mahiroğlu, 2009). However, it has been observed that the knowledge and skills acquired in these modules are not sufficient in order for the internalization and acceptance of implementations such as the usage of

information in research and performing presentations accordingly and in a functioning way with the course content. From this point of the view, it is thought that the content in the lecturing may be deficient but the deficiency and/or inadequacy in practice does not allow the computer use and its implementation into different fields.

Some of the students, who recently start higher education programs, start to use computer at early ages while there are students who have less experience in computer usage and there are students who do not even know how to use a computer. The most explicit reason of this situation can be expressed as deprivation of computer usage, socio-economic and socio-cultural life conditions. Dinçer (2011), studies this situation in his study and describes it as follows: *“Students who have no knowledge or less knowledge in computer usage have defined that they faced serious problems while writing reports or doing homework and they fell behind compared to their friends in the first year computer modules, they faced serious problems at the lesson due to situation that they had no knowledge for the most easiest commands.”* However, it is aimed to provide students with basic computer skills by reducing and eliminating the level difference among students as a result of the BCSM provided at foundation and undergraduate levels.

In line with these goals and achievements, it should be referred to the importance of adding not only the basic information but also the way how information is obtained, how they should be used in the daily life and in other models, how to benefit from existing knowledge and produce new information and how to share them in line with which purposes to the BCSM module curriculum in the context of individual education both in the formation of information society and in the information society in the rapidly developing and developing world. İşman (2001, p.2) says that there are important changes in education and individuals can learn more information in a short time. İşman (2001, p.2) makes the following expression for the made contributions: *“Due to these contributions, computed education forms the centre of scientific researches, information productivity, cultural interaction among individuals, evolutions, trade and education. All roles have changed in the centre of this new education. In addition, individuals have started to use computers effectively.”*

It should not be forgotten that the usage of technology tools has become a part of daily life. It is very clearly seen that computer, informatics and interaction as the most important accelerators of the rapidly developing are among the locomotive functions of universities and form the primary building blocks of changing education and changing world. In other terms, it can be discussed whether it is for the primary benefits of human beings to have what they learn stay in books, magazines and articles have benefits or not. It is believed that information centred formation and innovations which can be formed physically and provided to the benefits of humanity will bring humanity to the future.

It is also thought that the internet, which effects the age we are in, and computer and mobile communication tools used as the technological tools to access the internet provide important contributions to the information accumulation of individuals. Korkmaz and Mahiroğlu (2009) express this situation as *“Computer literacy skills are not only behaviours acquired in school but at the same time they are the behaviours which can be acquired in the present life at different environments.”* In this context, it is thought that information literates contribute to the education-teaching in private life and individuals in the work life and computer literates contribute to the success of individuals in achieving targets and thus to the society success by being an information society.

BCSM EDUCATION FROM STUDENTS' POINT OF VIEW

It is seen as general and common situation both at the interviews with the students and BCSM instructors that computer skills modules are perceived by students as a module which should be completed at the finishing stage of the faculty or department.

“I do not think BCSM will be beneficial for us. I would not attend the class if it was not compulsory. I am already a competent computer user.” (G:S(6)). One of the conclusions which was obtained from the interviews with students is the idea that BCSM is one of the compulsory lessons to be taken is dominant. It is thought that, students with this view will be devoid of important subjects inside lesson, from implementations and benefits which is predicted for them to acquire. Alaca and Yılmaz (2016, p.514) verifies that the view that students do not consider BCSM as a compulsory module is not true as follows: *“Individuals should be willing to use computer technologies to make life easy and they should be skilled at this topic. Besides, lagging behind the developing society will be inevitable.”*

In addition, the view that students attending the classes and following the education program are aware of the benefits and context of the course is dominant. It is an expected consequence for individuals who aim to learn and experience all learnings in reality to be successful.

It has been observed that the majority of students, who consider themselves as competent in computer usage, use the internet effectively and demonstrate success in terms of social media relationships as an example to this. However, information, photograph, document and images cover the majority of the information accessed by students when students' usage of the internet is observed and they are usually found to be passive. Nevertheless, the internet age of the present day is seen as a tool leading individuals to success as long as it includes activeness rather than passiveness. (G:S(29)) shared his/her views by saying *"I consider this module unnecessary because I use the internet and computers well and I have the ability to create programs for some small tasks."*

In the one-to-one interviews conducted with BCSM students, it has been stated that the taken modules have a negative effect on student success and/or learning, useless information to be implemented in real life is imposed on students and the lessons are taught in a didactic way. It is observed that students with these views do not perform activities such as being interested in the lesson, asking questions during the lecturing, taking notes for misunderstood parts and revising them later, doing given practical homework within the scope of the module and visiting lecturers during office hours and asking them questions.

Based on the interviews, it has also been concluded that the students cannot use computers actively. It has been stated that it is not possible for students to have personal computer due to various reasons and therefore cannot perform sufficient work and studies before lecture. As a result, it has been learnt that the mentioned students cannot revise the lessons taught during lectures at home. In the light of this information, it is clearly seen that students move away from the learning outcome of being computer literates targeted within the scope of the module. *"We cannot repeat the practices we do at school. In this context, it would be very good to open computer laboratories to us while there are no lectures."* (G:S(9)).

Another result obtained from the interviews is that some students are diligent and willing during lecture hours. It has also been observed that students with these views are aware of the content and significance of the module, they participate in practices at the laboratory, they ask questions and they even prepare for the next lesson by analysing the content of the next practice in advance with the purpose of being one step ahead from other classmates. Students with high motivation, who are not satisfied with this, expressed that they aim to visit lecturers during office hours, ask questions for the misunderstood parts and obtain information regarding the next lecture so that they prepare for the next.

BCSM AND THE INTERNET

It should be noted that the name of the current age and the effects in the foreground are not very important but the main significance is the human factor and what people can do. In short, it should not be forgotten that it is the human beings who experience and develop the new technology. In this context, having all our surroundings covered by technology does not make it a necessity to use these tools in a healthy and effective way. Using tools and technology is directly related with education, information, sustainability and research.

It has been observed in the interviews that students evaluate the content of BCSM same as surfing on the internet. The correctness of the research results are confirmed by Alaca and Yılmaz (2016, p.521) as follows: *"The internet is particularly used for purposes of joining social groups, creating profiles on the social media, sending messages or sharing photographs etc., reading online news, newspaper or magazines and downloading news."* (G:S(12)) also stated that *"It would be better if we were provided with information which we would benefit on the internet instead of BCSM. The future is on the social media websites."*

The social media and internet platforms on which computers and the internet are considered as a whole are encountered as the most effective medium where students consider themselves as masters. The mobile communication tools which are at an indispensable position in our lives is heading the most obvious reasons. Individuals live together with the internet thanks to these tools. The situation creates self-reliance in individuals and awakes the feeling that they know how to use a computer by surfing on the internet and staying live on the social networks.

It has been observed that the students lack the information on the dominance on the operating system and the problems experienced while using the word processor program Microsoft Word in preparing homework, formulas used on Microsoft Excel and performing effective presentations on Microsoft Power Point despite the individuals' high level of internet usage. (G:S(18)) stated the views as follows: *"We do not know how to adapt and use the BCSM to our professional life in the future. I think we should learn things which will be more useful and which we will use more such as social media management."*

The case that certain part of the students cannot understand the significance of the module means that they will not be able to practice the BCSM content in their future professional lives, this also refers to the view that they will not become computer literates to become dominant. Seferoğlu and Şenel (2009) explain this situation as follows: *“Individuals who are not computer literates in the age of information technologies stops being the human of the age and cannot participate in the social life effectively.”*

It has been observed that the information provided for the human life by BCSM creates awareness regarding being computer literates in the future. It is considered as inevitable fact that, this awareness will have a positive feedback for people and this will carry them to higher positions in their profession lives in the universal content.

BCSM EDUCATION FROM LECTURERS' POINT OF VIEW

One of the results obtained from the interviews conducted with the lecturers is that BCSM is considered as one of the ordinary courses due to the insufficient feedback obtained from the students during the lecturing despite the importance given to the BCSM in terms of teaching.

The lecturers with this view agree on the view that the motivation decreases during lectures. However, the dominant view is that lecturers, who consider negative feedbacks in the classroom and who can provide motivation to students without compromising from the quality of education, have important roles on the students' success. Turan and Çolakoğlu (2008) describe this situation as follows: *“The lecturers' usage of information technologies are directly affected by their decisions, experiences, approaches and attitudes.”* In this sense, the fact that expanding the lectures from the classroom only seen as modules, which means research in the real life and education and trainings in the academic world or professional business life, would make great benefits and differences for students should be conveyed well by the lecturers. The business world and/or academic life necessities and even compulsory requirements of individuals who have not completed the age of development yet, should be explained adequately by lecturers.

In one-to-one interviews conducted with lecturers, a lecturer stated one of the main factors considered to have negative effects on the lecturer's success and/or teaching in the classroom is the inadequacy of computers in the laboratories during the lectures but made no attempts in order to provide better conditions. (G:L(3)), a lecturer of the module, shared his/her views as follows: *“It is important to have updated computers, hardware and software in the laboratories where the lectures are held. There should be no expectation for efficient classes if this is not performed.”* In terms of the practices made in line with the lectures in laboratories, some lecturers expressed that they do not use interactive lesson contents in order to attract the students' interest and to motivate them. In terms of another result obtained from the interviews, the view is dominant that students experiencing this situation have difficulties in learning the subjects, lose their motivation in learning after a certain period of time and their lecture participation and level of success are correspondingly affected in a negative way.

This situation existing in the education-teaching cycle (Turan & Çolakoğlu, 2008) will only be provided by following the new technologies and by the cooperation of lecturers both in education and teaching. Achievements made through the cooperation will strengthen communication as well as improving the flexibility and facility in lecture implementations.

PERSONAL DEVELOPMENT PROCESSES OF BCSM LECTURERS

BCSM lecturers should be up-to-date as a necessity for their professions after graduation. One student shared his/her views for development of lecturers as follows: *“I believe that some of our lecturers teaching BCSM should improve themselves in order to become more efficient for us. They should follow the technology and developments closely.”* (G:S(11)). Dinçer (2011) explained the reason why self-development of lecturers is important as follows: *“The computer literacy levels of lecturers at educational institutions should be high for the efficient and active computer usage at these institutions, which is among the most important skills of information societies”*.

It is known by everyone that an individual, who does not develop himself/herself will not be at the position to perform his/her profession in the right way. Having taken into account the significance of BCSM from the technological perspective, it is believed that it is necessary to keep both the correct and reliable information to be provided by lecturers to give the lecture and the curriculum updated.

(G:L(1)) expressed his/her views as follows: *“I think in-service trainings should be conducted every term in order to follow the innovations in the field and this should be repeated on a regular basis”*. Attending conferences, in-service trainings and workshops and actively participating in these environments are considered

as a necessity for lecturers to stay up-to-date. Lecturers should also monitor the literature and should put an effort in order to contribute.

Lecturers should be able to transfer the new developments in technology obtained from in-service trainings to be arranged at their institution and conferences with their colleagues of BCSM. The fact that the contribution of this education to students in terms of being computer literates would also make significant contribution to the higher education institution in having an active role in creating an information society should not be ignored.

BCSM lecturers stated that their academic success have been affected positively through the positive feedback from the students by students and they made an attempt in order to provide more updated information to students with new and effective alternative resources in lectures. The mentioned alternative resources refer to the follow-up of the new developments related with the field and benefitting from online databases, services on the internet which provide e-book services and educational contents. (G:L(3)) referred to the significance of the innovation and content issues as follows: *“Following all the innovations and developments in the field of computer education as well as adapting to the country conditions are highly significant.”*

METHOD

“Observation and interview techniques among qualitative research methods were implemented in the research. It is possible to classify the interview technique as self-configured, semi-structured and non-structured interviews. Questions are determined in advance and data are intended to be collected at semi-structured interviews.” (Karasar, 1998). Semi-structured interview method was implemented in the research.

This method is not as strict as structured interviews and is not as flexible as unstructured interviews, this method is between these two points. Semi-structured interview method was implemented as it provided this flexibility to the researchers. Observation which is one of the most common qualitative research methods was used along with the interview method in this research (Yıldırım & Şimşek, 2006).

One-to-one interviews were conducted at the computer laboratories and in the lecturers' offices with the BCSM lecturers and BCSM students without any time limitation during the semi-structured interview process.

The lecturers' and students' attitudes, views and actions on the way how computer education is, how it should be and change process as well as their possible solution suggestions were focused was focused on lecturers of institution about implementation, how is computer educations of students, how should it be, examination of actions behaviour and thoughts about change process and possible solve suggestions.

In this research, (G:S(x)) refers to the interviewed students and (G:L(y)) refers to the interviewed lecturers.

CONCLUSION AND RECOMMENDATIONS

In case the issue regarding information research, acquisition and sharing are added to the BCSM education programs, it is believed that learning will be more efficient for students, the acquisition of lifelong learning will be enabled and it will be more suitable to present day conditions.

The consolidation of the student-lecturer relationship can be evaluated at the level of foundation and undergraduate students in accessing the right data, evaluating the accessed data and how to use the data for expected results. From this point of view, it is thought that lecturers may play a significant role in encouraging students to internet-based research and computer-aided guidance in accessing the right data.

This research may serve as an example in analysing different ideas of students and lecturers regarding the approaches of students and lecturers while carrying out new research in the field of computer education and it may demonstrate the sample lecturer and student behaviours in improving the motivation in education or regarding negative feedback.

It is believed that integrating the usage of technology and computer at foundation and undergraduate degrees to all modules available in the programs rather than limiting it to certain modules will be beneficial. As a result, it is thought that an important contribution will be made to the student in acquiring creativity and thinking skills while improving them as well as getting away from the memorization system. *“In-class and extracurricular practice opportunities should be provided to students where the information and knowledge obtained during the computer modules can be implemented in real life effectively.”* (Korkmaz & Mahiroğlu, 2009). A student who supports this view made a statement as follows: *“We want this module to have an effect on other module. I think*

it would be inevitable for us to become more fully-equipped people in terms of profession if our other field lecturers implement the content we learn in BCSM to their modules (G:S(2)).

As a result of the conducted interviews and observations, a certain part of the students think that this module is one of the ordinary modules which should be taken and passed. In order for the students to change their points of view towards this module, explaining that the module curriculum is sustainable both in the field of education as well as the real life is sustainable and supporting it with exemplary studies can be seen as an important stage. In this context, it can be considered that having students met with the sample people who are dominant in computer usage in their professions or businesses and who are successful in their field and accessible will help them to improve the student interest in course and motivation.

According to the data obtained from the conducted interviews and observations, it has been determined that some students attended the classes only for the obligation to attend. Willingly participation of students can be provided by practical homework given regularly every week.

It has been found out that lecturers stated that they wanted to receive in-service training in order to develop themselves in the field and to follow the developments and innovations closely. In fact, it is believed that this situation is an appropriate finding and it is a step in improving the efficiency and success of lecturers as well as facilitating the creation of an information society with the updated information and formation.

Based on the data obtained from the conducted interviews and observations, it has been determined that certain lecturers do not think that the computers and programs used in the laboratories are up-to-date. The importance to be given to the personal development of lecturers as well as their participation in congresses, in-service trainings and symposiums should be provided in order for them to closely follow the vocational education and new technological developments. As a result of this, lecturers will be able to determine deficiencies in laboratories on time and will be able to express the situation in the best way through a report which will be prepared by lecturer. In the context of management, institution will be able to take more efficient result by determining how to better canalize the investments in forming the information society by analysing this report.

Other data obtained from the conducted interviews and observations, it can be said that some students do not have personal computers and they cannot revise the practices conducted in laboratories at home and they cannot develop themselves. It can be thought that this problem will be overcome by opening laboratories to students outside the BCSM hours and allowing them to use computer during those hours.

Other obtained data from the conducted interviews and observations with the BCSM lecturers, lecturers teaching the module should be in communication and should be enabled to keep the course curriculum updated and to improve it. It has been thought that students will be able to join to target of information society by becoming more equipped computer literates by expanding the importance to multidisciplinary studies to all branches.

It is believed that designing the necessary transfers and implementations covering both the curriculum and the changing and developing innovations is highly crucial in terms of catching the era. In this way, the inclusion of individuals to formation of information society as information literates and computer literates by adjusting their behaviours towards the lectures and enabling the participation to the practices in the laboratories should not be ignored. Besides, evaluation and determination of individual characteristic and capacities of students receiving education and developing suitable education conditions to feasibility level can be suggested. (G:S(14)) stated that *"Some students have little knowledge about computers. We feel bored as we cannot finish topics early and we cannot progress. I think individuals who know how to use computers and individuals who do not know should be in different groups."* From this truth, it can be suggested that student-centred education system can be adopted and improved rather than a general education system. Alpar, Batdal and Avcı (2007) stated that *"Teachers focus on systematic planning for active usage of education technology and tools, concentrating on plans which include active usage of education tools in the classroom and they guide the designing of the learning process."* On the basis of the above mentioned data, it is believed that the BCSM makes a positive contribution to the academic success of students as well as their motivation and it is recommended to the lecturers to develop the course content. (G:S(2)) expressed his/her views as follows: *"Information sharing should be performed among lecturers teaching BCSM in order to enrich the module content and curriculum by resources and by lecturers."* Determining the needs for the necessities and student-centred education and the education level can be put forth in order to improve the module content.

Auditability of lecturers should be done with the purpose of providing the BCSM at the same level in all faculties of the higher education. However, it can be only suggested in line with suitability with curriculum and with the content of periodic or year academic lesson schedule.

The appeal towards the BCSM will be improved by developing the social media and new media platform programs usually used by the new generation and providing lessons to create new programs in terms of developing and expanding the computer education.

Dinçer (2011) stated the results of his study as follows: “*Having researched the dissatisfaction in the university education, it has been concluded that some students learn the lecture topics in advance and they get bored during the lecture, other students state topics are very difficult, they cannot reach the speed of the lecture and they are not satisfied with the course due to misunderstanding topics.*” Having combined the results from Dinçer’s research and the conducted observations, the subsection of students, who recently start education programs and about to start the first year, to an exemption exam for BCSM is suggested. It is believed that the exemption exam will reduce the number of students in the class and contribute to a more efficient course for other students.

Providing the participation of lecturers to in-service training programs in necessary situations will make an important contribution for improving the quality of education. These trainings will have a meaningful contributions to improving the motivation of lecturers, to improving their awareness for new technologies and at the same time to rendering the information to be conveyed to students up-to-date.

Following the latest developments in the field will contribute to adopting the habit to conduct research and for the self-development of individuals, provide the development of lifelong and learning-oriented habits and have an important contribution at transferring these to students. It is thought that triggering of lifelong learning and habits for social learning will come together with them.

The fact that knowing students are prone to using mobile devices, which are one of the ICT and a part of our lives, does not mean that they do not need BCSM. In other words, the situation that the widespread usage of the social media in circulation does not suppress the need for the BCSM.

ABSTRACT

The purpose of this study is to investigate the opinions of pre-service social sciences teachers on the project they applied- “Our Epic Veterans”. Activities were held by pre-service teachers for 10 weeks in an association related to the veterans in the city center where the university is located. With the aim of the study, the action research method from qualitative research methods was used. The study was conducted on five pre-service teachers in the third class of the Department of Social Studies Education of the Faculty of Education of a state university affiliated to the Republic of Turkey in the fall semester of 2017- 2018 academic year. Selection of teacher candidates was determined according to criterion sampling from purposive sampling methods. The data were gathered through document reviews (posters, reports) and interviews (semi-structured and focus group interview) in the study. The data obtained from the interviews were analyzed by content analysis method. The result of the study revealed that the project was viewed as a problem and this is why it was selected, the primary problem of the veterans was awareness and that it was concentrated on the activities aiming at this problem, that the project had many contributions, in particular awareness, that there were many problems mainly regarding finding activities, that pre-service teachers generally made suggestions for raising awareness, and that they thought that the project was associated with community service practices. Based on these results, it was suggested to carry out activities related to the awareness of the veterans themselves and their problems and to carry out studies related to the relationship of this project and the content and outcomes of Community Service Practices course.

Key Words: Service-learning, Community Service Practices, Social Project, Pre-service Social Studies Teachers, Veterans

INTRODUCTION

Veterans are divided into two as disabled veterans and warrior veterans. Disabled veterans include those who are the members of the Turkish Armed Forces who was injured in the war or in the domestic and international struggles against the terrorist organizations aiming at the survival of the state, by the effect of all kinds of enemy or terrorist weapons used or by the operations and services in the war zone, by the causes and effects of these operations and services and also were determined as a disabled with a report after their treatment. The warrior veteran refers to those from members of the Turkish Armed Forces who actually participated in the war (<http://muharipgaziler.org.tr/gazi-tanimi/>). Studies on veterans revealed that the legal regulations were sufficient but they were inadequate in practice (Kara 2010), they had psychological problems (Murthy ve Lakshminarayana, 2006; Byrne, 2009; Duran ve Ünsal, 2014); in the studies directly on warrior veterans showed that they encountered a number of problems, especially inattention and disrespect (Aydın ve Aykırı, 2013), and most of them did not take any invitation from anywhere and were not considered to be important (Aydın, Aykırı ve Köse, 2013). Our veterans, who are among those who need special protection, should be seen as one of the target groups within the scope of community service practices. To find a solution to these problems of our nationality's honorable friends, a community service practices project aimed at warrior veterans was carried out.

The Purpose of the study

The purpose of this study is to investigate the opinions of pre-service social sciences teachers on the project they applied- “Our Epic Veterans”.

The importance of the study

The result of the study is believed to be significant for the pre-service teachers who will implement a project on our veterans in the community service practices course by shedding lights on the activities carried out, problems faced, and the solutions to these problems. Moreover, no scientific work has been found in the literature on this topic.

The sub-objectives of the study

Within the context of general objectives of the study, the sub-objectives of the study are as follows:
What are the opinions of pre-service teachers on the topic of “Our Epic Veterans” project?

What are the activities carried out by our pre-service teachers in the scope of “Our Epic Veterans” project?
What are the contributions of “Our Epic Veterans” project on pre-service Social Studies teachers?
What are the problems faced by the pre-service teachers during the “Our Epic Veterans” project and their solutions to these problems?
What are the suggestions of pre-service teachers on “Our Epic Veterans” project?
According to our pre-service teachers, is “Our Epic Veterans” project related to Community Service Practices course?

METHODOLOGY

The Design of the study

With the aim of the study, the action research method from qualitative research methods was used. The action research, according to Berg and Lune (2015), is "a research approach in which individuals act as collaborators to solve certain problems with systematic activities". The reason for choosing this method is that the pre-service social studies teachers in this study did regular activities in the form of groups for the solution of certain social problems. Action plans are as follows:

- Subject selection and group competence
- Identifying project name and objectives
- Setting group members and target group meeting times
- Need analysis method and planning activities
- Organizing a conference
- Using social media
- Poster design

The Study Group

The study was conducted on pre-service teachers in the third class of the Department of Social Studies Education of the Faculty of Education of a state university affiliated to the Republic of Turkey in 2017- 2018 academic year. Activities were conducted by pre-service teachers for 10 weeks in an association related to the veterans in the city center where the university is located. A total of five teacher candidates were interviewed about the implementations. Selection of teacher candidates was determined according to criterion sampling from purposive sampling methods. According to Yıldırım and Şimşek (2013), purposive sampling allows for comprehensive study of situations that are thought to have a rich seam of information. In the criterion sample, a kind of purposive sampling, the "voluntary participation in the project" criterion was used. The group regularly went to the clubs on Saturdays every week and conducted activities for 10 weeks, from an average of 3 hours a day. Working with a group of five was deemed appropriate because the size of the sample was a single case considering the focus of the study. In addition, when weekly reports and studies were examined, it was found out that the concepts and processes recurred and that the saturation point was reached with a single group.

The role of the researchers

Researchers were not in the role of participation in the study. They followed the process, conducted the focus group interviews and examined the relevant documents and reports. The first researcher has taught social project and community service practices course for undergraduate and graduate level for about ten years. The second researcher has been closely following the courses of social project and community service practices for nearly four years. Both researchers have certificate of appreciation within the scope of community service practices, and they are working on social projects.

Data Collection Tools

In the study, the data were gathered through document reviews (reports, photographs, posters, magazine articles) and interviews (semi-structured and focus group interview).

Focus group interviews and semi-structured interviews were conducted in the social sciences seminar room. The meeting room consisted of a "u" shaped table and adjustable comfortable chairs. Every week, focus group meetings were held and action plans were set. The semi-structured interview form was created to take the views of each participant separately. In the semi-structured interview, six questions in total, appropriate for conversation and daily language use, were prepared. Depth interviews were attempted to be performed by the six probes arose during the interviews. In the preparation phase of the interview questions, the related literature was reviewed and after the items were firstly prepared, the expert opinion was taken. Pilot implementation was conducted on pre-service teachers who had already carried out a project in the course of collective service practices. The interviews were conducted by researchers.

Weekly photo-reports: Each week, a proven weekly report with the photographs was taken from the group to allow the pre-service teacher to provide evidence for working in the “Epic Veterans” project, and to take the pre-service teacher’s opinion before the impact of the activity vanished. The reports are written to not exceed 500 words. Incidents influenced by, emotions experienced, problems encountered and solutions proposed were asked to be included in the reports.

Magazine articles: Teacher candidates were asked to write a magazine article that will not exceed two pages. The reason for this was the wish for learning the feelings and experiences of the pre-service teachers in different ways as well. The required spelling rules were explained in detail and that the content should include the data about the target audience, incidents influenced by, problems encountered and solutions proposed was specified.

Poster: The pre-service teachers were asked to prepare a poster including the summary of all of their experiences appropriate to the poster format. The reason for this was the wish for learning the feelings and experiences of the pre-service teachers in different ways as well.

Data Analysis

Data obtained from the interviews were analyzed with content analysis method. The purpose of using this method is to reach the concepts and relations that can explain the collected data (Yıldırım and Şimşek, 2013). In the context of this method, the data will be encoded, the themes will be found and the data will be arranged and defined according to the codes and themes.

Credibility, Transferability and Consistency

Long-term interaction was maintained within the scope of credibility in the study, depth-oriented data were attempted to be collected, expert review was used and member checking was taken. In this context, “Our Epic Veterans” project lasted for 10 weeks, and thanks to the reports that came out every week, long-term interaction was ensured. The participants who were in dialogue with researchers for 10 weeks were in comfort and confidence that could contribute to the study. In order to gather depth-oriented data, ten probes were included during the interviews. In the preparation of the focus group interview questions, opinions were received from field expert and Turkish education expert. After the whole study was done, the field expert examined it. After the interviews, the member checking was obtained by showing the final version of the research, and by asking whether there are parts that needed to be corrected or added. The confirmation was obtained by holding a confirmation meeting as a group. The confirmation meeting was photographed with the permission of the participants. This evidence will be kept in the archive for a while.

In the scope of transferability, detailed description was made and purposive sampling method was used. The data gathered from the interviews were described in detail and direct quotations were often included. For purposive sampling, criterion sampling was used. To ensure consistency in the study, it was paid attention to the consistency in conceptualization during the encoding of the data obtained from the interviews. For the confirmation in the study, the coding and the result of the study were examined by the field expert.

Ethical Issues

Participants in the study voluntarily participated in “Our Epic Veterans” project. Their consent was taken to have interviews with them. After the study finished, the results were confirmed by them. Symbolic codes were used in the quotations. The data obtained from the interviews will be kept in the archive for a while.

FINDINGS AND INTERPRETATIONS

Findings related to the first sub-problem

Pre-service teachers’ “reasons for choosing the project” are as follows:

To raise awareness by informing us of that they served for us / that they sacrificed their all / that we owe to them / that they deserve / that they should not be forgotten

To do a similar work in teaching life and therefore to learn the process

Since it is seen as an important issue in terms of a social studies teacher

Since the news about the negative events experienced by veterans were witnessed in the media

Because of being military affinity and having military affection

To understand the veterans better and to meet their material and spiritual needs

Since it was known that similar projects had been conducted in the previous years

To understand the value of the country better

In the reports, the concepts of “martyr” and “veteran” are used together, and it is thought that there are some problems about these subjects. There is also a belief that even though the study group cannot find solutions to the problems that are predicted, even the visits can have positive effects (R1).

Here are some statements by the pre-service teachers supporting these judgments included in the reports: S5 *'we chose this project as we wanted these values to be remembered'*. S1 *'I want to create interaction and dialogue with the children of veterans martyrs' families. That's way I am in this project'*. S3 *'when I looked at the news about our veterans, I usually watched the news about that they had been forgotten. They really are! I participated in this project to show that our veterans have not been ...forgotten'*. S4 *'I chose this project not only because my close relatives are soldiers but also because I love soldiers.'* R *'they are the reason for our existence'*. R *'this subject should not be considered as a course but can be defined as showing our gratitude as a citizen of this country'*.

Findings related to the second sub-problem

"Activities implemented" by the pre-service teachers within the scope of the project are:

Greeting and needs analysis

- Making an interview
- Preparation of magazine articles
- Pre-conference preparations
- Organizing a conference
- Creating awareness on social media
- Poster for awareness
- Opinions about activities and farewell

It was seen that the targeted activities were carried out except for the conference which was meant to be held in a secondary school due to the fact that it was thought that the bureaucratic obstacles would be difficult and there was not enough time.

Here are some statements included in the reports supporting these judgments: R. *'One of the biggest problems of our veterans is that those people who does not know the meaning of the word "warrior veterans" ask them –if they are really veterans- as they do not have any scars of wound and bruise in their body. And we can say that this deeply hurts them'*. R *'In our society where homeland comes first, we should say that they think this conscious should be earned"*.

Findings related to the third sub-problem

The contributions of the project to the pre-service teachers are as follows:

Contributions estimated before the activities:

To gain a project experience related to veteran subject

Having information on the problems of the veterans

Contributing to sensitivity value

After the activities:

They reached the predicted contributions. Except for these:

Being aware of the veterans and understanding their values

Witnessing the negative psychological consequences of the war in person

Having oral history experience and excitement

Contribution to patriotic value

Understanding the value of soldiers

Some of the statements of the pre-service teachers supporting these judgments and included in the reports are as follows: R. *'we witnessed in the interviews the information and life stories that we did not know, which were not written in books, which could not be found on the Net by searching. In this regard, we can say that it is a very useful study for us as a group to develop ourselves.'* R. *'in the conversations we had with veterans, we understood better what loving the homeland means or, to be more precise, what loving the homeland unrequitedly means.'* S3. *»yes, we realized that our veterans are lonely and uninterested, and that we, student, do not know the value/concept of veterans.*

Findings related to the fourth sub-problem

According to pre-service teachers "problems encountered in the project and the solutions for these problems" are as follows:

The only problem predicted before the activities was being unable to make the prepared awareness video reach large masses. The proposed solutions include "using effective YouTube channels, posting to morning news, using the local newspapers and channels»

When we look at the action plans, the first problem: to decide on a common time for the meeting event. Because of the workload of the pre-service teachers, and the overlap of their lessons due to retaking failed courses/taking courses from the upper classes, and the veterans' showing up between 12.00 - 16.00 on weekdays in the afternoon at the association, setting time was a problem. This problem was solved owing to the fact that the pre-service teachers do not have any lessons at 11.00 on Fridays, the necessary sacrifices were made, and the association's representatives found this time appropriate and agreed to come early that day.

Second problem: the first meeting excitement and the fear of how the attitudes would be. This problem was resolved with the agreement on communicating with the group that made the project last year and initiating conversation only to establish a friendly environment without any analysis in the first meeting. After they met, they would realize that the responsibilities of the associations are very understanding, very sincere and ready for any kind of help.

After the meeting, the problem was having interviews and asking questions for needs analysis. This problem was solved by taking the opinions of field experts and preparing a semi-structured questionnaire. After the needs analysis, it was found out that they needed moral support rather than financial support and wanted to raise awareness.

Another problem was determining activities for awareness and ordering them. Opinions were exchanged on this, and similar samples on the internet and in the previous years were examined. As a result, activities were chosen and they were ordered logically.

Another problem was the issue of having interviews to write memories down and finding media to share that. Interview questions were reviewed by the field expert and videotaped. Although it took a long time to decipher memories from the videos, the interview was decoded, and it was decided to publish the interviews in the magazine which is published annually, belongs to the departments, and consists of articles by pre-service teachers.

Another problem was arranging the hall and the time for the conference. As the primary aim was to increase the awareness of pre-service teachers, the conference room of Faculty of Education was selected. It was thought that it would be difficult to determine the length of time that the veterans were available, but there was no problem as the plan was made 20 days earlier. The bureaucratic process was sorted out through the Social Studies Community, one of the university student clubs.

Another problem was preparing the content of the conference. General conference texts were examined, and it was decided to allot certain time for each veteran to give more time for their speeches by keeping the introduction short.

The other problem was getting a plaque or poster prepared. The first of these two problems here was that as our veterans were generally old and had health problems, it was not clear who would attend. For that reason, the plaque was made for the association, not for the individual. The plaque budget was met by the Social Studies Community budget. Only the name of the person who would attend the conference for sure was written on the posters. As they carry a community emblem, the posters were signed easily and hung on the faculty panels.

Another problem was about the issue of how our veterans would get to the university. Group members received helped from a family friend thanks to close relations.

Another problem was welcoming our veterans before and after the conference. The supervisor's room and the meeting room were used for this. Various refreshments were bought on the Social Sciences Community budget.

Another problem was increasing the number of followers of the social media account of the association. For this problem, everybody sent a request through their own account, and the number of followers was increased.

Another problem was sharing the lengthy interview video on social media by shortening.

The final problem was the preparation of posters. Thanks to field experts, a suitable poster was prepared.

Apart from these, the point emphasized was that these were only minor troubles, not very big problems.

Some statements of the pre-service teachers supporting these judgments are as follows: S4. *"While starting the project, we experienced some troubles due to the overlapping time when setting up the interviews with our veterans. While organizing the conferences, we had some problems with the vehicles that would bring our veterans to the university. S5. "Frankly, I could not say that we faced so many problems, we usually run into minor problems. We solved them as a group. "*

Findings related to the fifth sub-problem

According to pre-service teachers, "suggestions for the project" are as follows:

- Giving lectures at secondary and high schools
- Participating in the project voluntarily rather than compulsorily and first embracing it
- Good selection of group members and having good communication with them
- Knowing that the attitudes of the veterans are positive and that they are willing to take part in similar projects
- Establishing sincere relationships rather than formal ones with the veterans
- Being in constant contact with the veterans during the project
- Effective use of social media. Preparing appropriate videos for this environment and allocating specific time in these projects for the videos

Some expressions of pre-service teachers supporting these judgments are as follows: *S5 "first of all, different from what we did, veterans can be hosted not only to the university environment but also at secondary schools and high schools with permission from the authorities, and by that future generations can become conscious about the concept of veterans and veteran title "*.

Findings related to the sixth sub-problem

All teachers stressed that the projects about veterans are related to Community Service Practices course. According to the pre-service teachers, the relationship between the project and Community Service Practices course is as follows: Relating those who do important work on behalf of «society», important members / heroines of the «community» to the other individuals of the «society», and raising awareness, listening to their problems and getting to know them closely, and thus showing our gratitude as a country.

Our pre-service teachers want the projects about veterans to be continued within the Community Service Practices course. They believe that they will reach the outcomes of the course with this project. In this context, they stated that society should know what being a veteran means by listening to the primary source, when it is not possible to do so, at least some studies should be carried out to raise awareness, and these studies should be enriched with additional activities, and this project contribute to the benefit of society and individual awareness.

Some statements of the pre-service teachers supporting these judgments are as follows: *S5 "the project should be absolutely done, believe me we as a group misknow even the concept of veterans. So what I mean is that making our society listening to the veterans from the first person at least can make our society sensitive about this issue. As I mentioned above, I think it is appropriate for the course content and outcomes."*

CONCLUSION AND DISCUSSION

This project was chosen because it was really seen as a problem and responsibility. Given that the main problem of social aid is the inability to reach the people in actual needs (Yıldırım, 2010), the study group seems to have taken this fundamental problem into account. At the end of the project, pre-service teachers indicated that they find the project related to the contents and outcomes of community service practices course and they want the project to continue in the scope of the Community Service Practices course.

It was realized that the main problem of the veterans is awareness so the activities were generally planned for this problem. This judgment coincides with the results of some studies (Aydın, Aykırı ve Köse, 2013). In addition, awareness is mostly mentioned in the studies on veterans, which also supports this judgment.

It is seen that more contributions were gained with the veterans project than the expected. It is parallel to the findings of other studies (Çetin ve Sonmez, 2009; Tanrıseven, Öredi, and Yanpar Yelken 2010; Yılmaz, 2011), where community service practices are beneficial to pre-service teachers.

It is seen that they met certain problems in each activity and solve these problems. Facing various problems in collective service practices is also seen in the findings of other studies (Gürol ve Özercan, 2010; Tanrıseven et al., 2010).

SUGGESTIONS

- It is suggested that the activities to be carried out in the projects aimed at veterans should be done by taking into account the sample activities, the problems and solutions in this study.
- It appears that the project has significant contributions. It is recommended that pre-service teachers should participate in similar projects, at least even once.
- Pre-service teachers stated that the project contributed to the values of sensitivity and patriotism. It is suggested that studies on the contribution of this project to the values of sensitivity and patriotism be carried out.
- It is suggested to carry out studies on the relationship between the community service practices on veterans and the content and outcomes of Community Service Practices course.
- This study was conducted on undergraduate pre-service teachers. It is recommended that similar studies should also be carried out with other levels of education.

ABSTRACT

During the stay in Korea, besides language programs, there is a necessity of various practical, cultural and educational programs for international students to adapt to the specific characteristics of Korean culture and particular society, known as University. In particular, the purpose of this study is to make it possible for international students enrolled in graduate schools to pursue more specialized study and become experts in their respective fields. In this study, we examined the problems experienced by international students and adaptation strategy for them as well.

In this study, 113 international students, studying in graduate school at INHA University, were surveyed and analyzed for a total of two times. The first survey was conducted among 70 people from 16 countries (with beginner Korean language proficiency of 27 students, 20 intermediate, and 23 Korean advanced level students) from 5th of March to 5th of April, in 2012. The second survey was conducted among 43 people from 15 countries (18 beginners, 12 intermediate and 13 advanced proficiency levels) from 5th of March to 5th of April, in 2017. There was a 5-year difference between the primary and secondary investigations, but similar results were obtained.

The results of the main survey are as follows. First, the highest indicator among the factors of feeling sad after coming to study abroad was given as 'loneliness.' The latter played a significant role as international students left their home and pursued their studies in another country with different culture. Therefore, it is necessary to have a meeting, a school organization or a counselor to share their loneliness and to be advised. The next highest stress is related to academic work. International students study in a non-native language. Moreover, there is a lot of stress in submitting research results. There is a necessity for an institutional organization that can solve this problem.

Second, while analyzing the question of 'Listing difficulties in coming to study abroad,' it was found out that the most problematic point was 'language.' Especially in the beginner's classes, they felt the great difficulty of Korean language. If the Korean language ability is weak, it will lead to the burden of stress and academic work, so a solution strategy for language proficiency is needed. The next difficulty was economic and cultural differences. The financial aspects such as tuition fee or living expenses should be considered. Otherwise, the difficulty of studying can be great. Also, the biggest problem in cultural differences is food; especially international students from Islamic cultures have had difficulties because they do not eat food containing pork.

As a result of the comprehensive analysis of the research problems, international students were experiencing the difficulties in language as well as in coming into contact with other cultures while studying abroad. Especially, it was not only difficult to adapt to other cultures, but also it was challenging to adapt to a new education process and teaching methods. For solving problem, in this study, we propose language adaptation strategies, diverse cultural event strategy, sisterhood tactics, and economic problem-solving strategies based on organization and support of international student self-governing organization through practical experience and experiment as a teacher. This study is expected to help international students to succeed in their studies.

Keywords: Korean language and culture, international student, university culture, adaptation strategy, language adaptation strategy, culture event strategy

I. INTRODUCTION

During the stay in Korea, besides language programs, there is a necessity of various practical, cultural and educational programs for international students to adapt to the specific characteristics of Korean culture and particular society, known as University. In particular, the purpose of this study is to make it possible for international students enrolled in graduate schools to pursue more specialized study and become experts in their respective fields. In this study, we examined the problems experienced by international students and adaptation strategy for them as well.

In this study, 113 international students, studying in graduate school at INHA University, were surveyed and

analyzed for a total of two times to find out what problems and difficulties they experienced while living in Korea. Based on these analyses, we will describe the strategy and practice of language and culture adaptation for international students.

II. STATUS OF INTERNATIONAL STUDENTS' STAY AND ADAPTATION

1. Current Status of International Students

In the 21st century, the number of international students studying in Korea increased from 12,314 in 2003 to 104,262 as of February 2016, as Korea's economic development and K-pop popped up. Moreover, the number of international students according to their nationality is mainly Asian students such as China, Vietnam, Mongolia, Japan and Taiwan. European students such as North America, France, and Germany are the next place.

<Table 1> Current Status of International Students

Year	2010	2011	2012	2013	2014	2015	2016
Total	87,480	88,468	84,711	81,847	86,410	92,076	104,262
Degree course	69,600	68,039	64,030	60,466	61,257	69,061	63,104
Language training	17,880	20,429	20,681	21,381	25,138	23,001	41,158

Total	104,262	63,104	41,158

2. University Adaptation of International Students

When international students come to Korea, problems arise in coming into contact with other cultures of Korean culture and adapting to university society. Therefore, first of all, adaptation to other cultures is necessary. In this regard, the four stages of emotional reaction experienced by Oberg (1960) in touching other cultures summarized as follows.

- (1) Step 1 (Expectation and Passion): Expectation, ecstasy, admiration, enthusiasm to encounter a new culture
- (2) Step 2 (Culture Shock stage): Feeling anxiety, frustration, anger, etc. due to differences and maladjustment coming from new cultural contacts
- (3) Step 3 (Recovery Phase): Steps to solve the problems of cultural differences and learn a new culture
- (4) Stage 4 (Adaptation, assimilation stage): Accepting new culture and enjoying new culture by assimilation and adaptation

Bennett (1993) also argues that the process of acceptance of multiculturalism is, at first, self-culture centered, with boundaries and antipathy toward other cultures, but gradually progresses through adaptation and assimilation to an opponent's culture.¹ Ensari & Miller (2002) found that they could be more intimate through discovering commonalities in the process of contact between groups of different cultures. It may lead to a decrease in prejudice and change in attitudes toward other cultures through various group communication and interaction. Therefore, it is necessary for students who have studied abroad to reduce cultural differences and broaden their understanding through Korean cultural visits.

International students should adapt to another culture of living. They have to adjust to the new college life and adapt to the new curriculum and teaching methods. Baker & Siryk (1984) presented four types of adaptation factors for international students' college life.²

- (1) Academic adaptation: academic needs of the university, cognitive learning ability.
- (2) Social Adaptation: The degree of social adaptation of the university, capacity to manage new social relations, and the smooth communication with professors and students
- (3) Personal and emotional adjustment: self-value and personality formation, the role of the nature and position of self-existence, self-discovery process
- (4) General adaptation: commitment to college, satisfaction with college and commitment to academic goals

In the end, international students should pursue a hard academic life by adapting to the university, the educational needs of the curriculum required by the university, the adaptation and satisfaction of other cultures and college life, and their commitment to individual studies. Therefore, we examined the current status and actual status of international students at INHA University and explored the adaptation strategies of Korean language and culture.

III. ANALYSIS OF THE CURRENT STATUS OF INTERNATIONAL STUDENTS AT INHA UNIVERSITY

1. Survey Period and Subject

It is necessary to investigate the main actual status of international students to present policy on adaptation of language culture of international students staying in Korea. Based on the res

¹ All six steps move from "denial → defense → minimization → acceptance → adaption → integration".

² See Yoon Kyung Kyung (2014: 259-260).

ults of the questionnaire and analysis of the students studying at INHA University, we presented the strategies and practice for the adaptation of Korean language and culture.³

- (1) Survey period: March 5, 2012 - April 5, 2012 (primary)
March 5, 2017 - April 5, 2017 (Secondary)
- (2) Survey Method: Questionnaire survey
- (3) Subjects: 1st Graduate School of INHA University <Korean Language for Foreigners> 70 students (16 countries)
Korean Beginner 27, Intermediate 20, Advanced 23
2nd Graduate School of INHA University <Korean Language for Foreigners> 40 students (15 countries)
Korean Beginner 18, Intermediate 12, Advanced 10.

2. Current Status and Life Analysis of International Students at INHA University

1) Current Status of International Students at INHA University

Currently (as of December 2016), there are 664 international undergraduate and 368 graduate students are studying at INHA University. <Table 3> shows the number of international undergraduate and graduate students by nationality for the last four years.

<Table 3> Nationality and Number of International Students at INHA University

Year	2013		2014		2015		2016	
Nationality	Undergraduate	Graduate	Undergraduate	Graduate	Undergraduate	Graduate	Undergraduate	Graduate
Chinese (Han Chinese)	347	148	309	170	297	172	403	161
Chinese (Korean)	34	43	16	40	13	44	8	31

Total	616	323	559	354	589	382	664	368

In 2016, 603 Chinese students (411 undergraduate, 192 graduate), 70 Malaysian students (68 undergraduate, 2 graduate), 42 Mongolia (25 undergraduate, 17 graduate), 38 Vietnam students (3 undergraduate, 35 graduate), 15 Indonesian students (5 undergraduate, 10 graduate), 17 Pakistani students (0 undergraduate, 17 graduate), 12 Bangladesh students (1 undergraduate, 11 graduate), 10 Indian students (0 undergraduate, 10 graduate), 9 Japanese students (6 undergraduate, 3 graduate), 15 Cambodian students (9 undergraduate, 6 graduate), 41 Uzbekistan (29 undergraduate, 12 graduate), 5 Kyrgyzstan students (2 undergraduate, 3 graduate), 29 France students (22 undergraduate, 7 graduate), 6 Germany students (4 undergraduate, 2 graduate), 10 American students (5 undergraduate, 5 graduate), 4 Canadian students (3 undergraduate, 1 graduate). There are many students from Southeast Asia, and 1,032 students (664 undergraduate, 368 graduate) from 55 countries including Europe, USA, and Central Asia.⁴

2) Survey and Analysis of International Students at INHA University

The questionnaire survey of 113(70/43) graduate students among international students at INHA University divided into basic research (nationality, degree course), best and sad things, and understanding of studying abroad.

1. Basic Survey (nationality, degree course)

(1) Nationality

Nationality	Beginner		Intermediate		Advanced		Total	
	1 st	2 nd	1 st	2 nd	1 st	2 nd	1 st	2 nd
China	11	5	8	5	17	6	36	16
Bangladesh	2	4	2	1			4	5
Pakistan	2	2	2	1			4	3
Vietnam	2	1	1	1	1	1	4	3
Uzbekistan	2				1	4	3	4
India			3				3	
Cambodia	1		2				3	
France	2		1				3	
Kyrgyzstan					2		2	
Sweden	2						2	
Philippines	1						1	
Mongolia	1					1	1	1
Indonesia			1				1	
Kazakhstan					1		1	
Sri Lanka					1		1	
Australia	1						1	
Nepal				1				3

⁴ In the past four years, the number of international students studying at INHA University is 92 countries, with 3,855 students (2,428 undergraduates and 1,427 graduate students).

Germany		1						1
Turkey		1						1
Egypt		1						1
Azerbaijan						1		1
Ghana				1				1
Gabon				1				1
Finland				1				1
Kenya		1						1
Total	27	18	20	12	23	13	70	43

We conducted the questionnaire among students with beginner Korean language proficiency of 45 students (27/18), 32 intermediate (20/12) and 36 Korean advanced level students (23/13). There are 52 Chinese (36/16), 9 Bangladesh (4/5), 7 Pakistani (4/3), 7 Vietnam (4/3), 3 France, 3 Indian, 3 Cambodian and 3 Nepal (70/43). International students who come to the school every semester are required to take the entrance Korean exam at the same time as the entrance. If the score is greater than 80, it means that the student passed the Korean exam. The Korean classes of intermediate and beginner levels are required for scores in the interval of 40~79 and less than 40 accordingly. Applicants who have completed Level 3 or above of the TOPIK will be exempted from this examination. Students who want to take advanced Korean classes can apply for enrollment regardless of their pass or fail status. Most of the advanced students take TOPIK. The following process of catching up with the corresponding level in Korean language along with taking major classes can be considered as vital both in college and social lives of international students.

(2) Degree courses

Degree courses	Beginner		Intermediate		Advanced		Total	
	1 st	2 nd	1 st	2 nd	1 st	2 nd	1 st	2 nd
Master	22	6	11	6	18	10	51	22
Master and Ph.D. Integration	1		9		2		12	
Doctor	4	12		6	3	3	7	21
Total	27	18	20	12	23	13	70	43

There are 28 (22 / 6) students of masters' degree, one student of master and Ph.D. integration degree, and 16 (4 / 12) Ph.D. students in the beginner's class. Intermediate classes consist of 17 (11 / 6) students of masters' degree, 9 students of master and Ph.D. integration degree, and 6 Ph.D. students. In the advanced level, there are 28 (18 / 10) students of masters' degree, two students of master and Ph.D. integration degree, and 6 (3 / 3) Ph.D. students. Most of the reasons for the doctoral course in the beginner's class are students who graduated from the Graduate School of Engineering or Computer Information Graduate School and who have entered the school without studying Korean because they will write their theses in English. They are taught their major classes in English, but if basic communication will not be in Korean, they can have difficulties in their relationship with their professors or department students since they don't learn Korean.

2. The best thing or the saddest thing

(1) The best or glad thing

The best or glad thing	Beginner		Intermediate		Advanced		Total	
	1 st	2 nd	1 st	2 nd	1 st	2 nd	1 st	2 nd

Come to study at INHA University in Korea	10	7	3	3	6	4	19	14
Friendship with Korean friends	6	1	4		3	2	13	3
Korean culture tour	3	2	5	2	2	2	10	6
Eating Korean food	2				2	1	4	1
Good results	2	4	2	1	2	1	6	6
Learning the Korean language	2	1	2	1	2		6	2
Family visit or call			1	1	2	2	3	3
Good relationship with Professor		1	1	1	1		2	2
Receive gifts				2	1		1	2
Attend party invitation or concert		1		1	1		1	2
Eating home countries' food with friends				1	1	1	1	2
Others		1						1
Total	25	18	18	12	23	13	70	43

Participants argued that best and glad thing was come to study at INHA University in Korea. INHA University is ranked 10 to 12 out of all universities in Korea by the 4-year university evaluation. One of the reasons why international students prefer the INHA University graduate school is that they can receive a full scholarship until graduation. Currently, 90% of Ph.D. students are studying with the full scholarship, and most of the master's program students receive about 70% of the tuition fee. Also, to visiting the INHA University, they also interacted with their Korean friends and helped them explore Korean culture. Especially, beginner class was in INHA University, followed by friendship with Korean friends, and research results. In the middle class, there were Korean cultural tour and INHA University. The advanced course was followed by studying at INHA University, friendship with Korean friends, and visiting Korean culture. When international students came to Korea and studied at university and social life with difficulties, they often solved it with the help of a Korean friend or a helper. Moreover, international students interested in Korean culture, so they were interested in Korean cultural sites such as historical sites and tourist sites.

(1) Sad or hurting thing

Sad or hurting thing	Beginner		Intermediate		Advanced		Total	
	1 st	2 nd	1 st	2 nd	1 st	2 nd	1 st	2 nd
Loneliness	6	4	7	3	9	5	22	12
When something difficult happened	3	2	1	1	3	3	7	6
Difficulties such as study (language), research (experiment)	5	6	7	3	5		17	9
Ignored	3		1		3	1	7	1
Food is not right	2	1			1		3	1
When have a sick	2			3	2	1	4	4
When a family in their homeland is sick	1	1		1			1	2
When there is no money	1	2	2				3	2
Cultural difference	2	2		1			2	3
When misunderstood as communication difficulty						3		3
Total	25	18	18	12	23	13	70	43

The saddest or hurting thing to come to study abroad is loneliness (perfunctory). When students leave their homeland and come to strange land to study, their biggest difficulty was lonely. Therefore, it is necessary to have an organization or a counselor to meet and act for their loneliness. Next, challenges such as study (language), research (experiment), etc. were arising.⁵ In another case, there will be a difficulty in learning because the language problem is accompanied and the research result is good. Moreover, when they were sick or ignored, they feel loneliness a lot. In the beginner's class, the loneliness, difficulties such as study (language) and research (experiment) were the biggest problems. After the loneliness, the challenges such as study (language) and research (experiment) were the most significant problems in the intermediate class. In the advanced class, loneliness and challenging things happened when they are sick, etc.

3. Understanding of studying abroad

(1) Difficulties in studying abroad

Rating		1 st place	2 nd place	3 rd place	4 th place	5 th place	6 th place
Beginner	1 st	language	loneliness	food cultural difference	finance	study	
	2 nd	language	food loneliness	finance	cultural difference	study	
Intermediate	1 st	language	study	finance	loneliness	cultural difference	food
	2 nd	language	study	cultural difference	finance loneliness	food	
Advanced	1 st	study	language	finance	loneliness	cultural difference	food
	2 nd	study	language	finance	loneliness	cultural difference	food

The most difficult thing of international students' study life was the language in the beginner and intermediate classes. To live in Korea, it needs to speak Korean well. In another case, it will be a lot of stress. In the beginner class, loneliness, food, and cultural difference were the next place after language. Study and finance were in the next place in the intermediate classes. Moreover, the study was the biggest problem in the advanced classes. It seems that there is a burden related to the dissertation and the research results. There were many responses to the food, which appears to be due to Muslim culture students (mainly Bangladesh, Pakistan, Uzbekistan, India, Indonesia, Egypt, etc.) and vegetarian students who do not eat pork.

(2) How do you overcome the difficulties?

Rating		Overcoming difficulties
Beginner	1 st	friendship and help with Korean friends (7), study hard (5), overcome oneself (5), adapt to Korean culture (2), exercise (1)
	2 nd	overcome with positively and patiently (6), friendship with Korean friends (5), study hard or research (4), professor's help (3)
Intermediate	1 st	friendship and help with Korean friends (9), study hard (5), overcome oneself (1), exercise (1)
	2 nd	positive and patience (3), study hard or research (3), exercise and hobby, music (2), professor's help (2)

⁵ Students who answered that they were neglected while studying abroad came from students from countries with lower GDP than Korea.

Advanced	1 st	friendship and help with Korean friends (7), overcome oneself(2), study hard(6), tolerance(1), adaptation to Korean culture (1)
	2 nd	positive and patience (5), hard study or research (3), adaptation to Korean culture (2), friends or family (2), professor's help (2)

As a result of the questionnaire survey on how they to overcome difficulties, it was found that the students were helped through friendship with their Korean friends. The students were found to be in the beginner, intermediate, and advanced classes. The reason why the international students overcome themselves is that they cannot solve the problem even if they talk to their friends who are studying abroad. Therefore, if the organizations and personnel who can discuss the anxieties and difficulties of international students are satisfied, they will be able to listen to and solve their severe problems.

(3) What do you want to say to those who are going to study abroad?

Rating		What do you want to say to those who are going to study abroad?
Beginner	1 st	Korean hard work (14), recommendation for studying in Korea (4), Korean food (1)
	2 nd	recommendation for studying in Korea (13), Korean hard work (3), adaptation to Korean culture and life (5)
Intermediate	1 st	Korean hard work (14), adaptation to Korean culture and life (2)
	2 nd	Korean hard work (5), adaptation to Korean culture and life (6), compromise and determination (2)
Advanced	1 st	set goals and commit (5), adaptation to Korean culture and life (9), Korean study (8), recognition of the importance of human relationship (1)
	2 nd	Korean hard work(5), Korean culture and life adaptation (4), good affection and enthusiasm for everything (4) good planning for studying abroad (2)

The participants argued that they would like to say to those who are coming to come to study abroad in the future is to study Korean hard. It is consistent with the fact that the most severe problem with studying abroad is 'language.' Next, they answered that they are well adapted to Korean culture and life. If somebody wants to come to Korea, he/she needs to understand Korean culture and adapt well. Also, they were encouraged to study in Korea because they learned Korean education system and much kindness of Korean people.

IV. ADAPTATION STRATEGIES AND PRACTICES OF LANGUAGE AND CULTURE FOR INTERNATIONAL STUDENTS⁶

In the 21st century, the number of foreign workers has increased, and the number of immigrant women has also increased. In this situation, the number of international students has begun to increase at the University, and a strategy of adaptation of language and culture has become necessary. In order to adapt to college culture based on the questionnaire analysis of international students at INHA University, students should adapt to the new culture which is called Korean culture and education system according to the specificity of society which is called the University. For this purpose, we would like to suggest the organization of international student self-governing organization, language adaptation strategy, event strategy, sisterhood relationship strategy, and financial problem-solving strategy.

1. Organization and Practice of International Student Self-governing Organizations

⁶ The language and culture adaptation strategy and practice of international students have been carried out before the first survey in 2012, but they are based on the results of the study analysis.

(1) Organization for International Students

Adaptation to international students more systematic and efficient, it is necessary to establish an autonomous institution for international students. It is necessary to form a consensus by organizing national representatives for each country and holding regular meetings. INHA University organized the INHA Overseas Students Society in May 2003.

(2) Organization for International Student Support

It is necessary to organize the International Students' Association and to have an event that can maintain consensus. For that, of course, finances are needed. Also, to the welfare system for international students supported by the school, a sponsoring organization supported by a faculty or a private organization is needed. In case of INHA University, we organized a support program for foreign students in March 2005 to support various events.

(3) Acquisition and consultation of international student self-government office

Space is needed to activate the sense of belonging and meeting of international students. It is necessary for international students' staff meeting, each country meeting, national representative meeting. In addition, there is a need for environment and environment to consult about severe problems of international students. It's nice to arrange a Korean counselor who will be able to consult international students by recruiting linguistically qualified counselors.

2. Adaptation Strategies and Practices for International Students

(1) Opening Korean language courses for foreigners

One of the most challenging aspects of international students is language problems. Particularly, since graduate students are mostly in laboratories, they are more necessary because they lack the opportunity to learn Korean. So it must be reasonable for anyone to come to Korea to study Korean and Korean culture. I met with the president of the graduate school and the working group and talked about the necessity of Korean and opened the Korean language class. Since most of the graduate schools are taught in English and the thesis is also allowed to be written in English, many students do not have to learn the Korean. However, they decided to establish a Korean language class for foreigners and set up operating rules for effective learning. I made graduate school regulations (bylaws). This lecture teaches basic Korean to international students of graduate schools. If they take the Korean Language Proficiency Test regardless of their major, they will give lectures to beginners and intermediate students according to their grades. In the classroom, students will utilize both textbooks and online (this class), and each student will be instructed to review their study online. The advanced courses are selected by the students voluntarily, and they give lectures on the essentials such as report writing, presentation class, media language class, and discussion class.

(2) Weekend Korean language classes

For the students who are not enough with the Korean language course of the graduate school, the <Weekly Korean Language Class> will be operated from May 2012 and divided into beginner, intermediate, and advanced classes from 3 pm to 3:30 pm every Sunday. And it is organized to conduct Korean language education using the hall and seminar room.

3. International Student Cultural Events Strategy and Practice

Since international students come to Korea and have difficulties such as cultural differences and loneliness, it is necessary to have a strategy to encourage each other through cultural exchanges and fellowship. It is a good idea to have a place to communicate with international students through the welcome party for first-year students, picnic for international students, Korean cultural tour, physical education, cultural festivals, love festivals and Christmas celebrations. There is a public way to organize national events, but it will be efficient to hold them by the school.⁷

(1) Welcoming freshmen

The seminar provides variously information such as an introduction of the university with welcoming first-year students for new students who came to INHA University in March and September. It is a time to bring a lot of information and warmth to students who do not know what to do and how to come to Korea.

(2) International student family outings

In May of each year, we will go to family picnic centered on a couple of students studying at INHA University by

⁷ For reference, Vietnamese international students hold the National Vietnamese International Student Athletic Conference in July every year, and about 600 people gather for cultural events in October.

Incheon Grand Park and Songdo Amusement Park. Meals, refreshments and entertainment programs are conducted in nature.

(3) Local culture tour

Every July, we are going to visit local culture for 1 night and 2 days. By visiting Korea's traditional cultural areas, we will have more practical and concrete cultural experiences. I have been attending Daewallyeong, Chiak Mountain, Seorak Mountain, Gangneung, Taeon, Ganghwa, Buyeo, Gongju, and Gyeongju for about 40-50 students each time.

(4) Athletic Competition

Every October, we hold an athletic meet for all international students. Every year about 250 people participate in various events such as soccer, basketball, dodge ball, tug of war, cricket, relay, etc. Through the athletic events, international students are able to eliminate stress and form a common consensus by leaping at the playground.

(5) Culture Festival

Cultural festivals are held every November. It is a place for celebrations to introduce the cultures of various countries, and it has received many students' response as an opportunity to exchange diverse cultures. Each of them aims to promote traditional culture of their own countries, such as singing, dancing, and classic play, by wearing traditional costumes of their own countries.

(6) Chuseok holiday performances

At Chuseok holidays, there will be many students who think of their homeland and feel lonely and nostalgic. Moreover, students in the dormitories are not provided with meals, so there are various inconveniences. We will have a great time sharing traditional Korean food such as Korean traditional play and Songpyeon and sharing delicious Korean food.

(7) Christmas and Year-end party

Christmas and year-end party celebrations are held every year in the week of December. Carols songs, magic shows, dances, and so on.

(8) Outdoor Meeting

We have outdoor meetings in May and October every year. In May, we take a broad range of places including Songdo Amusement Park and Incheon Grand Park. After worship, we freely relax in the open space in recreation, meals, rides, bicycle rides, treasure hunting and so on. Moreover, in October, when the leaves are around, they have time to heal in nature through the surrounding mountains, such as Wolmi Mountain.

(9) Sisterhood Relationship

It is necessary to solve the difficulties of language and cultural difference by linking with Korean university assistants. Since 2012, the Korean Language Assistance System has been regularly used by the School Language Education Center for first-year students. Also, it will be able to understand the real Korean culture such as home visits in connection with a Korean family. It is not a one-time event, but it maintains a constant relationship after returning home so that mutual visits can be made. Since October 2007, we have been promoting a 1: 1 sisterhood relationship with the City Hall, ward offices, or in conjunction with CBMC (Christian Business Association) or volunteer organizations.

4. Strategies and Solutions for Financial Problems of International Students

One of the difficulties for international students to come to study abroad is economic problems. This issue can be a great challenge for international students because there are not enough resources to cover tuition fees and living expenses. Therefore, it is necessary for international students to utilize various systems that can secure financial resources without any significant hindrance to their study. There is a limit to the need for macro support such as the expansion of the government student invitation system or provision of dormitory through the International Education Promotion Agency or the International Education Exchange Center. It is also necessary to establish strategies such as expanding scholarship support and financial assistance for each school. We will use foreign language translation and interpretation system in cooperation with the regional information and communication promotion institute. International exchange center and multicultural support center introduce international students to married immigrants and multicultural family children by country and teach the Korean. Using active TA system

such as TA assistant is necessary.

V. CONCLUSION

When international students come to Korea, it is necessary to have diverse and practical cultural and educational programs to adapt to the specificity of Korean culture and society. To find out what the problems of international students are and what the adaptation plan is, we surveyed the international students who are enrolled in the graduate school of INHA University. According to the questionnaire analysis students have to adjust to the new culture which is called Korean culture, and it is education system to adapt to college life culture. For this purpose, the organization of international student self - governing organizations, language adaptation strategy, culture event strategy, sisterhood relationship strategy and economic problem-solving strategy are presented. In this study, 113 international students, studying in graduate school at INHA University, were surveyed and analyzed for a total of two times. The first survey was conducted among 70 people from 16 countries (with beginner Korean language proficiency of 27 students, 20 intermediate, and 23 Korean advanced level students) from 5th of March to 5th of April, in 2012. The second survey was conducted among 43 people from 15 countries (18 beginners, 12 intermediate and 13 advanced proficiency levels) from 5th of March to 5th of April, in 2017. There was a 5-year difference between the primary and secondary investigations, but similar results were obtained. The results of the main survey analysis are as follows. First, the result of the item analysis of 'the saddest or hurting thing in studying abroad,' the loneliness was the highest. Isolation played a significant role as international students left their homeland and conducted their studies in other countries with different cultures. Therefore, it is necessary to meet, counselors and organizations to share their loneliness and counsel. The next highest stress is academic. International students are stressed to study in languages other than their mother tongue and to submit their research results. Institutional devices are needed to solve these problems.

Second, it is the result of analyzing the items of 'List difficulties in coming to study abroad.' The most severe are 'language.' Especially, in the beginner's class. If the Korean language ability is weak, it will lead to a burden of stress and academic work, so a solution strategy for language proficiency is needed. The next difficulty was economic and cultural differences. The economic aspects such as the tuition fee and living expenses should be solved. Otherwise, the difficulty of studying was great. Besides, the biggest problem regarding cultural differences is food, and international students in the Islamic cultures have had difficulties because they do not eat food containing pork.

As a result of the comprehensive analysis of research problems, international students were experiencing the difficulties of language difficulties as well as difficulties in coming into contact with other cultures while studying abroad. Especially, it is hard to adaptation to the other cultures of Korea, such as new education courses and teaching methods.

In this paper, we propose language adaptation strategy, diverse cultural event strategy, sisterhood tie-up strategy, and economic problem-solving strategy based on organization and support of foreign student self-governing organization through experience and experiment as a teacher. The purpose of this study is to provide international students with the opportunity to study abroad successfully.

ABSTRACT

Even though e-learning may increase access flexibility, eliminate geographical barriers, improve convenience and effectiveness for learning environments, it suffers from some drawbacks such as lack of social interaction, experience feelings of isolation. With the concerns and dissatisfaction with e-learning, Blended learning (BL) has been presented as a promising alternative learning method. BL is defined as a learning approach that combines e-learning and face-to-face classroom learning. Considered as the “new normal” mode of learning, BL has become popular in recent years especially in University education. University has more flexible learning environment to adopt BL. As the interest and expectation of BL have been growing in University, the effect of BL on student performance has been researched in different contexts. However, literature review reveals that effect of BL has been analyzed mainly in terms of students and contents area. A role of professor is more important than any other factors, because BL is a mixture of on-line and off-line teaching methods. This study, therefore, proposes a research model to investigate the primary factors affecting the student learning satisfaction and intention to re-use BL in terms of professor's perspectives. This study empirically validate the proposed model and examine the relationships among those variables.

Keyword: Blended learning, Learner's satisfaction, Course design, Course management, Professor's attitude

INTRODUCTION

With the proliferation of information communication technology (ICT), e-learning has been emerged as an effective tool for enhancing learner-directed learning (Wu et al., 2008). Even though e-learning may increase access flexibility, eliminate geographical barriers, improve convenience and effectiveness for learning environment, it suffers from some drawbacks such as lack of social interaction, experience feelings of isolation (Kinshuk & Yang, 2003; Wu et al., 2008; Yang & Liu, 2007).

With the concerns and dissatisfaction with e-learning, Blended learning (BL) has been presented as a promising alternative learning method. BL is defined as a learning approach that combines e-learning and face-to-face classroom learning (Graham, 2006). Considered as the “new normal” mode of learning (Norberg et al., 2010), BL has become popular in recent years especially in University education. University has more flexible learning environment to adopt BL (Lim, 2007). As the interest and expectation of BL have been growing in University, the effect of BL on student performance has been researched in different contexts. However, literature review reveals that effect of BL has been analyzed mainly in terms of students and contents area. It is necessary to focus on the perspectives of professor for effective BL in university, because BL is a mixture of on-line and off-line teaching methods.

The primary purpose of this study is to investigate the factors affecting the learner's satisfaction and intention to re-use BL in terms of professor's perspectives.

THEORETICAL BACKGROUND

Blended learning (BL)

Blended learning is described as a learning approach that combines different delivery methods and styles of learning (Wu and Hisa, 2010). Graham (2006) defined BL as a combination of traditional face-to-face instruction and online learning. BL is not simply about applying new software or developing online learning modules, but rather it is about assisting learners to take advantage of web technology and community resources and to facilitate increasingly effective learning strategies (Barbara, 2014).

Higher education institutions have long recognized that holding onto past learning and teaching practices is not congruent with the needs of our knowledge society. BL allows for more interactive and reflective knowledge construction. Frequent online interaction and feedback makes class more student-centered than traditional class. It is believed that BL can enhance the quality of face-to-face meetings (seat time) provided that students can benefit from the online learning activities and resources (Köse, 2010). For that reason, the adoption of BL is increasing especially in higher education around the world (Charles, 2013).

As the interest and expectation of BL have been growing in University, the effect of BL on student performance has been researched in different contexts. However, literature review reveals that effect of BL has been analyzed mainly in terms of learners and contents area. Usually learner's satisfaction has been examined as an effect of BL

in University. In terms of learner's perspectives motivation (Seo et al., 2015; Victoria et al., 2011; Lim, 2009), self-efficacy (Seo et al., 2015; Wu and Hisa, 2010), performance expectation (Nikolaos et al., 2011; Wu and Hisa, 2010) etc. have been used as affecting factors of learner's satisfaction in BL. As for the contents area, ease of use (Nikolaos et al., 2011; Wu and Hisa, 2010), contents accuracy, diversity, and contents quality (Wu and Hisa, 2010) etc. have been examined for learner's satisfaction in BL.

Professor's factors of learner's satisfaction in BL

A role of professor is more important than any other factors, because BL is a mixture of on-line and off-line teaching methods. There is need for more in-depth research to understand what determines student learning satisfaction in a BL environment focusing on the perspectives of professor.

As for all educational endeavor, the instructor plays a central role in the effectiveness and success of e-learning based courses. Collis (1995) and Willis (1994) believed that it is not the information technology but the instructional implementation of the IT that determines the effectiveness of e-learning. Instructors should adopt interactive teaching style, encourage student-student interaction. It is so important that instructors have good control over IT and is capable of performing basic troubleshooting tasks. The most important skills of instructor for BL are the ability to moderate or facilitate learning and the ability to develop or plan for high-quality online courses (Selim, 2007). Instructor's roles such as course designer, profession-inspire, feedback-giver, and interaction-facilitator are key contributor to the success of learner's satisfaction in BL (Liu et al., 2005). Hong and Lee (2016) identified teaching preparation, teaching operation, and attitude of professors as important teaching competency in BL. Hung and Chou (2015) validated five constructs of instructor's roles in BL; course designer and organizer, discussion facilitator, social supporter, technology facilitator, and assessment designer. Those instructor's role and competency can be categorized into formal roles and informal roles (Arbaugh, 2010). Informal roles refer to immediacy behaviors and formal roles include course design and organization, facilitating discourse, direct instruction.

In this study course design, course management, and professor's attitude are used as affecting factors of learner's satisfaction in BL.

Table 1: Affecting factors of learner's satisfaction in BL

Factor	Definition	References
Course design	coordinating learning contents and materials	Selim(2007), Hong and Lee (2016), Hung and Chou (2015), Arbaugh (2010)
Course management	facilitating learning activities	
Professor's attitude	professor's passion, image, hospitality	

RESEARCH MODEL AND HYPOTHESES

The primary purpose of this study is to investigate the factors affecting the student learning satisfaction and re-intention to use in BL environment in terms of professors perspectives as Figure 1.

Figure 1:
Research

model

Based on prior studies which are mentioned in theoretical background section course design, course management, and professor's attitude are identified as affecting factors and following hypotheses are established as Table 2.

Table 2: Hypotheses

Hypothesis	Content
H1	Course design in BL will have a positive effect on learner's satisfaction.
H2	Course management in BL will have a positive effect on learner's satisfaction.
H3	Professor's attitude in BL will have a positive effect on learner's satisfaction.
H4	Learner's satisfaction in BL will have a positive effect on the intention to re-use

EMPIRICAL ANALYSIS

Data collection and measurement

A questionnaire was used to collect data for this study targeting the people who take the class which use BL in S university. The instruments measuring the constructs were adapted from the extant literature. The items were measured on a 5-point Likert scale using from 1 ('strongly disagree') to 5 ('strongly agree').

322 responses were used as a basis for the findings of this study. 71 respondents were freshmen, 102 respondents were sophomore, 90 respondents were junior, and 59 respondents were senior.

SEM (Structural Equation Model) was used for empirical test using SmartPLS. PLS is an extremely powerful multivariate analysis technique that is ideal for testing structural models with latent variables. This is a convenient and powerful statistical technique considered appropriate for many research situations (Henseler et al., 2009), suitable for studying complex models with numerous constructs (Chin, 1998).

The measurement model was assessed for construct reliability, indicator reliability, convergence validity, and discriminant validity. Table 3, 4 lists the average variance extracted (AVE), composite reliability (CR), Cronbach's alpha values, loadings. As shown in the table, the measurement model results indicate that the model has good construct reliability (Straub, 1989), indicator reliability (Churchill, 1979), convergence validity (Chin, 1998; Fornell & Lacker, 1981), and discriminant validity (Fornell & Lacker, 1981), ensuring that the constructs are statistically distinct and can be used to test the structural model.

Table 3: Confirmatory factor analysis

Construct	Factor loadings	Composite Reliability	AVE	Cronbach's α
Course design	0.865	0.925	0.755	0.755
	0.862			
	0.863			
	0.884			
Course management	0.856	0.917	0.736	0.736
	0.838			
	0.896			
	0.840			
Professor's attitude	0.887	0.946	0.813	0.813
	0.922			
	0.907			
	0.890			
Learner's satisfaction	0.919	0.965	0.848	0.848
	0.924			
	0.936			
	0.921			
	0.905			
Intention to re-use	0.936	0.957	0.882	0.882
	0.942			
	0.940			

Table 4: Discriminate validity

Factor	Course design	Course management	Professor's attitude	Learner's satisfaction	Intention to re-use
Course design	(0.755)				
Course management	0.811	(0.736)			
Professor's attitude	0.688	0.746	(0.813)		
Learner's satisfaction	0.603	0.619	0.480	(0.848)	
Intention to re-use	0.521	0.571	0.400	0.858	(0.882)

* Numbers in parenthesis are AVE

Hypotheses testing

The analysis of hypotheses and constructs' relationships were based on the examination of standardized paths using the bootstrap resampling method [21, 22]. The results are summarized in Table 5.

Course design ($\beta = 0.297$, t-value = 2.106) and course management ($\beta = 0.390$, t-value = 2.428) were found to be significantly related to learner's satisfaction, but professor's attitude ($\beta = -0.015$, t-value = 0.104) are not. Learner's satisfaction also has positive effect on the intention to re-use ($\beta = 0.858$, t-value = 22.068). According to the values given in Table 4, hypotheses 1, 2 are supported but hypotheses 3 are not supported.

Table 5: Result of hypotheses testing

	Path	Estimate	t-value	Result
H1	Course design → learner's satisfaction	0.297	2.106**	Accept
H2	Course management → learner's satisfaction	0.390	2.428**	Accept
H3	Professor's attitude → learner's satisfaction	-0.015	0.104	Reject
H4	Learner's satisfaction → Intention to re-use	0.858	22.068***	Accept

*** p < 0.001, ** p < 0.05

CONCLUSION

Around the turn of the twenty-first century, BL emerged as a new trend in teaching models and learning styles (Hien et al., 2017). Considered as the new normal mode of training, the effect of BL on student performance has been researched in different contexts, especially in university. However, prior studies have focused on the learner's and contents aspects in analyzing the learner's satisfaction in BL.

BL is a mixture of on-line and off-line teaching methods, professor's role and competency is, therefore, more important than any other factors. This study examined the learner's satisfaction in BL in terms of professor's perspectives such as course design, course management, and professor's attitude. The result provide strong evidence for the validity of each construct and the effects on learner's satisfaction. The estimates of 0.413 ($R^2 = 41.3\%$) for the learner's satisfaction and 0.736 ($R^2 = 73.6\%$) for the intention to re-use provide good support for the hypothesized impact of course design, course management, and professor's attitude. Therefore, as a whole, the model has strong explanatory power for the learner's satisfaction in BL.

The empirical results indicate that course design and course management are two strong determinants of learner's satisfaction in BL. Professor should provide well organized online course and essential materials in both online and offline. Professor also should inform students about class policy and schedule. T-value of the path between course management and learner's satisfaction is the highest. It implicates that Interaction is very important for effective BL. Therefore professor should provide timely feedback and encourage class participation and motivation. Using SNSs is very useful for enhancing interaction. University authority should provide several teaching promotion programs for effective BL as well.

This paper has the originality and value in that it examines the learner's satisfaction in BL in terms professor's perspectives rather than other factors. If further study targets several universities for generalization and considers the difference of media, class types, more sophisticated analysis can be done.

ACKNOWLEDGEMENT

This paper is a revised and expanded version of a paper which presented (poster) at INTE 2017.

ABSTRACT

This paper is a report on the results of a study on the relationship between free play in the forest and the happiness of young children. Experimental group that play freely in the forest twice a week and control group young children who free play in the indoor were compared. To examine the difference in happiness according to pre-experiment group the results of the t-test there was a significant difference in mean score difference, for post-test, covariance analysis was performed. The t-test was performed to calculate the average value and standard deviation of the criterion of happiness points in the pre-test of the experimental group and the control group, and to determine whether there is a difference in the average of the pre-test of the two groups. If there are no difference in the sub-factors, the t-test was used for verification. If not, the ANCOVA analysis was used. A t-test was conducted to determine whether the difference between the average scores of the two groups was statistically significant or not. As a result, commitment, peer relationship, teacher relationship, cognition and achievement, and parent relationship, which are sub-factors of the young children's happiness, were confirmed in homogeneous groups. However, health, spirituality, emotional and life satisfaction were confirmed in heterogeneous groups. In the sub-factors of happiness as a result of the t test there was no significant difference, commitment, peer relationship, teacher relationship, cognition and achievement, parent relationship was t-tested. As a result, there was a significant difference. Covariance analysis was conducted on the health, spirituality, emotions, and life satisfaction of young children presented with heterogeneous groups. As a result, there was a significant difference. According to the analysis of the sub-factors of young children happiness such commitment, health, spirituality, peer relationship, teacher relationship, cognition and achievement, emotion, parent relationship, life satisfaction before and after the Free Play in the forest, It was found that Free Play in the forest was effective and statistically significant. Therefore, in this research, it is shown that Free Play by young children's interests and needs in a natural forest environment positively affects the happiness of young children. As seen from the study results, through the Free Play in the forest, the young children is able to improve the emotions of immersion, health, spirituality, peer relationship, teacher relationship, cognition and achievement, parental relations and life satisfaction. It can be said that it gives freedom and a feeling of happiness to them.

INTRODUCTION

Today, due to industrialization and informatization, society has rapidly advanced and culture and living standards have been greatly improved, but there have been many problems due to rapid economic development. In particular, the natural space that is familiar and helpful to us is getting narrower and becoming an artificial world where it is hard to feel the sense of seeing, hearing, touching, and feeling. Thus, young children are increasingly distant from nature, living in an artificial structure, Physical and mental stress and psychological disorders from infancy due to various problems such as high intellectual needs of parents, change of family members. Playing in these forests gives children the opportunity to overcome various difficulties and large and small difficulties through free play and movement, and they have the opportunity to mobilize all the senses and experience new experiences. Because young children instinctively pursue freedom, play in free forests leads to feelings of happiness through naturally

communicating with nature. Also, because of the developmental characteristics of infancy, we are curious about the world around, and we learn knowledge and laws about nature through interaction with nature through curiosity. This knowledge and laws of nature have many effects on adulthood. In addition, play in the forest is very important for infancy because it can be strengthened physically and mentally by eliminating aggression and tension while playing through all the senses of the whole body in nature. Therefore, the forest is very suitable as an educational place where children can have a good educational experience to interact and communicate with nature in infancy. The study of free play in the forest, recently, various studies have been introduced. It was suggested that free play in the forest had a positive effect on the sociality and creativity of young children and that the nature-friendly educational activities positively affected the euphoria and self-concept of young children (Kim, 2011; Boo, 2012; Soo, 2012). In this research, I will study what influence the free playing by choosing and playing with young children themselves in the forest affects the development of happiness for young children.

THE STUDY

In order to investigate the influence of free play in the forest on the feelings of happiness of young children, we set up the research questions as follows. How is the effect of free play in the forest on the feeling of happiness for young children? How is the effect of free play in the forest on the feeling of happiness for sub-factors of young children?

This research was divided into two groups of 30 young children each, 30 young children in J Childcare Center (Experimental group) and G Childcare Center (Control group) in Bucheon City, Gyeonggi-do.

The gender distribution and the month distribution of the research are shown in Table 1 below. The average age of 30 children in the experimental group was 52 months. The average age of 30 children in the control group was 50.7 months.

Table 1: Distribution of age and sex of young children for each group (N = 60)

Section	Sex		Total	Average Age (Month)
	Male young children	Female young children		
Experimental group	13	17	30	52.0
Control group	15	15	30	50.7

The research tool used the "Evaluation scale of happiness for young children" of Lee, E. J. (2009). Table 2 summarizes the results of analysis of the components, questionnaires, and reliability (Cronbach's α), which are the sub-factors of the scale measurement tool for young children. As shown in the table, the reliability of happiness was higher than the level of 85, and the reliability of the young children happiness inspection tool was relatively high. "The scale of evaluation of the happiness of the young children" is composed of nine areas of 36 questions. Young children's commitment (4 questions), health (4 questions), spirituality (5 questions), and peer relationship (4 questions), teacher relationship (5 questions), cognition and achievement (5 questions), emotions (4 questions),

parent relationship (3 questions), and life satisfaction (2 questions).

Each question has a score of 1 to 5 and high score means that there is a high sense of well-being]

Table 2: Subcomponent elements and Question Composition of Early Childhood Evaluation Scale

Sub factors	Composition contents	Question number	Count	Cronbach's α
Commitment	Attention concentration, Continuation of concentration	18, 19, 20, 21	4	.85
Health	Health . Nutrition . Sanitary life, Safety life	31, 32, 33, 34	4	.95
Spirituality	Art experience , Expression	22, 23, 24, 25, 26	5	.91
Peer relationship	Support from the same age	9, 10, 11, 12	4	.90
Teacher relationship	Support from teachers	4, 5, 6, 7, 8	5	.88
Cognition and achievement	Cognitive characteristics, Adaptability, Problem solving	13, 14, 15, 16, 17	5	.93
Emotions	Positive emotions, Self-regulation	27, 28, 29, 30	4	.86
Parent relationship	Support from parents	1, 2, 3	3	.89
Life satisfaction	Overall life in early childhood educational institutions	35, 36	2	.98
Overall			36	.91

The research have proceed as follows. First, Training the teachers in each groups experimental groups and control groups. Second, Pre-test, teacher test young children directly and scoring (April 2017). Third, Teacher's control and playing in each groups according to programs. Fourth, Post-test, 3 month later teacher test each group and scoring (June 2017). Finally, processing the data.

The treatment period for the two group trials is 16 times, twice a week for 8 weeks from April 24, 2017 until June 17, 2017. And, the free time for the two groups is from 10:00 am to 12:00 am. The experimental group decided to play freely on the basis of the interests and needs of the children who were not selected programs. The children of the control group carried out free play in the classroom mainly in the Nuri Curriculum with various educational tool and course.

In this study, the collected data were analyzed using SPSS 18.0 and processed by the following statistical methods. To verify the reliability of the research tool, we used a method of verifying internal consistency using the Cronbach's alpha coefficient. The t-test was performed to calculate the average value and standard deviation of the criterion of happiness points in the pre-test of the experimental group and the control group, and to determine whether there is a difference in the average of the pre-test of the two groups. If there are no difference in the sub-factors, the t-test was used for verification. If not, the ANCOVA analysis was used. Statistical significance level of $p < .05$ was set.

FINDINGS

The results of the pre-test are shown in Table 3. The average score of the experimental group was 2.65 (SD = .41), and the average score of happiness in the control group was 3.73 (SD = .38). The t-test was conducted to determine

whether the difference between the average scores of the two groups was statistically significant or not. As a result, there was a significant difference between the average scores of the groups at $t = -3.33$ $p < .001$. The two groups were confirmed in heterogeneous groups.

Table 3: Verification of differences in average score of happiness sensed by group before experiment

group	Experimental group (N=30) M(SD)	Control group (N=30) M(SD)	t
Entire happiness	2.65(.41)	3.73(.38)	-3.33***

*** $p < .001$

Table 4 shows the results of the covariance analysis (ANCOVA) of the children's happiness scorecard after the pre-test revealed that there was a significant difference between the two groups. The main effect was 305.08, $p < .001$. It was found that there was a significant difference in the happiness feeling score of the young children between the groups. Therefore, it was found that Free Play in the forest influenced the happiness of the young children.

Table 4: Young Children Happiness Sense Covariance Analysis (ANCOVA)

Variable	Variable source	Sum squares	of Degree freedom	of Mean square	F
Entire happiness	Covariance (Pre-test)	3.05	1	3.05	13.36**
	Main effect(Free play in the forest)	69.64	1	69.64	305.08***
	error	12.33	54	0.23	
	total	15.38	55		

*** $p < .001$, ** $p < .01$

The results of the pre-test of the experimental group and the control group are shown in Table 5 in order to know how the free play in the forest affects the young child's happiness sub-factors. A t-test was conducted to determine whether the difference between the average scores of the two groups was statistically significant or not. As a result, commitment, peer relationship, teacher relationship, cognition and achievement, and parent relationship, which are sub-factors of the young children's happiness, were confirmed in homogeneous groups. However, health, spirituality, emotions and life satisfaction were confirmed in heterogeneous groups.

Table 5: Verification of young children's commitment, health, spirituality, peer relationship, teacher relationship, cognition and achievement, emotions, Parent relationship, life satisfaction average score by group before experiment

Group	Experimental group (N=30) M(SD)	Control group (N=30) M(SD)	t
Commitment	2.76(.49)	2.76(.51)	-.01
Health	2.79(.35)	3.77(.57)	5.23***
Spirituality	2.63(.36)	3.66(.62)	-3.55***
Peer relationship	2.46(.45)	2.45(.83)	.10
Teacher relationship	2.84(1.39)	2.68(.56)	.96
Cognition and Achievement	2.35(.71)	2.36(.89)	-.69
Emotions	2.38(.56)	3.43(.56)	-4.98***
Parent relationship	2.74(.39)	2.96(.56)	-1.50
Life satisfaction	2.86(.33)	3.29(.55)	-2.07***

***p<.001

The results of the t-test on the post-test of the homogeneous group are shown in Table 6. It is found that there is a significant difference between commitment, peer relationship, teacher relationship, cognition and achievement, parent relationship, which are sub-factor of young children's happiness. Therefore, it was found that free play in the forest affects commitment, peer relationship, teacher relationship, cognition and achievement, parent relationship of sub-factor of young children's happiness.

Table 6: After the experiment by group commitment, peer relationship, teacher relationship, cognition and achievement, parent relationship verification of difference in average score

Group	Experimental group (N=30) M(SD)	Control group (N=30) M(SD)	t
Commitment	4.88(.21)	3.96(.58)	7.81***

Teacher relations	4.66(.39)	3.71(.52)	7.74***
Cognition and achievement	4.74(.30)	3.76(.77)	6.24***
Parent relationship	4.41(.55)	4.05(.65)	2.22*

***p<.001, *p<.05

Covariance analysis was conducted on the health, spirituality, emotions, and life satisfaction of young children

presented with heterogeneous groups. The results of the pre-test score, post-test score, and adjusted score are shown in Table 7.

Table 7: After the experiment by group health, spirituality, emotions, life satisfaction verification of difference in average score

Group			Pre-test score M(SD)	Post-test score M(SD)	Adjusted score M(SD)	post-test
Health	Experimental (N=30)	group	2.79(.35)	4.81(.32)	4.54(.11)	
	Control	group (N=30)	3.77(.57)	3.26(.45)	3.43(.11)	
Spirituality	Experimental (N=30)	group	2.63(.36)	4.69(.37)	4.34(.09)	
	Control	group (N=30)	3.66(.62)	3.99(.74)	3.14(.09)	
Emotions	Experimental (N=30)	group	2.38(.56)	4.77(.25)	4.35(.10)	
	Control	group (N=30)	3.43(.56)	3.93(.79)	2.91(.10)	
Life satisfaction	Experimental (N=30)	group	2.86(.33)	4.50(.51)	4.45(.07)	
	Control	group (N=30)	3.29(.55)	3.39(.48)	3.57(.07)	

In Table 8, the covariance analysis of young children health showed that the main effect was 364.03, $p < .001$, indicating that there was a significant difference in the health scales of the young children between the groups. It was found that the Free Play in the forest influenced the health of the sub - factors of the young children's happiness.

Table 8: Young Children Health Covariance analysis (ANCOVA)

Variable	Variable source	Square sum	Degree freedom	Mean square	F
	Covariance (Pre-test)	1.17	1	1.17	5.59*
Health	Main effect (Free play in the forest)	75.92	1	75.92	364.03***
	error	11.26	54	0.21	
	sum	12.43	55		

*** $p < .001$, * $p < .05$

In Table 9, the covariance analysis of young children spirituality showed that the main effect was 121.51, $p < .001$, indicating that there was a significant difference in the health scales of the young children between the groups. It was found that the Free Play in the forest influenced the spirituality of the sub - factors of the young children's happiness.

Table 9: Young Children Spirituality Covariance analysis (ANCOVA)

Variable	Variable source	Square sum	Degree of freedom	Mean square	F
Spirituality	Covariance (Pre-test)	0.09	1	Variable	0.20
	Main effect (Free play in the forest)	56.66	1	56.66	121.51***
	error	25.18	54	0.47	
	sum	25.27	55		

*** $p < .001$

In Table 10, the covariance analysis of young children emotions showed that the main effect was 155.25, $p < .001$, indicating that there was a significant difference in the health scales of the young children between the groups. It was found that the Free Play in the forest influenced the emotions of the sub - factors of the young children's happiness.

Table 10: Young Children Emotions Covariance analysis (ANCOVA)

Variable	Variable source	Square sum	Degree of freedom	Mean square	F
Emotions	Covariance (Pre-test)	0.61	1	0.61	1.17
	Main effect (Free play in the forest)	80.43	1	80.43	155.25***
	error	27.98	54	0.52	
	sum	28.59	55		

*** $p < .001$

In Table 11, the covariance analysis of young children life satisfaction showed that the main effect was 225.25, $p < .001$, indicating that there was a significant difference in the health scales of the young children between the groups. It was found that the Free Play in the forest influenced the life satisfaction of the sub - factors of the young children's happiness.

Table 11: Young Children Life satisfaction Covariance analysis (ANCOVA)

Variable	Variable source	Square sum	Degree of freedom	Mean square	F
	Covariance (Pre-test)	0.04	1	0.04	0.15
Life satisfaction	Main effect (Free play in the forest)	55.49	1	55.49	225.25***
	error	13.30	54	0.25	
	sum	13.34	55		

***p<.001

The results obtained through this study are as follows. First of all, as a result of analyzing the feeling of happiness of young children before and after Free Play in the forest, Free Play in the forest appeared to be effective for the feeling of Happiness and was statistically significant. Secondly, according to the analysis of the sub-factors of young children happiness such commitment, health, spirituality, peer relationship, teacher relationship, cognition and achievement, emotions, parent relationship, life satisfaction before and after the Free Play in the forest, It was found that Free Play in the forest was effective and statistically significant.

CONCLUSIONS

In this study, I tried to examine the influence of free play in the forest on the feelings of young children's happiness. As seen from the previous result, there was a significant difference between the group free play in the forest twice a week and the group freely played indoors. Therefore, we were able to learn that free play in the forest had a positive influence on the feelings of happiness of young children. Such results will give the infant more opportunities to have frequent resonance gradually and intimately with the familiar nature through the exchange with nature through free play in the forest. I think that this gave me a chance to feel the joy of nature with the nature in the forest. This supports the research results (Park, 2011) that it affected infant's forest experience activities and natural affinity development. It was found that there was a significant difference also in the sub - factors of the young children's happiness. Therefore, I was able to learn that positive impacts on infant immersion, health, spirituality, peer relations, teacher relations, cognition and accomplishment, feelings, parents' relationships, and living satisfaction have been exerted. The results of this study, Free Play in the forest of young children an important role in promoting emotions about parenting, immersion, health, spirituality, cognition and achievement, This is consistent with previous studies of Choi and Park(2012). In addition, an emotional sense of stability is promoted through nature-friendly educational activities, and in order to raise intimacy with family peers, the study of Jung and Kim(2011).

I share the argument and context of Kim(2013) that it is shown that Free Play by young children's interests and needs in a natural forest environment positively affects the happiness of young children. When we look at the results of these studies and the discussion of previous research, Free Play in the forests can enhance the emotional stability and participation of young children. Also, they can explore and understand their feelings, attitudes, and thoughts through activities that enhance intimacy with their peers and dynamic interaction with them. Therefore, it can be concluded that free play in the forest is effective in improving the happiness of young children.

ABSTRACT

The purpose of this study is to observe the process of six-year-olds' experience with *gugak* (traditional Korean music) activities and examine the relationship between such experience with the children's self-efficacy. The study was conducted on a total of six six-year-olds (three boys and three girls) for a period of 15 weeks through direct classroom observations in combination with qualitative analysis on a wide range of data including photographs, video footage, daily research logs and instructors' daily observation logs. The key findings of the study are as follows: First, the pre-schoolers became more engaged and voluntarily involved in the *gugak* activities classes over the course of time. Second, the children learned to teach their peers and keep each other's pace. Third, the kids started to become much more animated and spirited in their everyday life, playing the beats with their hands, feet and voices even when they were outside the *gugak* activities class. All of these findings confirmed that six-year-olds' experience with *gugak* activities helps contribute to building their sense of self-efficacy. This is corroborated by the following three arguments: First, the children in the study gaining confidence in their own ability to achieve intended results pertain to the cognitive domain of self-efficacy. Second, the pre-schoolers rising up to the challenges relate to the physical domain of self-efficacy. Third, the six-year-olds feeling *sinmyeong* (excitement) are associated with the socio-emotional domain of self-efficacy.

INTRODUCTION

1. Background and Purpose of Research

Music is a mixture of different sound waves. When frequently exposed to music, a child becomes highly sensitive to human voice and grows into an emotionally stable and well-rounded individual (Jeong, 2005). Therefore, music plays a crucial role in providing children with enriching art experiences which help the sound and balanced development of their body and mind. If the kindergarten curriculum in Korea fails to offer pre-schoolers diverse art experiences as intended, it risks ending up being a half-baked education (No, 2005). The late Zoltan Kodaly, one of the most respected Hungarian music pedagogues, highlighted the significance of ethnic music and argued that the music education of children should center on ethnic music (Byeon, 2000). Besides Kodaly, numerous scholars claimed that the most desirable way to teach music to children is through exposing them to traditional music such as *gugak* activities (No, 2001; Park, Kim & Kim, 2006; Lee, 2003; Jeong, 2000; Jo, 2004). Against this backdrop, a series of studies have been performed to facilitate the growth and development of children through *gugak* activities. One of the studies include the on-going research by Kim Min-jeong and Oh Han-suk which delves into the relationship between the elementary school students' involvement in *gugak* classroom activities and the children's self-efficacy.

Self-efficacy is a positive sense of self-confidence in one's own ability to complete a certain task or a positive expectation for the improvement in one's own ability in the future. It is a concept incorporated into the notion of competence which refers to an overall belief in one's own ability. Children with a positive belief in their ability are easily able to overcome challenges and hardships they may face in the course of learning and maintain a strong motivation to learn by expecting a successful outcome even if they fail at the first couple of attempts. Accordingly, pre-schoolers with higher self-efficacy exhibit a greater motivation to learn which will eventually lead to a better scholastic achievement.

Based on the 18-year experience of operating an educational institution for children, one of the authors has found out that a significant number of pre-schoolers and their parents expressed satisfaction with *gugak* sessions where kids learned how to play the *janggu* (double-headed hourglass-shaped drum) or *sogo* (small hand-held drum). Such exposure to *gugak* activities transformed the children into confident and outgoing individuals over the

course of time. In this study, the authors seek to build on these insights and further investigate into the impact of children's exposure to *gugak* activities on their development while focusing on the relationship between such exposure and self-efficacy based on six six-year-olds consisting of three boys and three girls.

2. Research Question

In this study, the authors delved into whether six-year-olds' experience with *gugak* activities affects their self-efficacy.

Early Childhood *Gugak* Activities and Self-Efficacy

1. *Gugak* Activities

A. Scope

In this study, the *gugak* activities are limited to listening to and singing *gugak*, playing *gugak* instruments, expressing *gugak* with body movements and dance, and performing traditional musical plays during art experience classes based on Traditional Korean Music Education for Pre-schoolers on Everyday Life Topics of the Nuri Curriculum (Ko, Kwon, Lee & Lee, 2014).

B. Details

In this study, the *gugak* activities include the followings.

1) Listening to *gugak*

Gugak instruments create a reverberating, long-lasting sound which greatly help pre-schoolers develop senses when they are exposed to *gugak* activities. When listening to *gugak*, it is best to engage children in a number of related activities such as playing a wide variety of *gugak* to children, discussing feelings and talking about differences (Jeon & Lee, 2014).

2) Playing *gugak* instruments

Young children start to develop interest in the physical appearances, playing techniques and unique timbres of *gugak* instruments by touching and playing them first-hand. When playing *gugak* instruments, it is recommended to allow pre-schoolers to have fun with touching and playing the popular instruments including *sogo* (small hand-held drum), *janggu* (double-headed hourglass-shaped drum), *buk* (double-headed shallow barrel drum), *jing* (large gong), *kkwaenggwari* (small gong), *gayageum* (long zither with 12 strings) and *piri* (cylindrical bamboo oboe). It is more important to allow kids to freely try their hands at different instruments and express themselves in their own ways, rather than emphasizing the proper techniques or rhythms of each instrument

Figure 1: *Gugak* instruments

(Lee, 2003). *Gugak* instruments used in this study are shown at **Figure 1**.

3) Expressing *gugak* with body movements and dance

Since *gugak* activities consist of body movements, dance, languages and songs, it enables pre-schoolers to learn basic movement techniques which help them to better control their body. When expressing *gugak* with body movements and dance, it is advised to offer children ample opportunities to watch, listen to and express *gugak*

through which they can learn to sincerely feel *sinmyeong* and enjoy fun and thrilling traditional dance (Ko, Kwon, Lee & Lee, 2014).

4) Performing *gugak* plays

Pre-schoolers' *gugak* plays should be carried out in the form of a role playing game where the story is carefully analyzed and restructured into a simple, straightforward plot. While performing *gugak* plays, children can learn the effects and characteristics of various musical instruments and familiarize themselves with the instruments by playing different instruments for different sounds according to the plot; for example, *buk*, *kkwaenggwari* and *jing* for the loud sound or the *janggu* for the sound of horse hooves. The role playing also helps young kids unleash their creative expression and build confidence (Jeong, 2015).

C. *Sinmyeong* (Excitement)

As a logically inexplicable emotional energy, *sinbaram* or *sinmyeong* (excitement) which lies at the center of Korean culture is often expressed in the form of joy and delight or sometimes even accompanied by tears (Lee, 1991). From the business perspective, one unit of labor plus one unit of labor totals two for a regular person while one plus one can add up to three for a person feeling *sinmyeong*. Such *sinmyeong* is predominantly understood as one of the most indispensable forces in tapping into full potential of Korean people. From the cultural and artistic perspective, Koreans say that they feel *sinmyeong* or *sinbaram* when they feel most positive in the context of their culture and custom. In Korea, *sinmyeong* or *sinbaram* refers to experience that generates the most positive feeling as well as the feeling itself. To Koreans, it means a state of perfect satisfaction and joy where you simply cannot ask for more. In the context of this study, *sinmyeong* originates from a sense of pleasure arising from finding self-worth. If the situation was worse just before feeling *sinmyeong*, one may experience a greater feeling of *sinmyeong*. In this way, the level of pleasure is adjusted depending on external factors affecting the occurrence of *sinmyeong* (Han & Han, 2007b). For pre-schoolers, *sinmyeong* can represent a feeling of pleasure that they discover in the process of becoming adept at playing a new instrument. When introduced to an unfamiliar musical instrument, children may find themselves engulfed in a negative feeling of fear at first which damages their self-worth, but as they get used to the new instrument and start to understand how to play it, the negative feeling is transformed into a positive one.

2. Self-Efficacy in Early Childhood

A. Concept

Pre-schoolers' sense of self-efficacy is largely influenced by interactions with peers. Therefore, it is crucial to offer vast opportunities to children to play with their peers as they gradually develop self-efficacy as they interact with each other while repeating the same task. High self-efficacy enables individuals to put greater effort into the given task as it helps view oneself more positively and raise expectation for one's own ability to achieve the goal (Wu, 1993). According to Heo, self-efficacy refers to competence, efficacy and confidence about oneself or how much one believes he or she is competent, efficacious and capable (1991). While a high degree of self-efficacy represents an unwavering belief that one is competent to perform a special task, a low degree of self-efficacy proves otherwise (No & Kang, 2003).

B. Components

For the purpose of this study, self-efficacy consists of the socio-emotional, physical and cognitive domains. While the socio-emotional domain refers to self-efficacy regarding how one perceives human relationships in the social context, the physical domain represents self-efficacy associated with perceived confidence on one's own appearance, and the cognitive domain pertains to self-efficacy towards one's own ability perceived through interactions with objects or other people in one's daily life (Jeon, 2014).

METHOD OF RESEARCH

1. Research Participants

The study was conducted on six six-year-olds attending Nursery C located in Gyeyang-gu, Incheon. The details of their family relations and environment are shown in **Table 1**.

Table 1: Family Relations and Environment for Children at Nursery C

Participant	Birthdate(Age)	Description
Child A (F)	Feb. 13, 2011 (six-year-old)	- Double-income household - Grandmother is a main caregiver - Has a younger sister

Child B (F)	Apr. 9, 2011 (six-year-old)	- Double-income household - Parents & an elder brother - The elder brother thinks her dearly and takes good care of her.
Child C (F)	Apr. 19, 2011 (six-year-old)	- Only child - Mother is Vietnamese - Parents with big age difference - Double-income household - Parents come home from work at 11 p.m.
Child D (M)	Sep. 5, 2011 (six-year-old)	- Parents & a younger sister - Attends Nursery C with her younger sister - Father only comes home only in the weekends
Child E (M)	Sep. 19, 2011 (six-year-old)	- Parents & a twin younger sister (with a developmental disorder) - Attends Nursery C with her twin sister - Loved and adored by parents
Child F (M)	May 30, 2011 (six-year-old)	- Single-parent household - Lives with grandparents and a mother - Mother has a job but does her best in childrearing and travels with F a lot.

2. Research Process

A. Preliminary Research

Before performing the main research, a preliminary research was conducted to ensure the appropriateness of the intended *gugak* activities, measure the level of children's interest and the time taken for these activities, and make the children accustomed to observation and video recording sessions. The preliminary research was carried out on six-year-olds attending Nursery C, who is the subjects of the main research, by observing them twice on every Thursday from March 16 to 23, 2017.

The preliminary research found out that the pre-schoolers showed keen interest in *gugak* activities and actively participated in playing the musical instruments and singing folk songs and *pansori* (musical storytelling). For effective video recording, the direction of movements was taken into consideration in advance to set the position of the cameras. For accurate transcription, audio recording was conducted to supplement video recording where necessary. During the free play activities, the authors and the homeroom teachers recorded videos from different directions so as not to miss any movements of the children.

B. Main Research

In the main research, we observed a total of fifteen 50-minute group activity sessions, one session per week, between May 30 and July 6, 2017, where the young children participated in *gugak* activities. In the classroom, the children were engaged in *gugak* activities according to *Traditional Korean Music Education for Pre-schoolers on Everyday Life Topics of the Nuri Curriculum* (Ko, Kwon, Lee & Lee, 2014). A brief overview of one of the sessions is shown in the following **Table 2**.

Table 2: An Example of the Research Sessions

Date & Time	Thursday, June 8, 2017
Name of Activity	<i>Byeol Dalgeori</i>
Goal of Activity	- To experience <i>Hwi-mori</i> rhythm (fast tempo) with <i>Byeol Dalgeori</i> - To enjoy the exciting beats of <i>gugak</i> activities
Previous Activities	- Read the book titled <i>Dokkaebi</i> (goblins) and <i>Samulnori</i> Instruments - Listen to <i>Byeol Dalgeori</i> and tell children that the music was used to wish for good harvest. - Introduce vocal beats and <i>Hwi-mori</i> in <i>Byeol Dalgeori</i> .
Beats and Rhythms	- Discuss which instruments or tools to use. - Use body parts to play the beats before playing the instruments.
Wrap-Up	Discuss how children felt while playing the music with body parts and musical instruments.

3. Data Collection

The entire classroom activities were video-recorded by teachers and audio was recorded separately, where necessary, to ensure accurate transcription with a view to enhancing validity and reliability of the study. Additional data including teachers' daily observation logs and photographs of children's activities and the research results were accumulated.

The research was carried out for a period of 15 weeks from March 30 to July 6, with a focus on the participation of pre-schoolers in *gugak* activities, the progress of such activities and the children's interactions with peers.

A. Classroom Observation

Classroom observations were conducted over a 15-week period from March 30 to July 6 to take a closer look at interactions among the children during group activity, preparation activity, follow-up activity and free play activity sessions. The video and audio recordings for the free play activities amounted to 135 files and 69.9 gigabytes (GB). The transcription of the observation logs totaled 140 A4 pages written in 10-point *BatangChe* with 160% line spacing.

B. Instructors' Daily Observation Logs

Instructors' daily observation logs were prepared by the authors on how they felt about the program and how children responded to the activities from the perspective of the instructors for *gugak* activities and observers as well as by two homeroom teachers from the perspective of assistants to the instructors. On top of the instructor's daily observation log, a daily research log containing a brief description of the experience and researcher's special comments was developed after the completion of transcription of each session. In addition, a simple journal was recorded after each session, which totaled 31 A4 pages.

4. Data Analysis

Audio and video recordings were accurately transcribed and a concise interpretation of the situation, questions and comments were added to the full transcription. Data analysis was performed according to the following steps.

First, the transcription of data collected was reviewed multiple times to extract meaningful concepts and characteristics. Second, a preliminary list of categories was created in the process of examining and analyzing the pre-schoolers' specific languages, play behaviors and social environment of the activities. Third, a list of themes was completed based on the preliminary list of categories and the data collected were explored in-depth and classified into separate groups after a thorough review. Fourth, the categorized data were carefully examined, interpreted and associated with the sub-components of self-efficacy.

A Ph.D. student in early childhood education at Inha University Graduate School conducted an extensive review of the comprehensive analysis of transcriptions, daily research logs, instructor's daily observation logs and teaching plans for *gugak* activities to ensure the transcriptions are true to the original recordings. The student's analysis and interpretation were scrutinized by another Ph.D student in order to reduce the chance of distorting the situation and fully grasp the context of the on-site observations.

RESULTS AND INTERPRETATION

The results of the analysis in terms of different domains of self-efficacy based on a highly relevant tool to assess children's self-efficacy (Jeon, 1996), are shown in the following **Table 3**.

Table 3: Qualitative Analysis Results of Children's Self-Efficacy

Domain	Theme	Sub-theme
Cognitive	Children gaining confidence in their own ability to achieve intended results	"This is what it is supposed to sound like." "I'm doing this the right way, right?"
Physical	Children rising up to challenges	"I also want to try the <i>kkwaenggwari</i> and <i>jing</i> ." "Looks like you guys will beat the <i>buk</i> a hundred times."
Socio-emotional	Children feeling <i>sinmyeong</i>	"Let's do this again tomorrow." "This is so much fun, isn't it?"

In this study, an improvement in children's self-confidence was observed through an enhanced level of playing an instrument as well as of cooperation and consideration among peers over the course of ensemble playing, folk game or *gugak* play sessions. The results of the comprehensive analysis are as follows.

1. Children gaining confidence in their own ability to achieve intended results

The participating children seemed to understand what *gugak* is in their own terms through hands-on experience with *gugak* including listening to the music in free play activity sessions, playing *gugak* instruments, performing ensembles and expressing *gugak* with body movements and dance in group activity sessions, and participating in *gugak* plays. The pre-schoolers understood how our ancestors enjoyed their music and showed keen interest in *gugak* by actively engaging in the body movements and dance sessions and freely expressing their feelings and thoughts in the musical plays. In this study, confidence is defined as a feeling of self-assurance that one is competent, efficacious and capable (Heo, 1991). For analysis, the following statements concerning the cognitive domain from the children's self-efficacy assessment tool (Jeon, 1996) were examined: "I can try my best to answer teacher's questions," "I know how to reconcile friends who are falling out with each other," "I can carefully listen to teacher's instructions and learn how to do things very quickly," "I am very curious about new things and want to know more about them," "I can do my best to complete challenging tasks," "I can excel in making things in art class," "I can listen attentively to a teacher to understand difficult questions."

A. "This is what it is supposed to sound like."

When we introduced *gugak* instruments one by one and explained how to hold sticks and play them, children approached the musical instruments with an excited look filled with curiosity and fear at the same time. Since it was the first time they were handling the instruments, they took a long time to explore them by beating, rolling and touching them.

B: (Covers ears) "Teacher, it is too loud. I don't want to hear it anymore."

Teacher: "I understand. It's your first time hearing such sound."

A: "It's too noisy. I don't like these kinds of sound."

B: (Uncovers ears) "But, maybe... maybe if you play it this way, it won't be too loud."

Teacher: "Oh, that is a good idea. If you get used to *janggu*, you might even want to keep hearing this sound. Until then, you can beat it as soft as you want." . . .

B: (Beats it more quickly by holding the round-edged and sharp-edged sticks halfway and shouts with an excited look) "Teacher, this is what it is supposed to sound like. I'm okay now." "Can I hold it like this? In any way I want?" [B, 2, Mar. 30, 2017]

Previously, the children had not much chance to listen to *gugak* ensembles or play *gugak* instruments for more than 20 minutes. They seemed to be curious and scared at the same time because they were unfamiliar with the new instruments. As the pre-schoolers started to explore the musical instruments by beating, rolling and touching them, they were able to cast away their fears and made a brave attempt to play them.

B. "I'm doing this the right way, right?"

F: (Rolls *janggu*, keeps tying and untying the sticks with *janggu* strings, and swinging the sticks in the air) "It's very difficult to hold them in between fingers." (Holds the round-edged stick in the opposite direction and makes circles in the air, entering his own world) "They are potatoes and sweet potatoes."

Teacher: "What made you think of potatoes and sweet potatoes?"

F: "Just take these potatoes and sweet potatoes and you can make the *daeng-daeng* sound."

C: "I do it this way..." (Shows the teacher how she grabs the sticks the right way) "Teacher, I'm doing this the right way, right?"

Teacher: "Yes, you're doing it right." . . .

F: "Teacher, I am done for the day." (Throws the round-edged stick and goes to play with stacking toys) [F, 2, Apr. 6, 2017]

To the children, the *gugak* sticks remained fairly difficult to control. However, as they learned the techniques, they started to notice the difference between various beats and familiarize themselves with new beats and rhythms.

In the classroom, we had a brainstorming session under the theme of 'my neighborhood.' D had no trouble giving out related words, which was quite different from how he had been before. When asked how he was able to come up with so many words, he answered that he could contribute a lot because he saw *gilnori* (circling around the village before folk games) during the village sports day which was pretty much the same with *gugak* that we learned in the class. In the craft class, D was confident in making the *gugak* instruments and explained the characteristics of the instruments after attentively listening to what the teacher had taught them. These days, he seemed very active when playing the instruments which contrasted to how he had been when he was first introduced to *gugak*. D changed a lot after learning *gugak*. [Instructor's daily observation log, 1, Jun. 13, 2017]

The children belonging to this category used to be shy and passive. However, as they started taking part in *gugak*

activities, they learned to associate these activities with other programs and begun to find what they can do best. Overall, *gugak* activities brought about positive changes from the children so that they can better adapt to new things in their daily lives.

2. Children rising up to challenges

As the children started to understand the meaning of *gugak*, traditional rituals designed to wish for health and prosperity and folk games to bring harmony, they begun to look brighter and more confident. The pre-schoolers belonging to this category mentioned that "I am confident that I can express new things with my body with no trouble," "I can do new dance routines that our teacher is teaching us very easily," or "I am very strong. I can carry heavy things and go very far." With a view to examining how much the children changed in terms of the physical domain of self-efficacy, the authors thoroughly analyzed the observation records and interviews with the pre-schoolers.

A. "I also want to try the *kkwaenggwari* and *jing*."

Teacher: "What did I tell you to do when you want to play the *janggu* easily?"

"How can we play the instruments well? Can you tell me how?"

C: "Vocal beats. You should try the vocal beats. Say gung and beat it with the stick to make the *ttak* sound."

Teacher: "Uh-hm, that could be one way to do it."

C: "Teacher, I also want to try the *kkwaenggwari* and *jing*. (Makes circles as if she is holding the *jing* stick) *Jing, jing, jing*." [C, 2, Jun. 22, 2017]

Except the class where the children were taught about *gugak* instruments, the pre-schoolers became more actively engaged in the activities instead of being passively led by instructors, exhibiting a high degree of expectation. They started to count the days till the next session and showed great enthusiasm on the day of *gugak* activities, telling themselves that they would do well in the class. While participating in a wide range of plays and hands-on sessions, the children developed interest in *gugak* activities, saying "I think I can do better the next time," "I want to do it again," or "Can we do it again?"

B. "Looks like you guys will beat the *buk* a hundred times."

Teacher: (Children sit in a circle) "Who wants to be the master singer and sing a song?"

A: "I want to be a *buk* player."

D: "No, you're a girl. I'm a man, so I'll do it all."

A: "Girls can do it, too. The teacher said so."

D: "No, go away!"

E: (Watches A and D arguing over who should play the *buk*)

"I want to be a *buk* player, too, but I'm waiting for my turn. After you, you and you, wow... Looks like you guys will beat the *buk* a hundred times."

Teacher: "A wants to play the *buk*, and so does D. But is there any way to go at this without fighting?"

E: "One by one... we can take turns. Oh, somebody tried it yesterday, so those who didn't can do today." [E, 2, Jun. 30, 2017]

As the pre-schoolers played *gugak* instruments to the rhythm they had become familiar with through *gugak* activities featuring games, dances and songs, they increasingly expressed their curiosity about something new. The sound each *gugak* instrument produced gave the children hope to play other instruments. In the event of a conflict involving the newly-introduced roles, they demonstrated confidence to resolve it on their own.

F has been pulling out all the stops lately. He whipped his shoes and socks off to volunteer for a *ssireum* match. Of the *ssireum* techniques we saw earlier, he almost pulled off a leg grab. The teacher asked him to take a break after winning one match, but he stubbornly insisted on taking on other challengers. The second match was neck and neck, and it was hard to predict a winner. Both sides sweated with their faces reddened, but neither gave up and kept pushing. Finally, F won. Someone said if F could do it, anyone could, which heated up the excited crowd. Old neighbors who were passing by stood behind the fence, rooting for the children. F dashed inside with a smile on his face saying, "I put all my energy and now I'm hungry. I need a big meal." [Instructor's daily observation log, May 11, 2017]

The children's participation in physical activities, ranging from performing *gugak* plays, expressing the music in the form of body movements and dance to playing *gugak* instruments, gave them more confidence in their physical skills. Such confidence empowered them to try *ssireum*, a sport which requires push and pull while standing firmly with two feet on the ground. The change marks a positive step.

3. Children feeling *sinmyeong*

Historically, *gugak* has served a communal function of bringing together a community of people. Therefore, *gugak* activities largely involve the participation of a group of young children and help foster a sense of community and interaction. The children expressed *gugak* through their body movements and dance, shared their

feelings after listening to *gugak*, performed *gugak* plays and played *gugak* instruments with their peers. These activities allowed the children to experience the culture of patience and consideration that is deeply rooted in Korea's history. The children who fall into this category are identified as those who "get along well with anybody," "initiate a conversation with new friends in the nursery," "easily make friends," "have a heart to help those in need," "control their emotions and avoid crying when frustrated" and "are generous enough to control their feelings in unpleasant situations."

A: "Let's do this again tomorrow."

E: "Why don't we play *gugak* for the farmers?"

(E and F bring toy blocks to build *gugak* instruments.)

F: "Wow, we made it."

D: "Let's try these one by one."

E: "But we need one more person."

(Makes eye contact with B) "B, come here. Play the instrument with us."

D: "Let's put this in here. Now, you look like a real working man."

E: "Whoa! This is fun."

F: "I know!"

D: (Unwillingly finishes the activity and starts cleaning up) "Let's do this again tomorrow." [Free play session, May 11, 2017]

A group of children gathered for cooperative play, as suggested by D. They made *gugak* instruments after a discussion and went on to play the beats. E brought B to join the team, and together they played the instruments, singing the vocal beats out loud, "The *janggu* goes *gung-dda*, the *jing* goes *jing*, the *buk* goes *dung-dung* and the *kkwaenggwari* goes *kkaegaeng-kkaegaeng*." The excited look on their faces reminded the teacher of a sun-tanned farmer full of *sinmyeong*.

B: "This is so much fun, isn't it?"

Teacher: "A, why aren't you giving it a shot? Is everything okay?"

A: "I'm fine. I just can't remember how it went."

B: "Look what I'm doing. *Jing*. This is how you do it. Just *jing*."

Very simple, isn't it? Now, you try.

A: (Grabs the *jing* stick after a moment of hesitation.)

B: "Strike it now. Do it once and wait for a while with your eyes closed. See?"

B: (Plays the instrument facing A) "This is so much fun, isn't it?" (B, 2, Jun. 16, 2017)

When a group of people play *gugak* instruments together, individual performance matters. However, what is paramount is taking a liking to one another and finding a harmony. The beauty and purpose of a group performance is that members can motivate each other and work together as a harmonious whole.

The group practice began after the children learned how to play individual instruments. They each picked the instrument they wanted to play. Individual practice sessions went well, but once the four instruments came together, the *buk* players began following *janggu*'s smaller beats. The two sounds were virtually indistinguishable. There were also sliding and dragging sounds, which made me feel like they were simply striking their own instruments without thinking about playing in tune. In particular, E, the *jing* player, kept forgetting about hitting the instrument loud only once at the beginning of the rhythm and came half a beat late, which created confusion for the *janggu* players, who were supposed to tap their sticks lightly alongside the starting *jing* sound. With the performance turning into a mess, some children began to strike the *janggu* and *jing* on their own, completely off the beat. The homeroom teacher came in to help the *janggu* players get back on track. The author slash instructor who was conducting the group, asked the *buk* players and *jing* player to pay attention to her right hand and left hand, respectively for signals. The *kkwaenggwari* player, who should lead the other instruments, practiced individually whenever he had the time. A week later, we had another group practice. To my surprise, the ensemble hit it off under the lead of the increasingly confident sound of the *kkwaenggwari*. I watched as the children's faces light up with confidence. [Instructor's daily observation log, Jun. 22, 2017]

In the beginning, the children were unable to play *gugak* instruments properly, due to lack of knowledge. They initially played the same instrument as a whole but later split up by instrument. Then the whole group played together when the players were still unfamiliar with their new instruments. The children experienced great difficulty playing in tune with each other. When they practiced repeatedly with the same instrument, some wore a confident look on their faces. As the program progressed, they found playing as a group challenging. However, they carefully began to study how to play the instrument of their choice in tune, which allowed them to gain more insights into ensemble performance.

CONCLUSION

This study identified six-year-olds' shift to active and confident learners after being exposed to *gugak* activities and established the link between such exposure and the children's development, especially in their self-efficacy. Based on these findings, the study intended to raise awareness of *gugak* as a tool to experience musical expressions and sentiments native to the Korean people in education institutions for young children. The key findings of the study are summarized below.

First, the young learners overcame their fears that *gugak* classes are challenging and listened attentively to the teachers' instructions to learn new skills. They explored possibilities on their own, saying "This is what it is supposed to sound like" and "I'm doing this the right way, right?" The activities had a positive impact on the cognitive domain of the children's self-efficacy.

Second, after exposure to *gugak*, the children began to understand its meaning, showed a strong desire to play other musical instruments and expressed confidence in their strength and body during activities such as *ssireum*. They responded, "I also want to try the *kkwaenggwari* and *jing*" and "Looks like you guys will beat the *buk* a hundred times," which demonstrates the lessons had positively affected the physical domain of the learners' self-efficacy.

Third, repeated rhythm activities helped the children move away from the perception that *gugak* is difficult. While creating a harmonious sound, they first-handedly learned how to be considerate of others and helpful to one another. They said, "Let's do this again tomorrow" and "This is so much fun, isn't it?", which is indicative of *gugak*'s positive influence on the socio-emotional domain of the children's self-efficacy.

Accessing the Academy: Scrutinizing Accessibility Problems of Disabled Students

Ray ARCHEE

School of Humanities and Communication Arts

Western Sydney University

Australia

r.archee@westernsydney.edu.au

ABSTRACT

In Australia and many other countries, it is an ethical and legal requirement that all public sector organizations make their online information and processes available to all disabled citizens. Given the aging population and the 8-10% percent of the world who are perceptually disabled, such requirements should be a mandatory feature set of all universities. This is not the case, with the large majority of institutions only paying lip service to accessibility. Visually, auditorily and cognitively impaired citizens constantly struggle to navigate both the offline and the online world. The situation is particularly challenging for disabled students whose educational requirements not only necessitate locating information, but also submitting assignments to constantly changing learning management systems and interacting online with instructors and fellow students. Various reasons for this situation are explored including ignorance, expense, difficulty, and imprudence of website authors and university administrators.

INTRODUCTION

For the past 20 years, the author has taught able-bodied computer science, engineering and information science students the skills of writing reports about technology. When asked to consider the concept of accessibility to evaluate websites, students are always puzzled. Accessibility is a seemingly ordinary concept and the majority of students share the same view as most citizens (and some academics) of most countries – being able to view and use websites without hindrance from governments or censorship. Most of the students and the population do not imagine the fact that disabled people need to use the Internet. They seldom consider sight or hearing impaired users, and certainly never think about the cognitively impaired or those with learning difficulties. Why is this the case, when approximately 8-10 percent of the population suffers from some form of sensory or cognitive disability, with this figure set to increase as the baby boomers' health starts to deteriorate in their sixties and seventies (Vicente & Lopez. 2010)?

In Australia, the legislation derives from the 1992 Disability Discrimination Act. All government agencies are required to provide information and services in a non-discriminatory way. The website, www.Australia.gov.au specifies the federal government's role and acts as a model for the rest of government and the nation. Australia is also party to the United Nations' Convention on the Rights of People with Disabilities (ratified in 2008) in which Article 21 states that: "... information intended for the general public to persons with disabilities in accessible formats and technologies appropriate to different kinds of disabilities in a timely manner and without additional cost." (see <http://www.accessiq.org/news/news/2014/03/website-accessibility-law-and-policy-guide>).

Many companies and educational institutions mistakenly believe that the accessibility laws only apply to government departments or medium to large sized organizations. The Australian Equal Opportunity Act of 2010 precludes all business owners from discriminating against a customer on the basis of ages, race, gender, religion or disability. If anyone is discriminated against, then that person may make a complaint to the Australian Human Rights Commission.

Sydney 2000 Olympics

The first test case occurred in 2000, when Bruce Maguire, a blind person, sued the Sydney Organising Committee of the Olympic Games (SOCOG) because he could not choose a seat at one of the events using his computer. He asked SOCOG to make the website accessible, but was essentially refused. The case was ongoing, resulting in a damages award of AU\$20,000. Many people believe this sum was preferable to SOCOG since the website had a limited lifetime, and changing the entire website would have cost much more. Several other cases have subsequently occurred notably three women who in 2011, who sued the Disney Corporation for failure to cater for vision impairment on its websites and theme parks, and Donna Jodhan, who in 2010, filed a case in Toronto, Canada against the government because she could not apply for online government jobs. The first case was settled out of court, while the Canadian government was directed to make all its websites compliant by 2012.

The laws relating to many other countries are more or less the same as those in Australia, with some countries being quite explicit in specifying websites, and others being more general referring to disability discrimination in

general. Most of the Western world has legislation, which prohibits discrimination on the basis of disability. The exact penalties and recommendations do differ from country to country. The European Parliament recently accepted a ruling on 26 Oct, 2016, which requires websites and mobile apps of all public sector organizations and institutions be accessible to disabled persons. All EU member countries are expected to meet this obligation by 23 Sept, 2018. However, most EU profit-making businesses are seemingly exempt from this ruling.

Review of the Literature

The SOCOG case made media headlines around the world. Up until the 2000 SOCOG incident, research that studied the discrimination surrounding accessibility of disabled students was limited (Williamson, Shnauder & Bow, 2000). This was paralleled by a corresponding lack of fundamental services available to disabled Australian students in their educational lives. While the potential democratization of information has been celebrated (Smith, Waby, Neville and Dalloway, 1999), nearly two decades later, the evolution of the Web into Web 2.0 has added greater complexity and extra obstacles for disabled students.

Prior to 2000 there were a relatively small number of empirical educational studies that studied the use of web-based resources for disabled students. Accessibility was a forgotten aspect of most technology-rich classrooms. The majority of the early research into disability focused on blindness and visual impairment and can be typified by three main groups: 1. research, which reviewed an array of assistive technologies for a range of disabilities (see Ashcroft, 1983; Bayha, 1998; Galvin & Scherer, 1996); 2. costs-benefits analyses of various assistive hardware or software (see Ely, 1989; Leventhal & Earl, 1998; Ruconich *et al*, 1986;); and 3. early studies, which made speculative claims about the potential benefits of multimedia and web-support materials (see Rosas *et al*, 1997; Rutkowski, 1998; Włodkowski, 1999). At this time, which predates social media software and smartphone hardware, the function of the Web was to store information for later retrieval. Very little research considered the interactive possibilities of computer-mediated communication in order to create discussions and hold online classes, which included disabled students.

As of 2017, the number of research studies that have identified accessibility as a major problem has markedly increased, with a continued interest in blind and visually-impaired users, as opposed to other kinds of problems. This focus has had the most attention, both in the media and by researchers because the Internet is so heavily graphical and aimed at people with normal vision. Some researchers believe that the Web is a mature medium now and that accessibility reform is imperative, with disabled citizens, estimated to exceed 1 billion people or 15% of the world (World Bank, 2011). The literature shows that disabled citizens are accessing online sources in a range of settings (Alper, 2016; Dobransky, and Hargittai, 2016) and using variety of devices (e.g. smartphones, games consoles, smart TVs and tablets). More optimistic studies have conceptualized disability as the acid test for universal usability, with the remediation of accessibility issues seen as a model for universal design (Preiser and Smith, 2011; Steinfeld, Maisel, and Levine, 2012). Such research implies that if the Web can be designed for people with disabilities - then surely it can be used by everyone.

These utopian ideals need to be weighed against research reports surrounding Web policy and accessibility, which are arguably ethnocentric since they tend to depict the European, American or UK, approaches as the worldwide standard (see Blanck, 2014; Scholz, Yalpin & Priestley, 2017). These discussions usually totally ignore the majority of the world – China, India, Russia and the third world - where disability, and resistance to accessibility measures are far more prevalent. A 2014 UN report found that only 45% of the 76 countries surveyed reported that any of their government websites were accessible (G3ICT, 2014). Including the missing countries in the discussions is a significant challenge to all educationists and policy makers.

Specific educational research that treats disability access of students in educational contexts has yielded mixed findings. Most educational research starts from the same question - are disabled students being assisted by their various institutions' websites given guidelines and laws that require equity and fairness? Post 2000 research began by surveying the implementation of accessibility measures (Dunn, 2004; Tinklin, Riddell & Wilson, 2004). Most often, research is hopeful about evolving technology and the skills of web authors by identifying a range of issues that need to be addressed (Badge, Dawson, Cann & Scott, 2008; Golledge, 2005; Simonson, Glick & Nobe, 2013; Taylor, 2016) before disabled students can attain the same access as ordinary students. However, recent findings are more critical about the efficacy of accessibility guidelines (Brandt, 2011; Cooper, Sloan, Kelly & Lewthwaite, 2012; Liasodou, 2014) and the possibility of universal access. One major problem for universities (and students) is that special needs are not always disclosed – embarrassment, ignorance, and anxiety are accompanying characteristics of disability (Matthews, 2009) e.g. when a student suffers from undiagnosed dyslexia. An overlooked proportion of student populations are international students who speak the native tongue as a second language. A small number of studies have added cultural or cross-cultural problems to the W3C formal list of disabilities (Archee & Gurney, 2012; Archee & Gurney, 2007; Vitols, Arhipova, &

Hirata, 2011).

THE W3C GUIDELINES

The Australian government and most other countries use the World Wide Web Consortium (W3C) standards and guidelines on accessibility, which originally dates from 1999. The 2008 Web Content Accessibility Guidelines (WCAG 2.0) (see <https://www.w3.org/TR/WCAG20/>) have succeeded the older recommendations by making the previous statements non-technology specific and by including a wider range of disabilities. The guidelines now encompass all kinds of computers, televisions, gaming consoles, tablets and phones, and refer to sight, hearing, learning difficulties, cognitive limitations, limited movement, speech disabilities, photosensitivity and combinations of disabilities. The guidelines do not include language or cultural preferences. However, given these guidelines are nearly ten years old, and converging advances in technology, such as new devices, new apps and new ways to access Internet mediated content, the existing accessibility guidelines may not be an appropriate document to be the basis of national regulations, which usually allow transitional compliance time.

Both the first and second iterations of the guidelines do nothing to specify exactly what disability or accessibility means, even though various problems are spelt out. By not defining the exact meaning of accessibility and disability the task then falls to governments, legislation and other regulatory bodies to determine whether the situation falls under the policy definitions on a case by case basis, if a breach is detected or reported (Ellcessor, 2015). In the Maguire vs SOCOG case, the Olympic body claimed that the 1999 standards were so new and that the website planning pre-dated the planning for the establishment of the website. This argument was not accepted and SOCOG was directed to change its website accordingly. After these changes were subsequently only partially performed, the Human Rights Commission awarded damages to Mr Maguire who was considered to have suffered feelings of hurt, humiliation and rejection. It is worth noting that the awarding of damages was not automatic, nor was there a mandatory fine, but a determination by the Commissioner about Mr Maguire's feelings, not his disability, per se.

The latest version of the W3C guidelines comprises 4 main principles, divided into 12 guidelines, and 61 sub-criteria. The problem with all the W3C guidelines would seem to be just that – they are guidelines and nothing more. While the latest version states that the “criteria are written as testable statements” (in Abstract) and supplies examples of bad practice for each of the criteria and sub-criteria, the language used is jargonistic and so generic that usability of the guidelines becomes a real issue for those seeking genuine compliance. It would be extremely challenging to identify accessibility problems in the design of a website using these guidelines as a design tool. It would also be challenging for any court to make realistic judgments without the assistance of an expert accessibility consultant.

Here is an example with respect to Guideline 3.2 Predictable: Make Web pages operate in predictable ways:

- 3.2.1 On Focus: When any component receives focus, it does not initiate a change of context. (Level A)
- 3.2.2 On Input: Changing the setting of any user interface component does not automatically cause a change of context unless the user has been advised of the behavior before using the component. (Level A)

This is not plain English, nor can it be, because it is dealing with highly complex technical matters and written to encapsulate a variety of platforms, devices and disabilities. The words, “focus”, “context”, “interface” and “behavior” will be very different according to the assistive technology being used, and whether the user is blind, or deaf or cognitively impaired. For example, the user experience is totally changed if the screen is removed from the browsing process – a screen-based context disappears into a string of text. For hearing impaired students, video content is very different without the music and sound context that accompanies most clips.

Not only are the guidelines littered with jargon, and cluttered with links, but some of the previously useful guidelines have been deleted from the original version, e.g using CSS for layout, not tables; avoiding embedding text within images; and using clear and simple language, have been removed. Particularly worrying is the elimination of the last three guidelines from version 1.0, which related directly to accessibility. For this author, dead end links are a navigation problem for all web users (disabled or not), but where is the guideline for dead links? Ordinary people, including web authors and administrators are ill-equipped to decipher the W3C guidelines because they are simply not usable. Moreover, Power, Friere, Petrie & Swallow (2012) used 32 blind users to test 16 government websites and found that there were 1383 user problems, only half of which were covered by the success criteria of the WCAG 2.0. For the problems that were covered, implementation of the guidelines did not actually remedy the situation in 16% of cases. Results show that few web authors are implementing the guidelines, and for those who do, problems will still exist as to make the website inaccessible to blind users.

ACCESSIBILITY AND BLENDED LEARNING

Blended learning, or the hybrid combination of traditional face-to-face teaching with e-learning has become the de facto standard for most universities in the western world. Most Australian universities use a learning management system (LMS) in order to 1. standardize the design, layout and navigation of individual units, and programs of study; and 2. house the online unit content of the weekly tutorials – information, resources, videos, links, and references; 3. support online interaction in the form of quizzes, chats, blogs, forums and wikis. Some of the popular brands include Canvas, Moodle, Sakai, Desire2Learn and Blackboard. Educational publishers have recently entered the market with McGraw-Hill and Cengage offering their own off-site, lookalike versions. While certainly helpful, these LMS's add an extra layer of complexity to accessibility issues for both students and developers alike. If the popular duplication detection software, Turnitin is also employed to prevent cheating, then even more complexity is created since Turnitin is an add-on module to the LMS that provides extra functionality, but also extra opportunities for accessibility issues.

Universities usually provide the bare basics of Alt-tag text labels for graphics, use of semantic headings for long documents, and sensible colour schemes. When it comes to their chosen LMS, universities tend to devolve responsibility to the vendors themselves and assume that the LMS accessibility credentials are tested and true. This assumption is the problem. Many LMS vendors maintain that their systems are W3C compliant, but they do not state how they have arrived at these conclusions. This author consulted a profoundly blind advisor, who used the JAWS assistive screen reader at the Australian Royal Blind Society in 2001 and discovered that the forerunner to Blackboard, WebCT was inaccessible at a Sydney university because of inadequate navigation assistance and many dead links. Similarly, Conway (2010) tested Blackboard with the most popular JAWS program and by using a range of automated and manual methods and found that Blackboard scored “better than average”, but that score was still a fail grade in terms of producing accessible content. Missing sitemaps, inability to grasp user location, inconsistent page layouts, missing META data elements, use of unreadable pdf files and missing html equivalents, and missing ALT text labels for graphics. To make matters worse, the university stated its aim was for WCAG 1.0 compliance, which was not met, with no mention of more difficult WCAG 2.0 guidelines. This situation is not much better at other universities or with most other LMS's.

The amount of competition for LMS market share is fierce with many companies now offering a LMS, and with traditional print publishers now entering the market. The commercial vendors are rushing to invent innovative features in order to distinguish themselves from the open-source vendors such as Moodle and Sakai. Thus, commercial vendors are always trying to push the boundaries of what a LMS can do. Such companies wish their concepts to be the first so that the institutions will identify with them and remain loyal. The problem is that old products like Blackboard rest on software code that was not originally designed to be accessible. By developing new features on older code, the legacy of inaccessibility remains and can only be changed by rewriting established processes. Companies like Blackboard are suffering from historical problems because it used to be so popular (76% in 2007) at a time when indifference to disability and accessibility was the norm. This indifference is also present in its basic code, and needs to change before the LMS can become more accessible.

One of the most recent innovations for upping the ante in terms of blended learning is to provide fully online courses replete with professionally produced video pods for domestic students, but to also on-sell those units and whole programs of study to other commercially oriented institutions both nationally and overseas. Universities can thus benefit by recording their academics' best practice and packaging these programs of study into a product that can be sold ostensibly to a global market. Apart from the blended learning content on a LMS, a key element in this commercialization of education is the accompanying video pod lectures that add the human touch to somewhat bland web pages. Unfortunately, video pod content usually using PowerPoint slides is entirely audio/visual and often unreadable by assistive devices or accessibility software. Such video pods necessitate textual translations of the spoken word and the PowerPoint text, and this is seldom considered in the haste for universities to sell their courses to the highest bidder.

An overlooked aspect of blended learning is that it extends beyond LMS information retrieval. Blended learning also comprises the student face-to-face and online interaction with instructors and peers, the writing of assignments, submitting assignments to online evaluation sites, sitting exams, tests and quizzes, and receiving feedback. Every one of these activities is a possible source of accessibility problems, rarely considered in the literature, and given scant recognition in the W3C guidelines. A good example is the common practice for universities to require a student signature on a pdf copy of the institutional cover sheet to accompany all electronically submitted assignments. This is an anachronistic obligation from the past, but still mandatory for many institutions. Acrobat files have always been a bugbear for accessibility software, and is still a problem depending on how the institution creates the files. The disabled student must download the pdf, open the file in Acrobat, add an already saved graphical file of their signature, save the file, convert to Word, and then add the

cover to the beginning of the essay, then upload to the LMS. This process is a tricky one for able-bodied students, but is very stressful and error-prone for disabled students. It involves the student in owning and using Acrobat, MS Word and Photoshop in order to accomplish a legacy task from when students simply signed the front cover of their assignments. A simple solution would be to offer disabled students the alternative of submitting hard copy.

Students are expected to use a variety of online and computer-based software in the performance of their assessment tasks. MS Word, Adobe Acrobat and Photoshop have been mentioned, but in an arts and humanities school, use of Excel and PowerPoint, statistics software such as SPSS, the Library's online scholarly databases, such as ProQuest and Ebsco-Host, and social media sites like Facebook and Twitter are all mandatory parts of the curriculum. Videoconferencing programs such as Skype, and Zoom are also prerequisites for some classes at some institutions. This is an added burden for disabled students, with many of these programs not designed with accessibility in mind. It does not seem possible that a disabled student would be able to compete with an able-bodied student in terms of these specialized program skills, nor would it be possible for disabled students to perform equally within teams in the execution of group assignments. Such skill deficits are usually unexpressed by most research into disability and accessibility.

WEBSITE REMEDIATION FOR DIFFERENT TYPES OF DISABILITY

All types of disabilities are not identical in terms of the problems that arise from browsing the Web. Considering just hearing and sight impairment, it is only websites that depend upon speaking, audio effects or music that cause a problem for hearing impaired students, whereas the bulk of content and the majority of the world's websites are problematic for sight-impaired students. Hearing guidelines necessitate a relatively easy fix - a textual equivalent - but substitutes for sight-reliant processes are challenging because of the highly graphical nature of websites and navigation, in addition to computers themselves. The user-friendly, graphical nature of PC's and Macs developed originally from command line driven operating systems, and are certainly why personal computers have become universal tools in our current technology-rich society. Without the graphical computer, we would be using technology from about 25 years ago, when Windows 3.1 revolutionized computing. The opposite is essentially what is required to make the modern personal computer (and website) accessible to sight-impaired students. Developers seeking accessibility compliance need to re-invent the modern graphical interface into an effectively command line (or textual) driven one – in essence a 25-year retrograde step.

Hence, a key element of all accessible websites is the use of the markup language, HTML5, which allows for a range of customization without recourse to programming add-ons such as java or Flash. These latter programmed features are notoriously awkward because they do not allow for easy change, or user control. HTML5 is a mature language, not "code", with semantic-based terms that permit a great deal of user choice, if the need should arise (Peterson, 2012). However, HTML5 is not a Web standard at this particular period in time, and while most of the popular browsers accept HTML5 commands, there may be some occasional glitches due to incomplete recognition by browsers. An easy way to conceptualize HTML5 is to understand some of the tags, viz: <nav> for menu and sub-menu choices; <aside> for information that is not a part of the main page content; <article> for extra items such as blog posts, when users are not taken out of the current webpage, and thus losing their location.

It seems incongruous, but universities enrol many students whose disabilities are brain-related, or who may suffer from a learning difficulty such as dyslexia or memory problems. It is erroneous to think that intellectual ability is correlated with cognitive impairment. Thus, academics who create and edit websites related to their courses need to be aware of these requirements. The W3C guidelines are simply not clear enough to produce content for cognitive disability, with some recommendations surprisingly overlapping with sight and hearing fixes. Labeling, captioning and providing alternative content sources are identical to sight/hearing impairment. New recommendations include: allowing for mistakes in context changes by asking for confirmation; error announcements when a mistake is made; clear explanation on how to fix an error; allowing for extra time for users to perform a task; and being very clear when asking users to fill out forms. Media Access Australia has a Cognitive Disability Digital Accessibility Guide that spells out these recommendations in full detail (see <http://mediaaccess.org.au>).

Color-blindness or color-vision deficiency affects 1 in 12 males and 1 in 200 females around the world. It is another problems that is unfamiliar to website developers or academics who write content for their own pages (Collinge, 2017). While red-green color-blindness is the most common form, other color variations can also affect people - just red, or just green can be problematic, or blue and purple, or blue and yellow. Any of these combinations of colors can lead to confusion if the website relies on these colors for meaning, e.g. using bold red

text on a web page may not be seen as important by some students. Some of the recommendations include: do not only rely on color to convey messages; keep color palettes limited to 2 or 3 colors; use texture and patterns to show contrast; carefully select any contrasting colors and shades; and avoid using any known relevant color combinations.

While eye-tracking devices are more known in the latest games and the new world of virtual reality, assistive eye-tracking and head-tracking is the preferred method for assisting students who have limited movement. Such students include those suffering from Parkinson's disease, quadriplegia, multiple sclerosis, and dystonia. These students can now navigate the Web by simply looking at various parts of the screen, and then blinking in order to perform a mouse-click. The WCAG 2.0 guidelines make recommendations about the integration of websites and these eye-tracking assistive devices, mouth-stick pointers and head pointers. Obviously many of the error recovery recommendations apply to such disabilities because of the inevitable mistakes that will occur with headsets. Commonsense would decree that university websites need to be tested with a range of such assistive devices in order to discover any problems in their abilities to function (Moore, 2015).

DISCUSSION

The entire logic behind universal accessibility seems to rest on the idea that websites are the norm and that students without equitable access to websites are disadvantaged and discriminated against. This is certainly the case when we think about locating information from websites and research databases in order for students to write essays and reports. Most researchers would not wish to go back to using incomplete holdings of university libraries. The e-catalogues and databases of libraries should be a priority in terms of educational accessibility. Yet, there are other processes that universities have implemented that are much more debatable in terms of their educational value, and this value is seldom considered once a process has become entrenched.

For example, many tertiary institutions have completely rejected the notion that paper provides a more tangible medium for students (and staff) to base their learning upon. Many students complain that every single aspect of their education is online. Most of my students have never received a paper handout from a tutor in their entire three-year degree. Every single aspect of their course is available on the website 24/7, but students do not always appreciate this availability, they do not view this information, or perhaps forget certain aspects (Archee, 2015). Textbooks, thankfully, are still a feature of many first year subjects, but textbooks are substantially decreasing in sales and numbers. The problem here is that students believe that textbooks are too expensive given the amount of information they can obtain from free web-based sources. Most of the educational research shows quite conclusively that paper-based materials are significantly more easily comprehended, recalled and learned than screen-based content (Hooper & Herath, 2012; Jabr, 2013, Mangen, Walgermo & Brønnick, 2013).

However, many universities have decided that this research is irrelevant and dismantled their print facilities and placed all student (and staff) related content on the institutional website. If an institution proclaims their information on paper should cease to exist, then hinders a disabled person from finding that information on the Web, this is certainly discrimination. If that information is available in a paper-based format, or audio-based or in Braille the institution should not be accused of wrongdoing. The real problem seems to be that the institution has placed all its faith in technology that has glaring flaws for a significant proportion of its student population. Educational institutions, especially universities have been more radical than most other societal institutions such as banks and retail shops, both of which have adopted online processes, but have not ceased using paper, or offering old-fashioned service. There exists online banking and traditional banking, ebay and bricks and mortar stores, but there is only online information in the form of web-based content at many universities in 2017.

Such reliance upon web-based content, interaction and service is a societal phenomenon that is having negative side effects for all people, not just disabled ones. The prodigious increase in computer crime, such as current ransom-ware attacks, and the wide-ranging potential of digital terrorism are a direct result of the folly that governments, organizations and institutions have created by building vulnerable computer systems that are obviously flawed. Accessibility issues are just one example of these imperfections.

The only solution for this accessibility problem is for universities to test their websites by using a variety of methods – using automatic tools, checking websites manually, and employing specialist consultants who operate a variety of assistive devices and technologies. This could be an inexpensive method to ensure accessibility compliance and would function as insurance against being sued in the future. To date, most universities have largely avoided this systematic testing of their own processes, websites and learning management systems.

ABSTRACT

This research aimed to evaluate accidental risk factors of cyclists in Khao Yai National Park. Objectives are accidental risk factor analysis and to created accidental risk map for cyclists. Eighty five questionnaire, stakeholders, in-depth interviewed, and cumulative cyclist accidental statistics of Khao Yai National Park were investigated in this study during December 2016. The results found that majority 76.2% of the samples were male. 44% of sample group were using mountain bicycles, and 71.4% were amateur cyclists. 89.3% never experienced cycling accidents on the route between Prachin Buri to Khao Yai National Park headquarters. The results of the cyclists' opinion on factors affecting the risk of accidents found that the most effective factor was the curvature route downhill ($\bar{X} = 3.88$, S.D = 0.93), the second factor was high slope in a high risky level ($\bar{X} = 3.69$, S.D. = 0.98), the third factor was climbing up route which was also in a high risky level ($\bar{X} = 3.63$, S.D. = 1.01). Cyclist's satisfaction level with facilities in Khao Yai National Park was found that the sign on the road surface was clear ($\bar{X} = 3.61$, S.D. = 1). Secondly, the road surface was suitable for cycling ($\bar{X} = 3.54$, S.D = 1.05). Thirdly, sufficient sign/ label ($\bar{X} = 3.31$, S.D. = 0.91). While, the width of bike lane was the lowest satisfactory level ($\bar{X} = 2.77$, S.D. = 1.11). Consequently, cyclists suggested that Khao Yai National Park should increase the bike lane's width in order to reduce accidental risk for cyclist if possible.

INTRODUCTION

Khao Yai National Park (KYNP) was established as the first national park of Thailand in 1962. The national park covers an area of 2,165.55 square kilometers in the four provinces of Nakhon Nayok, Prachin Buri, Nakhon Ratchasima and Saraburi. Consisting of large forested areas, scenic beauty and biological diversity, Khao Yai National Park, together with other protected areas within the Dong Phrayayen mountain range, are listed as a UNESCO World Heritage Site. To reduce the effect of environmental degradation is an important issue for natural forest conservation (Popradit et al, 2015). Additionally, Khao Yai is represent as a home to a great diversity of flora and fauna, as well as pure beautiful nature. KYNP became a popular destination for both domestic and international tourists. The major activities for tourists are various such as trekking, bird watching, nature sightseeing, and camping (Utarasakul, 2014). Khao Yai National Park is a 3-hour drive from Bangkok. Tourists both motorists and cyclists can head north via Phahonyothin Highway to Saraburi onto Highway 305 and then left to Khao Yai. The route is 190 kilometers distance. Alternative route is Highway 305 to Nakhon Nayok. Drive to Highway 33 to the Noen Hom intersection, then turn left to Khao Yai. The route is total of 160 kilometers distance (Figure 1).

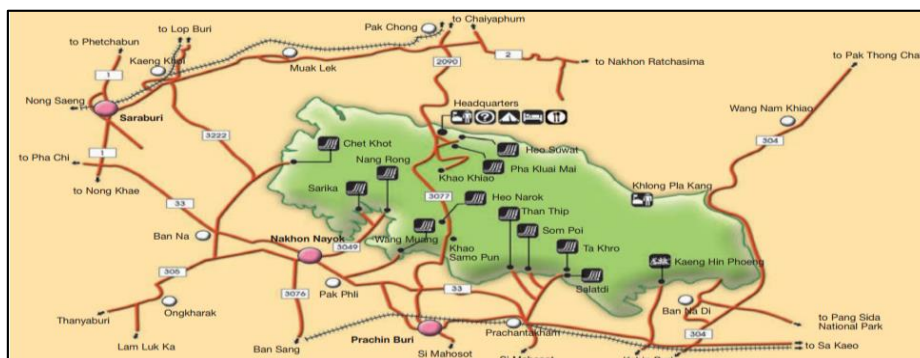

Figure 1: Map and route to Khao Yai National Park
Source: DNP, 2017

As the convenience of transportation to Khao Yai, more cyclists also travel to Khao Yai to explore adventure along greenery scenic route. Information of biking adventure club described characteristics of the bike route in Khao Yai from Rachasima Province to Heo Suwat waterfall as follows. The tracks climbs from below 400 m up to more than 800 m over the first 10 Km. It continues up and down hill, passing the visitor center, toward the crossing at the training center. The bicycle track is about 50 Km long and is paved all the way. Biking takes about 4-5 hours. A few highlights on this itinerary have been listed more for the sake of smoother navigation and referencing, although they may also appeal to many cyclists as points of interest. Individual cyclists can choose where to stop according to their own tastes and time constraints. Cyclist route also represent in Figure 2.

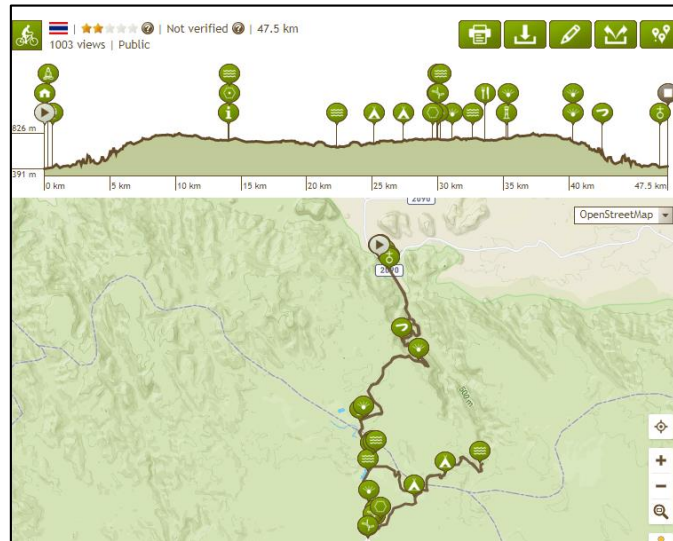

Figure 2: Khao Yai National Park bicycle track
Source: Ayutthaya Biking Adventure (2017)

From last few years statistics of cyclist to Khao Yai National Park, many cyclists visited Khao Yai National Park increasingly especially during winter and holiday seasons. More accidental rate were increased in some areas, in case of any severe accidental happened will take time and has more lost and injured. Therefore this research aimed to analyzed risk factors and to created accidental risk map for cyclists in Khao Yai National Park to prevent future accidental rate for cyclists.

THE STUDY

Eighty five questionnaire, stakeholders in depth interviewed, and cumulative accidental statistics of Khao Yai National Park were comprised in this study during December 2016. Framework of methodology was identified in Figure 3.

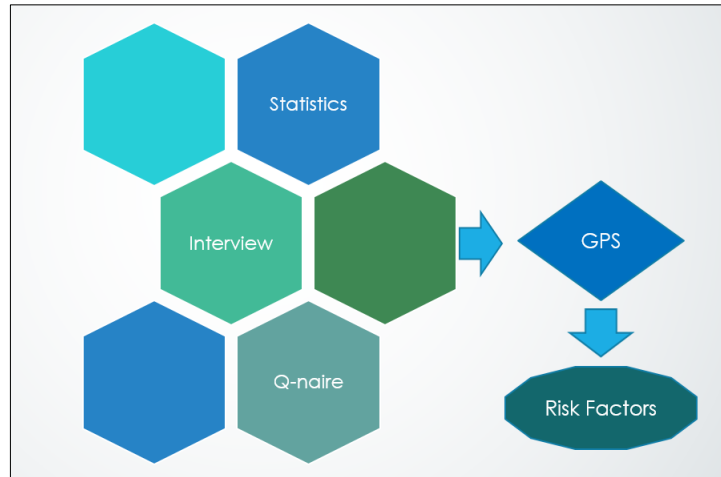

Figure 3: Methodology framework

Photos from field survey at Khao Yai National Park were presents in Figure 4-5. After integrated data of statistics, questionnaires, and in-depth interview, GPS data was also collected at risk points along the route of Khao Yai National Park (Fig. 6).

Figure 4: In-depth interviewed of staff in Khao Yai National Park

Figure 5: Questionnaire collection of cyclists

Figure 6: GPS data collection at risk points

FINDINGS

The results found that the majority 76.2% of the samples were male. 44% of sample group were using mountain bicycles, 71.4% were amateur cyclists. 89.3% never experienced cycling accidents on the route between Prachin Buri to Khao Yai National Park headquarters. The results of the cyclists' opinion on factors affecting the risk of accidents found that the most effective factor was the curvature route downhill ($\bar{X} = (3.88, S.D = 0.93)$). The second factor was high slope in a high risky level ($\bar{X} = 3.69, S.D. = 0.98$), the third factor was climbing up route which was also in a high risky level ($\bar{X} = 3.63, S.D. = 1.01$). When focus on cyclist's satisfaction level with facilities in Khao Yai National Park was found that the sign on the road surface was clear ($\bar{X} = 3.61, S.D. = 1$). Secondly, the road surface was suitable for cycling ($\bar{X} = 3.54, S.D = 1.05$). Thirdly, sufficient sign/ label ($\bar{X} = 3.31, S.D. = 0.91$). While, the width of bike lane was the lowest satisfactory level ($\bar{X} = 2.77, S.D. = 1.11$). Consequently, cyclists suggested that Khao Yai National Park should increase the bike lane's width in order to reduce accidental risk for cyclist if possible.

Summarization of risk points for cyclists were divided into 3 categories base on the criteria of type and frequency of injury as presented in Table 1.

Table 1: Summarization of risk points for cyclist at Khao Yai National Park

Level level	Number (point)	Type of Injury
Red (High)	7	Dead, body broken
Yellow (Moderate)	5	Medium injury
Green (Low)	2	Hurt, painful

In addition, risk map for cyclist in Khao Yai National Park was also presented in Figure 7.

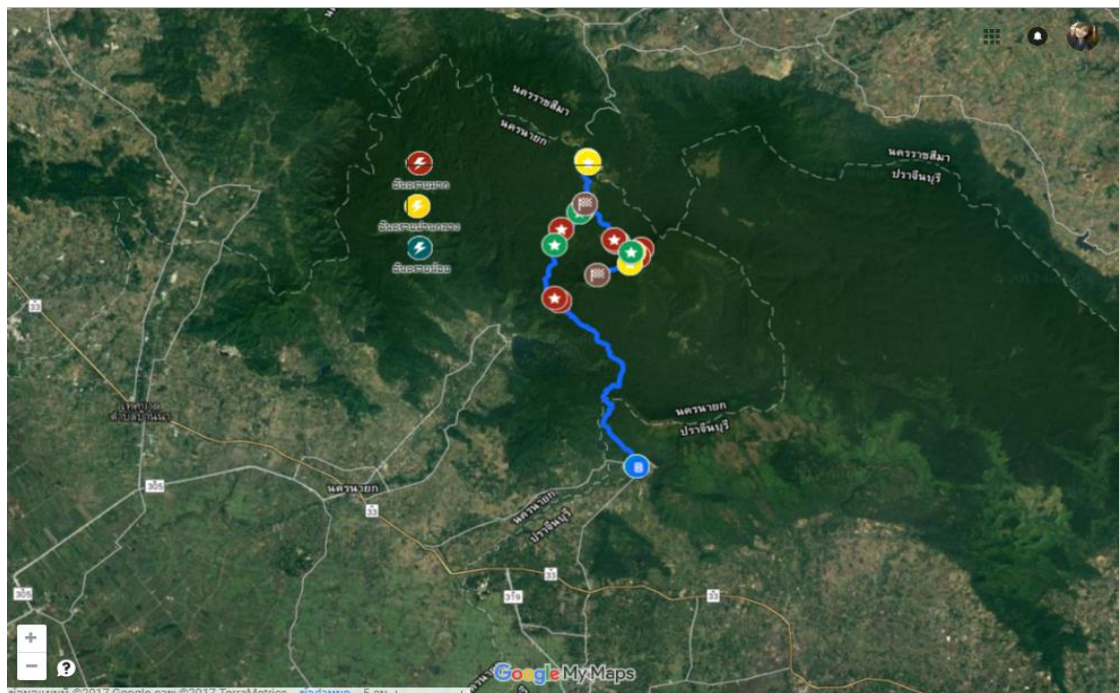

Figure 7: Risk map of cyclists at Khao Yai National Park.

CONCLUSIONS

From this study can conclude that risk factors of cyclists were composed of various factors such as physical condition of road, skills of cyclists, and also appropriate signs along the route.

- Type/ condition of road especially in sharp curve downhill, high slope, and narrow lane.
- People: experience of cyclist and mindfulness
- Excess baggage for touring cyclist during downhill
- Lack of warning symbol
- Risk area: during Khao Kieo route (approximately 11 Kilometers)

RECOMMENDATION

1. At sharp curve downhill, should set up sign or enlarge the width of the road to reduce future accidental rate.
2. Bike lane should not less than 1.5 meters.
3. Car speed limit in KYNP should be enforcement.
4. KYNP must develop safety guide for cyclists and add sign especially at curve downhill.
5. Digital risk map for cyclists is recommend to develop and share in social media in order to inform all type of cyclists.

ACKNOWLEDGEMENTS

This research was supported by Suan Sunandha Rajabhat University. Special thanks to students from Environmental Science Program, Faculty of Science and Technology, staff in Khao Yai National Park and tourists who helped and supported this project.

ABSTRACT

Accreditation is a subject recently on the agenda of university - vocational training in Turkey as it is in the rest of the world, and it is gaining importance each day. While holding an accreditation documents the quality of the education offered by an educational institution, increases its desirability and demonstrates that it meets national or international standards; it also ensures the recognition of the diploma issued by the institution. Moreover, with globalization has come the ability for architects to find work in other countries as well as their own. The diplomas being recognized in other countries, having a minimum knowledge and skill as a professional are of great importance today. For the first time this year, the Institute for Higher Education (YÖK) has included information regarding the accreditation of universities in its Student Selection and Placement System (ÖSYS) Higher Education Programs and Quotas Guide for students making their applications. At the top of accreditation requirements comes providing graduating students with specific knowledge and skills in accordance with the mission of the education program. Within the scope of this study, the accreditation process commencing in the 2000s at Uludağ University Architecture Department and continuing with a certain quality understanding, as well as its contribution to education is described. The Uludağ University Department of Architecture program accreditation process experiences, which commenced with the application to the American NAAB Accreditation institution, due to a lack of an institution offering accreditation to architecture departments in Turkey at that time; and continued with the establishment of MIAK in Turkey and an application and accreditation by MIAK will be described.

Keywords: Accreditation, architecture education, Turkey

1. INTRODUCTION

The path to individual and social development and progress is through education. Education forms the basis for social, political, legal and economic progress. With the emergence of the concept of globalization, proximity between different countries and individuals eliminate boundaries, individuals, societies and institutions obtain the opportunity to meet their needs from the most suitable places. The changing needs of society, developments in communications, education and technologies fields have brought the requirement for the review and development of education systems and programs in the field of higher education as in all areas. University education has gained an international dimension. It is important as a professional to have a minimum of knowledge and skill determined on a global scale. The opportunity for education in overseas universities during undergraduate and post graduate education with student and faculty exchange programs, ensuring the mutual recognition of education programs for those wishing to complete their post graduate education in another country, as well as diplomas received following graduation being recognized in other countries is important and required today. Accordingly, receiving a university education is not sufficient; the quality of the education provided at the universities is also queried. Educating professionals with individual characteristics is aimed. Quality assurance in education is documented with accreditations provided by national or international independent accreditation boards. Accreditation is defined generally as the assurance of quality, the development of quality, and the improvement of existing quality, and is accepted as an element of external observation (Esin, N. 2014)

Accreditation is a method developed in order to guarantee the quality of a program and services offered in many countries and industries with a systematic approach. (http://www.yok.gov.tr/egtfakdoc/egtfakdoc/akr2/bol1/bolum1_1.html). Accreditation is the process of giving formal recognition to the qualifications of an institution of individual carrying out a specific job by a competent institution. It is the certification by an independent and impartial institution that an institution works according to the technical criteria determined by a third party. (<http://www.dtm.gov.tr/SORULAR/AB/STAND.HTM#156>). Accreditation is one of the qualities within the total quality perception. It is an important factor for quality education and learning. It constitutes a system which is becoming increasingly important in recent years, and which must be applied to institutions offering education and training. The accreditation process is a phenomenon which requires careful handling particularly at universities offering graduate and post graduate education. The review of the benefits and features of

accreditation in academic studies will be valuable in terms of a quality education and being an indicator of the importance placed upon the quality of education in a country (Günlü, E.) Accreditation focuses on inputs, namely education, the characteristics of the teaching staff, academic and physical infrastructure (library, classrooms, computer laboratories etc.). With accreditation, the standards of the accrediting institution are created and the institution to be accredited meeting those standards at a minimum level is certified.

Accreditation is a method which determines a vision for an institution to improve, which improves dialog between employees, and offers information about the quality of the service to those benefiting from the service offered. In accreditation management, where the quality of programs and services offered to the public are ensured with a systematic approach, the increase in quality of education, the assurance and guarantee of the provision based on specific standards is ensured. Education institutions that provide accreditation usually follow the following method (<http://www.naab.org/accreditation/information/>): Accreditation, in general, is a process of external review that evaluates colleges, universities and educational programs for quality and improvement.

Any accreditation system includes five core elements:

- The evaluation is carried out by a non-profit, non-governmental organization.
- The program or institution prepares a self-evaluation report.
- The program or institution hosts a visit by a team.
- Judgments are made by peers who are trained.
- The program has opportunities to respond to the process at certain points along the way.

The Higher Education Council (YÖK) in Turkey defines the accreditation process in higher education with six basic factors (http://www.yok.gov.tr/egtfakdoc/agtfakdoc/akr2/bol1/bolum1_1.html):

- A “standards” set used in reaching a conclusion regarding programs,
- A self-assessment prepared by the faculty, describing how they work to meet standards and including their own assessment of how successful they are at meeting these standards,
- Visits carried out by a team of expert colleagues trained in the examination of the self-assessment report and other documents, the review of facilities, the monitoring of classes and carrying out discussions regarding teaching staff, teachers, the dean, and other individuals,
- A report prepared by the team carrying out the visit, including team assessments regarding to what degree the faculty meets standards regarding the accreditation, and their recommendations regarding the accreditation status of the programs,
- In the event of the team not considering an important fact in their report, or in the event of an important fact emerging following the visit, a written response by the dean of the faculty visited,
- The decision of the competent authority made on the basis of the evidence obtained from the faculty and the team carrying out the visit.

Within the scope of this study, the accreditation process commencing in the 2000s at Uludağ University Architecture Department and continuing with a certain quality understanding, as well as its contribution to education is described. The Uludağ University Department of Architecture program accreditation process experiences, which commenced with the application to the American NAAB Accreditation institution, due to a lack of an institution offering accreditation to architecture departments in Turkey at that time; and continued with the establishment of MIAK in Turkey and an application and accreditation by MIAK will be described.

2. INTRODUCTION OF ULUDAĞ UNIVERSITY FACULTY OF ARCHITECTURE DEPARTMENT OF ARCHITECTURE

The 4th largest city in Turkey, Bursa has a rich historical heritage which carries the Byzantine, Ottoman and Republican era cultural history and physical structure to today, in addition to its natural wealth and green texture. Established in 1970, the university is home today to 15 Faculties, 18 Vocational School of Higher Education, 1 State Conservatory and provides education services in the centre and districts of Bursa. The Architecture Department, which began offering education in 1993, gives education at the Architecture Department Building, which was designed as 3 floors (Figure 1).

Figure 1. Uludağ University Faculty of Architecture Department of Architecture

The undergraduate program covers a 4 year education program, and at the end of the 4 years students graduate with an “Architecture Degree”. Students graduate from “Master’s Degree in Architecture” at the end of 2 year thesis and non-thesis master’s programs, and as “Architecture PhD” at the end of the doctoral program. The doctoral and thesis graduate program offers education in four different areas under the Architecture Department; Building Technology Department, Construction Design Department, Architecture History Department and Restoration Department. At the Architecture Department, undergraduate education began in the 1994-1995 academic year, post graduate education began in the 2000-2001 academic year, and doctoral education began in the 2005-2006 academic year. The student quota determined by YÖK as 20 students the year undergraduate education commenced in 1994-1995 was increased to 103 for the 2016-2017 academic years. As of the 2016 fall semester, there are 544 undergraduate, 144 post graduate and 23 doctoral program students undergoing education at the Architecture department. As of the 2012-2013 Academic Year, double major and minor programs with the Department of Civil Engineering are possible. In addition, students graduating from the 2 year vocational schools are able to vertical transfer into the Architecture Department depending on their External Transfer Exam scores.

On the other hand, according to agreements made with universities in Europe for programs such as Socrates/Erasmus (a support program organizing student and academic staff exchange between institutes of higher education in Europe and organized by the Education Commission of the European Union responsible for education) and Leonardo Da Vinci (European Union vocational training program), the Architecture Department can carry out student and academic staff exchange with architecture schools abroad. Within the scope of the exchange program, a large number of foreign students have received education at our department. The department has a young staff consisting of 3 professors, 9 associate professors, 5 assistant professors, 3 PhD lecturers, 2 PhD researchers and 10 researchers as of the 2016-2017 academic years.

3. ACCREDITATION PROCESS AND SELF-ASSESSMENT WORK

In order to instill a quality culture, in line with this culture Uludağ University began national and international education and service accreditation as of the year 2000. The Accreditation Board under the Rectorate and the accreditation sub committees established at the Faculties and Departments under this Board defined their own self-assessment processes, and quality culture and accreditation work began in line with procedures. Uludağ University carried out adaptation work in all their education programs in the Bologna Process of which they were included in 2001, implemented ECTS, diploma supplement and program requirements which are the basic elements of the Bologna process, and commenced the quality process by ensuring continuous improvement of the education programs by obtaining the views of all stakeholders, such as students, teaching staff, graduates and employers. In parallel with this work carried out, Uludağ University was included in the Quality Culture Project and Corporate Assessment Program process of the European Universities Union. In this part of the study, the self-assessment processes of the Architecture department, which began accreditation work in 2012, are summarized.

1. Preliminary phase: The accreditation preparation process is a thorough process which requires a lot of preparation. First of all, everyone (faculty, administrative staff, and students) must believe in and be included in the work. In the preliminary phase involving all faculty members:

- Meetings were held on a Department level,
- An Alumni Advisory Board and Employer Advisory Board were established, meetings were held,
- The existing vision and mission of the Department reviewed,
- Swot Analysis completed,
- Activities and department strategic plan was determined in accordance with goals and objectives.

The Department swot analysis was carried out in accordance with the following setup:
Strengths and weaknesses, opportunities-risks were determined under the titles of

- Education

- Research
- Social relations (communication and integration).

The Architecture Department Strategic Plan was evaluated under 2 main headings:

- Developing Education Services
- Increasing the level of scientific research and development activities
- To continuously improve the services offered to the community, to strengthen relations with stakeholders in the framework of social responsibility

In the preliminary phase, course files were prepared for all mandatory elective courses included in the program. Course files were prepared taking into consideration all knowledge and skills to be imparted, by determining under what conditions and how the course content is provided. Within the scope of the accreditation conditions, work was carried out on how the knowledge and skills within the compulsory program within the general program would be integrated to the students in line with the knowledge, skills and competency required. How it would be supported with elective courses was explained (preparation of course matrix).

In addition, by carrying out surveys of teaching staff and students within the scope of the course, clarification of the knowledge, skills and competency imparted by the class was carried out.

2. Defining the Self-Assessment Process

3. Identification of the Originality of the Program

Work has been carried out for the definition of our existing qualifications, how it is given in a studio environment, and for the definition of studio culture.

4. Preparation of the self-assessment report.

Work was carried out in accordance with the MIAK Accreditation Conditions Self-Assessment Report Content.

5. Ensuring continuity of accreditation activities.

3.1. International Accreditation Process: NAAB (National Architectural Accrediting Board)

The initiative for Uludağ University Architecture Department architecture education to be brought to international norms, and becoming more beneficial to students, all teaching staff and administrative staff at the department began with the EUA-IRP process. Following the establishment of the Accreditation Committee in 2001 for the Architecture Department, due to there being no accrediting institution for architecture schools in Turkey in that period, no applications could be made. The National Architectural Accrediting Board (NAAB) is the only institution accrediting institutions offering education with “professional” diploma in the United States. When the NAAB took the decision to grant Substantial Equivalency certificates in the international arena in 2007, the Department decided to apply to this institution in 2007.

In order to obtain and maintain accreditation in America, an architecture department must develop a program parallel to their mission, and is expected to train knowledgeable and skilled individuals who can produce work according to performance criteria. NAAB members consist of representatives of four institutions. There are the ACSA (Association of Collegiate Schools of Architecture), AIA (American Institute of Architects), AIAS (American Institute of Architecture Students) and NCARB (National Council of Architecture Registration Boards). ACSA is the Association of Collegiate Schools of Architecture. AIA is the American Institute of Architects. AIAS is the Institute of American Institute of Architecture Students, which does not yet exist in our country, and has an active role in the accreditation process. NCARB is the board which carries out controls in America during the admission to the profession process, and issues authorization to candidates to work as architects. The process is as follows (<http://www.naab.org/>):

- Self-study
- Peer review
- Preparation of visiting team report (VTR)
- Action (judgment) by the NAAB Board
- Ongoing external review

In November 2007, General Secretary of NAAB visited Uludağ University Architecture Department and gave a positive view for the Architecture Department to be included to the work plan of NAAB. Consequently a Self-Assessment Report of the Department was prepared. There are four sections in the NAAB Self-Assessment Report (<http://www.naab.org/>). The report was prepared according to the articles below.

- **Program Description:** History and Mission, Learning Culture, Social Equity, Defining Perspectives, Long Range Planning, Assessment

- **Progress since the Previous Visit**

- **Compliance with the Conditions for Accreditation:** Human Resources and Human Resource Development, Physical Resources, Financial Resources, Information Resources, Administrative Structure & Governance, Student Performance Criteria, Institutional Accreditation, Professional Degrees & Curriculum, Evaluation of Preparatory Education, Public Information, Annual Statistical Reports, Interim Progress Reports

- **Supplemental Material**

As Uludağ University Architecture Department, all these conditions were dealt with in detail in the report (APR) prepared for the delegation to visit from the NAAB. The NAAB Visiting Delegation was welcomed at the Architecture Department 25-28 November 2007 (Figure 2). With the Annual Reports at the end of 2008 and 2009, the arrangements made in accordance with suggestions were relayed to the NAAB Board. The NAAB process was slowed in 2010 due to budget constraints. However as a result of the positive and encouraging 2nd Visit Report, thanks to the motivation of our university administration, resuming work at speed for a 3rd and final visit is on the agenda at our faculty.

Figure 2. NAAB Visit

3.2. National Accreditation Process: MİAK (Architecture Accrediting Board)

Under the leadership of Uludağ University Rectorate, at the end of 2010, a decision was made to support work in accreditation and education quality, and the accreditation through MİAK, the first and only architecture school accreditation institution in Turkey, became the primary objective in the self-assessment process.

Architectural Accrediting Board MİAK; is a board which accredits Architecture Education programs, established in accordance with the Chamber of Architects Accreditation Board Regulations. The basic purpose of the Architecture Accreditation Board is to develop architecture education through assessment and competency work. Thus it is aimed for better educated and quality architects to be cultivated and the welfare of society to be increased. Aims to guarantee the required design, technical and professional skills and ethical formation for a competent professional practice to be sufficient for those successfully graduating the education program for the benefit of society, whether voluntarily requested by the institution itself, or deemed mandatory by the competent authorities (<http://www.miak.org>, Chamber of Architects Architecture Accreditation Board Regulations, Aim, Article 3). The course program of an architecture department accredited by MİAK includes vocational courses, general courses and elective courses. An architecture education program which wishes to be accredited is requested to develop an education program suited to their own mission and providing MİAK accreditation conditions, and to provide students with an education to meet “MİAK Knowledge and Skills Required of Graduates”.

The Architecture Department, in recognition of the importance of national accreditation, made its application in 2011 with a Self-Assessment Report prepared again in accordance with MİAK criteria. MİAK Accreditation Conditions Self-Assessment Report Content consists of the following sections (<http://www.miak.org/>):

- **General Information Regarding Program:** Affiliated Institution, General Specifications and History of Institution, Vision and Mission of Institution, General Characteristics of Program, History of program, Mission and Vision of Program, Program-Institution Relationship, Program Self-Assessment Work, Report on Improvements, Responses Regarding Findings of Visiting Team, Responses Regarding Revisions of MİAK Accreditation Conditions, Program Approach, Architecture Education and Academic Scope, Architecture Education and Students, Architecture Education and Professional Environment, Architecture Education and Society, Human Resources, Teaching Staff, Students, Administrative Staff, Resources Regarding Learning Environment, Physical Resources, Information Resources, Financial Resources.
- **Education Features of Program:** Education Degree and Curriculum, Learning Environment and Performance Level, Learning Culture, Knowledge Required To For Graduation, Skills

- **Attachments:** Resume Information of Full and Part Time Teaching Staff, Architecture Education Qualification Framework/Knowledge, Skills and Competency, Courses, Statistical Information, Visit Team Report of Previous Visit

Annual reports following previous reports and MIAK Assessments, Annual Catalogue of Institution The MIAK Visit took place in December 2012, and the Architecture Degree Program accreditation process was successfully completed (Figure 3).

Figure 3. MIAK Visit

As a result of the evaluation of the Visit Team Report, with the 06.07.2013 dated 4/10 numbered meeting of the Architecture Accreditation Board, the Architecture Degree Program was accredited. In Table 1, the architecture degree programs accredited by MIAK in Turkey and their accreditation status is given (<http://www.miak.org/>).

Table 1. Architecture degree programs accredited by MIAK in Turkey and their accreditation status

Programme Name	Accreditation Type	Accreditation Year	Next visit year
ANADOLU UNIVERSITY Faculty of Architecture and Design Department of Architecture	2 Years - Monitored	2008	2010
	3 years	2010	2013
	6 Years - Conditional	2014	2020

GİRNE AMERICAN UNIVERSITY Faculty of Architecture, Design and Fine Arts Architecture Department	Accreditation Process		
NEAR EAST UNIVERSITY Faculty of Architecture Department of Architecture	Accreditation Process		
OKAN UNIVERSITY Faculty of Engineering and Architecture Architecture Department	Accreditation Process		

As of the 2016/2017 academic year, in Turkey there are 45 state, and 47 private Architecture departments under YÖK, making a total of 92. There are also 10 private Architecture schools in the TRNC, as well as one in Skopje-Macedonia. The number of these departments that are accredited is a total of 7, 4 states and 3 private.

4. GAINS POST ACCREDITATION

In this section of the study, the gains at the beginning, during and following accreditation are described under 3 titles.

• **Becoming a Faculty:** Changes were made to the administrative structure of our Department following the MIAK visit. It was decided by Academic Board decision for Architecture Education, which was included in the Faculty of Engineering and Architecture structure between 2002-2013, to be removed from the Faculty of Engineering and Architecture and to continue alone as the Architecture Faculty with its existing academic infrastructure and recommended departments. As Uludağ University Architecture Department, following the MIAK Accreditation Report, the necessary work was commenced and in February 2013, the application process was completed by the Architecture Faculty. In August of 2013, the Faculty of Engineering and Architecture was split and the “Architecture Faculty” was established. Changes were made to mission and vision. The Administrative and Education Staff were revised.

Within the Architecture Faculty, the Architecture Department, Urban and Regional Planning and Interior Architecture Departments were established. The Urban and Regional Planning and Interior Architecture Departments are expected to accept students when the necessary education and physical conditions are met.

• **Changes in Education:** First of all the Department Self-Assessment Report was prepared. Organizations to contribute to the self-assessment of the department, such as Employer Advisory Board and Alumni Advisory Board were established. Employer, Alumni and Student Surveys were prepared. The surveys were given to employers, alumni and students during the process. The course gain forms were prepared, and students and faculty members were requested to complete these forms for each course.

A file was created for every course in the education plan. Explanatory and introductory information such as tables containing course description, the knowledge and skills students must acquire, examples of good, bad and medium exam papers, course notes, course presentations, resources etc. were added to the file.

All courses offered within the scope of the Architecture Department education program are evaluated and revised according to the results of the “U.U. Course Evaluation Survey” carried out with students at the end of each term. In addition, opinions are also obtained on the revision of the course program from the Alumni Advisory Board, consisting of U.U. Architecture Department graduates working in different areas of the profession.

A new criterion was added to NAAB accreditation in 2005. This criterion, defined as “Studio Culture”, expects all architecture programs applying for accreditation to have a written policy explaining and shaping studio culture. Therefore, our department started work to define a net policy on “studio culture” as of 2002 when we applied to be accredited by the NAAB.

Revisions were made to the course program in order for students of Uludağ University Architecture Education Program to have obtained the knowledge and skills required of graduates by the NAAB and MIAK. The knowledge and skills intended to be imparted to students were matched with the U.U. Architecture Department Architecture Degree Program.

• **Improving Physical Spaces:** After becoming a faculty, the organization of the top floor was intensified. The studio area in the top floor was split, and the creation of studio areas, archive room and new additional offices began. The elevator, which was under construction during the period the Visit Team visited was completed and opened to use.

For the development of physical space, a protocol was signed between the Metropolitan Municipality and Uludağ University Rectorate on 02 July 2015 for the construction of an annex to the Architecture Faculty. The design work is ongoing. As part of the bicycle route throughout the university, a bicycle part application was developed for students coming to the department by bicycle. Work for the arrangement of the top floor continued, material cabinets were organized.

5. CONCLUSION AND EVALUATION

Accreditation is a subject recently on the agenda of university - vocational training in Turkey as it is in the rest of the world, and it is gaining importance each day. University education has gained an international dimension. While holding an accreditation documents the quality of the education offered by an educational institution, increases its desirability and demonstrates that it meets national or international standards; it also ensures the recognition of the diploma issued by the institution. Moreover, with globalization has come the ability for architects to find work in other countries as well as their own. The diplomas being recognized in other countries, having a minimum knowledge and skill as a professional are of great importance today.

For the first time this year, the Institute for Higher Education (YÖK) has included information regarding the accreditation of universities in its Student Selection and Placement System (ÖSYS) Higher Education Programs and Quotas Guide for students making their applications. In order to obtain accreditation, an architecture department must develop a program parallel to their mission, and is expected to train knowledgeable and skilled individuals who can produce work according to performance criteria. Accreditation is an ongoing process. An institution holding an “accreditation” certificate does not mean that it is permanently accredited. The accreditation process is repeated at the education institution at specific intervals by the institutions carrying out the reviews, and whether the determined standards are met is controlled.

Achievement Comparison of Lecture Method and Media Using in Rural People Training at Kanchanaburi Province

Jaruwan CHUTRTONG1

*Suan Sunandha Rajabhat University, Science and Technology Faculty
Thailand
jaruwan.ch@ssru.ac.th*

ABSTRACT

Main purpose of this research was to study the effectiveness of media using in training to rural people relative to traditional lecture method. The sample groups were people in Kanchanaburi province, Thailand. The data were collected by questionnaire. Sample groups were divided to 4 groups by age. They were under 15 years old, 15 – 25 years old, 25 – 55 years old and more than 55 years old. From this research, it was found that the satisfaction in using media as technology-assisted instruction had an average assessment as followed, 3.6, 3.3, 2.2 and 2.9. The research showed that younger people are better in learning from media. Senior in rural area liked tradition learning more than self- studying from media.

Keywords: Achievement, Rural people, Kanchanaburi province, Media

INTRODUCTION

People in rural areas training is the mission of the Thailand University. The purpose of the training is to increase knowledge for improving the quality of people's lives. Trainings with trials are having trouble in explaining because of the lack of basic science learning. Most training failed to establish adequate control experiments to rule out alternative explanations for the different groups. Therefore, it is necessary to find a solution. The idea is find something to help, such as media. Media refers to technological devices used for the purpose of instruction (Clark & Sugrue, 1995). Instructional methods refer to strategies used within a course to convey course content such as providing opportunities for practice or group discussions. Media-based instruction is one of another way that can create a meaningful learning environment where learning is fostered and supported. In a survey of organizations in the American Society of Training and Development's benchmarking service, the percentage of companies using technology-delivered training increased from 8% in 1999 to 24% in 2003, and more than half of the technology-based courses in 2003 were delivered online (Sugrue & Kim, 2004). In addition, over 1,100 institutions of higher education in the United States offer online courses (Newman & Scurry, 2001).

The present study examines cumulative evidence of the effectiveness of media relative to lecture method, since it is the most common training technique (Sugrue & Kim, 2004). It is important to determine whether or not media is effective for imparting useful knowledge and skills, as a form of technology-assisted instruction (TAI). If evidence suggests that it is not as effective as existing, organizations and institutions may be more cautious about replacing traditional teaching instruction with media, or develop more effective training methods. But if using media is effective under some conditions, we can use the results of this study to identify optimal conditions for learning.

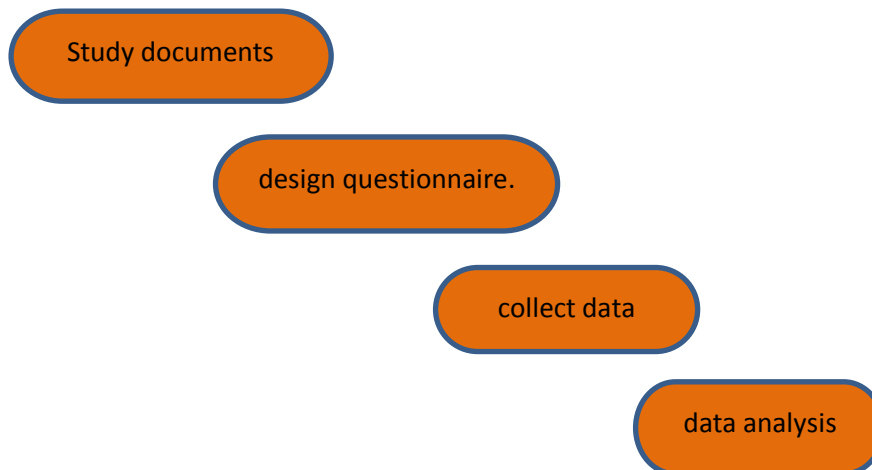

RESEARCH QUESTIONS

The objective of the study was to examine the effectiveness of media-based instruction relative to traditional lecture method.

METHOD

This research paper utilized the qualitative method. The data were collected by questionnaire. Questionnaire had been conducted by the researcher. First, study all available documents and research papers. Second, design the research tools and prepare questionnaire. The research tool was designed to elicit information from the respondents. The questionnaire sheet consisted of two parts, the first part was about the status of the respondents and the second part consisted of satisfaction in using the media. Third, collect data. Fourth, do the data analysis. The statistics used to analyze the data were percentage, average and standard deviation.

The informants could be classified into four main groups. The first group consisted of 10 persons who were children in rural area, under 15 years old. The second group consisted of 12 persons who were teenager, 15-25 years old. The third group consisted of 12 working persons, 25 – 55 years old. And the last group was 13 senior persons, over 55 years old. Collected data was conducted by these steps.

FINDINGS

1. The status of the respondents:

Respondents of this research are divided into male and female by females is 65.9 percent and 34.1 percent were male. If differentiate by age group, the first group of age under 15 years old had 60 percent of female and 40 percent of male. The second group (15-25 years old) had 83.3 percent of female and 16.6 percent of male. The third group of 12 working persons consisted male and female evenly by 50 percent. And the last group, which is senior people, had 53.8 percent of female and 46.2 percent of male.

Table.1. status of the respondents (%)

Group	male	female
All respondents	34.1	65.9
under 15 years old	40	60
15-25 years old 0.031	16.6	83.3
25 – 55 years old	50	50
over 55 years old	46.2	53.8

2. Satisfaction in using the media:

From this research, it was found that the satisfaction of using media as technology-assisted instruction had an average satisfaction assessment (from full mark 5) as follows; The average assessment of the first, second, third and fourth group were respectively 3.6, 3.3, 2.2 and 2.9.

Table 2. Satisfaction assessment of media using

Group	Satisfaction score
under 15 years old	3.6
15-25 years old 0.031	3.3
25 – 55 years old	2.2
over 55 years old	2.9

Group 1 could learn from the media as well. They didn't have problem about media playing speed. And also, they understood word on media. They didn't want more explanation. They informed that the content in the media are sufficient. Group 2 was similar to group 1. But Group 3 and Group 4 were different from groups 1 and 2. They wanted more slowly speed. They couldn't catch word on media clearly and they wanted more detail.

Table 3. Problem of media using

Group	main problem
under 15 years old	Not have
15-25 years old 0.031	Not have
25 – 55 years old	Quick speed, couldn't understand clearly
over 55 years old	Couldn't catch word, couldn't understand

CONCLUSIONS

From the findings revealed that the essential factors influencing the media understanding of people in rural areas were age and education. Gender was not the factor. From the questionnaire, there are no different data between male and female.

Children under 15 years are familiarity with the media because it currently has a widespread of medium instruction in classroom. Population in the age range 15-25 years old in rural areas sometime finish their school learning but they still continue learning about new technology.

So these 2 groups are able to understand the media as well while the other 2 group are focus on the work and daily routine. They are not familiar with studying from media. They like traditional classroom instruction, learn from human which have the interaction. In addition, physical performance is also the other factor especially in senior group.

RECOMMENDATION FOR FUTURE RESEARCH

The future research in this area should focus more on type of method which suitable for member of each age and each community area.

ACKNOWLEDGMENTS

This research was supported by Suan Sunandha Rajabhat University. I thank my colleagues who provided insight and expertise that greatly assisted the research, although they may not agree with all of the interpretations/conclusions of this paper.

Action Research in Teacher Education: Cases From ELT Teacher Trainees

Ayşegül ZINGİR GÜLTEN

Uludağ University

Turkey

zingir@uludag.edu.tr

ABSTRACT

Collaborative action research is a powerful form teacher development. In the recent years, it is becoming a common and a popular tool in English Language Teacher Education by taking its place as an important component in pre-service teacher education. Since it is still relatively uncommon for teachers to conduct action research studies in their own teaching, we aim at familiarizing our English Language Teaching (ELT) teacher trainees with the major characteristics and procedures of action research by also giving them opportunities to conduct their first collaborative action research studies. The present study discusses ELT trainees' first implementations of collaborative action research studies in the teacher training programme. Four collaborative action research cases conducted by ELT teacher trainees focusing on their own solutions and conclusions to their unique problems related to classroom silence, motivation, and vocabulary learning are discussed. The results indicate the positive role of action research as an important component of teacher education.

INTRODUCTION

Action research is a process in which participants examine their own educational practice systematically using the techniques of research (Kemmis & McTaggart, 1988; Nunan, 1992; Burns, 1999). Nunan (1992) points out the three major characteristics of action of action research: It is carried out by practitioners- the teachers, it is collaborative, and it is aimed at changing things. In practice, teachers conduct action research studies when they want to solve an educational problem they have in their own classrooms in order to improve their practices.

Collaborative action research is also known to be a powerful form teacher development. However, it is still relatively uncommon for teachers to conduct action research studies in their own teaching (Borg, 2010). Thus, in the recent years, it is becoming a common and a popular tool in teacher education by taking its place as an important component in pre-service teacher education in order to familiarize teacher trainees with the major characteristics and procedures of action research and by also giving them opportunities to conduct their first collaborative action research studies from the very beginning of their teaching experience (Atay, 2008, Shanks, & Miller & Rosendale, 2012).

The purpose of the present study is to explore ELT teacher trainees' attitudes towards action research studies. We also aim at gathering more information on teacher trainees' overall evaluation of their own action research experience, the effects of this experience on their teaching and their concerns towards being a 'Teacher as Researcher'.

THE STUDY

The participants of the study are 9 ELT teacher trainees from Uludağ University, Turkey. All the trainees are 3rd grade- 5th semester- students. All of the participants are in charge of planning and teaching English to their assigned classrooms. They are taking their regular courses including ELT Methodology II (2-theory, 2-practice). ELT Methodology II course primarily emphasizes the application of classroom-based research, teacher-directed research and action research: characteristics, procedures, data collection techniques by giving particular importance to action research.

In the initial stages of the term the teacher trainees are well informed about the definition of the action research, its major characteristics and procedures. After reviewing the components of the research, the data collection techniques, four different action research studies selected for further examining are dealt with the course instructor during the practice sessions. Then, the teacher trainees are asked to form pairs or groups of threes to

conduct their own collaborative research studies relying on classroom problems they have in their actual teaching. Following the action research procedures suggested by Cohen, Manion, and Morrison (2000) as shown below, the teacher trainees are asked to perform their action research samples.

- Stage 1: Researchers identify, evaluate, and formulate a problem that is viewed as critical to their everyday teaching.
- Stage 2: Researchers consult with other interested parties – teachers, other researchers, and administrators – in order to focus the problem more and perhaps suggest the cause of the problem.
- Stage 3: Researchers review research literature to find out what can be learned from comparable studies.
- Stage 4: Based on their reading, researchers may modify or redefine the initial statement of the problem, which may take the form of a set of objectives or a testable hypothesis.
- Stage 5: Researchers specify the research design including the participants, choice of materials, and procedures.
- Stage 6: Researchers clarify how the project will be evaluated with an understanding that this evaluation will be continuous.
- Stage 7: Researchers implement the project undertaking the data collection process.
- Stage 8: Researchers analyze the data, draw inferences, and evaluate the project.

During the remaining ten weeks, the action research groups have step by step followed the procedures listed and provided weekly reports to their instructors about their research. The course instructor-and also the author of the present study- is responsible to provide feedback to each group in each practice session. Thus, the challenges action groups faced with are immediately solved and suggestions are provided.

Besides the four collaborative action research cases conducted by ELT teacher trainees focusing on their own solutions and conclusions to their unique problems in the classroom setting, the data collection techniques employed in the present study include semi-structured interviews with the trainees, course instructor's field-notes and observation.

FINDINGS

In this part of the paper, brief information about the each four action research case is summarised by giving details about the real classroom problems teacher trainees detect during their teaching and then decide as the focus of their action research studies.

- **CASE I:**
The first research group consists of two collaborative teacher trainees. The trainees are teaching 38 7th graders- two groups. From the first lessons of their teaching, they notice a problem: "Silence". Students are keeping quiet throughout the lessons and they are unwilling to participate. So, the trainees identify their problem as 'Classroom Silence' and following the action research procedures they collect data via questionnaires, interviews and observation. They try identifying the reasons of silence and solving the problem by trying different strategies in the classroom. Finally, relying on the data, they list out some effective strategies that may help them in their unique setting.
- **CASE II:**
The second research group consists of 3 collaborative teacher trainees. The trainees are teaching 36 A2 level- three groups- adult learners attending a private language school. Although they have been taking EFL courses for over 10 years, they still have difficulties in English. Relying on their observation and consultation, the trainees identify 'limited vocabulary repertoire' as the main reason of their failure. Getting help from the related literature and asking students' preferences, the trainees decide on different actions like vocabulary learning with e-materials, vocabulary learning with vocabulary reports etc. After applying different techniques in the classroom, they get students' opinions by arranging interviews. They also evaluate students' progress by referring quiz results. Finally, they figure out some effective vocabulary teaching activities that are supposed to be valid in their own setting.

- CASE III

The third group is comprised of two collaborative teacher trainees. They are teaching 16 A2 level university students. The greatest challenge they have with their young adult students is their students' being 'unmotivated' in the Foreign language lessons. Considering their age and needs, the research group, tries integrating technology to their EFL classes. They basically focus on vocabulary learning as they believe this is the most important limitation in their language classes. They prepare different word lists, videos, vocabulary games, tests to take their attention and discuss with the students how effective they are in their setting.

- CASE IV

The fourth group, similarly, consists of two collaborative teacher trainees. They are teaching 15 5th graders attending a public school. The trainees are quite dissatisfied with the students' limited interest on learning English. Reviewing the literature on young learners, they decide to take their attention by considering the recommendations of 'peripheral learning'. They, then, decorate the classroom setting by posters, flashcards and colourful materials. They conduct follow up interviews with young children to support the observation data and identify some tips that would work well with their young learners.

CONCLUSIONS

Just before the term is over, the teacher trainees have completed their action research studies. Then, it is time to explore trainees' attitudes towards action research. After the analysis of the qualitative data gathered through different sources, some emerging key themes are categorised. First of all, the ELT teacher trainees emphasise the power of action research to enable them engage more closely with their classroom teaching. That is, the trainees indicate that the process help them both to understand their own practices and improve them. With regard to personal and professional growth, the trainees indicate the positive role of action research in terms of developing confidence, building self-efficacy in teaching, encouraging change and reflection, increasing self-awareness and personal insights, developing critical thinking. The teacher trainees also indicate that action research provides them the opportunity to develop teacher-student relations by encouraging mutual 'sharing'. Secondly, collaboration with other teacher trainees is also declared as one of the important contributions of action research. The teacher trainees all agree that action research encourages sharing and cooperation among them. Collaboration also facilitates the process by challenging them to think many issues. Thirdly, the trainees are quite satisfied with their action research and they are encouraged to write up and publish their own work. This is considered to be an important step in achieving the concept 'Reflective Practitioner' and 'Teacher as Researcher' perspective. As Stenhouse (1975: 143) indicate

- The uniqueness of each classroom setting implies that any proposal-even at school level-needs to be tested and verified and adapted by each teacher in his own classroom. The ideal is that the curricular specifications should feed a teacher's personal research and development programmes through which he is increasing his own understanding of his own work and hence bettering his teaching... It is not enough that teachers' work should be studied; they need to study it themselves.

As we strongly believe the potential of action research as an important tool in teacher education, we would highly recommend teacher education programs to integrate action research practices to their curriculum. It is also particularly important to increase planning/ teaching opportunities for 3rd grade EFL teacher trainees', where they can perform real action research samples as practitioners in their own classrooms. Providing in-service training for more experienced ELT teachers in order to make them familiar with action research may also take an important part in teacher development. Last but not least, we also need to encourage and support action research studies in school-settings in Turkey.

Faculty of Education

Constantine the Philosopher University in Nitra

Slovakia

ABSTRACT

One of the possibilities of increasing the social position and social interactions of pupils with special educational needs is the application of targeted educational programs. The presented scientific study approaches the current issues of inclusive education in Slovakia in terms of the educational aspect in the context of the social component of inclusive pedagogy. In practical terms, the author points out the social situation and interaction of pupils with special educational needs in inclusive leisure activities. The possibilities of its support were also explored through targeted educational programs with a sketch of the perspective of their further development.

INTRODUCTION

Nowadays the inclusion is the part of the basic human rights movement. Its supporters seek to ensure that regular pupils are not excluded by their physical disability or by psychological or physiological differences. Inclusive education, in essence, does not only concern certain specific groups of pupils, but all pupils involved in the process of education and training. So, talking about the school environment as such, because every pupil is an individual, is something specific. It is just a school that should go as far as possible to the pupils to meet their specific development needs. Of course, in order for education to be directed towards a certain cultural homogenization. Each participant should therefore have at the end of the learning process such competencies (knowledge, skills, competencies and values) that enable him / her to apply to the society in which he / she lives.

THE THEORETICAL BACKGROUND

As stated by B. Kováčová (2010), we do not refer to the majority and minority groups **in the process of inclusion** but to a heterogeneous group of people or children with their differences, especially with relatively irreparable mental, somatic, sensory impairment, with a potentially damaging impairment of communication ability, psycho-social disturbances or children with obvious or hidden threats or an acute risk of disruption or disability, mother tongue, family, environment, different nationality, different eye color, height, weight, etc.

J. Průcha et al. (2008, p. 322) in the Pedagogical Dictionary define the inclusion in the field of education as follows: *"This is a change in the view of the child's failure in the school system or the failure of the school system in the case of a particular child. The principle of inclusion implies that ordinary schools should educate children regardless of their physical, intellectual, emotional, social, linguistic or other conditions. Conventional schools with inclusive orientation are the most effective means of suppressing discriminatory attitudes. Through climate change at school and class, it allows children inclusive education, including children with specific needs, including children with severe disabilities."*

Introducing an inclusive education model requires these **changes and conditions**:

- It is essential to relieve the external pressure on pupils' school performance, the quality of the teacher's work and the quality of the school have to be considered more complex. The success of the learning process should be given in particular by the individual progress of each pupil;
- The teacher should have greater autonomy in the pupil assessment process. They have to be able to use all forms of evaluation, not only summative (classification by marks), but also a formative, critical and authentic assessment. School marks can't have a primary status in inclusive school;
- There is a need to strengthen the competence and responsibility of teachers and teachers for the individual progress of pupils. This, in turn, implies a weakening of the importance of an external evaluation, which primarily monitors objective test data and draws attention to quality indicators of success (e.g. the success of methods and practices for helping pupils with special educational needs). Emphasis should be put on an internal assessment (self-assessment), which is built on its own quality concept and on the priorities that the school follows (Bagalová, L., 2015, pp. 6-10).

Š. Porubský (2013) states that an inclusive education system is the only way, as otherwise there will always be some groups that are marginalized or excluded from the learning process in the sense that they do not get what they need in order to succeed successfully in company. The gap between standard middle streaming and marginalized groups has increased so that we will need ever greater costs to bridge this gap.

D. Ostatníková (2013) points out that the moral decline of today's society and its excessive economic focus threaten not only the healthy functioning of society but also the successful inclusion of individuals with disabilities, disruptions and threats.

While in the past, the platform of access to these individuals, in particular the socio-economic factor and the cultural and ethical factor played a very important role in accessing and caring for these individuals, we believe that in today's society, these platforms can paradoxically in the inclusive education more harm than help. Obviously the whole concept of inclusion and its implementation is significantly influenced by current social conditions. As P. Zászkaliczky (2010) adds: *"The economic crisis and the identity crisis in society cause many conflicts and the values, such as acceptability, tolerance, and respect that are characteristic of inclusion, are increasingly disappearing"* (In Šuhajdová, I., 2005, p. 17).

To **the current problems of inclusive education** we could note the following starting points. Inclusive learning means to create education conditions for all pupils in schools to help them overcome barriers to learning and encourage the development of their individual potential. An inclusive approach is defined as "unconditional acceptance of the special needs of all children". Heterogeneity is perceived as normality (Bizíková, L., 2015, p. 5).

Understanding inclusion as a natural, everyday part of our lives requires that inclusive education be developed in the world of children, through education in educational institutions as well as in the adult world, their cultural, social, working environment.

People with disabilities, disturbances, threats are inseparable parts of our society. Passing their pre-school and compulsory schooling together with intact children and pupils does not mean for them the end of the inclusion, on the contrary, it should be the beginning of their life-long social inclusion. As a consequence of this, inclusive society and inclusive education have to create a symbiosis whereby they will enrich, complement, learn from one another, or ultimately cooperate to achieve the common goal of inclusion in all areas of our life (Šuhajdová, I., 2015, p. 18).

A study by B. White (2007) found that from the five participating inclusion teachers after five years was only the one convinced that inclusive education could be successful. Others teachers were frustrated and tended to blame pupils with special needs for not being sufficiently motivated. Alarming on this research was that the attitudes of teachers at the beginning and the end of the study and hence of inclusive education did not change very much.

Despite the increasing interest in educating pupils with health disabilities in regular schools, they are not sufficiently secured in all schools in the constituency of municipalities or self-governing regions compared to special education. The practice and the findings of the checks imply the need to endorse in schools, in particular, support services and other elements which are aimed at educating all pupils without distinction according to their educational needs and personal prerequisites so that each school can effectively educate all pupils without distinction of their special educational needs or talents (Tekelová, M., 2013, p. 18).

It is obvious that our education isn't ready for inclusion. If materials are lacking, there is a lack of cooperation between primary school teachers and special pedagogues and psychologists, and such cooperation with special schools is naturally. The results as such can't yet be evaluated as inclusion pupils have not yet reached the years in which such an assessment could be made. However, the results are offered, for example, in the current research on the issue of special pedagogical diagnostics, special pedagogical counseling and early intervention for children with disabilities in Slovakia (Vančová, A., Kastelová, A., 2016).

In inclusive school, any variety is perceived as an opportunity to develop acceptance, cooperation with others, empathy, tolerance. **Experience from abroad** shows, for example, to the inclusive school that has been implemented in the Czech Republic for many years.

One of the successful projects is the Human Rights League project "Fair School". The main objective of the project is to contribute to the development of a basic education system in which no one will be excluded from the mainstream of education due to social disadvantage. The League grants the Fair School Certificate to a school that meets the standards, particularly in the field of human rights and non-discrimination. Valuable are the experiences that can be generalized and appropriately used or revealed problems that do not arise from the nature of the process of inclusion but stem from external objective as well as subjective factors.

The "Fair School" project details the benefits and possible problems that may arise in the process of converting a regular school to an inclusive school, at the level of a pupil with good social background, disadvantaged child (social, mental, physical), parents, schools and society (Bagalová, L., 2015, p. 14).

Table 1 INCLUSIVE EDUCATION FROM THE PERSPECTIVE OF: (Tannenbergerová, M., Krahulová, K., 2011, pp. 4-8).		
	BENEFITS:	POSSIBLE PROBLEMS:
1 PUPIL	<ul style="list-style-type: none"> - Class diversity provides the child with a realistic picture of the society in which the child will live, work, and better prepare for the future. - Teacher's individual approach can help the child to discover skills that the child didn't know. - The child learns to naturally perceive and respond to changes and differences. - In a heterogeneous group, a child better develops social and civic feelings, communication skills, or the ability to solve problems. 	<ul style="list-style-type: none"> - If a parent does not have a positive relationship to inclusive principles (for example, he or she expresses negatively about his / her child's classmates), it may affect the child negatively, because the child perceives the differences as a natural part of life.
2 PUPILS WHO ARE SOCIALLY OR PHYSICALLY DISADVANTAGED	<ul style="list-style-type: none"> - The child gets the opportunity to find friends in a regular college, its social environment is not limited to children with disabilities. - Teacher's individual approach can help the child to discover skills that he / she didn't 	<ul style="list-style-type: none"> - Children with disabilities, disabilities are mostly accustomed to special treatment, which can lead to dependence on others. Inclusive school teaches kids to make the most of their own abilities which children can perceive negatively, for example as a loss of attention.

	<p>know.</p> <ul style="list-style-type: none"> - The child gets the feeling that is a part of society, which strengthens its self-esteem. - The diversity of the class provides the child with a real picture of the society in which it's living, working, making it better prepared for the future. 	
3 PARENTS	<ul style="list-style-type: none"> - The openness of teachers, their willingness and willingness to cooperate allows parents to more effectively control the results and the course of their children's education. - Inclusive access to education makes it easier for parents to educate their children. - By participating in various school events, parents better know the life of their children. 	<ul style="list-style-type: none"> - Due to the fact that most inclusive schools are actively working with parents, parents may have to spend more time on school, which may seem to be a problem for someone.
4 SCHOOLS	<p>They are constantly developing the teacher's abilities and forming a team from the pedagogical colleagues.</p> <ul style="list-style-type: none"> - The inclusive school emphasizes the quality of team collaboration, making the teacher's work easier. - An inclusive school plays an important role in local community life. It is a cultural, educational and family center. 	<ul style="list-style-type: none"> - Inclusive process is at the beginning time-consuming. - Implementation of inclusion requires organizational change and staffing. - Changing conservative thinking may be challenging for teachers, parents, and school leadership.
5 COMPANIES	<ul style="list-style-type: none"> - Inclusive school leads children from early childhood to tolerance, empathy and understanding. - Deconstruction of xenophobia, racism and learning to co-operate with minorities. - Inclusive school helps solve taboo topics. 	<ul style="list-style-type: none"> - People usually oppose changing stereotypes, introducing new practices into practice may require many efforts.

In the issue of inclusive pedagogy in terms of education, we quote P. Lenčo (2012, p. 182), which states that: *"Similarly to formal as well as informal education, it should pay increased attention to the application of an inclusive approach to people with special educational needs"*. From this point of view, free time education seems very necessary and beneficial. It's not an exception if such children are isolated from an intact population, nor do they have enough free time in all regions. In special schools, for mentally handicapped children, there are also school children's clubs, but there, as well as in education, children do not have the opportunity to interact with intact peers.

Education should include two processes: the individualization and the socialization. Although they may seem contradictory, a balanced and full-fledged life of man is necessary. It should be borne in mind that if the socialization is precarious, the child can become too conforming, passive and submissive, but if the individualization becomes precarious, the individual becomes selfish and unable to cooperate (Zelinová, M., 2012, p. 27).

Non-formal education has several distinct features over formal education. These can positively influence the inclusion of people with disadvantages or disabilities in society. Differences lie mainly in its principles, methods, forms. Furthermore, it is characterized by greater autonomy, non-standard environment, activity character, more open organization of educational activities, but also non-traditional composition of educators, not only professionals but also volunteers (Kratochvílová, E., 2010, pp. 75). These appears to be an appropriate environment for applying an inclusive approach to education. L. Fenyvesi, D. Kollárová and G. Pintes (2014) complement this topic in view of the specifics of the professional start of educators in the conditions of school children's clubs.

One of the main arguments for inclusive education is **the social interaction** in particular. However, it is important that educators can also ensure their direct interaction, as it may happen that intact children do not have to be interested in children with disabilities.

In addition to the pedagogue, however, according to some research findings, it appears to be an effective peer support. For example, research by S. Naraian (2011) has highlighted the fact that sustained parental support can be spontaneously provided in primary education to a pupil with disabilities. At the same time we have to state that we share the opinion of N. Bizová (2012, p. 148), which states that: *"The inclusion of a pupil with a disability in the classroom, a children's school club or an interest unit without further work with a group of children does not guarantee success inclusion"*.

One of the best ways to support inclusion is to rock support. C. Hughes and E. Carte (2008) describe the positive experiences of schools in the US where such forms of support were implemented within the framework of teaching. There are a number of rosters support programs that are mainly focused on tutoring, mentoring, or prevention of socio-pathological phenomena (Liberčánová, K., 2011, p. 202). In Slovakia, peer programs are used mainly for tutoring. They are mostly implemented by civic associations.

The peer support for inclusion in educational establishments is that the peer-bearer engages his or her disability or disadvantaged group in group activities, is involved in teaching, exercising tasks and knowledge, and last but not least, spends the time with him, and acts as a mediator in establishing new friendship relationships with other children. Therefore, their application in education is not only desirable but also perspective. The basic pillar is the difference of children and their guidance to understanding the differences as enriching factors and phenomena for their own personal growth.

The free-time and interest-based services could be a good environment for **diversity**, as they are not limited by any performance and content standards. Easily achievable is the age heterogeneity, gender heterogeneity, heterogeneity based on the type of temperament of children, the cultural, ethnic or linguistic heterogeneity. Here are some rules and principles for the effective functioning of such a social group as a whole. In addition, we are talking about the specifics of integration of students with specific educational needs at the university, which are addressed by V. Beliková, H. Zelená and Z. Babulicová (2012).

The first step should be to understand this heterogeneity, its naturalness and its benefits. Only then can we start working on its full application in practice. In order to implement inclusive education, it is necessary for the teacher to recognize in his/her educational group the basic criteria in which all are similar and different, which are specific to individuals, while fully respecting them in the direction of individual approach (Polakovičová, R., 2015, 2016; Komora, J., Polakovičová, R., 2013¹²).

THE STUDY

In our study, we focused on the issue of inclusive pedagogy in terms of leisure time, and we followed several indicators (see Nagyová, K., 2017). Our **main goal** was to describe the issue in depth and to deepen it into its context. That is why we have chosen the qualitative nature of the work. We have therefore set two fundamental **research objectives**:

- C1: To point out differences in the education of intact children and children with mental disabilities.
- C2: To point out the benefits of inclusion of mentally disabled children in terms of leisure time education.

From the research objectives we have identified the following **research questions**:

- O1: Do children with mental disabilities have the opportunity to spend free time in the spirit of inclusion in Levice and its surroundings? (As an available research file)
- O2: What is the impact of inclusion in free time education on all its stakeholders?

- O3: Do children with mental disabilities in the interest group and some friends or their healthy children just accept as part of the group?
- C4: What positive is the inclusion of your free time?
- C5: Have parents of children with mental disabilities sometimes thought about inclusion in education?

Our **research group** consisted of 5 mentally handicapped children, particularly in the middle of mental retardation, attending a special elementary school in Levice within the framework of education, but in leisure time attending for a number of years various interest departments, with the common and basal reality of all interest departments is their inclusive nature. In addition to the children, our parents' testimonies were very much needed for the purposes of our study, and so they also belonged to our research team because they have innumerable experiences in the field and personally touch their issues. In addition, they are best able to describe the behavior and survival of their children, and to estimate the impact of individual devices and leisure time activities, taking into account the environment where the education takes place, on their offspring. A total of 9 parents were involved in our research.

A very important part of the research group was, last but not least, pedagogical staff leaders of individual interest departments who come into contact with children with mental disabilities and have decided to lead their interest department in the spirit of inclusion. We were able to obtain testimonies from 3 such pedagogues.

METHODS

In order to achieve our stated goals, ie to answer research questions and to clarify the research objectives, we have chosen the qualitative nature of the work, taking into account the deeper penetration into the given issue and thus a better understanding on the basis of the personal experience of our respondents.

We used the following **research methods** to collect data:

The **case study** was used as an illustration of the individual life stories of children and their families, which were the subject of an entire study of the influence of free time inclusion. We focused on the description and characteristics of their diagnoses and the specifics that arise for teachers working with them, whether in education or training. We also described the family environment and the backgrounds of children, as the family environment is one of the important factors in shaping the personality of each person. Last but not least, in the case of case studies, we have left room for the description of personality expressions, behavior and survival as well as the work in the school environment of each child that formed the object of our investigation.

We interviewed parents who have children with mental disabilities included in the free-time interest group among healthy children, as well as educators who lead interest groups in the spirit of inclusion. We used a **structured interview**, in which we asked respondents open questions, which are more difficult to evaluate, but our goal was to give respondents the opportunity to express deeper thoughts and opinions, according to qualitative research. We focused on deeper intrusion into the issue of leisure time inclusion, and we were interested in the reflection of all stakeholders on the subject. We also wanted to point out how inclusion can, in our opinion, be more effective, since it is a matter of opinions, attitudes and understandings that should be based on quality education, which at the same time provides free time for adequate space.

The data collection was made through a meeting with individual respondents. We typed them with respect to our personal experience with them through work in a special elementary school, we knew that they were attending interested departments along with intact children. Data collection took approximately 3 weeks, each meeting was recorded on a dictaphone and then converted to a written form.

When interviewing families and their children, we proceeded individually, so we set a particular time for each family to get the most honest and truthful information possible and then compare the testimonies to each other. We preferred personal contact because of the greater authenticity of data collection and information. We

interviewed our parents without the immediate proximity of the children, playing on a nearby playground. However, the parenting couple had a synchronous interview with us.

When interviewing educators, we also approached individual interest groups without the presence of the children concerned with the research.

The data processing method was as follows. Case reports have been prepared on the basis of interviews with parents of children as well as with pedagogical staff in the special school attended by all children. We also went from a study of children's health records from specialist doctors as well as from psychological reports where a family history was also based, as well as a study of school documents (IVPs) and reports from which we were able to obtain information about children's behavior, specific educational needs as well as learning outcomes. Interview was obtained through direct contact with respondents, recording interviews on a dictaphone, and then transcribed for better illustration and comparison of the results.

RESULTS

Built case reports

For a more accurate illustration, we have compiled the following case studies of the individual children that are part of the subject of our research. We briefly focused on a family history, a description of the state of health, behavioral characteristics, the school environment, the specifics of access to them, and a description of interest activities.

Interview Analysis

In the interview, we turned to 9 parents, namely 4 parental couples and one single mother, who have 5 children with mental disabilities. It is also common for all that their children, at the same time, visiting or in the past attending an interest of an inclusive nature. Our parents willingly answered questions. They were speechless, they needed to express their opinions, feelings and attitudes, and appreciated the space offered. From many expressions, we felt joyful that even a handicapped child can be integrated into healthy children, others have read the disappointment in negative experiences, but we can say that all parents have a real interest in their children and do what they can to help their children To ensure the most valuable life possible in order to balance healthy children.

Table 2

INTERVIEWS WITH PARENTS OF MENTALLY DISABLED CHILDREN ATTENDING THE INTEREST GROUP WITH HEALTHY CHILDREN ON THE PRINCIPLE OF INCLUSION INCLUDED THE FOLLOWING QUESTIONS:

1. What are the opportunities for leisure time activities in the city and its surroundings for a child with a disability?
 2. Have you noticed some influence of the interest unit on your child?
 3. What attitudes have you registered from other children in the interest department or from their parents?
 4. Does your child also have some friends in the interest department?
 5. Your child is attending a special school. Have you ever thought about inclusion in a regular school? What were the reasons for this?
- Other questions have not been the subject of our research, but they are completing the picture of the whole issue:
6. How did you approach the neighborhood to you and your child, as well as your potential admission to the interest group, did you meet?
 7. Your child is attending an interest unit. Can you specify what kind it is?
 8. What does it mean to you that your child is attending an interest unit with intact children (children without disabilities)?
 9. Would you like to have some other options for spending your baby's free time?
 10. What plans do you and your child have at the end of his / her education? Where will your child spend time when it doesn't go to school?

From these interviews, we have come to the following results. The first research question as to whether **children with mental disabilities have the opportunity to spend free time in the spirit of inclusion within the city of Levice and its surroundings** has consistently learned from all parents that the possibilities are very limited. It is not yet common practice

for the heads of interest departments to accept children with disabilities and there is no prescription or law to motivate them. Nevertheless, these parents have been able to find interest for their children, where they have the opportunity to spend their free time in the company of healthy children. However, they had to submit a lot of papers on their child's ability to attend the chosen interest group, and first of all they had to make a nice, friendly, willing and new affair of the head of the department. In spite of this, children with mental disabilities have few options within the city and its surroundings to spend free time in the spirit of inclusion, but the demand for such options from parents is still small. All parties must gradually become accustomed to opening up new opportunities. Prevailing are facilities offering leisure activities but segregated to disabled clients, but there are also shortcomings in the perspective of prospective issues, especially for capacity reasons where demand exceeds supply and so the future will also be for the parents of these children, other children with disabilities within the city environment, the dilemma where to go with the child after the end of the educational process.

Our second research question was, **what impact does inclusion of free-time education have on all its stakeholders?** Parents of four children consistently reported observed changes in their children's behavior after long-term attendance of interest groups, and in particular, enjoyment of activity and therefore overall positive emotion. Furthermore, children became less shy, more open, self-confident, enjoyed a sense of usefulness, especially when they have the opportunity to present themselves to the public and experience success. In just one case, unfortunately, the inclusion did not follow the parental plan, and the child eventually turned off from the interest unit because she was not accepted among the group members, the teacher's intervention did not help and the girl had psychosomatic troubles. For all parents, however, the opportunity to visit their child's interest in healthy children was somehow fulfilled by their wish for meaningful spending of their child's free time; in addition, this option served as a form of satisfaction for all of their parents to have their child in something successful for a while the feeling of having a child with disabilities, and everyone expecting their children to grow up and grow personally will improve their social skills. Only in one case, for a negative experience, the parents came to the conclusion that their daughter would be better off among the seborrheic people.

The third question was whether **children with disabilities also had some friends in the interest department?** All the parents consistently said that they were still a form of acceptance rather than friendship, the children would greet, they would say a few sentences, but they did not want a deeper interest in themselves. It's still too little time to make progress against the beginning, but it also depends on the children in the group, it seems that younger people are adapting more easily. Of course, a great deal of attention must be drawn to the behavior of children with disabilities towards others, and that is why their reciprocal relationship with them depends on them. In one case, however, it turned out that the children did not get used to it and despite the effort, the problems could not be eliminated. In this case, the negative situation had serious consequences for children with disabilities in the form of psychosomatic difficulties. It therefore shows how extremely important it is working with healthy children as much as possible to bring them closer to the health problems of children with disabilities and to be a model for their right access to them. These facts arise from the personality of the head of the interest unit, that is, the pedagogue, his convictions, attitudes, moral values, education, experiences. On healthy children there is undisputed influence of family education and its value orientation.

We were also interested in **what kind of benefits has the inclusion in the free time?** Here, parents agree that their children, in the first place, bring joy and thus a more positive attitude. Furthermore, children became less shy, more open, self-confident, enjoyed a sense of usefulness, especially when they have the opportunity to present themselves to the public and experience success. For other children, such inclusive functioning as social training in the area of the elimination of prejudices, fear or feeling of superiority.

The last question that asked **whether parents sometimes considered inclusion in the education as well?** Three families said they never thought about inclusion in the classroom, or they had the opportunity to appreciate teachers' attitude as well as the quality of the teaching process in a special school or the whole climate and the relationships in school and class. In addition, they are aware of the limitations and specificities of their children's education, as well as intolerant approach to the environment. In two families, there were situations when they considered inclusion because their parents felt that their children did not develop sufficiently and collaterally. In the end, however, they did not reject the inclusion for the reasons already mentioned.

Parents' view of the inclusion of free-time units and facilities based on their personal experience has very accurately outlined the essence and gave us a comprehensive view of inclusion's core. Through the mediated experience, we looked at the shady pages of inclusion as well as the undeniable positive it brings.

However, we also enjoyed the view of the other side, namely the educators and the staff of the department, who also willingly shared their insights into inclusive practice as well as their valuable insights and attitudes on this issue. We contacted 4 pedagogical staff, who have just mentioned children with mental disabilities included in their interest departments/gropus. The speech gave us a lead of art course in the Center of free-time, the head of the dance group at the elementary art school leading the folk dance class. The speech was refused by a former teacher who led the dance ring a year ago, focusing on social dances. Finally, we gave the speech from the head of the swimming course.

Table 3

INTERVIEWS WITH LEADING INCLUSION INTELLIGENCE TEACHERS AND ATTENDING MENTALLY DISABLED CHILDREN CONSISTED OF THE FOLLOWING QUESTIONS:

1. At present, it is becoming more and more common to include children with various disabilities in ordinary schools and ŞKD. What is your opinion on the inclusion of children with mental disabilities in interest groups?
 2. What meaning do you see in this form of inclusion?
 3. What responses did you have of healthy children and their parents about integrating and accepting children with mental disabilities?
 4. What were the responses of your colleagues when you started practicing your interest group on the basis of inclusion?
- Other questions have not been the subject of our research, but they are completing the picture of the whole issue:
5. What is the work with children with mental disabilities within your department?
 6. What do you find the most difficult thing to do with children with mental disabilities?
 7. What are your plans and visions for the future with your interest group, even with regard to an inclusive idea?

Our research question has been **about the impact of inclusion in free time education on all its stakeholders**. Here all respondents have responded that the main impact is mainly on healthy children and on changing their attitude towards inactivity. At the same time, they consider this to be key. In addition, children with disabilities learn to respect social norms and rules of behavior, they also improve their skills and learn to be more prolific. For pedagogues, such experience also brings new experiences, while one learns a lifetime, so they can also shave their attitudes and values.

Another of the research questions was **whether the children with disabilities have in the interest groups some friends**. Like parents, pedagogues have pointed out that it is just a matter of tolerance and gradual interaction, but friendship can't be said so far. There is the possibility that over time, the situation will change when healthy children mature but there is also the chance that it will never change, as children with mental disabilities have different minds, interests, and this gap will grow as healthy children Grow and move forward.

We were also interested in **what kind of benefits does has the inclusion in the free time?** Pedagogues agreed that for healthy children, such a form of leisure time activities provides a space for deeply educative action through immediate experiences, allowing them to positively influence their attitudes and values and to build socially desirable values. It's the opportunity for people with disabilities to meet healthy populations, experience new social situations, discern differences and build mutual tolerance.

DISCUSSIONS

As demonstrated by research results analysis, inclusion appears to be a win-win process, although it requires a highly sensitive approach and a thorough preparation of all the stakeholders involved, as well as of the whole society, both theoretically and practically. However, the results should be worthwhile, although it must be kept in mind that the results will not arrive immediately and inclusion is a long-term process. One possible subject for research could be to observe and explore social relationships and interactions between healthy children and

children with disabilities to prevent only superficial territorial inclusion and to achieve a profound meaning of inclusion. A theory could also be developed, which would then be followed in practice. It would focus on specific activities aimed at bringing inactivity of children with disabilities to healthy children at an acceptable level as well as the so- "Entangling" activities for the entire inclusive team as a lesson for educators who choose to go through the inclusion process to make it easier for them to work in new children's composition and to prevent possible failure of inclusive efforts.

Last but not least, care should be taken to care for children with disabilities after school attendance, as there is a great lack of capacity in practice. As shown by the research, parents would appreciate more facilities working on the principle of day care, where they would provide their clients with activities and activities during the day while their working parents are in employment. The question of where to place a child who is already physically mature but mentally at the child's level or unlawful if parents do not want to place their offspring in a social service facility is a big dilemma for many parents and should be a matter of interest to the whole society, Government authorities and politicians to be able to ensure a full-fledged life for people with disabilities while allowing them to live in the home, with the people closest to them. Another subject of interest should be, at the same time, sheltered workshops, so that such people do not become marginalized exiles, but they can survive their lives knowing that they are useful, because many would want to prove that they can apply, only to them it is necessary to create acceptable opportunities for self-realization and also to help the society to get out of these people too, thus eliminating the barriers in the thinking of many people in society.

CONCLUSIONS

As we discussed in previous sections and we were trying to point out that the current state of the school system in Slovakia is not adequately prepared for the inclusion of children with special educational needs in the educational process, we would see the possibility to start with inclusion first in the free-time (no in school-time). In the case of interest activities performed by children in interest groups, the mental level and knowledge of children, such as manual skills, interest in activity and some degree of self-realization, are not necessary. Even children with mental disabilities have their own interests and hobbies, though perhaps not so creased as their intact peers, because there are also no opportunities within which their children can develop and refine. But they have a great interest in doing, wanting to do something, wanting to succeed, not just sitting in the corner or between the four walls of the apartment. Moreover, leisure time as a space especially for the upbringing and shaping of the personality provides an ideal space for inclusion, since it should benefit not only disadvantaged children but also their healthy lay-ups. Children with mental disabilities would have the opportunity to accelerate their development in certain manual, social and personality skills, a team of healthy and more skilled children could act as a sufficient stimulus for activation and therefore legitimate improvement over time. Conversely, in intact children, such an experience could also create their attitudes, social feelings, empathy. At the same time, under professional and sensitive pedagogical leadership, it would act as a means of preventing racism, discrimination, exile, and egocentrism to egoism.

Even in this area, some training for pedagogical staff, especially educators, would be needed to also be able to properly and adequately access and develop potential children with mental disabilities. An inalienable part should be the high demands on the moral aspect of the pedagogue, as it should also be totally recognized as an educational aspect of inclusion, to be congruent, and thus to be able to conquer and properly nourish healthy children. He would also have to work on the part of parents and carry out as many activities as possible to present both the work of all children, including those with disabilities, but also to point out the cooperation of children in the group, positive relations and the climate.

In our view, in our opinion, such an optimal state would be, in addition to the conviction of a pedagogue and continuous education, it was necessary for the educator to provide suitable conditions for such an inclusive form of education at the leisure time. We mean a clear reduction in the number of children, particularly with regard to school clubs. It is equally important to us to involve the pedagogical assistant in non-teaching. In addition to the aforementioned hypothetical benefits, such a form of work with the child could improve his / her relationship with the assistant, as it would also be informal education, which allows a better and deeper knowledge of the child, and therefore a more adequate development of his / her personality or compensation in deficient areas.

Also, the work of the educator is very challenging, especially to maintain discipline (it does not have methods, forms, means to maintain it compared to the teacher), and if he should be adequately dedicated to all children, he would need some support and conditioning in this respect. It would be very beneficial for the educator to cooperate with experts who are more experienced in the education of children with special educational needs, especially children with mental disabilities, either with professional scholars (school psychologist, special pedagogue, social pedagogue and others) or directly With special pedagogues dedicated to educating mentally disabled children in school conditions at the time of teaching. They should have enough information about the child, his health status, his prognosis, as well as his / her genes, the development of personality, knowledge, progress and skills, or sufficient experience with working with such a child. They should therefore be able to advise adequately on what and how to do with the child, what can be developed, what its characters are, what appears to be the most effective in terms of educational attainment and personality formation, as well as what are potentially problematic sites And situations. Such cooperation between special pedagogues, pedagogues, educators, assistants and other professional staff or specialist doctors, however, will have to break the imaginary and wrong barriers, the false feeling of competition and superiority or inferiority, and start building on balanced cooperation, aware that Every single article is extremely important and can improve the quality of the educational process, and thus the whole life of mentally handicapped, but also any other disabled and disadvantaged children, whose well-being should be the focus of all those who are interested in quality, responsible and honest work. Inclusive education seeks and is deeply and truly convinced about its accuracy.

In addition, a child with a mental disability would not act as a disruptive element, since discipline and atmosphere outside the classroom is more relaxed, and activities are not immediately focused on performance that is rigorously evaluated. In addition, the most common form of education is play, which is natural for every child without exception that is to say for children intact as for children with special educational needs, also children with mental disabilities. The game brings kids together, combines the differences between them provides space for self-fulfillment, fulfillment, a sense of success and satisfaction.

Inclusion as such is a demanding and long-lasting process, requiring engagement and philosophical conviction for all involved, and for the whole of society. There is a need for an overall change in the social perception of people with disabilities, their status in society, and the improvement of care in all aspects. This change requires a lot of money, but first of all everything is at the good will of the competent and all involved in this process because of the lack of it, all efforts can be made worse.

The research plan

The presented results are partial output of the research solved within the UGA project *"Modernization and innovation of the teaching of subjects focused on communication in the educational process, development of technology and culture of speech of students of universities"* V / 12 / 2017th.

ABSTRACT

Inclusive education implies a bilateral commitment between people with and without disability. The activities in preschool education, such as the exploration of children's stories, nursery rhymes and songs, are special moments of knowledge sharing, linguistic development, social interaction and emotional improvement. Truly sharing these moments means sharing channels of communication between the interlocutors to provide an effective exchange of information between sender and receiver. Following this principle, during a school year, a set of activities was adapted in accordance with the needs of children with Autism Spectrum Disorder (ASD), so that they could be performed in a class context targeted at children both with and without developmental disorders. This adaptation, based on linguistic simplification/structuring and the provision of multimodal information, fulfilled one of the fundamental principles of the Salamanca Statement, namely that students with and without problems should learn together. This resulted in a more active and effective involvement of the 4 children with ASD in the dynamics of the class, as well as better ability by their colleagues to deal with other realities, fostering early social and civic concerns and competences.

Keywords: ASD, Inclusive Education

INTRODUCTION

In 1994, the Salamanca Statement (UNESCO, 1994) established the transformation of the education system in an inclusive system for all children, regardless of individual differences, as a political and economic priority. In Portugal, the concept of inclusive schooling became official when legislation on special needs education came into force with Decree-Law No. 3/2008 (after publication in the Portuguese Official Journal, 1st series, No. 4 on January 7th, 2008) ("Decreto-Lei n.º 3/2008 de 7 de Janeiro," 2008). This Decree-Law regulates specialized educational measures for children with significant limitations in terms of activity and participation, resulting from permanent functional and structural changes (special educational needs, SENs), from preschool to secondary education. The objective is to ensure the principle of equal opportunity, both in access to education and learning results. In the particular case of children with autism spectrum disorder (ASD), Article No. 25 of the Decree-Law provides for the creation of Structured Education Units for Students with ASD (*Unidades de Ensino Estruturado para Alunos com Perturbações do Espetro do Autismo*, UEEAs) in schools that integrate students with this diagnosis. The creation of UEEAs sought to provide an adequate educational response to students with special needs. This decision included not only students but also the whole school environment, in which teachers play a particularly relevant role. Among other objectives, these units aim to “promote the participation of students with autism spectrum disorder in curricular and enrichment activities with their peers from the classes they belong to”, “apply and develop interdisciplinary intervention methodologies that, based on a structured educational model, facilitate learning, autonomy, and adaptation processes within the school context” (“Decreto-Lei n.º 3/2008 de 7 de Janeiro,” 2008). UEEAs are expected to “adapt resources to children’s needs”, “ensure the necessary support for speech therapy”, and “create spaces for reflection and training about differentiated learning

strategies from the perspective of the development of multidisciplinary and collaborative work among professionals” (“Decreto-Lei n.º 3/2008 de 7 de Janeiro,” 2008).

It was within the framework of this Decree that the speech therapist leading this project had the opportunity to work in a UEEA, where she became aware that it is still necessary to further improve the inclusion plan to achieve more effective educational practices in classrooms.

ASD is a neurodevelopmental disorder that affects all areas of child development, but most notably communication and interaction (Capucha & Pereira, 2008; Wetherby & Prizant, 2000). Although there is great variability in the characteristics of children with ASD, the Diagnostic and Statistical Manual of Mental Disorders - DSM-5 (American Psychiatric Association, 2014) defines two major diagnostic criteria: A) persistent deficits in social communication and social interaction across multiple contexts, and B) restricted, repetitive patterns of behavior, interests, or activities. It also determines that C) symptoms must be present in early childhood.

Language, the development of which is determined by the interaction between biological, cognitive, psychosocial, and environmental factors (ASHA, 1982; Sim-Sim, 1998), is a complex, organized, and dynamic system of conventional symbols (sounds, words, and signals) that allows human beings to communicate and think (ASHA, 1982). A socially shared linguistic code is essential to effective communication between interlocutors (Franco, Reis, & Gil, 2003; Sim-Sim, 1998). Speech, defined as “the production of language in its phonetic form through a process of sound articulation” (Sim-Sim, 1998), is the main communication vehicle in society. However, this communication channel is not effective for many children with ASD because they possess a limited speech mechanism, or no speech mechanism at all, to express themselves – or because they do not understand their interlocutors’ speech. For these children, speech ceases to fulfill its communication role and it is necessary to use other means of communication that contribute to identity building, knowledge, and socialization. Specialized technicians, namely speech therapists, are responsible for devising solutions to improve communication as much as possible (Morris, 2005).

Based on the needs identified in a kindergarten with a UEEA during a school year, several activities were adapted to be implemented in the class, among children with ASD and their peers. Inclusion is believed to imply a bilateral and symbiotic commitment between people with and without impairment. Thus, it is important to stimulate children with SENs to achieve their full potential within their condition and environment, as well as enable society to include them.

The adaptation of some curricular activities aimed to ensure a simpler, more structured and multimodal presentation of information with the purpose of facilitating understanding and communication when compared to the traditional verbal/oral communication channel.

It would be naive to think that the skills of children with ASD could be boosted to the levels of their peers with no developmental impairment. Rather, this adaptation sought to adjust the method and content of information to the children’s needs in order to maximize each child’s potential and contribute to the achievement of an inclusive school.

METHODOLOGY

This project is a case study and the result of the speech therapist’s professional experience of the daily needs and demands of a kindergarten.

Characterization of the context

The study was conducted in a kindergarten with a UEEA in the Centro region of Portugal that applies the Treatment and Education of Autistic and Related Communication Handicapped Children (TEACCH) program. This pedagogical response is centered on a set of principles and strategies that, by harnessing the areas of greatest potential in ASD students (e.g., visual processing, memorization of functional routines, and special interests), promotes the organization of places, time, materials and activities in order to structure the external environment, making it predictable and, thus, promoting internal organization. It is, however, a flexible model, capable of being adjusted to students’ individual characteristics to facilitate learning and autonomy processes (Capucha & Pereira, 2008).

Children with ASD remained in the usual classroom (which was adapted to the TEACCH structured teaching model) during most classes, only leaving for set periods of time to receive individualized and specialized support provided by the SEN teacher, the speech therapist, and the occupational therapist.

Characterization of the participants

All 21 children from the only classroom in the kindergarten participated in this study. The children were aged 4 to 6 years ($M=5.01$; $SD=0.51$). Among them, four children (three boys and one girl) had been diagnosed with ASD. From a functional perspective, the children with ASD were at different levels in the continuum of the spectrum and showed different clinical expressions of the disorder. Therefore, this small group highlights the variability and heterogeneity found in the literature regarding the communication and linguistic skills of children with ASD. Based on the classification of language subgroups (Rogers, 2006), two children (I. and F.) belonged to the subgroup of verbal children (they imitate speech - often in an echolalic manner - but are unable to deconstruct their interlocutors' speech and infer relationships between the form, content, and use of speech (Peixoto & Varela, 2009)). The two other children (M. and C.) belonged to the subgroup of nonverbal children, with no vocal imitation (they did not imitate adult behavior).

Children I. and F. interacted socially with adults they knew and peers, albeit with qualitative limitations, through verbal and non-verbal language. Children M. and C., on the other hand, exhibited social behavior marked by isolation, stereotyped movement disorders and, in the case of M., self-harm episodes. Children M. and C. used an aided Alternative Communication System (Communication Notebook) by means of ARASAAC (Aragonese Portal of Augmentative and Alternative Communication) pictograms, which they were learning through the PECS (Picture Exchange Communication System) teaching methodology. This system has different stages of implementation and aims to develop the understanding, communication, spontaneity and autonomy of people with severe communication difficulties. Pictograms are images that represent a word/concept to make it easier to understand, promote access to information and the participation of people with communication difficulties, and develop literacy and learning skills (Encarnação, Azevedo, & Londral, 2015). Pictograms were selected for each child's communication notebook according to his/her daily nutritional, hygiene and recreational needs.

The group was culturally diverse, comprising 12 Portuguese children and 9 children of other nationalities. Although there were no other children with SENs in the class, two children were referred to a neurodevelopmental pediatrician because their language development seemed greatly below the expected level for their age. To date, there are no clinical findings and some of the foreign children were not yet at the stage of Portuguese language acquisition.

PROCEDURE

Adaptation and implementation of the activities

Several authors state that visual stimuli are a good learning strategy for children with ASD (Bruni et al., 2013; Fossett, 2004; Goldstein, 2002; Paasche, Gorrill, & Strom, 2010), due to their greater capacity to memorize visual/spatial stimuli than auditory stimuli. Taking this into account, the speech therapist adapted content taught in the classroom, notably that which was more demanding in terms of language skills (children's stories and songs, rhymes, recipes, etc.). These activities were carried out weekly or every other week, according to the class schedule. The kindergarten teacher provided the classroom activity plan to the speech therapist to allow the adaptation of activities to the characteristics of the children with SENs. The adaptation consisted in converting content into ARASAAC pictograms (Gobierno de Aragon, 2017) and their linguistic adaptation (Figure 1). These pictograms, which represented words and concepts, were selected due to their graphic quality and iconicity (the similarity between a graphic symbol and its meaning (Wetherby & Prizant, 2000)). In addition, both children who used the Alternative Communication System were already familiar with them. The linguistic adaptation consisted in rewriting the original sentences by: [1] reducing the length of the sentences; [2] simplifying the more complex sentences from a linguistic/cognitive perspective, mostly following Subject-Verb-Object order; and, given that children with ASD have difficulty understanding abstract concepts (Kutscher, 2011), [3] replacing abstract concepts with concrete ones while maintaining the semantic value within the linguistic context.

In most of the adapted activities, pictograms were framed using the Fitzgerald Key, which enhances sentence structure visually through a consistent color coding system for each part of speech: yellow for

people, green for verbs, blue for adjectives and adverbs, orange for nouns, pink for personal-social words, and white for function words (Encarnação, et al., 2015).

The goal was to help children to keep attention, understand the main concepts of the story, boost their initiative to communicate, and improve the quality and quantity of their communication. Children with difficulties in verbal comprehension and expression were provided with both the verbal label and visual representation of the concepts (multimodal language). Some of the adapted activities were provided in paper format, others in digital audiovisual format, and others used laminated images and signs with Velcro added, to ensure the durability of material and promote child interaction and participation. Whenever the activity involved handling signs (building sentences, organizing a narrative structure, etc.), children were given clear verbal and visual guidance.

Figure 1: Example of adaptation of one children's story.

The teacher in charge and the speech therapist selected and adapted the different activities based on the need to stimulate the different language components. The semantic component (the ability to acquire and express new words - their vocabulary - and their meanings, as well as the relationship between them (Franco, et al., 2003; Sim-Sim, 1998)) was developed through the representation of each word in a pictogram. Morphosyntax, which is essential in developing command of a language, is composed of rules that use parts of speech (nouns, verbs, adjectives, prepositions, etc.) and define the conditions that govern the organization and combination of words in sentences (Franco, et al., 2003; Mateus, Brito, Duarte, & Faria, 2003; Sim-Sim, 1998); (Gerber, 1996; Rigolet, 1998; Sim-Sim, 1998). This component became clear in the material that was adapted using the Fitzgerald Key.

Phonology is defined as the ability to learn and apply rules on how to use and combine speech sounds (Franco, et al., 2003; Sim-Sim, 1998). The teacher developed this component through songs and alliterations in rhymes.

Results monitoring of the adapted activities

The project was developed between the beginning of the second school term (January 2016) and the end of the third term (July 2016). During this time, results were monitored through direct observation of the children in the learning space (in adapted and non-adapted activities), interviews with the teacher in charge and SEN teacher, analysis of the notebook and the "Personal and Social Development" and "Expression and Communication" sections of the quarterly evaluation grids completed by the teacher in charge.

Results and discussion

The adaptation of activities within the classroom seems to have reduced the limitations and restrictions of children with ASD regarding their activities and participation. This was particularly evident in children I. and F., who possessed verbal-oral language skills. Thus, it appears that the visual communication system (signs) has helped to overcome the difficulty in understanding purely auditory information.

Children with ASD displayed greater levels of attention and active participation, albeit in different ways, in the adapted activities when compared to non-adapted activities. In the case of I. and F., these children displayed initiative to communicate more often, which points to improved self-confidence and

communication intentionality, as well as a greater ability to keep up topics of conversation related to the activities at hand, both with adults and their peers, thus contributing to the acknowledgment of social roles.

As for M. and C., the main changes in these children were the decrease in their levels of agitation and stereotyped movement disorders, and the improvement in their ability to self-regulate and maintain eye contact (although brief) with their interlocutor and the materials being used. These two children also displayed behaviors of motor imitation, such as clapping. However, this behavior was not exclusive to or more frequently observed in adapted activities. In the third school term, M. pointed to the used material twice when the activity was no longer in progress, and sat at the work table to explore it with the speech therapist, albeit only briefly. These displays of communication intentionality and attention, which, according to the literature, predict understanding and expression of verbal language in typically developing children (Peixoto & Varela, 2009), emerged for the first time in this context.

The observation of greater participation in adapted activities was not exclusive to children with ASD, as it was observed in most of the group, notably in children with poor language skills such as foreign children and two children with language difficulties.

When the activities started, children I. and F. had difficulties scanning in the reading direction (left - right), which is not uncommon in ASD (Kutscher, 2011). Throughout this project, children were able to develop this skill by performing appropriate readings using pictograms and building sentences in the correct direction and order. This ability allowed them to better follow the activities, which was demonstrated by the lower frequency of immediate echolalia and a greater ability to understand the main ideas of narratives and reproduce these using semantic content and more mature grammatical structure (aided by pictograms). According to Fossett (2004), the use of visual aids and graphic signs are good strategies to promote literacy. The observations of this study are in line with a case study by Francisco (Francisco, 2016), who adapted a book using the Communication Pictographic System. This system, when compared to the original version, was able to structure and facilitate understanding and communication in four children with developmental problems.

In addition, the repetition of adapted activities within the context of individualized support seems to contribute to the observed development, as repeating stories allows children to become familiar with them, thus benefiting the sequencing of events and memory (Ferreira, Ponte, & Azevedo, 1999).

Despite the development mentioned, and in view of the descriptive nature of this paper, it should be noted that because children with ASD receive support in many forms (special education, speech therapy, and occupational therapy), the progress cannot be solely explained by the inclusive work carried out through the adaptation of materials. However, all the professionals who took part in this project acknowledge its contribution.

The adapted activities, resulting from the simplification of syntactic structures and conversion of symbols, were not exclusively aimed at children with ASD, but rather at the whole group in order to enhance the naturalness of other forms of communication. Thus, it was possible for one sender to share two common codes with different receivers: verbal language and visual information. This conversion ensured that children with difficulties understanding verbal language were able to understand the main concepts of a story when provided with both the verbal label and visual representation of the concepts. This adaptation allowed students with SENs to overcome difficulties, giving them equal access to story contents, and raised other students' awareness of other forms of communication. Most children in the group acquired basic notions of Augmentative and Alternative Communication and displayed behaviors in line with this learning in their interactions with children with ASD during daily activities in the kindergarten. By the end of this study, the remaining children had become more competent communication partners. In order to communicate, they often retrieved pictograms themselves, and used the symbols to interpret what was said to them.

Early awareness by children of inclusion is of utmost importance in building positive environments and promoting ethical and social values for the future (Correia, 2013).

According to Wetherby & Prizant (2000), an effective ASD program should include not only learning more efficient forms of communication and motivation but also developing verbal and non-verbal understanding and imaginative capacity. The adaptation of activities provided a response to these challenges while maintaining the content of the class, placing equal importance on both components. The adapted activities

improved both the quality and quantity of experiences and exchanges among children with and without SENs.

The different presentation of the material elicited the curiosity and motivation of all those who took part, raised students' awareness, and increased communicative interaction between them. The interactions and experiences enable natural integration of children with communication difficulties by integrating them in their class, school, and society. Literature supports this idea, suggesting that interaction between children with ASD and typically developing children in the same settings improves social interaction between both groups and produces acceptable social behaviors (Levy, Kim, & Olive, 2006).

The adapted activities also proved to be useful to the teacher in charge and the SEN teacher by allowing the use of a multimodal language (auditory and visual), which facilitated the teaching-learning process, and by aiding the evaluation of children's skills.

As far as limitations are concerned, the main difficulty in this study was adapting the material to be used in the classroom due to the heterogeneity of competences found in the children with ASD. This also limited the creation of grids to monitor the children's evolution.

Final remarks

Communication and language disorders hamper the development of other cognitive skills, namely learning, thinking, and reasoning. For this reason, this project contributed to the psycholinguistic and social development of children with ASD and their peers. It is important to conduct similar projects since 75-90% of autistic children will gain a certain degree of functional use of verbal language if they receive adequate attention during preschool age. (Rogers, 2006).

ABSTRACT

This paper deals with the self-regulated learning of adult students in the part-time form of study. The focus stems partly from the methodological criticism of the traditional positivistic study of this phenomenon over the last decade, and partly from criticism of the research regarding adult education in the Czech Republic, which is also predominantly positivist in its orientation. This paper presents a qualitative study conducted in response to these criticisms. The research project included four focus groups comprised of a total of 34 informants enrolled in the part-time study programme. A grounded theory design was applied in order to analyse the data obtained. A paradigmatic model of tertiary education was designed within coding. Then the acquired categories were integrated into the grounded theory. The research identified motivation as the key variable affecting self-regulated learning management. Managing the context of learning also plays a pivotal role and is a prerequisite for the process of self-regulated learning.

INTRODUCTION

This paper describes qualitative research in self-regulated learning. Through an analysis based on the grounded theory, the paper aims to understand the process of self-regulated learning in a group of adult part-time students in tertiary education. The research subject choice and methodology used are based on the current state of knowledge in two previously-unconnected research fields: (1) the study of self-regulated learning and (2) adult education (in the Czech Republic more often referred to as andragogy). Recently, both have been a target of epistemological and methodological criticisms that challenge the dominant positivist view used for the study of the phenomena.

While there are numerous definitions of self-regulated learning based on various theoretical approaches (see, e.g., Boekaerts, 2002; Borkowski, 1996; Pintrich, 1999, 2000; Winnie, 1995; Zimmerman, 2001, 2002; Zimmerman & Schunk, 2011), for qualitative research it is appropriate to work with the most general, and in relation to the research phenomenon, with only a provisional definition, that is a definition which is not a definitive, deductively-testable model, but rather a “sensitising concept,” as for example the one offered by Herbert Blumer (1969). Such a concept is provided by Jonathan H. Turner (2006, pp. 371–372), who identifies self-regulation as an individual's ability to manage their activities – behaviour, actions and experiencing – with regard to both the social structures that surround the individual and the individual's own psychodynamic processes. In relation to learning, self-regulation is the ability to manage one's activities with regard to learning and intervene factors.

A deeper understanding of the process of self-regulated learning is crucial, as it enables a determination of the socio-psychological factors and meanings that influence the regulatory mechanisms of human learning, which change during the life course of the individual depending on the particular situation. Deeper understanding

concerns efforts to identify the “deep meanings” (Reed, 2011) that learning and its management have for the social actors and that orientate their motivation and their cognitive and metacognitive processes and actions, as well as shape their selves. These meanings are only accessible via an interpretation of statements of individuals placed in the natural environment of their “life-worlds”, which create their horizon of meaning (Schutz, 1967).

At present, there are a number of theoretical approaches to self-regulated learning, which, on the one hand, draw from general concepts of self-regulated behaviour, especially from the approach of cybernetic control of organism (Carver & Scheier, 1981, 1998, 2012; Carver 2012) or of behaviour control (Powers, 1973), and on the other hand, from the social-cognitive theory of Albert Bandura (1986, 1997). Among the most influential concepts at present are the following:

- (1) Paul Pintrich’s (1999, 2000) four-phase model of self-regulated learning. According to Pintrich, self-regulated learning is a process of management of cognition, motivation and learning context, which takes place in four consecutive phases: planning, goal setting, controlling and reflecting.
- (2) The multidimensional concept of self-regulatory strategies of Monique Boekaerts (2002, 2005), characterized by her consideration of self-regulated learning as a conglomerate of various partial control mechanisms (attention, motivation, emotions, and will) and related strategies, which should help the individual to achieve goals based on a self-rewarding system.
- (3) Zimmerman’s (2001; 2005; Zimmerman & Schunk, 2011) social cognitive theory of self-regulated learning. This theory operates with a model of three recurrent phases: (i) forethought, (ii) performance, or volitional control, and (iii) self-reflection. While the first phase takes place before the specific learning activity and includes components of motivation and goal-setting, the performance phase occurs within the actual process of learning and includes mainly the processes of attention and effort control. The last of the phases described by Zimmermann occurs after learning has been finished and includes mainly reflection on the experience, a comparison of the results with the set goals and their justification.
- (4) Events-oriented approach of Phillip Winne (Winne & Hadwin, 1998, 2008; Winne, 2010, 2014). This approach emphasizes that self-regulated learning is conclusively a contextual phenomenon, and that it is useful to conceptualize it in terms of events, because context evolves as learners regulate learning. Like with the previous concepts, this theory claims that self-regulated learning is a multi-phase process that includes the following: (i) reflection of the learning activity on the basis of the previous experiences of the individuals and their levels of success in solving tasks; (ii) goal-setting and planning; (iii) deciding on tactics and strategies to be used in the context of problem-solving; and (iv) reflections on the experience gained during the previous three phases. Duration, specific content and even the order of the individual phases under this concept are dependent on the context of a situation and on the learner’s abilities.

The four approaches share several important characteristics. First, they understand self-regulated learning as a model of various sub-processes of management of cognitive and meta-cognitive operations, behaviours and emotions of, as the case may be, a generally defined environment. Second, the individual processes conceptualize into sub-phases or dimensions, the successful implementation of which is a condition for obtaining the final results of learning. Individual concepts differ in whether they anticipate the needed consequentiality of some phases (Pintrich, Zimmerman) or not (Boekaerts, Winne). Finally, the theoretical approaches count with a certain degree of universalness of the processes of self-regulation, a fact that has major consequences on epistemology and methodology, which build on them. In other words, it impacts the methods of recognizing self-regulated learning and studying it.

These epistemological and methodological consequences lie mainly in the strongly-positivist orientation of theories on self-regulated learning, which manifests itself on several levels. The components of self-regulated learning are understood as operationalizable variables, among which causal relationships can be determined; and theories of self-regulation also assume that these components (variables) remain the same regardless of the changing environment and individuals. A partial exception in this regard is Winne’s theory (2010, 2014), which is more sensitive to the context and differences among learners. Nevertheless, even this theory works with the phases of self-regulation, which are omnipresent in a situation.

An argument against this epistemological position, however, is that not even the partial phenomena of self-regulation, such as goal-setting or emotion management, are simple variables convertible into a system of

indicators. Their valency for individuals and concrete meaning is specifically bound to the environment, in which they occur, to the relationships, in which they are placed, and to the values, which they profess. Individual components of self-regulation can thus unimaginably vary depending on the individuals and the learning environment, but they can also reversely influence each other. It is therefore impossible to assume simple causal dependence between the individual components. Additionally, if the contents of self-regulated learning (i.e., individual processes of control, goal-setting, self-reflection, etc.) are predetermined by a theoretical model, and the process of their scientific recognizing is dominantly focused on confirming their existence (deductive-nomological testing of a theory), there is a significant risk of reification of the given models. There is a risk of confusing self-regulated learning “on paper” (the analytic concept) for self-regulated learning “in reality” (real mechanisms of learning of real actors in real social conditions).

Positivist orientation is not only manifested on the level of epistemology, but also methodology, namely in using questionnaire-style research tools. A large part of the current research in the area of self-regulated learning has been criticised for over-relying on self-assessment questionnaire methods, which do not measure what they originally intended to measure – i.e., the problem of its validity and reliability. This is because general questions allow for diverse interpretations from respondents, deviating from the intent of researchers, as, for example, illustrated in detail by Karaberick et al. (2007). This can happen within the studied group, as well as when re-using the research tool with another sample of respondents.

In addition, self-assessment questionnaire techniques also ignore the context, which is always bound with the participants, even despite Hadwin et al.’s (2001) indication that respondents have a tendency to associate even general questions with a certain specific context, created by their personal experiences. As a result, these research techniques are unable to capture the changes in the self-regulation strategies that occur with a change in the individual’s situation, whether due to the maturation of the respondents or a complete transformation of the environment in which their learning takes place. Studies of self-regulated learning thus neglect what is referred to as “social worlds” or “life worlds” in the symbolic interactionism and phenomenology (Schutz, 1967; Strauss, 1982; Clarke, 1991), or as “situational conditions” (Clarke, 2003, 2005), which affect the behaviour of individuals by offering a “horizon of possibilities.”

What is equally important is that self-assessment scales and other traditional positivist techniques merely refer to the probable strategies/choices of the learners, rather than their actual practices (Boekaerts & Corno, 2005; Nesbit & Winne, 2006). Therefore, there is a substantial difference between what the respondents declare they would do in a certain situation and what they actually do. Winne, Jamieson-Noel & Muis (2002) confirm that respondents are highly unreliable in reporting on their learning (for example, in the frequency in which they use specific tactics), unless it immediately precedes the interview.

The positivist approach to the issue has been, in the last decade, trying to solve a part of this criticism by shifting from the self-assessment questionnaire techniques to sophisticated software research tools enabling monitoring of the currently-ongoing processes of learning within electronic platforms (Järvelä & Hadwin, 2013; Järvelä et al., 2013; Zhou & Winne, 2012). A clear advantage of this research strategy is the possibility to monitor not just the probable strategies, but the actual processes taking place in real time. On the other hand, this research procedure creates a unique epistemological problem in that it produces for the study of self-regulated learning an artificial (laboratory) environment, which is often distant from the learner’s real-life experiences. It also sets aside certain important mechanisms relating to self-regulated learning – e.g., motivational processes or management of emotions that go beyond the currently-ongoing learning processes (Pekrun, 2006; Pekrun, Elliot & Maier, 2009).

Such methodological shortcomings can be partially overcome by intensive qualitative research, which will focus on how actors situated in a natural environment understand the process of their own learning and its self-management. Qualitatively-oriented methodology allows the collection of answers to the questions about specific experiences of individuals in regulating their own learning, with an emphasis on particular situational conditions and actual strategies rather than the hypothetical choices of the individuals.

The research in the area of adult education is also dominantly built on positivist epistemology and the related quantitative methodology. Consequently, it brings rather biased results on the adult educational reality (see, e.g., Merriam 2008; Usher & Bryant, 1989; Usher, Bryant & Johnston, 1997; Usher & Edwards, 2007; in the Czech Republic, see, e.g., Průcha, 2014). In addition, the theory and research in this area are also based on the hidden premise that the education of adults is different from the education of children and youth in the fact that an adult participant is endowed with the ability to regulate their learning, i.e., self-direction (Knowles, 1978, 1980; Grow 1991; Long et al., 1992; Merriam et al., 2007). However, it has neither been sufficiently theorised nor tested to what extent adults are able to regulate their learning and how they do so.

This makes it necessary to develop a qualitatively-oriented study to a greater extent and also to begin to address the issue of self-regulated learning in adults, which will make it possible to determine exactly how adult learning differs from the learning of children/youth, or what features they share.

The logical outcome of these two streams of methodological criticism is formed partly by the choices of subject and objectives of this study and partly by the methodological strategy used. The research method is based on grounded theory (Corbin & Strauss, 2008; Strauss & Corbin, 1999; Charmaz, 2005, 2006), which allows a post-positivistic understanding (Charmaz, 2009) of self-regulated learning in adults. It also allows data creation from a shared relationship with the research participants and on this basis, builds a theory that is strictly tied to the place and actors concerned (see, e.g., Bryant, 2002; Clarke 2003, 2005; Charmaz, 2007; Charmaz & Belgrave, 2012). Such a “theory” or, more precisely in the terminology of the contemporary philosophy of science, rather a collection of local generic mechanisms, differs substantially from what was previously presented as a theory of self-regulated learning – i.e., general deductive-nomological models seeking to explain the widest range of phenomena (see, e.g., Boekaerts, 2002; Pintrich, 1999; Zimmerman, 2001; in the Czech Republic, Hladík & Vávrová (2011, ch. 2-3), Jakešová (2014), and Vávrová, Hladík & Hrbáčková (2012).

THE STUDY

The aim of the conducted research was to attain a deeper and well-situated understanding of the process of self-regulated learning in adult students of the part-time form of study, i.e., those who enter tertiary education from practice and often after a longer period of time since the completion of their secondary education. In accordance with Strauss and Corbin (1998, p. 25), the research question was broad but “not so broad as to give rise to unlimited possibilities.” The main research question was, How do students of the part-time form of study regulate their own learning and process of study in relation to context, meanings and determinants? Due to the nature of the research problem, a qualitative research strategy was chosen, using the technique of focus group interviews. Such a technique focuses on smaller groups (eight to twelve respondents are recommended) with an emphasis on understanding the opinions and assessments provided by the participants (Morgan, 2001; Plichtová, 2002).

The focus group technique was chosen on the basis of the research participants’ preferences. Given the choice of either individual in-depth conversations or the focus group technique, the participants chose the latter, considering it more natural and more suitable for sharing information about their learning and studying. This choice might also have been associated with the fact that a higher number of participants in the focus group created a safe environment for the students, in which they could support each other and offset any “power” imbalance between themselves as students and the researchers as members of the academic community. The use of this technique did not limit in any way sharing of meanings and feelings about studying and learning, because the interactions in the group led to a high degree of reflexivity of experience of the learners.

The research itself took place in November and December 2014. The selection of the research sample was deliberate via the institution - the university. The data were collected through four focus groups with a total of 34 informants (4 men and 30 women), aged 27–56 years, who were all employed (with one exception). The informants were 3rd year students of service professions in the part-time form of study. The majority of them returned to the formal education system after lapses greater than ten years. Thus, they can be considered as representatives of the so-called “non-traditional students in tertiary education” (Slowey, 2011). Each focus group contained seven to nine informants, and the main exploratory part took 60–80 minutes. The course of the interviews was recorded on camera along with an audio recording on a dictaphone.

In accordance with (Lofland and Lofland (1995), a group of respondents was chosen with whom the researchers had already had a positive personal experience (through classes) and with whom a sense of trust and openness was easily created. For this reason, focus was also placed on the emotional dynamics of the interviews, as recommended by Ezzy (2010), which is reflected in the following results discussion. Promised anonymity, the research participants agreed with the publication of their views in professional studies. Therefore, all names used in the research are fictional.

The group interview was a variant of the focus group oriented towards content rather than interaction within the group (Beitin, 2008; Morgan, 2010, 2012). However, the study also reflects on the most significant characteristics of interaction among the focus group participants. Given that all participants came from one study group, there were close interpersonal relations among them, established during their 2.5 years of studying together. It followed that all participants knew each other well, and therefore their declared opinions were subject to a certain group control. This led to the participants themselves taking over the activity of the group moderator and urging others to contribute when convinced the others might actually want to relate. At times, the role of an informal group leader also emerged, assuming the right to speak on behalf of others. None of this could hinder the situations in which the group split into two mutually opposing “camps”. However, group solidarity appeared to be a more common phenomenon – consistent agreement with the presented opinions. Group cohesion proved to be of a great advantage for the researchers, as joint discussions in all focus groups were dynamic and produced large amounts of data. However, the researchers also realised the cons of such cohesion as certain group symbols, the significance of which they were not able to decode, could remain latent.

The questions in focus group interviews focused on the perception and evaluation of various areas that affect the process of self-regulated learning. The research on the selected social phenomenon - self-regulated learning in

students of service professions in the part-time form of study - uses interactional and organisational research questions abstracted in previous research (Hladík & Vávrová, 2011, p. 41) aimed at helping students of professions in the full-time form of study. The interactional research questions deal with the effects of motivational factors in the process analysed, students' self-efficacy and causal attribution. In contrast, the organizational questions aim at cognitive and metacognitive strategies in students applied in the learning process. The questions for discussion in the focus group were selected from the previously-used set of questions, which however appeared to be too broad. The idea of selecting from the existing questions rather than constructing new ones was prompted by a possible comparison of the selected areas of self-regulated learning in students of full- and part-time forms of study.

In the interviews, the following basic groups of questions were used:

- (1) How do you perceive yourself as a student? What are your strengths and weaknesses?
- (2) What led you to study your field? How do you perceive/assess your studies?
- (3) What do you think your success depends on when studying? How can you affect these causes?
- (4) How do you prepare for lessons? What influences your choice of modes of learning? What are the differences in your preparation for various subjects or exams?
- (5) What specifically do you think about in connection with your learning? What do you do when you find out that you don't understand something or that you are not good in something? How do you know that you have made progress in learning? How do you regulate your learning (at home)?
 - (6) What motivates you when learning? How do you motivate yourself to learn?
 - (7) What helps you when learning? What makes your learning difficult?
- (8) What feelings do you experience in connection with learning (school)? How do you try to influence these feelings?

In order to achieve researcher triangulation, as demanded by Norman K. Denzin (1978), interviewing and moderating the debate was carried out by two moderators, and each of them moderated two focus groups based on the identical scenario. Triangulation of the researchers was then used in data analysis including only the codes that both researchers agreed on within the final analysis.

THE DATA ANALYSIS AND FINDINGS

The data gained in the focus groups were first transcribed and subsequently analysed through the grounded theory procedures: open, axial and selective coding (Strauss & Corbin, 1999; Strauss & Corbin, 2008; Charmaz, 2005, 2006). A commented data transcription was used to transfer the data from oral into written, using the audio recordings taken. The transcription was completed by field notes, so as to also take into account the emotional dynamics of the interactions within each group, in addition to the content. First, open coding of the obtained data allowed for the exploration, comparison and ultimately the categorization of 62 abstracted codes into twelve categories. The codes were often assigned the names used in the informants' own statements. In vivo codes were used due to their higher degree of authenticity and lower degree of distortion. Table 1 provides the list of codes merged into categories and their dimensions.

Table 1: List of acquired codes and categories.

CODES	CATEGORY subcategories	CATEGORY FEATURES AND THEIR DIMENSIONALISATION
I want to study	DECISION ABOUT STUDIES	Spontaneity (low / high)
I have to study		
Choice of field of study		
Availability of school		
I can still do it	MOTIVATION intrinsic	Degree (low / high)
To make progress		Duration (short-term / long-term)
To be successful		Scale (negative / positive)

Having a career	extrinsic	Degree (low / high)
Safe future		Duration (short-term / long-term)
I need it for work		Scale (negative / positive)
Home alone	CONDITIONS FOR STUDIES family	Assessment (bad / good)
Little children		
Supporting partner		
They have to create conditions		
Busy at work	work	Assessment (bad / good)
I join theory and practice		
I learn at work		
A lot of free time	time	Assessment (bad / good)
Children have grown up		
Academic year plan	ORGANISATION OF STUDIES	Quality (low / high)
Access to information		Assessment (bad / good)
Classmate cooperation		
Meet deadlines		
Soft skills	CONTENT OF STUDIES	Assessment (content / discontent)
Difficult subjects		Difficulty (low / high)
Easier subjects		
Adults have different approach	RESPONSIBILITY	Degree (high / low)
I stress about it		Adequacy (adequate / inadequate)
Responsibility to family		
I do not give up	PERSEVERANCE	Intensity (low / high)
I simply have to		
When I start, I always finish it		
I can overcome problems		
I learn some things easier	KNOWLEDGE OF SELF	Evaluation (low / high)
Start in advance		
I need a deadline		
New group of people	STUDY GROUP	Effect (strong / weak)
Close people		
Mutual support		
I struggle for time	TIME MANAGEMENT	Quality (bad / good)
Juggle more things		
Do less of something		
I come from work and study		
I use weekends		
The sword of Damocles		
Last minute		
Nothing else interests me	LEARNING STRATEGIES	Efficacy (low/ high)
Updating information		
Looking up terms		
Mind map		
Re-reading		
Using highlighting		
Self-awarding		
Making notes		

Revision		
Using post-its		
Learning plan		
Learning as fun		
Just do it	SUCCESSFUL COMPLETION OF STUDIES	Quality (low / high)
Not to be ashamed		
To have a university degree		
The best I can		

Axial coding enabled the establishment of connections between individual categories. Managing one's own studies proved to be a key category in self-regulated learning. Managing the external organisational aspects of the studies, i.e., time management of persons taking over for the students while they fulfil their study duties, together with the so-called self-management (managing oneself) create conditions for learning. The key category of Managing one's own studies forms the basis on which the student's self-management develops, particularly in relation to time management and efficient use of time, combining work, family and study duties, and to self-regulated learning. It is obvious that self-regulated learning only follows once appropriate conditions, within managing the studies and self-management, have been created. The research showed that part-time students emphasise the creation of external conditions for learning, which they associate with their academic success. The attainment of such conditions is only possible when combining several social roles: an employee, a parent, a grandparent, a student, etc.

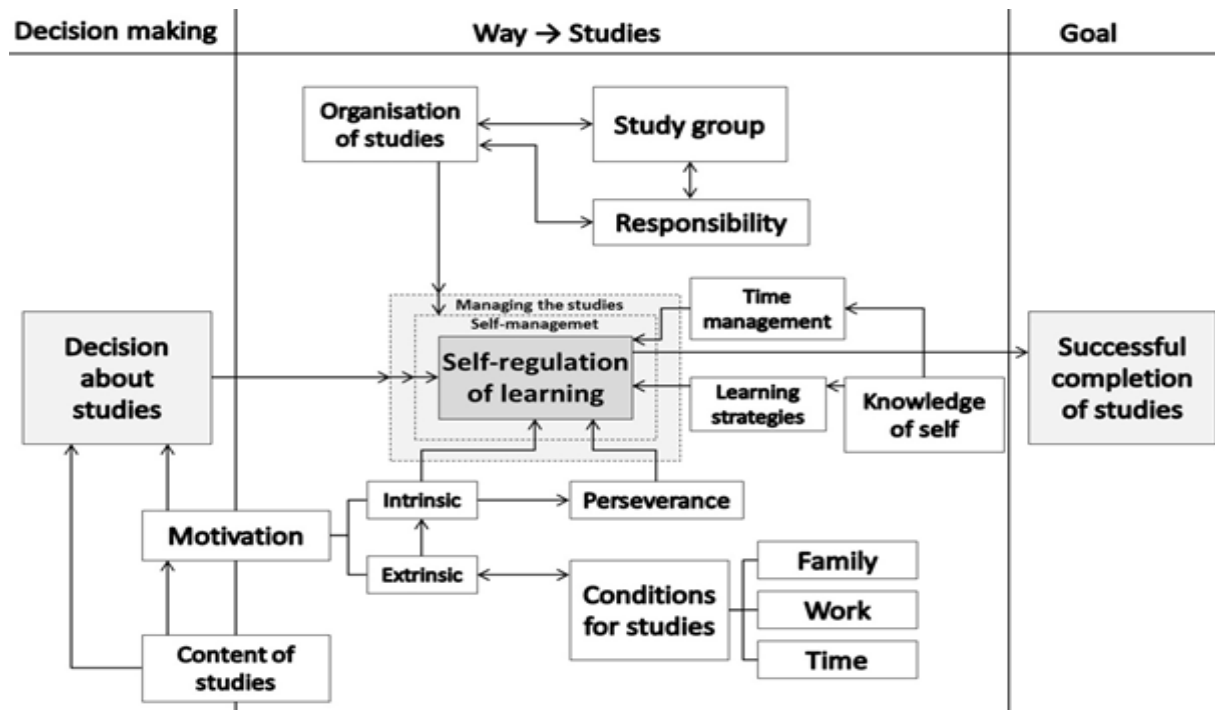

Table 2: Paradigmatic model of tertiary education of part-time students.

CAUSAL CONDITIONS	PHENOMENON	CONTEXT	INTERVENING CONDITIONS	ACTION STRATEGIES AND INTERACTION	CONSEQUENCES
Decision about studies Motivation / - intrinsic - extrinsic	MANAGING THE STUDIES ↓ SELF-MANAGEMENT ↓ SELF-REGULATION OF LEARNING	Conditions for studies / - family - work - time Organisation of studies	Content of studies Responsibility Perseverance Knowledge of self Study group	Time management Learning strategies	Successful completion of studies

The data source: the authors' own research, 2017

Axial coding served as a basis for selective coding. After an in-depth analysis of the data, the findings were integrated into grounded theory. The categories with their dimensions were related to each other as well as to the central category in accordance with the general coding paradigm. The relations between the categories and their dimensions created a model depicting the process of self-regulated learning in adult students in the part-time form of study in tertiary education (Fig. 1). Table 2 shows the result of the second phase of the analysis, i.e., the paradigmatic model.

Figure 1: Self-regulated learning in adult students in the part-time form of study in tertiary education.

From managing the studies to self-regulated learning

A data analysis of the findings revealed that in the first phase, the students in tertiary education find it most important, and also most difficult, to manage their studies. In the broadest sense, it entails incorporating their studies into their life rhythm and introducing the related changes into their current way of life. The time devoted to their studies is usually made by ending or limiting other activities. One of the informants in this regard reports: “I see more disadvantages to the part-time form of study. Simply because combining the time with education is a huge problem. You have a family, you have a job and you have to function in multiple directions, it is not just learning, as in the full-time studies ... It's different now” (Martina).

Managing one's own studies is a context in which self-management, i.e., effective management of oneself, and self-regulated learning develop. Without successful management of one's own studies, the student is incapable managing other persons in their social environment (in the family, in work) in order to create favourable conditions for learning. Only mastering both the management of their studies and self-management provides space for self-regulated learning and its development. Self-regulated learning constitutes the so-called tip of the iceberg, while its degree determines students' academic successes and the successful completion of their studies. Self-regulated learning could be understood as a higher phase in the process of tertiary education of adults in the part-time form of studies. It is dominantly connected with goal setting and time management. Students achieve success in this phase only when successfully regulating the general areas related to their studies. This point is highlighted by a participant who points to a link between her readiness for study and for exams and her ability to manage the learning process: “it is possible that I won't manage to do everything (...) I have just finished an essay, so I must catch up on weekends, but then again it is possible that I will not be fully prepared for the school or exam” (Karla).

All three types of an individual's self-regulation are oriented by a long-term goal in the form of the successful completion of their studies, which represents their broadest common framework. What differentiates them are the specific behaviour goals that emerge in the given situation. While studies management is dominantly associated with the regulation of behaviour in relation to the educational institution, self-management is associated with managing the work- and family-related conditions of the student, self-regulated learning is linked with setting goals of the learning, using learning strategies and their timing during the academic year, as well as within the weekly and daily cycle of the student.

The learning strategies and time management depend on the self-reflection of the actors – on the knowledge of self. In this respect, it is interesting that students unequivocally declare that they know themselves well in terms of learning and that they know precisely how to learn, for their learning to be effective and their time management good. A typical statement by a student: “In our age, we know very well what method of learning suits us and what not at all. I also know very well that I have to start studying at the last possible moment. If I don't feel at least a bit under pressure, my learning is not very effective. However, I need a free weekend for that. I then evict everyone from the house for two days, to have my quiet” (Pavla).

The knowledge of self in the field of learning management is the basis for all learning activities. In this respect, students often do not carry out a metacognitive reflexion of their learning on the basis of various feelings for various items, or on the basis of a success or failure in reaching them. On the contrary, they emphasize that they always routinely learn in the same way and that they always routinely use the same repertoire of learning techniques. One student stated, “I learn always in the same way. I have my system. I have a notebook, notes from the classes and a learning plan with a checklist of items. Then, I just look for key terms in my notes and underline and underline” (Petr). Similarly, another student stated that she bases her learning on a model of learning that she found useful in the past and now just replicates it: “I do it again and again. You said that you first read it in parts and then the whole thing. I must do it the other way round. First the whole unit and then smaller segments” (Eva).

The only aspect that changes in the case of their learning is their time spent on learning. The more difficult the subject or exam, the more time the students devote to preparations. This applies even to the last-minute learners. It is the ability to find and reserve a sufficient amount of time for the preparation for difficult subjects that the

participants of the survey consider to be the most crucial criterion of whether their time management is good or bad.

Decision about studies and motivation

The presented model (Fig. 1) shows that an important intervening component of the process of self-regulated learning is the decision regarding one's studies. Such a decision is influenced by the content of studies and by motivation, whether intrinsic (I want to study) or extrinsic (I have to study). As reported by the informants themselves, in the case of positive motivation (I want) based on a volitional decision, the student stands a higher chance to increase the degree of self-regulated activities (learning, self-management, and management of the studies). This is faithfully illustrated by the statement of one student: "If someone is capable of self-motivation, then they definitely have an advantage in learning over those who aren't, and who are then less successful." (Václav)

In the opposite case of negative motivation, when the student has to obtain a university degree because of impending sanctions (decrease in pay, job loss or demotion), the development of self-regulated practice is often hampered. In this case, the path towards achieving the desired objective (obtaining the required degree) is often taken with the lowest effort possible. This is frequently the case of students with low levels of development of self-regulation, who prefer strategies aimed at quick goal achievement.

The content of the studies that resonates with one's personal interests becomes the source and the driving force of motivation for some students. The basis of self-regulated learning is formed by intrinsic motivation and closely-related perseverance - defined by the students themselves as the ability to overcome the initial and ongoing difficulties (internal and external) and not giving up: "I am studying of my own will. I was not forced by the employer. It is my own choice, so for me it is internal motivation, which is probably good because it pushes me forward. I am satisfied with my studies and my knowledge" (Blanka). "For me, it is actually all about motivation, the more the subject interests me, the more I learn. There is also responsibility, although only to a certain extent" (Pavčina).

Extrinsic motivation is related to the learning conditions, i.e., within the family, work and time. Family, relatives or work colleagues usually become external motivators in the process of adult education. They offer support and encouragement and often help the students persevere, despite their tendency to drop out. Sometimes, however, they may become a constraint: "Not everybody can be made to study by the employer. Those of us who are doing it voluntarily, just come to their boss and say, I need the day off and they just say no, simply no. ... I just had to choose, and I chose to finish the school so I had to leave work" (Martina).

Intervening conditions

Among part-time students, unlike among daily students (Vávrová, Hladík & Hrbáčková, 2012; Hladík & Vávrová, 2011), formal organisation of studies becomes an important determinant of self-regulated learning, i.e., timetable, exam and credit test dates, credit and exam requirements. Organisation of one's own studies has a significant effect on management of one's studies and self-management and is thereby latently participating in creating conditions for the process of self-regulated learning. An important factor in the organization of one's studies is the access to information in the form of study materials and communication with teachers. Students highlight in this regard that teachers who communicate keep them motivated: "When I am getting feedback and [the] teacher talks to me normally, I am energized and much more motivated. It makes me want to learn more than when I have no information" (Jana).

Another key category related to organisation of studies is responsibility, not only to oneself but also to others. A student highlights in this regard that an adult learner must act much more responsibly during studies: "An adult approaches school a little bit differently ... a fresh high school graduate comes and says "I will just sail through somehow" (Jiří). The responsibility here works as an additional motivational factor that is attributed by the students to their age and the status of an adult and that emerges from the attitude to the organization of studies.

Group cohesion and solidarity also play an important role. "At my age, if I can say so, it's about communication

and asking for help. ... When you really do not know, I know there are people in the group that I can ask” (Klára). “And one more thing, but perhaps not entirely related to the studies, the classmates ... You meet a new group of people and you become close. You laugh together, you cry together, you are happy together when you pass [an] exam” (Saša). From these two examples it is apparent, how important it is for adult learners to have mutual support that enables not only collaborative forms of learning and sharing of materials, but also sharing of positive and negative emotions.

CONCLUSIONS

The research suggested that self-regulation of learning is an integral part of the process of managing one’s own studies, which includes a significant component of self-management. Only after creating optimal conditions for learning can the development in self-regulated learning be observed. The main source of self-regulation development is motivation, especially intrinsic motivation affecting perseverance. In students entering tertiary education after a break, perseverance is associated with will and serves as a prerequisite for a successful achievement of goals.

The present study demonstrates the extraordinary benefits of qualitatively-oriented methodology, as it allows identification of the unique situational context and meanings of self-regulated learning, which the quantitative design tends to omit. Moreover, self-regulated learning is examined from the perspective of the students who are directly concerned, which leads to the determination that the process is perceived rather widely and depends on numerous determinants.

For the informants themselves, self-regulated learning includes the management of the social determinants of learning, which represents a significant difference compared to some other definitions of the phenomenon (cf., e.g., Boekaerts, 2000; Zimmerman, 1999, 2008). It is therefore necessary to consider self-regulated learning in the learner’s natural environment always in relation to other areas of self-regulation of their behaviour and not to limit the given phenomenon only to cognitive and metacognitive processes of management of the study subject. Social structures in the form of family and working relationships or in the form of organization of studies on one the hand and psychodynamic processes relating to long-term intrinsic motivation on the other hand, clearly exceed the “temporal boundary” (Zerubavel, 1998) of currently ongoing learning activities. However, they are still important, as they frame and structure the given processes.

Relating the research results to the existing theories of self-regulated learning, in many ways they correspond to the findings of Monique Boekaerts (2005), who highlights the extraordinary importance of intrinsic motivation. According to Boekaerts, the higher intrinsic motivation, the easier the process of self-regulation and the higher the efficiency of learning. However, the mechanism of intrinsic motivation is, in the case of the analysed students, closely associated with two different sources of intrinsic motivation. The first one is the obtaining of a university degree, which is, by many, considered the goal of one’s self-development during middle age and a tool for improving one’s position on the labour market. The second one is the learner’s interest in the field of study. In that case, the motivation is primarily oriented towards an effort to learn as much as possible about the field of service professions.

Also typical for the learning situation of our informants is that the management of the context of learning acts as a key area, compared to other areas of management cited in the professional literature (Boekaerts & Niemivirta, 2005; Pintrich 1999; 2000) as the main dimensions of self-regulation: i.e., management of attention, will, emotions, motivation or cognition.

This research has not identified the sequence of the processes of self-regulated learning in the form of several phases assumed by some theories (Pintrich 1999, 2000; Zimmerman 2001; 2005; Zimmerman & Schunk, 2011). The individual sub-processes of management do condition one another (see Fig. 1), but they do not form a sequence of consecutive processes. They are different sub-dimensions of self-regulation that permeate one another and act in dependence on the learners and their environment. The findings thus fully confirm Winnie’s (2010) argument that self-regulation of learning is always contextual and should be conceptualised in terms of the learning event, which includes both the learning context and the learning person, who tries to regulate their

activity.

This study further finds that metacognitive processes related to learning strategies play a relatively-small role in the case of the analysed group. The students declare that they rely on a habitual learning pattern, unmodified in regards to the goal of learning, with the exception of the temporal aspect (the duration of learning activities). This contradicts the opinion of Pintrich (1999) and Zimmerman (2001, 2005), according to whom learning processes are accompanied by a reflection of undergone experience and a modification of behaviour. Students do not verbalize such reflections and they cannot be detected in their behaviour. It is likely that the “reflections” of results and learning processes take place only at the level of affects, as highlighted by cybernetic control of organism (Carver & Scheier, 1981, 1998, 2012). This allows students to receive feedback on their learning and the achieving of goals only on the emotional feedback level – feelings about their conduct.

Such findings can serve in many ways as a higher reflection of one of the standard assumptions of adult education, according to which an adult learner is able to manage the learning process without difficulties (Grow 1991; Long et al., 1992; Merriam et al., 2007). Authors claim that an adult student does not require direct pedagogical support, but merely a facilitator of their leaning, who helps them with understanding the content of learning. The results of this study have shown that not every adult is capable of self-organised learning, especially when unable to manage one’s own studies and self-management. An adult learner needs greater facilitation in the area of managing their studies and self-management, rather than in the area of the management of learning.

These findings cannot be generalised and applied to all cases of self-regulated learning in students of the part-time form of study or adults, as it is possible that the presented model (see Fig. 2) could have been influenced by certain unique situational factors present only among this study’s informants. In this regard, the conditions for studies could be a factor. These could have been distorted mainly by the fact that the vast majority of informants were women, who, in the Czech society, are faced with greater challenges while combining work and family studies (see Kuchařová et al., 2006). Another factor could be the area of organisation of studies, which is characterised by the unique profile of the studied undergraduate programme, with focus on service professions, and its difference from other undergraduate programmes, e.g., of an economic or technical nature; A third factor could be the knowledge of self. Since the informants were third-year students, they had already developed the knowledge of self as a student, for example, what is easy for them to learn and how to manage the time needed for learning. A final factor might be social ties. The informants had previously known each other for 2.5 years, which created strong social bonds allowing for group support in their studies, both in dealing with the emotional stress associated with studies and in the distribution of the learning materials.

Despite the specificity of the study group, further qualitative research on self-regulation of learning is essential, as it enables a description of other “arenas” and “life-worlds” (Schutz, 1967; Clarke, 1991, 2005) in which learning takes place. In other words, it is possible to record variations in the mechanisms of self-regulated learning depending on various situational contexts and actors who enter them. This concept of further research activity could possibly further the current empirical knowledge of the issue, as well as generate a meaningful theoretical programme striving to create situation-specific models of self-regulated learning.

ABSTRACT

Students' misconceptions are difficult to change in a short time because misconception is embedded in students' thinking. The alternative instruction that can be done is present the phenomenon with supported by relevant tasks. Therefore, the purpose of this research was to comparing PDEODE*E tasks with POE tasks to alleviating students' misconceptions on Newton's First Law. The research method used the 4D (Defining, Designing, Developing, and Disseminating). The participants in this research are 13 senior high school students (7 boys and 6 girls, whose ages were middling of 16 years-old). At the disseminating step, we get the value of effect size is 1.00 in the "large effect" category, thus PDEODE*E tasks are more effective than POE tasks.

Keywords: Students' Misconceptions; Newton's First Law; PDEODE*E Tasks; POE Tasks

INTRODUCTION

The furthestmost key aspect that students fetch to their lessons are conceptions, nevertheless most of which unlike from scientists conceptions (Gurel et al., 2017; Carmona et al., 2016; Sumpter, 2016). The different students' conceptions and scientists' conceptions called misconceptions. Misconceptions are thriving entrenched in students' formerly thinker outline, time-consuming process to change, sturdy to transformation through customary teaching and prerequisite extraordinary courtesy for students to improve a scientific conceptions (Samsudin et al., 2017; Gurel et al., 2017; Liu & Fang, 2016; Samsudin et al., 2015; Costu, 2012). Students embrace misconceptions can be described by quite a few causes; teaching instruction, student foregoing understanding, scarce linking among conceptions, and other (Ipek & Calik, 2008). Furthermost teaching in science concentration on facilitating students accumulate facts about scientific concepts, on the other hand does not substitute improvement of accepting of these concepts, nor does it benefit them to learn in what way to smear the concepts freestanding of school in the actual sphere in which they breathing (Costu, 2008).

For the reason that of the meaning of daily lifespan uses, teaching instruction should be established for teachers in the direction to deliver students to create linking among their science' understanding and linked daily conditions (Dudu, 2017; Anderhag et al., 2015; Costu, 2008). Create linking among science' understanding and daily conditions on students' mind may unveiling the students' misconceptions. Research by Samsudin et al., (2017) shows that PDEODE*E tasks effectively in improving students' conceptual understanding and altering students' misconceptions. In another hand, Costu et al., (2012) stated that POE tasks can supports students to succeed restored conceptual accepting and allows students to recollect newfangled conceptions in their continuing remembrance.

Modifications among POE and PDEODE*E is tally Discussion (D) and Explore (E*) into POE. Tally "D" into POE provisions students for producing an educational air that provisions discussion assemblies, and an assortment of opinions (Samsudin et al., 2017; Costu et al., 2010). The existing research is efforts to comparing PDEODE*E tasks with POE tasks to show which is more effective in alleviating students' misconceptions. Many researchers (Poutot & Blandin, 2015; Ipek & Calik, 2008; Bayraktar, 2009; Liu & Fang, 2016; Samsudin et al., 2017) in the physics education discuss students' misconceptions, such as force and motion, force and acceleration, mechanics and magnetic field. We focus on the Newton's First Law about the balance forces and inertia concept.

METHOD

In this research, we used the 4D model (Defining, Designing, Developing and Disseminating) (Samsudin et al., 2015; Fratiwi et al., 2017; Hermawan et al., 2017; Afif, Nugaraha, & Samsudin, 2017). At steps defining and designing, we define and design the PDEODE*E tasks and POE tasks. At step developing, we developed two tasks with the same topic but different stages. And then, at the disseminating, we calculate the differences PDEODE*E tasks and POE tasks to know which is more effective. Before PDEODE*E tasks and POE tasks are given, students fill a pre-test of eight Four-Tier Newtonian Test (FTNT). And then, one week after the pre-test, treatments are done for 3x45 minutes. After that, three weeks later students are given a post-test with the same question as the pre-test. The FTNT used to identifications the students' misconception. The instrument was developed by the researcher before used for pre-test and post-test. The test items were systematized in the formula of four-tier test items that established as of the two-tier test. The instrument test arranged on two-tier was employed in the introductory study to accumulate students' rejoinders as reasoning choices positioned in the third-tier. The FTNT was validated by four experts in physics education. The validity of the instrument was acknowledged at .84.

The participants in this research are 13 senior high school students (7 boys and 6 girls, whose ages were middling of 16 years-old). All of the students acquired to the pre-test and post-test, and then they were separated into two clutches. One clutches are used PDEODE*E tasks and another are uses POE tasks with the same of average score on the pre-test. The sum of students that used PDEODE*E tasks are seven students and the sum of students that used POE tasks are six students.

Defining

The PDEODE*E tasks are involved seven stages (Samsudin et al., 2017; Zulfikar et al. 2017). In the first stage is Prediction (P), the teacher accessible a conceptual occurrence to students by exhausting worksheet and entreated them to predict independently as to what ought to arise. In the second step is Discuss (D), the resolve talented to discuss and stake students' discerning in their team. In the third stage is Explain (E), students in apiece team explored to clench a conciliation and deduction about the occurrence, and to present their concepts to other teams concluded class deliberations. Consequently, the students over functioned in their teams to undertake a practical experiment and independently recognized their observations roughly what happened. In the fourth stage is Observe (O), the students observed vicissitudes in the occurrence and the teacher primes them to the emphasis on observations that pertinent to the beleaguered concepts. In the fifth stage Discuss (D), the students were entreated to settle their predictions with the unaffected observations completed in the previous step. At this stage, the students were requested to investigate, associate, dissimilarity, and disapprove with their colleagues in their teams. In the sixth stage is Explore (E*), to deliver conceptual change and to improve conceptual understanding. In this stage, students explore the occurrence by them self. In the last stage is Explain (E), the students challenged completely inconsistencies among observations and predictions.

The POE procedure examination student understanding by demanding students for three stage (Costu et al., 2012; Halai, 2012). In the first is Predict (P) stage, students need to predict the consequence of some occurrence and need to rationalize their prediction. In the second stage is Observe (O), students designate what they perceive transpire. Finally, is Explain (E), students need to reunite any incongruity among prediction and observation.

Designing

According to the stages at PDEODE*E tasks that are Predict, Discuss, Explain, Observe, Discuss, Explore and Explain, we can design the PDEODE*E tasks as shown in Figure 1.

PDEODE*E Tasks	
Predict
Discuss and Explain
Observe

Observe
Explain

Figure 2. Design the POE tasks

Developing

The developed PDEODE*E tasks in this research embrace two concepts that balance forces and inertia concepts. One of the example about inertia described in Figure 3.

	<p>Predict (P)</p> <p>Predict what will happen to the beam when HVS paper and duplex paper are pulled slowly and quickly? State and explain the reasons for your predictions!</p> <p>.....</p> <p>.....</p> <p>.....</p> <p>.....</p>
<p>Discuss (D) and Explain (E)</p> <p>Discuss your predictions and reasons in your team, and then explain your reasons in detail!</p> <p>.....</p> <p>.....</p> <p>.....</p>	
<p>Observe (O)</p> <p>Observations that occur on the beam as the HVS paper is pulled slowly and quickly! What will happen? Is there a difference between the two occurrences? State your observations!</p> <p>.....</p> <p>.....</p> <p>.....</p>	
<p>Discuss (D)</p> <p>Why does this happen? Discuss with your team! Then explain your reasons in detail!</p> <p>.....</p> <p>.....</p> <p>.....</p>

Figure 4. Example of the POE tasks

At Figure 3 and Figure 4, we can see that the content of PDEODE*E tasks and POE tasks was same. The differences are at the stages on each task. At the tasks, accessible two pieces of paper that different thickness and several blocks of different mass. Researchers did the tasks in the order that students can test some phenomena and build their own conception based on what they have experienced. As suggested by some researchers (e.g. Gurel et al., 2017; Liu & Fang, 2016; Samsudin et al., 2015; Costu, 2012; Stein et al., 2008) that student misconceptions can be powerful and awkward to alteration as of wrong to right understanding. Therefore, students must experience and discover their own scientific concepts in order to avoid misconceptions.

Disseminating

At disseminating, we use the effect size to indicate an indistinguishable prominence that analyzes the size of the distinctions midst sets (Tellez et al., 2015). The Glass's delta was used to the effect size as given by Equation 1.

$$\Delta = \frac{\bar{X}_{PDEODE*E} - \bar{X}_{POE}}{SD_{POE}} \quad (1)$$

After analyzing the significance of Glass's delta, Table 1 was used to explanation roughly the significance.

Table 1. Explanation of the consequence on Glass's delta

Glass's delta effect size	Explanation
$.00 \leq \Delta < .20$	Trivial effect
$.20 \leq \Delta < .50$	Small effect
$.50 \leq \Delta < .80$	Medium effect
$\Delta \geq .80$	Large effect

Students' conceptions are clarified on five categories, that are Sound Understanding (SU), Partial Understanding (PU), Misconceptions (MC), No Understanding (NU) and No Coding (NC). Each conception was scoring as shown in Table 4.

Table 4. Scoring the students' conceptions

Students' Conceptions	Score
Sound Understanding (SU)	2
Partial Understanding (PU)	1
Misconceptions (MC)	0
No Understanding (NU)	0
No Coding (NC)	0

After the test, we scoring each students' conceptions using Table 4 and then finding the average, standard deviation, and effect size of students with PDEODE*E tasks and POE tasks as shown Table 5.

Table 5. The effect size of the data

Students with...	Average (\bar{x})	Standard deviation (SD)	Glass's delta (Δ)
PDEODE*E tasks	6.3	2.4	1.00
POE tasks	5.2	1.1	

At Table 4, the value of effect size is 1.00 that explanation as "large effect". This value shows that students with PDEODE*E tasks more effective than POE tasks to alleviating students' misconceptions. The finding is related to Samsudin et al. (2016); Zulfikar et al. (2017) that stated PDEODE*E tasks was effective earnings of altering misconceptions students whispered.

CONCLUSION

PDEODE*E tasks is a development of POE tasks. Based on research, we can compare the PDEODE*E tasks with POE tasks in alleviating students' misconception. The results show that value of effect size was 1.00 with interpretation "large effect". The effect size has facilitated recognized that the influences of differences (Sinaga & Feranie, 2017) between PDEODE*E tasks and POE tasks on decreased students' misconceptions. So, the use of PDEODE*E tasks is more effective than POE tasks in alleviating student's misconceptions on Newton's First Law.

ABSTRACT

For the new generation, defined as digital native learners, mobile learning and mobile applications constitute a motivation source with no alternative. For individuals who know the language of information technology and the internet and communicate easily by this language, mobile learning has become a matter of concern as a new teaching method. As mobile learning becomes increasingly widespread and digital native learners want to utilize it in their learning, it is also important how mobile learning applications, directly related to mobile learning, should be designed.

This study was conducted with digital native learners studying at undergraduate level in the Faculty of Education. The purpose of the study is to reveal the design preferences of digital native learners for educational mobile applications and to reach the principles and guidelines related to mobile designs in this concept. In this study, Sequential Exploratory Mixed Methods Research Design was used. Qualitative data were collected first, and then quantitative data to augment qualitative data in the design. The qualitative dimension of the study includes 10 digital native learners with maximum sample diversity while 285 digital native learners are included in the quantitative dimension with random sampling.

Results of qualitative data analysis indicate that the most preferred, by digital native learners, mobile applications are educational applications followed by social media, entertainment and shopping applications. Digital native teacher candidates point out that they prefer to be provided mostly with “pleasant visual design, user friendly menu, rich content, fluency and speed” in the educational mobile application, and when it comes to design aspect, the most important elements of design are "color palette, layout, font selection and smooth transitions" they added. Participants also expressed the importance of "navigation and application logos" in educational mobile application design.

The results in analysis of quantitative data, collected to augment qualitative findings, support these findings. The majority of digital natives pointed out that the design should be prioritized in mobile application rather than content / information. They also stated that the number of users who downloaded the mobile application and the screened images of the mobile application placed on the market affect the downloading behavior for the application; but there is a factor that needs attention here. Digital natives also think that the logo preferred in mobile application will affect the use of mobile applications and that a simple design should be preferred when preparing the mobile application logo rather than complex one. According to them, the logo should not be traditional logos such as universities, schools, diplomas; it should be creative or suggestive logos. In addition, a good mobile design should include blank spaces for the user to feel spacious, and short words should be preferred instead of long ones in mobile application titles due to limited space. Looking at the preferences of digital natives, it seems that the number of elements seen in the menu of a mobile application should be at most 3 to 6. Regarding content, digital natives have stated that there should be as little content as possible on a screen, and that the text should include known / familiar fonts. Georgia, Comic Sans and Arial fonts are preferred typing characters top to bottom. In regard to mobile design, digital natives are also emphasizing the fact that the unique icons and, if possible, the use of vivid colors in design instead of neutral ones such as black, white and gray will positively influence the use.

As a result, designing an educational mobile learning application is not just about combining specific icons, elements and colors, but to try to make sense of the user's effectiveness and to offer a unique experience. As a result

of this study, a number of design principles and guidelines based on data on mobile learning applications have been put forward.

Keywords: digital native learner, mobile application design, educational mobile applications, mobile application interface, mobile app layout

INTRODUCTION

Along with the widespread use of mobile technologies, a new social identity emerged that sociologically preferred to express itself on a technological level. It is possible to define this sociological community, called digital natives, as "a generation that can speak the language of machine and digital technology". It is suggested that digital native learners differ from previous generations not only from the sociological point of view but also from the physiological structure of the brain (Prensky, 2001b). For this generation, which has its own distinctive differences, mobile learning and mobile applications constitute a source of motivation with no alternative. It is seen that this new approach spreads as an instructional method and especially the individuals who start their life by opening their eyes into the digital age want to carry out their learning in this way.

Mobile technologies have a significant impact on learning and supporting teaching (Zurita & Nussbaum, 2004). Despite this favorable impression of mobile technology, it should be stated that it does not mean learning directly and should not be regarded as equivalent to learning. Students may not be aware of the use of mobile technology for learning, even if they have mobile products / devices and are benefiting from them for everyday use. Mobile learning and mobile learning environments have educational benefits and unique advantages, provided that student awareness, motivation and active participation are ensured. Schofield, West and Taylor (2011) have compiled a comprehensive review of literature in regard to advantages of m-learning. Mobile learning, according to them, is primarily handy and flexible. This provides access at any time from any location. The work place, the school, the task field, the house now becomes a single learning center. Mobile learning ensures learning "as required". Mobile technologies and devices now reduce the amount of information delivered to students, thereby reduce cognitive burden and provide a more internalized learning experience. Mobile learning is also more convenient to situated learning than vicarious/simulated learning. The situated learning is more significant in terms of learning and provides sufficient learning when required. Additionally, choosing what, when, how much and by which method (text, graphics, video, animation, blog, discussion forums, search engine, etc.) to learn transforms mobile learning into a "fully customized" learning format. Mobile learning is also economical. Producing a single design and distributing it to multiple platforms is a very economical way.

An important dimension of mobile learning consists of mobile learning platforms and mobile applications. M-learning platforms and applications are not just learning environments where users are left alone with mobile technology to carry out their own learning. Mobile learning platforms and applications have their own unique design principles. There are some criteria to be considered both in terms of design / interface and in designing content for mobile application. Ko and Rossen (2004) state that "if you publish your courses and lessons on the Web without a design, you are not creating a viable and applicable tool for your students. The missing element here is the lack of instructional design". An application with a poor content but good design may motivate the student thus increase his interest in the lesson while another one with a high quality content but poor design may affect teaching negatively from the very beginning. When developing an educational mobile application, it is necessary to pay attention to the design / aesthetic preferences of the users and to make use of the established practices and create quality designs.

Ballard (2007) stated that there are many criteria in designing. These criteria are summarized as follows:

Small devices: Small screens of mobile devices may not support multiple windows. In this case, for example, a drop-down list, pop-up menus and small dialog boxes can be used. Because of this feature, care should be taken when creating mobile content so that it does not scale so as to prevent the reader from focusing on the small screen. Also, users may have to quit applications suddenly. A mobile application should keep the data in the cache as much as possible, reduce the wait time and offer its functions very quickly.

Personal Device: Each mobile device is also a personal device, an application must be designed to store each password entry or secure data entry. An application should offer the option to store private information, such as member login. If an app uses cookies, it should not delete them immediately.

Customizable Device: Even though quite appealing in terms of design, an application should offer its users freedom to use different themes. Some colors may be found by some users unfavorable. The difficulty in choosing the size of texts can also be overcome in this way.

Always On and Always Connected: Silent or vibrate mode should be available in the design as mobile devices to be used almost everywhere.

Battery: An application must be designed to use less power (keeping processor less busier, display usage, data connectivity).

Difficulty of Text Input: Users prefer to type short texts. In addition, an application should also provide other input sources such as cameras, address books, calendars, autocomplete, speech, image recognition, and GPS other than text input / keyboard.

Designing a mobile learning environment is an extremely demanding and specialization-required activity. Among the features that should be considered in terms of mobile learning design are speed, performance, design, fluency, updateability, debugged mobile software and codes, correct analysis of user experiences, mobile application development platforms, privacy, auto rotate function for images and shapes both horizontally and vertically, while "allowing interaction, individualized learning, individual pace, graphics intensive text and interactive links" are important criteria in terms of teaching. In relation to this, Ozata and Ozdamar Keskin (2014) have examined the preferences of learners regarding mobile learning application design and stated that students prefer features such as visual learning, updateability, allowing interaction and being entertainment oriented in mobile applications. With respect to visual learning, learners have stated that information is easier to grasp with shapes, graphics and pictures, and that long texts are intimidating and boring. In regard to updateability, learners have emphasized that the most important factor in determining mobile application preferences is updating the application. In terms of interaction, the learners expressed that they want both human-machine interaction (presentation of contents in different forms such as text, sound, video) and human-human interaction (interaction with other students and social media integration). Reviewing the literature, Naismith and Corlett (2006) list the principles of mobile learning design in the following way:

"Creating fast and simple interactions, Preparing flexible materials that can change according to the needs of the learners, Designing access and interaction by considering the differences of devices and standards, Contributing to the learner experience by using the features and restrictions of mobile devices, Using mobile technologies not just as a means of distributing learning content, but also as a facilitator to learn by employing local applications (notebooks, camera, calendar, voice recording) of mobile devices, Designing material with a learner-centered design approach "

As a result, mobile learning has been examined in terms of many factors such as unique potential of experience, advantages of use and its influence on learning; but the design issue in mobile learning remains a matter of further research on it. Therefore, this study aims to determine what kind of preferences real users have for mobile design and to set guidelines for how a mobile learning application design should be.

METHOD

Research Design

In this study, sequential exploratory design was adopted as a research method from mixed research models. When using a mixed method in a scientific research, it is necessary to pay attention to the strengths and weaknesses of this method. Creswell (2003) stated that using both quantitative and qualitative approaches together would provide better understanding of research problems than using each approaches alone. It is very important to know how and for what purpose to combine qualitative-quantitative data in mixed method searches (Onwuegbuzie and Leech, 2006). Creswell (2003) presented six basic mixed method designs. In this study, Creswell's sequential exploratory mixed method design was used; because, by doing so, first it is aimed to explain the case by qualitative data, and

then to augment qualitative data with quantitative data by developing a quantitative measurement tool in the second stage.

Population and Sampling

For combining probabilistic and purposive sampling techniques in mixed method research is the most common and most powerful way preferred in these studies (Creswell, 2003, 284-285); Purposive sampling for qualitative data, and probabilistic random sampling for quantitative data were utilized in this study. For the collection of qualitative data, purposive sampling method was preferred and 10 digital native teacher candidates were selected in maximum diversity with teacher candidates at undergraduate level from each department. The quantitative data of the study were composed of 285 digital native learner undergraduate students (teacher candidates). These digital learners were undergraduate students studying at Faculty of Education, Mersin University, in 2016, and the sample was determined by random sampling method. Digital natives participating in the research were teacher candidates studying Elementary Mathematics Teaching, Science Teaching, Classroom Teaching, Preschool Teaching, Turkish Language Teaching, English Language Teaching and Psychological Counseling and Guidance.

Data Collection Tools

For qualitative dimension of the research, a focus group interview consisting of 10 digital native learner undergraduates and researchers was conducted. The data were gathered by voice recording and then converted into a written form. The interview took approximately 180 minutes in three sessions. It has been noted that the interviews based on the question and the response to be in the form of daily conversation. Previously, questions were asked another sample group and their intelligibility was checked. At the beginning of the focus group interview, the researcher gave information and explained the purpose of the study. The responses of the participants were analyzed and the themes related to the design were identified. Using these themes, Mobile Learning Application Design Preferences Survey was created for the quantitative data collection tool. In line with the opinions of the three experts who were experienced in the field of Educational Sciences and Educational Technologies, three items were ruled out and after the correction was made in 5 items, the pilot application was carried out and the final form was decided.

Analysis of Data

In this study, it is planned to analyze qualitative and quantitative data in a sequential manner. In the qualitative aspect of the research, collected data were analyzed by content analysis (using NVIVO) from the techniques in qualitative research methods, and then codes and themes were revealed. For reliability, these data were further coded by two teaching staff experienced in qualitative research. All the data were given to encoders and they asked to recode according to the prepared code definition table. Miles and Huberman's (1994) procedure was applied to calculate the reliability of qualitative analysis.

Reliability = Consensus / Consensus + Dissidence X 100.

In the study, the overall correlation level of the researcher with the first encoder was 0.88 for all codes, and it was 0.92 with the second encoder. The average correlation score of the researcher with two scorers was calculated as 0.90. It is stated that it is sufficient for the researchers to have more than 80% correlation for the coding credibility (Miles and Huberman, 1994).

The distribution normality was checked to determine which of the central distribution measures would be used in the analysis of quantitative data. Saphiro Wilk Test, one of the most powerful tests for determining distribution normality of the data, was used. A significant difference was found in the test result ($p < .05$) for each item. It has been decided that the distribution of the test result is not normal, so the median should be used instead of the average from the central distribution measures in the analysis of the data.

Findings

As a result of analysis of the qualitative data obtained in the research, various codes and themes were obtained. The responses of the 10 digital native teacher candidates to the questions regarding their preferences of mobile applications were analyzed by content analysis. The codes in Table 1 were obtained at the end of the analysis.

Table 1 Types of mobile applications that digital natives prefer most

Mobile apps used by participants	<i>F</i>
Entertainment	4
Shopping	3
Educational applications	6
Social media	5

Digital native learners have responded that they use primarily educational applications, followed by social media and entertainment applications. This situation is expressed by the following statements:

"Mostly, I download the application to learn languages" (C1)

"I prefer applications developed for learning purposes" (C2)

"I download entertainment applications such as games, travel." (C5)

On the other hand, three digital native teacher candidates have responded that they download the mobile app for social media use. This situation is expressed by the following statements:

"I communicate through social media; therefore I prefer applications for communication purposes" (C9)

Digital native participants were asked about how educational applications should be and their responses were analyzed by content analysis. As a result of the analysis, the participants stated that the content should not be text-intensive in educationally developed applications. These considerations were expressed by the following statements:

"Educational design should not mean just text." (C3)

"There should be various alternatives in the context, such as color, font, figure, table" (C6)

"Even if applications are good in terms of information, it is always incomplete if its design is bad, and consists of just text." (C7)

On the other hand, one of the participants stated that the design of educational applications should be in line with modern mobile application designs:

"If students download an educational app, they look for its visuality, especially whether it resembles the design of appealing and popular applications that have emerged in recent times" (C2)

Digital native teacher candidates were asked about whether a mobile application could be designed for each course and their answers were examined by content analysis. Eight out of ten participants indicated that the mobile application of the courses should be designed, while two participants regarded it unnecessary.

"I support the implementation of mobile applications for courses" (C4)

"It's a pretty exciting idea" (P5)

"Considering its advantages, one thinks that "why not, it deserves to be tried". It would be nice to login the mobile application and prepare for the class "(C7)

The two participants stated that a mobile application for each course is unnecessary:

"The mobile application is cool, but it doesn't mean something that required for every course" (C10)

"Some courses need to be learned only by reading, underlining it" (C2)

Digital native teacher candidates were asked about what kind of expectations and preferences they would have in a mobile application developed for educational purposes and their responses were examined by content analysis. The codes in Table 2 were obtained at the end of the analysis.

Table 2 Preferences and expectations of digital natives for an educational mobile application

Mobile activity preferences	<i>F</i>
Audio narration	1
Pleasant visual design	6
User friendly menu	5
Concept maps	2

Taking notes	2
Rich content	5
Fluency and Speed	4

Digital native teacher candidates have responded that they preferred primarily to be provided with "pleasant visual design, user-friendly menu and rich content" in an educational mobile application. They expressed this situation with the following statements:

"Visuality is important. The design should be pleasant "(C1)

"When the user looks at the application, he/she should not get bored. So appropriate and plain colors should be used in harmony "(C4)

"Now when we login the menu, it must be clear what is where, and the student should not be in a difficult situation" (C6)

"An educational application related to a course should cover the subject matter thoroughly, and satisfy learner in terms of knowledge." (C7)

"There should be more concept maps. I mean, at least we can keep it in mind in verbal lessons. "

"It works quite well if there is a note taking section in mobile application" (C9)

Digital native teacher candidates were asked about how learning would be influenced by a mobile application that would be developed for educational purposes, and their answers were analyzed through content analysis. As a result of the analysis, 9 participants showed positive opinion. These views were expressed by the following statements:

"I think that with educational applications, individuals somehow can maintain their own education. In addition, applications for learning really work "(C1)

"I think it will be positive in terms of learning." (C3)

"Learning via mobile applications instead of carrying books can be beneficial both in terms of time and impact." (C4)

"People now prefer to learn something by downloading a mobile application. While sitting at somewhere, you can just login your application, and start to learn. If you do not understand, you can login and look at it again "(C6)

On the other hand, a participant expressed a negative opinion on the subject. This view was expressed by the following expression:

"In fact, there is nothing like teachers and books. I do not think educational mobile applications will be like a teacher, no matter how instructive and effective." (C10)

The responses of the digital native teacher candidates to the questions directed to them about what should be the main points in the design if an educational mobile application design will be developed are analyzed by content analysis. The codes in Table 3 were obtained at the end of the analysis.

Table 3 Digital natives' preferences for mobile application design

Mobile app design preferences	<i>F</i>
View (Layout)	6
Navigation	4
Color palette	6
Font Selection	5
Smooth transitions	5
Application Logo	4

Digital native teacher candidates have indicated that the most important design elements in educational mobile application designs are "color palette, layout, font selection and smooth transitions". Participants also expressed the importance of "navigation and application logos" in educational mobile application design. These considerations were expressed in the following statements:

"The colors need to be well chosen. Colors in pastel tones make mobile application more effective; but yellow-blue, yellow-red colors can be distracting. "(C3)

"The colors are the first thing drawing attention in the mobile application. Plain colors should be preferred. "(C4)

"Using the right color will both satisfy the user providing a good experience and make the media look more organized." (C7)

Digital native teacher candidates expressed their thoughts about the layout order as follows:

"When the mobile application is launched it is more appropriate to see all the menus. The user should have a schema and be able to access everything easily "(C7)

"Depending on the topic or lesson, a layout that appears as a list or stands side by side in boxes may be preferred. If the whole menu is visible on one screen, user will be provided with comfort. "(C9)

It is also stated that another important mobile application design factor is smooth transitions and speed perceived. These considerations were expressed in the following statements:

"Yes, there should be no halt or freeze. If there is too much on a screen, it would cause strain on application. I should be able to work fast in an educational app. "(C8)

The font selection is another important point related to mobile application design. Digital native teacher candidates expressed their views on font selection in mobile application design with the following statements:

"The preferred font character can affect the whole feeling in application. Too thick or too thin fonts are all distracting"

"Some applications have a font incompatibility. The screen is shifting, some characters are not legible. In an educational mobile application, a known font should be preferred. The size of the text is also important. For example, it can be 12 pt. I need to try and see it on the screen. "

Quantitative data were collected and analyzed after qualitative findings were analyzed. When we look at the descriptive statistics of the digital native learners in the quantitative part of the research, 44 percent of participants were using Android Operating system on their mobile devices, 32 percent IOS operating system; 18 percent Windows operating system. When we look at the frequency of mobile application searches on the market, it is seen that 40 percent of the participants searches once in a month, 38 percent once in a week and 15 percent more than once in a week. When the monthly mobile application downloading frequencies are examined, it is seen that 37 percent of them download almost no applications, 45 percent 1 to 5; 11 percent download 5 to 10 applications. The most common reasons for downloading mobile apps include "feeling a need (58 percent), looking for entertainment (11 percent), and downloading aimlessly (10 percent)".

The preferences of digital natives for mobile application design have been examined. The majority of digital natives pointed out that the design of the mobile application should be at the forefront rather than content / information. They also stated that the number of users who downloaded the mobile application and the screened images of the mobile application on the market affected the downloading behavior for the application; but there appears a factor that needs attention here. Digital natives have stated that the size of the mobile application must be at the minimum level, otherwise larger application size (i.e. how many MB's.) will reduce the downloading behavior for the application. Digital natives also think that the logo preferred in mobile application will affect the use of mobile applications and that a simple design should be preferred when preparing the mobile application logo, not complex one. According to them, the logo should not be traditional logos such as universities, schools, diplomas; it should be creative or suggestive ones. In addition, a good mobile design should include blank spaces for the user to feel spacious, and short words should be preferred instead of long ones in mobile application titles due to limited space. Looking at the preferences of digital natives, it seems that the number of elements shown in the menu of a mobile application should be at most 3 to 6.

Regarding content, digital natives have stated that there should be as little content as possible on a screen, and that the text should include known / familiar fonts. Georgia, Comic Sans and Arial fonts are preferred writing characters top to bottom. With regard to mobile design, digital natives are also emphasizing the fact that the unique icons and, if possible, the use of vivid colors in design instead of neutral ones such as black, white and gray will positively influence the use. Instead of using multiple colors throughout mobile design, they added, it would be more effective to use a dominant color or shades of the color. Another factor, important in mobile design other than the color, has

emerged as page transition effects. In respect to this, digital natives stated that they prefer uncomplicated, plain and simple transitions (non-bending, non-folding and non-rotating reversibly) and that being exposure to unavoidable advertising images on mobile applications, even it covers a small area, is extremely demotivating. When digital natives visit the application store, the most important factors that lead them to download an application emerged as in the following order: "comments and reviews of the application, the application's logo and colors in general; and finally the name and the subject of the applications." Looking at their interface preference associated with a mobile application, digital natives favor at most matrix interface (78 percent) and then comes the list interface (12 percent). The interfaces for mobile design preferred by digital natives are shown in Figure 1 and Figure 2:

Figure 1 Matrix / Grid interface

Figure 2 List Interface

DISCUSSION AND RESULTS

Mobile learning, on the basis of mobile technologies, is a dynamic process which eliminates the need for specific location in access to the content, and enables communication with other users. When performing these functions, mobile learning applications offer them through an interface design and application menus. Mobile learning applications are easily adopted or rejected by digital native learners depending on their design and menu items they contained. Although there are limited number of options with regard to items they contain, interface and themes, each mobile applications are different from each other in terms of their design.

It is found in this study that digital natives are in favor of a simple design in general, that they seek creativity in selection of logos and icons with simplicity; but they prefer familiar characters and fonts in text writing. Digital natives give quite importance to choice of logo. The logo are designed for the small area, thus it is best to choose abbreviation of the app and single drawing rather than too many colors, drawing or text, relevant to app's purpose. According to Kim, Rueckert and Seo (2013), consistent with this finding, practicality and simplicity in design are the two most important design principles to be considered. Kim et al, put emphasis on need for making mobile learning environment pedagogically user-friendly. If this condition is met, they concluded, the content communicated with small mobile devices would be useful as much as that of big-screen computers. Addressing the design principles for mobile apps, Hermansson (2013) indicated that "a high level practicality" is of great importance. This principle leads a better experience for the users and more widely utilization of applications. Furthermore, the application shouldn't have a complex layout to cause distraction, and not require much time and effort to learn /to use it; otherwise users quit using the application and uninstall it from their mobile devices after a while. In their study on mobile application design, Charland and Leroux (2011) pointed out that application interface should met criteria of "scrolling via kinetic physics, lovely bounces, easing" to make feel real and to be a delight to use it. According to them, text and visuals with scrolling problems and freezing on the screen affect adversely the student's user experience.

This study demonstrated the need to use vivid colors in mobile application design instead of neutral ones, and to use contrasting colors or a dominant color with its shades in order to avoid a chaos with color. In mobile application design, it is not only the color choice, but also other factors including icons, text frames and line thickness should also be taken into consideration. These factors also increase users satisfaction and pleasure that they receives from

the app. Referring to this point, Gong and Tarasewich (2004) emphasized the need mobile applications to give users "feeling of pleasure". According to them, an application should be visually pleasing and entertaining as well as practical. Also, functions with context sensitive and capable of adapting to environmental conditions should be included in designing mobile applications.

Regarding the mobile application interfaces, the study reveals that digital natives mostly prefer matrix / grid (box layout) interface followed by list interface. Matrix interface is a layout which elements are presented in categories and folders as boxes in a single screen. The List interface is a layout which elements are presented as a list extending downwardly. As the reason why digital natives prefer the matrix / grid interface, it can be said that they are primarily accustomed to this layout and they find it easy/simple to use due to appearance of everything on a single screen. In line with these findings, Sarac (2014) noted in his study about the factors affecting the mobile learning design, that "designing interface in a simple, perceptible way avoiding distraction", "complying with the principles of visual design such as color, balance, size, legibility, etc.", "fitting for purpose of used multimedia elements (audio, video, text, animation, simulation, image, etc.)", "having pause, forward, backward, replay features for items such as video, audio, etc. and their smooth operation" are "very important".

Kineo (n.d) has made a number of inclusive suggestions in the design of mobile learning. According to him, the most important feature of the mobile design is "updatability". To give an example, the changes in colors, menu, icon or text made by designer in the application should be available as soon as the end user launches the application. These changes may be about either the learning process or the product itself. Secondly, mobile design should have a high quality appearance. Many times, however, better graphics and high quality visuals can lead to higher cost in apps. Thirdly, the design should be able to utilize features of mobile device (GPS, camera, barcode reading). Mobile learning design does not mean replacing the mouse clicks of the desktop users with touch screen finger taps. An environment to be explored by user should be designed. Mobile application design is different from the design of website etc. Mobile devices allow a single interaction on screen. This is about the principle of simplicity in design. The object to be focused on is presented on the screen. The design of the object to be communicated is also very important for just a single interaction occurs at a time. A balance should be sought between attractive and highly intriguing design, and fast, simple but functional solutions.

Elias (2010) also mentions eight factors on the user interface design. According to the Elias, following items should be taken into consideration when designing mobile interfaces. These factors related to the mobile interface design are "equitable use, flexible use, simple and intuitive, perceptible information, tolerance for error, low physical and technical effort, community of learners and support, and instructional climate". Table 4 includes inclusive advices on interface design for m-learning:

Table 4 Suggestion for Inclusive M-Learning Interface Design

Interface Design Principles	M-learning Suggestions
1. Equitable Use	Deliver content in a format as simple as possible Use cloud-based file storage and sharing sites Course content should be available for users with different competence and on different venues
2. Flexible Use	Pack content in small portions Consider options for non-traditional assignments.
3. Simple and Intuitive	Keep mobile application codes as simple as possible open source code software
4. Perceptible Information	Add captions, tags, descriptive information
5. Tolerance for Error	Support situated learning methods
6. Low Physical and Technical Effort	Writing text on a mobile device is about physical effort. Responding open-ended questions via small keyboard can sometimes be intimidating. Use specific assistive technologies unique to mobile phones
7. Community of learners and support	Encourage for multiple communication method Take technological access and preferences into consideration when creating groups
8. Instructional climate	Communicate reminder, exams and questions to students on a regular basis Allow the content that learner can also contribute as much as possible

(Elias, 2011)

In conclusion, designing a mobile learning application is not just to bring some elements, colors and icons together, deliver the content in a visual feast or bias the users; it is about making sense of the user's activity and to provide him with an opportunity of unique experience. In this context, some design principles and guidelines suggested in results of the study can be listed as follows:

- When designing mobile learning media, focusing particularly on content should be avoided
- Text should not be displayed frequently on the screen; instead, schemes, graphics and figures should be prepared
 - Mobile application should be finger-friendly in exercising its activities
 - The information in the content should be highly valuable
 - Access to menu should be easy and comfortable
 - Screen scrolling or page transition effects should be kept as simple as possible
 - Menu should have 3 - 6 categories maximum
 - Keyboard should be user friendly in typing text
- Horizontal and vertical use of screen should be supported; but the screen should be optimized in portrait layout as default
- Creative/unique icons should be utilized in application (taking colors, thickness of lines and frames into account)

An Analysis of The Project Education for A Culture of Peace to Promote Reconciliation in Cyprus

Zehra Azizbeyli

Near East University,

Department of International Relations,

North Cyprus

zehra.azizbeyli@neu.edu.tr

“A culture of peace will be achieved when citizens of the world understand global problems; have the skills to resolve conflict constructively; know and live by international standards of human rights, gender and racial equality; appreciate cultural diversity; and respect the integrity of the Earth. Such learning can not be achieved without intentional, sustained and systematic education for peace.”

(Global Campaign for Peace Education, 2016)

Abstract

This paper discusses the importance of peace education and the impact it can create on post-conflict societies by analyzing the project of Education for a Culture of Peace in Cyprus. The lack of contact and communication between the Turkish and Greek Cypriot communities in Cyprus over the years has not only resulted in protracted conflict but also produced great educational challenges as well as a culture of violence within the education systems on both sides of the divide. UNICEF (2009) emphasizes the crucial role of education in peace-building processes in prevention of conflicts in the future. The project of Education for a Culture of Peace in Cyprus follows a similar rationale that peace can be cultivated and sustained, and real social change can be achieved by transforming the educational systems across the divide, through peace education. This project enabled to bring students and educators together from both communities for the first time for multi-communal peace education workshops, and this has created a potent space for everyone to participate, communicate, tolerate, understand and show empathy to each other effectively.

Introduction

According to the figures, approximately half of the 104 million children worldwide that do not attend schools currently live in countries recovering from violent conflicts or similarly fragile states (UNESCO, 2004, cited in Vonhm, 2015). Over the past fifty years, our world has seen major conflicts. Two world wars and many different regional conflicts generated a new urgency for humans to pursue peace more than ever. Therefore, the traditional explanation of peace as absence of war is no longer sufficient now (The father of international law, Hugo Grotius in 1625, developed this idea (Alliez & Negri, 2003), this is widely known today as the definition of negative peace -absence of physical violence-); instead peace has come to mean harmony at all levels of human endeavour (Educational innovation and information, 1999). UN Charter also states that it is “we, the peoples of the United Nations, determined to save succeeding generations from the scourge of war” (UN Charter, Preamble). As is also stated by Alger (2014), I believe that the first step should be the attainment of belief in the possibility of peace everywhere. The pursuit of existence of a system of economic and social justice requires a vision of a peaceful world. To be able to do this, we have to engage with the depths of our history to teach ourselves alternative orientations that can be achieved through education. We cannot create world peace in one day but through education, we can offer an important contribution to the development of a “culture of peace” (Vriens, 1999). Peace education is actually the result of the pacifist movement, where much of its work remained with small projects and groups and it was right after the First World War that peace education became an international concept (Pandey and Upadhyay, 2016). In the beginning, it was associated with the League of Nations in the preservation of peace and security. However, there was no significant development for the concept for a long time (Pandey and Upadhyay, 2016). Since its establishment, the United Nations has been seeking to establish conditions to pave the way towards peace. The Universal Declaration of Human Rights (1948) affirms that ‘Everyone has the right to freedom of thought, conscience and religion’ (Article 18), ‘of opinion and expression’ (Article 19), and that education ‘should promote understanding, tolerance and friendship among all nations, racial or religious groups’ (Article 26) (Declaration of Principles of Tolerance, 1995). Education of people towards building peace became the vital mission and peace education has been developed as a means to achieve the goals stated above. In 1999, The Hague Appeal for Peace was created as an international network of organizations and individuals dedicated to the abolition of war and making peace a human right. The Network has launched the Global Campaign for Peace Education and took the responsibility of coordinating the peace education campaign. The Network defined peace education as “a participatory holistic process that includes teaching for and about democracy and human rights, nonviolence, social and economic justice, gender equality, environmental sustainability, disarmament, traditional peace practices, international law, and human security” (The Hague Appeal for Peace, 1999). Hague Appeal for Peace (1999) further elaborates that we can

only reach a culture of peace if we develop an understanding of global problems of our earth and create an ability to tackle conflicts non-violently with justice. In this sense, cultural diversity is important. We have to develop respect to the Earth as well as each other. This kind of learning can be attained through peace education (The Hague Appeal for Peace, 1999, cited in Bhatti, 2010). In fact, today, peace is recognized as an essential condition for human survival and a new way to think about peace is necessary to eliminate unforeseen circumstances for human beings. Peace education is of fundamental importance to the mission of the UNESCO and the United Nations. As the Director-General of UNESCO also stated, building a culture of peace throughout the world is a difficult social action and it involves long-term social and cultural changes. Education at all levels is a fundamental element of to this process (Matsuura, 2008, p. xix).

So, what is peace education then? There are many different definitions of peace education in literature. Pandey and Upadhyay (2016) define peace education as the process of acquiring the values, the knowledge and developing the attitudes, skills and behaviours to live in harmony with oneself, with others and with the natural environment. Ian Harris and John Synott (2002) further described the term as a series of “teaching encounters”, where people’s desire for peace and non-violent alternatives for managing conflict and skills for critical analysis of structural arrangements that produce and legitimize injustice and inequality becomes evident (Harris and Synod Jones, 2002, cited in Gill, 2016:99). This definition addresses the prevailing violence in our societies today. In fact, violence is not a new concept for our globe; it has been predominant throughout the history of the world and it is certainly not about to disappear unless something has been done about it. Therefore, we need a structural change through education as a means through which one can develop critical thinkers and active, democratic citizens, willing to participate in the affairs of their country and to seek creative solutions to problematic situations, supporting equality for all, justice and compassion (Kotziamani, E. POST RI, 2014). Culture of peace and the role of education for a culture of peace in bringing forward this change are both crucial to deal with potential violence in a given society and to establish a civil and peaceful society (Pandey and Upadhyay, 2016). In this sense different types of peace education exists. Harris (2004) lists five different types: international education, human rights education, development education, environmental education and conflict resolution education. These are different types of peace education but yet they make an effort to explain forms of violence and present information about alternatives to violence (Harris, 2004:5). “Peace educators point out problems of violence and instruct their pupils about strategies that can address those problems, hence empowering them to redress the circumstances that can lead to violent conflict”. In schools and community settings they impart to their students the values of planetary stewardship, global citizenship and humane relations” (Harris 2004:5).

Cyprus is an island with a tortured history of ethnic intolerance and has been divided since 1974. The island is a perfect example of a post-conflict society that is divided, with separate dominant educational systems across the divide. Both of the systems are designed to promote national education as part of societal cohesion and unity as part of the nation-building process. In fact, it is the central dilemma for education in divided societies that lies in the way it engages with difference (Gallagher, 2009).

The use of peace education in this paper refers to teachers’ and students’ involvement on a day of workshops about peace through music, arts and other activities to define what peace is and how to achieve it. These workshops become an eye-opener for the participants to see the challenges of achieving peace, developing non-violent skills and promoting peaceful attitudes. Therefore, this paper discusses the importance of peace education and the impact it can create on post-conflict societies by analyzing the project of Education for a Culture of Peace in Cyprus (Education for a Culture of Peace was held between the years of 2014-17, the project is supported by the European Commission through the Civil Society in Action IV Program opened for the Turkish Cypriot Community. It was held with the collaboration of POST Research Institute and Association for Historical Dialogue and Research in Cyprus). It is important to mention that the research was conducted on an NGO level with the collaboration of the two NGOs at the grassroots level. The project received EU funding only for duration of three years and worked on different fields within education throughout the running of the project. Those fields were: gender studies, human rights, children’s rights, environmental education, conflict resolution studies, human security, development studies, intercultural education, citizenship and democratic education, and migrant education. These are all inter-related issues that have the goal of enabling individuals to act upon their environment and transform their societies into more peaceful ones. Education for a Culture of Peace can be considered the methodology that one can use to develop a culture of peace. International law and human rights conventions are the foundations that support the field and make it stronger and more stable to the wind (e4cp, 2014). The project took the model called the Petals of Peace Education. The Petals can be described as: dismantling the culture of war, living with justice and compassion, building cultural respect, reconciliation & solidarity, promoting human rights and responsibilities, living in harmony with the earth, cultivating inner peace. In the workshops, these were the topics that were covered, discussed and analyzed

In this paper, my methodology primary involves ethnographic research that I carried out during the workshops, also student questionnaires, meeting reports designed by the E4CP project team in the duration of the project helped me to conduct this research. I should also add that my main focus is the Turkish Cypriot community. On the day of the bi-communal peace education workshops, more than 200 children participated. The event was the first ever large-scale, full-day peace education event and was open for youngsters aged between 6 and 18 from both communities. Bi-communal Peace education workshops were comprised of 177 Turkish Cypriot and Greek Cypriot children and youth that took part in activities and workshops ranging from sports, music, theatre and music were held with topics on human rights, social inclusion, antiracism, intercultural dialogue and sustainable development (Final Narrative Report, E4CP, 2016).

Over the course of the project, the students were first introduced with the concept of peace education through mono-communal introductory workshop on education for a culture of peace. These workshops were organised with a maximum duration of 4 hours for the second half of the school year 2015-2016 in selected schools on primary, secondary and gymnasium levels. Then, one-day long bi-communal workshops were organised for the duration of 8 hours for the same students on education for a culture of peace in May 2016. In this paper, I will focus on this one-day long workshop and the use of peace education on 80 students across the divide in Cyprus. As is mentioned by Karahasan (2007), “education is not the only thing that will help mutual trust and understanding but it is through individuals’ interactions that meaning is given to issues like peace education” (Karahasan 2007:555). The bi-communal peace education workshop therefore, has proved to break the routine and provided a practical way of interaction for students with their peers from “the other” community. During the workshops on education for a culture of peace, the students were provided with two sets of questionnaires at the aftermath of the workshop, on their perceptions of Greek Cypriots. In the questionnaire after the mono-communal introductory workshop, the students displayed mostly negative or neutral comments, as they have never met a Greek Cypriot of their age before. In the bi-communal peace education workshop however, the students displayed friendly and more positive reactions to the same set of questions, showing that contact and interaction with each other made a huge difference in students’ reactions against each other. A questionnaire was prepared by the E4CP team and was distributed to the participant students at the end of the mono-communal workshops to draw images as an answer to the questions on how they feel about members of the “other group whom they never had opportunity to meet; the answers provided the students’ perceptions on the image of “the other group”. These images predominantly displayed negative perceptions of fear, insecurity and hostility against something that is unknown, as the students had never met their peers from the other community before. Then, after the first interaction with one another in the bi-communal workshops, another set of questionnaire was provided to the students at the end of the workshops. This time students predominantly provided a positive picture with the themes of friendship, coexistence and peace. The obvious change in the perceptions of students towards a positive reaction and this shows us the impact and importance of interaction between two groups without any prior contact with each other. This can be explained with the contact hypothesis tradition that social change can be attained through extensive interaction (Bekerman, 2009). The possibility of regular good contact between in-group and out-group members with equal status seems to generally promote intergroup acceptance and diminish intergroup anxiety caused by fearing the unknown. This is an assumption that is captured in the contact hypothesis (Allport, 1954, cited in Niens, 2009) that proposes contact between members of opposing groups will promote positive intergroup attitudes in individuals and improve relationship between groups (Niens, 2009). “Prejudice may be reduced by equal status contact between majority and minority groups in pursuit of common goals. The effect is greatly enhanced if this contact is sanctioned by institutional supports... and if it is of a sort that leads to the perception of common interests and common humanity between members of the two groups” (Allport, 1954:281). It should also be mentioned here that it is rather difficult to meet all of the conditions required by the contact hypothesis. The key is to create environments to lead cooperation and interdependent interactions in pursuit of common goals, shifting people to re-categorize from “us and them” to “we” (Desforjes et al., 1991; Dovidio & Gaertner, 1999; Sherif, Harvey, White, Hood, & Sherif, 1988).

As also mentioned by Karahasan (2007) elsewhere, this paper deals with intergroup interaction on a micro-level and I am aware that micro-level interactions do not provide a basis for macro-level transformations. In other words, it is a fact that peace education cannot resolve intractable conflicts in one day, however it can prepare the ground for desirable political change. In order to promote peace education, peace and reconciliation should be encouraged on a micro level, because daily interactions can change the whole structure (Bekerman, 2005). Reconciliation process necessitates is the restoration and rebuilding of relationships. Kosic and Senehi (2009) states that contact may lead to improved communication and better understanding between groups and consequently, to greater cooperation and coexistence at the individual and group level. These statements are based on the theory of contact hypothesis (Allport, 2004, cited in Kosic & Senehi, 2009:163). Contact hypothesis is one of the most durable ideas in the sociology of racial and ethnic relations. It states that close and

sustained contact with members of different groups promotes positive tolerant attitudes. In contrast, the absence of such contact is believed to foster prejudice and stereotype (Allport, 1954; Williams, 1964; cited in Gibson, 1951:136). It should also be mentioned that contact with members belonging to the other community might be associated with social anxiety, especially in post conflict areas (Kosic & Senehi, 2009). Therefore, different strategies and activities should be used to produce positive attitudes towards others. Education becomes a great tool here that involves a variety of strategies to be used in the activities prepared for the societies with post-conflict situations. Intergroup contact can greatly decrease prejudice and improve attitudes. In the case of Education for a Culture of Peace Project in Cyprus, students from different sides of the divide interacted with each other for the first time in their lives. This first contact was very crucial for the project and it should be noted that the bi-communal activities that involved the teachers and the students were very well received. While the teachers really benefited and enjoyed sharing ideas and building knowledge in a collaborative setting, the students at primary and secondary level, particularly those from underprivileged, immigrant or right-wing families in public schools, were given the opportunity to meet peers from the 'other' community for the first time. Those interviewed expressed their enthusiasm, surprise and amazement at the prospect, and clearly expressed that this helped them 'break' their prejudices (POST RI report, 2017).

Peace education can transform people's mindsets in the long run with regard to the inevitability of war and can enable people to see that alternatives exist and there are ways violent conflict can be prevented. In other words, it can be argued that education itself is not the only thing that will help mutual trust and understanding but it is through individuals' interaction that meaning is given to issues like peace education (Bekerman, 2005). Education, within its wider definition, can play an essential role in embedding the value of peace. I envision creating an educational system for Cyprus to bring the two communities to a mutual understanding, toleration and compassion to contribute to peace-building process itself. As the 'Education for a Culture of Peace to Promote Reconciliation in Cyprus' project also states that Cyprus could be set as an example for future initiatives in Europe and elsewhere on how to integrate Education for a Culture of Peace in societies with conflict or post-conflict societies. In the activities, peace education workshops were designed with games in sports; arts, music, drama and students were encouraged to participate in games with students from the 'other' community. These activities were well designed, where the language barrier was absent and communication between students was possible, it was clear that they also recognized and grasped some of the key concepts of peace education such as the concepts of 'bullying', 'environmental sustainability', 'mediation' or 'gender equality'. The workshops were held on the buffer zone, which could be accepted as a neutral zone across the Cyprus divide. The activities facilitated learning in a playful and innovative way to connect the participants. It should be noted here that classroom research has found that cooperative learning techniques increase the self-esteem, confidence, and understanding of students across racial and ethnic divisions, also the academic performance of minority students is improved without compromising the performance of majority group students (Aronson & Bridgeman, 1979).

The workshops were therefore very crucial to promote peace for Cypriot students across the divide. My only criticism for the workshops could be the lack of continuation and follow up process as the Education for a Culture of Peace was held between the years of 2014-17 and was supported by the European Commission through the Civil Society in Action IV Program opened for the Turkish Cypriot Community. According to the contact literature, contact should be regular and frequent (Bekerman, 2009). However, as much successful this one-day activity was, lack of continuity makes it difficult to measure the impact and the extent/depth of learning of the participants. As the key theorist behind contact theory Gordon Allport (1954), a positive impact of intergroup contact occurs only in situations marked by four key conditions: equal group status within the situation; common goals; intergroup cooperation; and the support of authorities, law, or custom. I believe the fourth element, support of the authorities is a crucial aspect for the success of the project Education for a Culture of Peace in Cyprus. The project faces a great danger to lose its value with the lack of support by authorities or any law in Cyprus. This can be accepted as a criticism for the future of the project. In conclusion, I would like to add that this one-day workshop of the project and its activities can be set as an example that everyone can contribute to the promotion of peace. It is only a matter of enthusiasm, commitment and action to make it happen. It is true that peace education cannot resolve protracted intractable conflicts as it is in the case of north Cyprus, but it can prepare the ground for desirable political change. Education will prepare the path towards peace.

An Analytical Study of Organizational Implication in EFL Writing Experienced by Iranian Students with Learning Difficulties (LD)

Yoones Tavoosy M.A

*Faculty of Foreign Languages,
University of Isfahan, Hezar Jerib St, Isfahan
Tavoosy.ys66@yahoo.com*

ABSTRACT

This present study concentrates on the organizational implication the Iranian students with learning difficulties (LD) experience when they write an English essay. Particularly, the present study aims at exploring students' structural problems in EFL essay writing. A mixed method research design was employed including a questionnaire and a semi-structured in depth interview. Technical Data Analysis of findings exposed that students experience a number of difficulties in the structure of EFL essay writing. Discussion and implications of these findings are presented respectively.

Keywords: *organizational implication, EFL, writing, Iranian Students, learning difficulties*

1. INTRODUCTION

Students' writing ought to indicate their consciousness of their own Communicative objectives, of the reader, and also of the writing context. Essay writing, which constitutes a problem for many ESL/EFL students widespread, is a foremost challenge for a considerable number of students with learning difficulties (LD). In spite of various attitudes and broad number of approaches to the teaching of writing have evolved from different methods, tackling EFL writing is still one of the most challenging areas for teachers of students with LD. Iranian students with learning difficulties (LD) need to authorize many academic assessments in English. Nonetheless, these students still experience certain obstacles in the organization and organization of their English essay writing as revealed by the results of an introductory essay writing questionnaire administered to fifty students.

In Iran yet there have been conducted limited studies in the field of essay writing. The present study is associated with investigating the organizational difficulties that Iranian students with learning difficulties (LD) experience while writing their essays in English.

Iranian students with learning difficulties face particular implication in writing. As many teachers of candidates with LD of English have observed, learning and developing the writing skill seems to be more painstaking and challenging than acquiring the other language skills (Zheng, Y., 1999). The fact of the matter is that generating an effective and well-organized piece of writing is an enormous challenge, particularly in one's second language (Nunan, D., 1999). This is hugely highlighted by the notion that the rhetorical conventions of English texts-the structure style, and organization-often vary from those in other languages (Leki, I. (1991) as they necessitate a great effort to identify and manage the difference. This is principally true of the rhetorical conventions of the Persian language as candidates' mother tongue.

In Iran, the education system gives importance to writing mainly for taking tests. In this respect, several studies in Iran were conducted offering different approaches and remedial programmes to tackle the de-contextualization of writing and to develop candidates' EFL essay writing skills (21).

The present study attempted to find answers to the students with learning difficulties and their teachers perceive the organization of the written essays.

How do Iranian students with learning difficulties (LD) and their teachers perceive the structure of the written essays?

2. LITERATURE REVIEW

Writing is “a reflective process and requires time to think about the topic, to analyze and classify background knowledge (Chakraverty, A., & Gautum, K., 2000). Writers need to employ an appropriate language to organize these concepts in the form of an efficacious and well-organized discourse. Writing is an intricate activity, a social act which reflects the writer’s communicative skills which is complicated to learn and develop, particularly in an EFL context (Shokrpour, N., & Fallahzadeh, M., 2007). L1 writing is perceived as: a cognitive psychological perspective, a socio-cultural perspective and a linguistic perspective (Myhill, D., 2009). In line with the process writing approach, this paper perceives EFL writing as a multi-dimensional process composed of a cognitive activity affected by a number of linguistic and contextual factors; EFL linguistic proficiency, instructional, psychological, sociocultural, and socio-political issues. If these factors are well-addressed, this will make writing an easy experience.

L2 Writing has consistently been regarded a seminal and significant skill in teaching and learning. According to Rao, Z. (2007) EFL writing is beneficial in two respects: First, it stimulates students thinking, forming ideas, and developing their aptitude to summarize, analyze and criticize. Second, it reinforces student learning, thinking and reflecting on the English language.

In regard to the context of the present study, essay writing is substantial to the learning of Iranian students with learning difficulties (LD) since it assists students and teachers’ acquisition of the fundamental study skills needed for understanding what they study and expressing it in their own words. This will assist them to evade memorization, rote learning and plagiarism that are much discouraged in the recent theories of teaching learning. Furthermore, aptitude and competence in essay writing will aid students pass their academic courses effectively and also successfully. Likewise, being proficient in essay writing in English will facilitate students with LD and their teachers to be successful teachers and action researchers in the future.

Coherence, or texture, is the combination of semantic configurations of two dissimilar, kinds: register and structure (Halliday, M., & Hasan, R., 1985). Text-based features mean structuring (i.e., the linking of sentences) and unity (i.e., being straightforward and sticking to the point). Reader-based features mean that the reader interacts with the text reliant on his/her earlier awareness. Structuring defined as “the organization of discourse with all elements present and fitting together logically” (Heller, M., 1999). This signifies that a well-organized essay involves an introduction, a thesis statement, rhetorical support, and a conclusion.

A number of research papers across Iran would have illuminated students’ organizational problems in English writing. For instance, Arab students’ written products revealed that repetition, parallelism, sentence length, lack of variation and misuse of certain cohesive devices are major sources of structure and textual deviation (Qaddumi, M., 1995). Furthermore, other studies declared that Yemini and Moroccan student writers have some weaknesses, in terms of organization, displayed in the student writers’ written texts.

In relation to EFL essay writing organization, numerous researchers come to an agreement that organization, on the instruction level is related to connecting concepts while on the micro level, it is concerned with connecting sentences and phrases. “The concept of organization is a semantic one; it refers to relations of meaning that exist within the text, and that define it as a text” (Halliday, M., & Hasan, R., 1985). Many researchers have highlighted the importance of text organization asserting that a text stands as

a text by means of organization. But for organization, sentences would be disintegrated and would result in a number of unconnected sentences (Hinkel, E. (2004).

3-METHODOLOGY

In respect of the investigative nature of the present study, and its context-specificity, the interpretive, qualitative research was selected. The interpretive approach will aid the researcher inspect and comprehend the context within which essay writing in English is taught and learnt in typical Iranian upper-intermediate level colleges. This, in turn, will assist the researcher reveal the problems those Iranian students with learning difficulties (LD) and teachers face in the organization of their texts.

The sample of the present study includes fifty students with learning difficulties. Students with learning difficulties were recognized through a check list designed by the researcher. Ten out of fifty students were chosen to be interviewed. Additionally, five teachers filled in the questionnaire and were interviewed to supplement the data and findings. The present study made use of a questionnaire and a semi-structured interview.

4-FINDINGS

Findings of the present study exposed that students with learning difficulties have to undergo organizational problems in their English writing. In respect to organizational problems in their English writing certain problems were discovered such as difficulty in writing the introduction, the thesis statement, the topic sentence, writing concluding sentences and writing the conclusion. Equally important, the teachers reported that their students have difficulty writing the thesis statement, the topic sentences, transition of notions, and sequence of notions.

A great variety of motives are linked with students' organizational problems in English essay writing. Primarily, the effect of topic-specific background knowledge was seen as effective on the overall quality and local organization of students' writing (Langer, J.,1983). What is more, it was highlighted that low English proficiency students find it difficult to develop well-organized writing due to paying attention to language matters rather than making meaning (Lee, C., 2004). Furthermore, this paper supports that students are inclined to observe distinct techniques in their written English that make their writing poorly organized such as including a broad statement in the opening sections of their essays before introducing the topic sentence the same was found with Iranian students with learning difficulties. In addition, Iranian students with learning difficulties overused coordinate sentences and misused topic sentences which were the reasons for their poorly organized and improper quality of writing.

In reference to student problems in organization, some were reported such as difficulty in using cataphoric and anaphoric reference, ellipsis, substitution, and genre related organizational bonds. Besides, overusing certain cohesive bonds was also reported. Varied studies have approved the value of text organization in English writing as a mechanism that expedites discourse flow. These studies also added that constructing well-organized texts by second language learners entails focused instruction and additional attention (Reid, J., 1993a). Moreover, numerous reviewed studies emphasized that production of well-organized text in English constitutes a serious problem to Iranian students.

5. DISCUSSION

The present study exposed in its findings that there are varied and diverse elements and contexts lying behind these organizational problems. In fact, in terms of psychology, students undertake a number of barriers such as lack of incentive, lack of self-assurance, and writing uneasiness.

Iranian students with learning difficulties (LD) are not encouraged to write English essays for more than a few conceivable reasons. First of all, they are taught in a large class characterized by physical as well as intellectual distance between teachers and students. Second of all, Iranian teachers tend to use traditional teaching techniques such as lecturing, reading aloud, and book reading; they are frequently indifferent to student writers' communication in class; and student writers report negative attitudes towards essay writing as a difficult course. These factors are similar to the issues revealed by Holliday, A. (1996) as "sings of boredom", "passive watching" and "teaching spectacle". Lately, it has been referred to the impact of student passive listening on their learning in general and particularly creative writing (Abdollahzadeh, E., 2010). This lack of enthusiasm can affect negatively on students' improvement in essay writing. Finally, another study has confirmed that students' lack of motivation intensity impact on their vocabulary problems in writing (Al- Akloby, S., 2001).

Students' low self-esteem could be attributed to a number of socio-cultural issues. Parents' perspective on controlling might be an influential element in students' confidence-rising. As they unintentionally insert a lack of self-confidence in their children by disregarding their opinion in the family. Students distrust their parents to communicate their thoughts; this ordinarily occurs in the Iranian upbringing context where notable number of parents is potentially willing and ready to reprimand both physically or psychologically their children. Moreover, students habitually have a tendency to ask someone else to assist them in personal activities or school learning tasks. It is common among many Iranian that they depend totally at home on their parents or elder siblings. Individuality and self-reliance in study is an uncommon phenomenon in the Iranian education system and living culture. Another significant factor is parents' unrealistic academic expectation which is beyond some students' intellectual abilities. Regarding the educational system in Iran, students in classroom due to the fear of the teacher's strong authority are not given the opportunity to argue or negotiate with their teachers. All these factors might be the original source of lacking self-confidence among most Iranian students.

Most learning environments at Iranian public high schools or colleges are not designed to elevate student's self-confidence. In fact, it is underscored that writing multiple drafts, putting emphasis on the "publication" of students work, and teachers' comments that focused more on content and organization than on grammatical errors helped them create better pieces of written composition and grow more self-confidence in writing (Tyson, R. , 1997). Similarly, it is claimed that when students are self-possessed in their reading and writing skills, they are able to adjust to new teaching/learning methods quickly (Albertson, K., 2006). As a result, teachers and colleges must design a mentally reassuring and fostering learning environment in to the Iranian context to develop students' self-reliance and ease their psychological challenges.

Writing tension is said to negatively affect both the learners' incentive (Cheng, Y., 2002) and their academic accomplishment (Macintyre, P., Noel S, K., & clement, R., 1997) on one hand and their outlooks towards writing on the other hand (Atay, D., & Kurt, G., 2206). Research has confirmed that high anxious writers, in comparison with other low anxious ones, tend to stop more while writing and are less concerned with planning the overall structure of their essays (Selfe, C. ,1984).

Data exposed a number of features that might have contributed to Iranian students' writing anxiety such as lack of written feedback, undesirable oral reproach, working under time limitation, and about difficult topics for writing. A study across the Iranian context underscored that students with low wrote better quality pieces of written composition and had higher self-esteem than those with high nervousness (Hassan, C., 19981). Furthermore, it is acknowledged that students' writing anxiety is triggered by their previous negative assessments or by more complex psychodynamics (Rose, M., 1985). In reference to feedback, it was revealed that the peer feedback group of prospective teachers experienced considerably less writing anxiety than the teacher feedback group as they received opinions from their classmates to

elaborate on, and this collaboration assisted them look at their papers differently and lessen their writing anxiety (Rose, M., 1985). Additionally, it is implied that writer's block that leads to their anxiety in writing may be due to students' writing under time pressure (Lee.S., 2006). As a final point, it was reported that students with high apprehension selected topics that were more familiar to them and avoided unfamiliar topics (Lee.S., 2006).

Findings of the current study emphasized that teachers have expressed their concern about their students' lack of reading authentic English texts resulting in substantial challenges with regards to topic prior knowledge, coherence, organization, style, range of vocabulary, and grammatical structures and punctuation. What is more, teachers reported that students normally read the simplified texts of novels and plays. They are not used to reading for long hours and they are not ready to apply that effort. This is likely to impact on English writing because the more one reads the better writing style and vocabulary one develops.

To highpoint how strong and close the relationship between reading and writing should be, it is exploited that the teaching of reading and writing are inseparable (Zheng, Y., 1999) academically, it was recommended that L2 reading would help improve L2 writing at the primary and the higher levels (Bell, T. 1998). In line with this, it has been confirmed that reading for pleasure and mandatory reading affect developing writing skills positively (Feeris, D., & Hedgcock, J., 1998). In reference to the Iranian context, the importance of reading to enhance students' previous knowledge was highlighted (El-koumy, a., 1983). He added that the teaching of reading and writing should be integrated. A few of reasons could be counted for this lack of broad reading, such as lack of motivation from parents, lack of monetary resources, lack of appropriate and well-resourced libraries.

The current study also exposed that Iranian student's lack topic previous knowledge. This was reinforced by the observations of both students as well as their teachers. Accordingly, it was asserted that there is a convincing relationship between topic-specific background knowledge and the quality of student writing (Larios, J., Marin, J., & Murphy, L. , 2001). Similarly, previous knowledge and writing experiences appeared to influence on students' revision processes more than any other factors (Selfe, C. ,1984).Previous knowledge about written English is thought to be one among other effective factors in students' success (El-Mortaji, L. ,2001).

Rote learning is one of the characteristics exemplifying the Iranian educational system. Students are stimulated to memorize what they study rather than actively take part in serious and generative thinking processes. In cultural terms, Iranian students who memorize what they study are viewed as smarter than those who do not. This is supported by most exams in the diverse educational steps in most courses which ask students questions that mostly require them to evoke what they have memorized in their earlier studies. These exams do not only generate distress and hindrance, but also accentuate rote memorization and restrain critical thinking.

It is widely believed that the Iranian educational system is to evoke competitive learning environment. In an Iranian classroom, students are ranked based on accomplishment that is gained through a grim competition. This has led to teachers constructing some perplexing exams that permit only smart students to pass and necessitate other students to resist several exams or repeat the whole academic year. Consequently, Students contest due to specific socio-cultural factors such as teachers and parents' inspiration.

6. IMPLICATIONS FOR TEACHING OF WRITING

The current study contributes significantly to EFL education in Iranian in terms of English language educational research, and curriculum planning and design. Furthermore, the present study has the potential to develop English language teacher education in several of ways:

- a) It highlights the very importance of students' needs as this will facilitate teachers to appreciate ways to find to satisfy these needs and also conduct an effective learning.
- b) It functions as a model for further studies in education in terms of using the explanatory constructivist research agenda. This attitude has been entirely overlooked in Iranian and no previous study having used an investigative approach to study the organization and organization problems faced by Iranian students with learning difficulties (LD).
- c) It assists curriculum designers take into consideration students' needs and interests in planning their core curriculum.

7. CONCLUSION

- The teaching resources used with Iranian students ought to cover a wide range of organizational skills coping with students; diverse proficiency levels.
- Teaching and learning tasks should be categorized and varied to aid students make the most out of them, in particular, in big classes of different capabilities and skills.
- Essay writing teachers should be educated to employ different classroom interaction techniques and teaching approaches such as pair work and group work, peer-review, student-teacher conferences and any other related techniques. It is also recommended that teachers should be acquainted with using technology in the classroom to help students with different learning styles learn efficiently and rapidly.
- It is recommended that essay writing lecturers should be involved in conducting studies in general and action research in particular where they can discover students' weakness areas and attempt to develop them.

An Effective Personal Education Through English & American Novels

Shinhee JUNG

Department of English Language & Literature

Hannam University

South Korea

stellajsh@hnu.kr

ABSTRACT

English has usually been necessary and sufficient condition from the younger generation to adults. Specially, there are many universities and companies to need English abilities in South Korea. Ultimately, this can consider why English is important to get ideal jobs. Accordingly, diverse ways to master English have been studied and poured out for many years. However, English education should serve as not only helping learners improve its skill but as a guide lightening the course of one's life. Above all, personality education can be the most important. So this paper aims to examine the effect of building humanism through a variety of English & American novels. Works at the ages of students are selected. In fact, personality educations have been done in many ways, but many students tend to be inspired easily by characters of literature works. However, those who have concentrated on academic knowledge may be deficient or negative about the opportunities building upright character. Especially for those who long to get good grades of English exam. Such much concern can decrease by acquiring English ability through the sentences of novels. Therefore, literary works help students do much better in two aspects. Therefore, this paper is comprised of introducing and the various application method of English & American novels which the author of this paper has been teaching and researching over years in the school curriculum.

INTRODUCTION

Personality is a set of individual differences that are affected by the development of an individual: values, attitudes, personal memories, social relationships, habits, and skills (McAdams, Mischel & Shoda & Smith). Engler mentioned that different personality theorists present their own definitions of the word based on their theoretical positions. The term "personality trait" refers to enduring personal characteristics that are revealed in a particular pattern of behavior in a variety of situations. It has been shown that personality traits are more malleable by environmental influences than researchers originally believed (Briley, Tucker & Jeronimus). Personality differences also predict the occurrence of life experiences. Is an effective personality class through English & American novels possible?

THE STUDY

According to the regular curriculum, English novel is opened to the 3rd grades in every spring semester, and American novel to the 2nd in every fall semester. Once Collecting distinguished novels is important and then, reading and analyzing works follows. Discussing works in English with each partner (Using the sentences in works). Writing the key sentences after discussing and reading novels. Some of works which the author has taught or studied are summarized as follows.

With main texts, other novels (including young-adult literary works) are introduced and studied. First, *River Boy* is a young adult novel by Tim Bowler, published by Oxford in 1997. It is the story of a teenage girl facing the prospect of bereavement. Bowler won the annual Carnegie Medal, recognizing the year's best children's book by a British subject (Tim Bowler's Official Website. Retrieved 2012-09-10). *River Boy* also won the 1999 Angus Book Award (Angus Council. Retrieved 2010-05-30). Fifteen-year-old Jess, a dedicated swimmer, dotes on her grandfather, a fiercely independent and cantankerous artist. When he falls ill, he insists on returning to the isolated valley where he lived as a child to finish his last painting, a haunting landscape called 'River Boy'. Jess is desperately trying to cope with the knowledge that her grandfather is dying, and she does her best to help him finish the painting that is so important to him. Jess then learns that her grandfather has died peacefully, leaving her his painting of the 'River Boy', which she now realizes is both a landscape and a portrait of the boy she met – a self-portrait. Focused on understanding the gap between generations. Second, *The War that Saved My Life*, written by Kimberly Brubaker Bradley, is a 2015 children's middle grade historical book published by Dial Books

for Young Readers. The War that Saved My Life was a Newbery Honor Book in 2016 and was Bradley's first Newbery Honor Book. Ada Smith: The protagonist of the story. Ada is a ten-year-old girl with a clubfoot (right foot). She has been abused by her mother physically and mentally. She learns how to walk, write and ride horses after running away from her mother to the countryside. Third, *Summer* is a novel written by Edith Wharton published in 1917 by Charles Scribner's Sons. The story is one of only two novels by Wharton to be set in New England, who was best known for her portrayals of upper class New York society. The novel details the sexual awakening of its protagonist, Charity Royall. "Wharton begins her book, in other words, with Charity Royall discarding both models of female perfection from the past: the ancient erudite make one and the modern sentimental female one" (Wharton, Introduction by Elizabeth Ammons of *Summer*, xxvi). This work is focused on real love and the value of life in the class. Fourth, *Number the Stars* (1989) written by American author Lois Lowry is a work of historical fiction and about the escape of a Jewish family (the Rosens) from Copenhagen during World War II. "I think readers of every age match themselves against the protagonists of books they love. *Would I have done that?* they ask themselves as they follow a fictional character through a novel. *What choice would I have made?* And ten-the age of Annemarie in *Number the Stars*, and the approximate age of most of the book's readers- is an age when young people are beginning to develop a strong set of personal ethics" (Lowry, "Introduction of *Number the Stars*"). Fifth, *The Great Gatsby* written by Fitzgerald, F. Scott explores themes of decadence, idealism, resistance to change, social upheaval, and excess, creating a portrait of the Jazz Age or the Roaring Twenties that has been described as a cautionary tale regarding the American Dream- "a dream that goes unrealized for Gatsby and Daisy in Fitzgerald's prose." In *The Great Gatsby*, Fitzgerald brilliantly captures both the disillusionment of post-war America and the moral failure of a society obsessed with wealth and status (64. Leland, Person S. "'Herstory' and Daisy Buchanan." *American Literature*, Vol. 50, No. 2, (May, 1978), pp. 250–257. Web.). There's much to be learned from the author's fiction, too, especially his most famous novel, "The Great Gatsby." According to HUFFPOST, there are 7 Life Lessons From 'The Great Gatsby'. These are:

1. Optimism is a noble, if futile trait.
2. Money can't buy you love (or friends).
3. Unbridled passion isn't always a good thing.
4. It's not easy to leave your past behind you.: So we beat on, boats against the current, borne back ceaselessly into the past.
5. Don't critique others: His open-mindedness gives him a deeper perspective on the people around him and protects him from falling subject to the glitzy, surface-level materialism of the '20s.
6. Physical beauty is fickle and fleeting.: From the moment we're introduced to Daisy, she seems more like a beautiful caricature of herself rather than an actual person, but ultimately she leaves Gatsby the dust in spite of his immense efforts.
7. You know what they say about assuming. : When George discovers that his wife has died after being hit by a car, he assumes that Gatsby was the driver and proceeds to take revenge on him. In fact, Gatsby was covering for Daisy. (HUFFPOST, http://www.huffingtonpost.com/2013/09/24/great-gatsby_n_3976598.html) (09/24/2013 07:50 am ET | Updated Sep 24, 2014)

In the class students can discuss and think about these lessons. Also, they may adapt the work to themselves and their surroundings. Gradually they recognize and understand self and others. Finally, *About a Boy* written by Nick Hornby in 1998. Nick Hornby is a popular England writer and has written many novels related to various social problems and let readers perceive. His typical works sports are *Fever Pitch*, *High Fidelity*, and *About a Boy*. As mentioned above, the works have diverse subjects, that is, family, life, or love-is original, moving, and insightful. When readers face some problem, it helps them resolve the solution. Especially it is considered his works are useful for young people in 21st century. There are favorable reviews on *About a Boy*. Here are praises for *About a Boy*. The Washington Post praised that "You should read [About a Boy] for its depictions of the trials of motherhood, the drawbacks to self-imposed detachment, the ache of childhood need, the elastic confines of what constitutes a family, and how it may never be too late to grow up." And Vogue reviewed that "An utterly charming, picaresque tale of an older guy, a young id, and the funky, dysfunctional real-life ties that bind-and unbind."

FINDINGS

At the beginning of class, students are worried, nervous and hesitate to select novels because most novels have many pages. As it goes by, they acquire various vocabularies and expressions from novels and finally they can write compositions. Of course, the instructor encourages them to create their opinions and compositions. Most of all, it is very important to give students' confidence a boost. These scanned materials are written by students taken courses. Students were given assignment and quiz after finishing each work. These scanned materials are permitted by some students.

Prejudices.

When I was 20, when I started university, I had a lot of prejudices, which made me a bad person. One of prejudices was what I thought of who people smoke was bad. So I have never tried smoking. But I realized that I was wrong. It was just prejudice. There were a lot of people who were nice, even they smoke. I was in the class and I saw one of my classmate giving a presentation about his stories when he was young. After this class, I was talking to him, and he told me about his stories much more. It was impressive. He always does his best, even he doesn't like. I realized later that he smoked, but I wanted to keep meeting him because he was so nice. At the very least, he was not someone who would do anything bad. And he became my best friend now. At that time, I could know that I was wrong about thinking of smoking people was bad.

Now, I have done better than before about prejudices. If I meet someone, I have tried to meet several times and then I judge if the person is good or bad. Not to have any prejudices, I have tried to talk a lot to someone since 20 years old. Talking a lot to someone is one of best way to solve my problem.

I want to understand more people like foreigners, gay, lesbian and so on. When I was in Canada, I met a lot of friends, there were some gays. I didn't like gay people and I kept away from them until I was in Korea. But they are people like me or my friends. In the future like 40 years old, I want to be a familiar person to everyone. To do this, I have to meet more people, talk a lot and learn their culture. I will do my best to be a familiar person and I keep trying always.

When I became 14 years old, I transferred to another school in Cheonan. I was lonely because there is no one who I knew. Almost of students knew each other because they came from same elementary school. I should adapt to new school and circumstances. I kept trying to hang up with friends. Unfortunately, the more I gave affection to them, the more they required something to me. For example, whenever I said funny joke, they required more and more joke. I was tired of everything and even I told to my parents that I wanted go back to Daejeon where I left. My parents who worried about my school life didn't scold me and touched my feeling. My mother advised for me to refuse my friends' requests if the requests made me painful. With my parents' support, I could manage the relationship with my friends. When I concerned about which high school should I go to, my parents and I always talked together. I can't tell my story and life without my parents' love. One day, I came back home after school and I heard sound of crying in my house. My mother was crying quietly because someone hurted her feeling. I was really sad and realized that even adult could be hurted and cry. Even though there is problem in their life, they always masked their bad feeling in front of me. They worried about me first. With my parents' love I entered Hannam University. Before I became an adult, I thought that there would no problems in my life. Because I already have been too stressed out due to Korean SAT. I faced some problems as an adult. In this case, I should overcome myself. I easily get red in my face and I have shy character. All of my classes in the school required me to speak in front of many people. I was really embarrassed and got red in my face, announcing in front of people. My father always told me to be a positive person and I thought what my father told to me.

So, I became to think positively. I acknowledged my weakness and kept trying to be brave. To be honest, I'm still shy and easily get red in my face, but I have confidence to overcome these things. Also, I have confidence to overcome any problems in my life. In my 30 years old, maybe I'll become a good mother and have a counseling job. I have a passion to listen someone's hurts and touch their mind. I want to give love to people as my parents do to me.

CONCLUSIONS

By reading distinguished English & American novels, students learn vocabularies and sentences naturally. Through works, they think and discuss again and again, and they get accustomed to accept others' opinions. Gradually they can break down walls of prejudice. As many scholars have mentioned, we all have faced an era of artificial intelligence, like AI, so most of all personality education is very important. In the end, English & American novels are considered as the best appropriate. These are the steps of developing personality:

First,		Positive		thought
Second,	To	Open	one's	mind
Third,	The	Improvement	of	Communication
Fourth,		Tolerance	toward	others
Fifth, Sympathy (other's face)				Sixth,
Collaboration				

Figure 1. Four steps building personality through reading English & American novels

Consequently, they can be represented as above diagram and gradually students' personalities are expected to get improved and do better.

Correspondence should be directed to: Keow Ngang, TANG, tangng@kku.ac.th

ABSTRACT

This study aimed to explore the intercultural competency skills among Thai undergraduate final year students who are studying in an international college of a public university located in Khon Kaen province, Thailand. Researcher utilized qualitative method focus group interview design. A total of six students were involved as informants. Results revealed that most of them prefer to practice cultural tolerance rather than cultural adjustment when they are dealing with their foreign course mates. They respect, accept, and appreciate of other people cultures and let other people behave according to their beliefs even though they disagree with the belief.

Key Words: Intercultural, competency skills, international college students

INTRODUCTION

Intercultural competency skills are one of the values that critical and demanding to be added through educational process in order to produce future relevant human capital for the nation. The key challenge of higher education institutions particularly international college is building knowledge-based and skilled workforce. As a result, the aim of this study was to explore the intercultural competency skills of Thai students of an international college in a Thailand public university. Since the main characteristic of international college students are ready to work in international communities, intercultural competency skills are significantly important to explore so that the graduates will possess knowledge that will allow them to compete successfully by fulfilling the needs of society and providing world-class quality labor and talent.

Intercultural competency skills refers to an individual's ability to function effective across cultures (Whaley & Davis, 2007), to think and act in intercultural appropriate way (Hammer, Bennett, & Wiseman., 2003: 422) or an individual's effectiveness in drawing upon a set of knowledge, skills, and personal attributes in order to work successfully with people from different national cultural backgrounds at home or abroad (Johnson, Lenartowicz, Apud, 2006: 530). Intercultural competency skills development is emerging as an important competency as well as relevant to employability especially in the diversity of the world and the pressing global challenges confronting us as humans (Deardorff, 2012).

The key issue for education policy makers is the extent to which the higher education institutional design of education systems makes a difference to university-to-work transitions or whether economic aspects dominate (Karmel, 2017). Therefore, higher education institution rely greatly on numbers of graduates to exhibit success in internationalization, such as developing intercultural competent graduates who can compete successfully in the global workforce. Tang and Sanoamuang (November 2016) emphasized that the result of internationalization of international college has become one possible response to such challenges. However the specification of anticipated outcomes of internationalization are often general and vague, with goals stated broadly that the institution will become internationalized or that a goal is to graduate cross-culturally students or global citizens (Tang & Sanoamuang, November 2016).

The studied international college was established in 2008 and strives to be the leading international education center especial in north-east of Thailand. The international college was attached to the public university aims at producing quality graduates equipped with the knowledge and professional skills in the areas of business and social sciences. Students are recruited from various countries including China, South Korea, Vietnam, Cambodia, and so on thus creation of a multicultural society. Therefore the improvement in the quality of graduates that possess knowledge and skills that will allow them to compete successfully by fulfilling the needs of society and providing world-class quality labor and talent is especially important.

Multicultural societies in this international college help to promote cultural acceptance and pluralism among students. However students should be careful not to focus on simple aspects of culture such as food, dance, music, and clothing, as they do not represent a culture in its complexity and do not disturb the organization and power of the dominant culture. In its rich diversity, culture has intrinsic value for development as well as social

cohesion and peace. Then living in multicultural societies requires tolerance and acceptance of the diversity in the societies.

The Thailand Qualification Framework (TQF) of higher education system is planned to support the educational practice based on the guidelines set out in the National Education Act, to guarantee consistency in both standards and award titles for higher education qualifications, and to make clear the correspondence of academic awards with those approved benchmarks set by other universities worldwide. As a result, this TQF will assist to deliver appropriate ideas of comparison in academic standards for higher education institutions in their planning and internal quality assurance processes, for evaluators involved in external reviews, and for employers, in understanding the skills and competencies of graduates they may employ (Thailand Ministry of Education, November 2006). Consequently, all the higher education students in Thailand have to study according to these five domains namely ethical and moral development, knowledge, cognitive skills, interpersonal skills and responsibility, and analytical and communicative skills. Out of these five domains, intercultural competency skills are mainly included in interpersonal skills.

Cultural tolerance is defined as the respect, acceptance and appreciation of the rich diversity of our world's cultures, our forms of expressions, and ways of being human. The essence of tolerance is the right of people to behave according to their beliefs, even when there are others who disagree with the belief. Being tolerant means not to exert any pressure on anyone to change his/her beliefs, to respect opposite opinions, habits, and to be free from prejudices. Tolerance is not a compromise, forgiveness or encouragement of negative behavior. On the other hand, it is an active attitude on the basis or recognition of the human rights and freedoms. Cultural adjustment is defined as a common stress reaction that individuals have when they find themselves immersed in an unfamiliar culture. Generally cultural adjustment has four common stages namely 'The honeymoon – initial euphoria/excitement, culture shock – irritation/hostility, gradual adjustment, humor and perspective, and feeling at home – adaptation and biculturalism (Oberg, 1954).

CONCEPTUALIZATIONS OF INTERCULTURAL COMPETENCY SKILLS

Leung, Ang and Tan (2014) had conceptualized intercultural competency skills based on 300-plus personal characteristics identified in previous research that could be distilled into the content domains of intercultural traits, intercultural attitudes and worldviews, and intercultural capabilities. Costa and McCrae (1992) and Funder (2001) defined personality traits as enduring personal characteristics that determine a stable pattern of cross-situational behaviors. In other word, intercultural traits refer to enduring personal characteristics that determine an individual's typical behaviors in intercultural situations. Researcher concluded the operational meaning of intercultural traits as open-mindedness (Van der Zee & Van Oudenhoven, 2000), dissimilarity openness (Lloyd & Härtel, 2010), tolerance of ambiguity (Bird, Mendenhall, Stevens, & Oddou, 2010; Deardorff, 2006), cognitive complexity (Lloyd & Härtel, 2010), flexibility (Matsumoto, LeRoux, Ratzlaff, Tatani, & Uchida, 2001), inquisitiveness (Bird et al., 2010), quest for adventure (Javidan & Teagarden, 2011), patience (Kealey, 1996), and emotional resilience (Kelley & Meyers, 1995).

Intercultural attitudes and intercultural worldviews as the second component of intercultural competency skills focus on how an individual perceive other cultures or information outside their own cultural worlds (Leung et al., 2014). According to Leung et al., individual may have positive or negative attitudes toward other cultures or intercultural interactions. Individuals who are highly culturally competent have positive attitudes toward intercultural contact. Bennett (1993) and Srinivas (1995) highlighted that individual may have cultural or global worldviews that either ethnocentric (i.e., seeing the world from one's own cultural worldview) or emphasize the complexity and contradictions of different cultures and countries, as well as the similarities beneath surface-level differences. Individuals who are highly intercultural competent should have sophisticated, rather than ethnocentric or simplistic, construal of cultural differences and similarities. Constructs that capture such individual differences include ethnocentric-ethno relative cultural worldviews (Hammer, 2011), cosmopolitan outlook (Bird et al., 2010; Javidan & Teagarden, 2011), and category inclusiveness (Bird et al., 2010).

Intercultural capabilities will be the third components of intercultural competency skills emphasize what a person can do to be effective in intercultural interactions (Earley & Ang, 2003). Examples of the intercultural capabilities include showing knowledge of other cultures or countries (Earley & Ang, 2003; Javidan & Teagarden, 2011); metacognitive, motivational, and behavioral cultural intelligence (Earley & Ang, 2003); linguistic skills (Imahori & Lanigan, 1989); social flexibility (Bird et al., 2010); adaptability to communication (Lloyd & Härtel, 2010), and cultural tuning in terms of holistic concern, collaboration, and learning (Leung & Cheng, 2014).

In this study, the intercultural competency skills are domain specific and focus solely either intercultural traits

(Van der Zee & Van Oudenhoven, 2000), intercultural attitudes and worldviews (Bennett, 1993), or intercultural capabilities (Earley & Ang, 2003). The Bennett's (2004) Development Model of Intercultural Sensitivity (DMIS), with cultural worldviews as its conceptual basis, posits that intercultural competency skills advance along a developmental continuum, with increasing complexity and sophistication in the perception and understanding of cultures and cultural differences was utilized in this study. The trajectory of intercultural competence development begins with an ethnocentric mindset characterized by a simplistic set of perceptions regarding cultural commonalities and differences. Across six distinct stages, intercultural competency skills progresses toward an ethno relative mindset characterized by a complex understanding of cultural commonalities and differences and the ability to shift between cultural perspectives. The six stages are denial, defense, reversal, minimization, acceptance, and adaptation (Hammer, 2011).

LITERATURE REVIEWS

Leung et al. (2014) surveyed the current conceptualizations of intercultural competencies and proposed the intercultural competency skills consisted of traits, attitudes and worldviews, capabilities, or a combination of all the dimensions. Dimitrov, Dawson, Olsen, and Meadows (2014) investigated on how teaching programs facilitate the intercultural competency development among the graduate students as well as prepared them for communicating effectively in the global workplace after graduation. Dimitrov et al. found that teaching development programs should be planned to make students became more aware of cultural and disciplinary differences and were able to adapt their communication style to audiences with different levels of background knowledge, and felt more prepared for interpersonal interactions across cultures. In addition, they revealed that students were able to transfer the skills that they learned to other areas of their specialization and used effective intercultural communication strategies when interacting with their foreign peers and faculty supervisor.

Tang and Sanoamuang (November, 2016) employed a survey design to 129 undergraduate students in an international college of a public university indicated that international college students possess intercultural competency skills differently according to their nationality, program, and academic year by using independent t-test and one way ANOVA analysis. Findings of their study indicated that there was a significant difference between Thai students and international students of their intercultural competency skills in terms of identification of their friends' ethnic group ($p = .001$), different cultural practices ($p = .036$), and the impact of prejudice ($p = .009$). In addition, there was a significant difference between the different program of students on their intercultural competency skills such as impact of cultural background on their thinking and actions ($p = 0.006$), impact of different ethnic and cultural background on their learning ($p = .007$), impact of institutional practices ($p = .010$), and building positive relationship with friend from different ethnic and culture ($p = .002$). Finally there was a significant difference between the different academic year of their study on their intercultural competency skills namely ignore racist statements ($p = .032$), impact of cultural background on their thinking and actions ($p = 0.000$), concern about values, traditions, and culture of others ($p = .004$), and the impact of prejudice ($p = .009$). Table 3 indicates the inferential findings of this study.

The implications of Tang and Sanoamuang's (November, 2016) study revealed that the international college students should have an opportunity to reflect consciously on their intercultural skills, receive feedback on those skills, and develop a foundation of intercultural knowledge would be better prepared them to take on leadership roles in diverse group. This is because when these students enter the workplace later, they are often identified as potential leaders, given their training in areas such as project management and leading teams. However, according to Chuang (2013), to be successful leaders in a diverse workplace specifically need to acquire intercultural skills and knowledge. These international college students have to become increasing globally mobile, moving from country to country as part of their career areas such as global business, international marketing, and tourism management. Even within Thailand, international college students are going to encounter a highly globalized workforce upon graduation. Tang and Sanoamuang (November, 2016) suggested that all the teaching programs have to be planned to enhance with intercultural competency components in order to allow graduated international college students in the future are equipped with a highly transferable set of interpersonal and facilitation skills that are sought by employers both in academia and in industry setting. Faculty educators were expected to help international college students to reflect on the competencies they have gained in the training programs and articulated them to potential employers after graduation.

RESEARCH QUESTIONS

In this study, researcher planned to look at the intercultural competency development from the perspectives of six Thai students who experienced in dealing with people who have different cultures. The researcher would seek to describe the intercultural competency skills development from these 10 specific research questions as below:

1. Do Thai international college students find difficulty to get along with some of their friends who have

- different culture with them?
2. Do Thai international college students feel uncomfortable when someone shows different values and beliefs with them?
 3. To what extent do Thai international college students have knowledge regarding the culture of other ethnic groups in their class?
 4. To what extent that their cultural background affecting their thinking and actions?
 5. To what extent do Thai international college students agree that the international college practices that impacting on students from ethnic minority groups?
 6. To what extent do Thai international college students understand about the concept of cultural diversity and sensitivity?
 7. Do Thai international college students able to communicate their needs to their friends who are from different cultural background?
 8. To what extent Thai international college students are able to build positive relationship with their friends from different ethnic and culture?
 9. To what extent Thai international college students can apply their cultural awareness and knowledge while interacting with multicultural friends?
 10. What do Thai international college students understand about the meaning of prejudice?

METHOD

Purposeful sampling technique was employed in this qualitative research for the identification and selection of information-rich cases for the most effective use of limited resources (Patton, 2002). This involves identifying and selecting individuals that are especially knowledgeable or experienced with this phenomenon of interest (Cresswell & Plano Clark, 2011). In addition to knowledge and experience, Bernard (2002) noted the importance of availability and willingness to participate, and the ability to communicate experiences and opinions in an articulate, expressive, and reflective manner.

After considering the above circumstances, focus group interviews were conducted to six final year international college Thai students. The selected participants had the experience in dealing with other countries cultures such as stayed at oversea countries through student exchange program for the length of time spent ranged from six months to four years. The study was approved by the university's Research Ethics Board. Participation in the research was voluntary. Participants were invited to indicate their willingness to participate in focus group interviews (Dawson, Dimitrov, Meadows, & Olsen, 2013). The duration of the focus group interview was one and a half hours. The interview guide included a series of probes and clarification questions to maintain consistency in questioning across participants. The most frequently represented cultures included China, Mexico, United States, and Europe cultures.

The interviews were audio recorded and partially transcribed, then coded using a theme analysis approach (Miles & Huberman, 1994). During coding, key themes related to research questions were identified, such as concrete examples of intercultural competency skills learned and also examples of how participants' knowledge of cultural differences influenced their interactions with their foreign course mates. After the first round of coding, similar themes were grouped into larger categories (Strauss & Corbin, 1990). Exact quotes representing each frequently occurring theme were then fully transcribed based on the audio recordings. To ensure participant anonymity, participants' quotes are identified only by symbol R.

RESULTS

Results of this study are presented according to the research questions as indicated above.

Difficulty to get along with different cultures friends

Qualitative findings indicate that most of the Thai international college students found difficulty to deal with their foreign course mates particularly from China. All the informants did not take initiatives to work together with foreign course mates partly they have their own Thai friends whom they can understand each other very well. Language differences can be one of the reasons made them feel reluctant to work together. They also found difficulty to understand their foreign course mates' cultures. Likewise they also found their foreign course mates did not take initiatives to understand their cultures.

"I did not join together with them...just a little bit. I do not have language problem but I have many friends from Thai. We can easily understand each other. But foreign course mates like those from China, they did not understand our Thai culture like they did not take off your shoes when they come to have discussion in our hostel." (R1)

"They have different identity with us and also different cultures with us. But they always try to cope with our Thai culture and learn the Thai culture from us. I have difficult to explain to them about our

cultures.” (R2)

“May be because of the language.... Sometimes I find difficult to work with them. Most of the time, I will let them do what they want.” (R3)

“Most of the China boys are very stubborn, they do not accept our ideas when we are doing our group assignment together. Most of us have given up to work with those China boys. China girls slightly better, they are not that stubborn.” (R4)

“I find difficult to work together with them. They do not understand our Thai culture.” (R5)

“When we do activities together, China course mates are very serious. We are more relaxed, not as serious as them. They are very serious in their studies. But we have to work it up with them. Most of them I have to tolerate with their style.” (R6)

“My foreign course mates especially those from China, now they have their group already. They do not want to mix with us. Actually they understand what they have to do by studying in other country like Thailand. But they just do not want to learn our cultures and they do not have much commitment in our student union. They refused to be part of our big family.” (R4).

Feeling comfortable with different values and beliefs

Majority of the informants can tolerate with the different values and beliefs. The informants stated that they are young generation therefore they are also very open to accept west values and beliefs. They are not extremists. They found some similarities between eastern cultures but not western cultures.

“Thai people are not serious about religion. We do not go to temple very often. I can accept the modern culture nowadays like the couples stay together without marriage, nothing wrong.” (R1)

“We do not mind so much about other people’s belief and value system that are different from us. Well, they can do what they like” (R4)

“I found that most of the eastern cultures like Thai culture and China culture are quite the same in term of value. For example, we respect older people, we take care of our parents. But not western people, they do not care about their parents once they grow up, they stay on their own, they do not so much respect elderly people.” (R2)

“Sometimes I really cannot accept the west value like they like kissing at the public, hugging their girl friends. Wear very little clothes....Oh..Oh, I do not know what happen to our parents if we do that.” (R3)

Having knowledge regarding the culture of other ethnic groups

Most of the informants do not have much knowledge about other ethnic groups’ cultures unless they have opportunities to go abroad or visit other province. If they are locals, most of them do not have much knowledge about other people cultures.

“I have been in United States for 4 years under student exchange program. I stayed with my adopted Mexican family and learned a lot about their cultures. Such as they believe that their ancestor will become ghost after they died. They will pray to their ancestor and believe the spirit of their ancestor will help them to have better life.” (R2)

“I do not have a chance to travel abroad. But I found that I myself do not have knowledge about cultures in other province of Thailand either. For example, the local language here is different from the north of Thailand, different place, same word may have different meanings. I am always confuse.” (R4)

“Our Chinese friends like to talk loudly. When they are eating, they eat loudly. I do not understand why they like to act like that. It seems to be rude in our culture.” (R3)

“During the first year, I was quite shock with China students’ attitudes.” (R4)

“I have an American roommate during my first year. She is very open, always bring different boyfriends to our room. Sometimes even have sex with the boyfriend in our room. I cannot understand how can she do that. Finally, I advise her to do this outside the hostel, not in the hostel. After that she did not do that again. I can accept her openness by having sex with her boyfriend before marriage but not in my territory.” (R6)

“Besides, she likes to be naked, she always drunk. This is her daily life, but it is ok for me. I know this is their cultures” (R6)

“I want to say about Laos culture, their people like to wear long skirt and very formal most of the times. Thai people are not like that, we do not like to wear very formal.” (R5)

“I found that my foreign course mates are quite different from us especially those from western countries. For example 3 years ago, my foreign friend came late to the class, still can say hello to the lecturer. They do not feel sorry at all. Thai people are very respect teachers or lecturers, we will look down to the floor if we came late, we dare not to say hello to our lecturer. We respect and trust our lecturer.” (R1)

“Those China students sometimes even hold lecturer’s shoulder. I never see that happened to Thai

students. Thai student will not stand near to the teachers, we must sit or bend lower or knee down when we talk to our teachers. This is our culture to show respect” (R4)

Cultural background affecting thinking and actions

Most of the informants agreed that their background have affected their thinking and actions. For example, sometimes they do not need words to understand each other because their friends who are from the same cultures will send the message automatically to them through their actions.

“We do not reject people directly in Thai culture. We seldom say no even though we disagreed with somebody. It is considered rude if we do that.” (R4)

“Thai people want something from you but they do not say they want. They still do not want your gifts although they like it so much. We have to give many times, then only they accept. This is our manner that we learned since we are young.” (R2)

“Normally when we invite our friends several times, he or she still not responded, means that he or she rejected my invitation.” (R4)

We don’t mind so much if our friends rejected to join us for any activities. For me, it is important to have many friends around.” (R2 and R4)

“Most of the time, we can understand each other very well because we are from the same background. It is easy to talked among friends, normally the young people say no means no. Not like adults, when we talked to adult, we need to be more polite.” (R6)

The impacts of international college practices on ethnic minority groups

Informants stated that most of the international college practices are using English as a medium. Therefore they concluded as a part of concern on ethnic minority group. However, certain events were not welcomed by foreign students such as Freshman Activity because of using Thai language instead of English.

“This international college is using English most of the time, which shows that they are considered about minority group.” (R1)

“Because some words we cannot express in English, we have to use Thai language. Thai language and English language are very different. Chinese students do not like to join us because they cannot use Thai language. For example Freshman Activity, I never see any China student attend it.” (R4)

“All the forms in our international college are in English. But China students very funny. Sometimes we talked to them in English but they like to reply using Thai language.” (R2)

“My feeling why they act like that because they try to be parts of us. Thai language is hard. It is difficult for China students to speak Thai. Likewise we Thai students found hard to speak in English.” (R4).

“We are shy and less confidence to speak English. That is why you will find that Thai students do not answer questions asked by lecturers.” (R5 and R6)

Understanding about the concept of cultural diversity and sensitivity

Most of the informants are not sensitive about cultural diversity and they got culture shock when they started to mix with their foreign course mates.

“For me, I am not sensitive. I was shock at first but is ok after that. For example, take off the shoes, sit on the floor are the Thai cultures. But our foreign course mates do not care about it.” (R3)

“But we are not sensitive about that. If they do not take off their shoes, just advise them.” (R2)

“In Thai culture we are very sensitive about women cannot touch monks. I always advise my foreign course mates to be sensitive in this matter.” (R1)

“In Thai culture, we respect monks and older people very much. If they are older than us, we have to alert for not going close to them or touch their head.” (R4)

Communicative abilities with different cultural background friends

All the informants do not have problems dealing with friends who have different cultural background.

“Yes, I have no problem to tell my friends about our Thai culture.” (R1)

“We not only tell them about our culture, we also help them to understand.” (R4)

“I have Australian friend, she come to my house to stay for a few weeks. My mum and dad cannot speak English. But because of her, now my mum and dad can speak English a little bit.” (R5)

“I joined the student exchange program to Hungary. I spent time with them and told them my lives in Thailand.” (R6)

Abilities to build positive relationship with their different culture friends

All the informants did not clearly show that they possessed this kind of ability to build positive relationship with friends from different cultures.

"I have friends from countries like Mexico and Taiwan. They like to give candy to each other to build positive relationship." (R1)

"Although I was in US for 4 years, but it took me 6 months to adapt to their cultures. I like Mexican friend but I do not like US friend. They are more arrogant." (R2)

Cultural awareness and knowledge while interacting with multicultural friends

All the informants seemed to be low cultural awareness and knowledge while interacting with multicultural friends.

"I have New Zealand friend and Japanese friend, but I do not know very much about their cultures." (R5 and R4)

"I do not have any knowledge about their cultures, they come to me and approach me as friend." (R2)

"Normally I learned other people cultures through watching movie. Among us, we seldom talk about other people cultures." (R4)

"I will only start to learn about other people cultures if I plan to visit that country especially about its law. Because some country may restrict us from doing something so I will alert about that." (R1)

Understanding about the meaning of prejudice

All the informants did not really understand the meaning of prejudice.

"I found easy to talk with my Thai friends but I wish to have friends from other countries too." (R1)

"I can accept anyone, I am easy going person." (R2)

"I can easily accept Thai but not others." (R3)

"I choose friends because of their behavior but their ethnic groups. As long as their cultures not much different. I am comfortable to talk with them."

"I would like to add on why Thai people speak weak English. This is because we learned English according to principles. So Thai people will laugh at us when we speak grammatical wrong English. But when we speak to foreigners, we do not care about the principles anymore. Thai people may look at you as you are showing off if you speak English too much."

"We do not like to speak English because we scared to make mistake in front of our Thai friends." (R4)

CONCLUSIONS

In conclusion, the more different people from one to another, the more difficult it will be for them to work together and communicate, which is the basis of any society. Diversity is not only involves how people perceive themselves but also how they perceive others. Those perceptions are affecting their daily interactions. Today the awareness of this diversity has become much more widespread because of being facilitated by globalized communications and increased cultural contacts. Findings of this study revealed that most of Thai international college students are practicing cultural tolerance more than cultural adjustment when they dealing with their foreign course mates. This can produce a range of consequences form such as simple lack of civility or ignoring others, through elaborate social system or the international destruction of people in the perpetuation of genocide. On the other hand, peace is impossible without tolerance. To live in the multicultural society like this international college, we should practice cultural tolerance which will contribute to the evolution of a culture of peace and social harmony. The essence of tolerance is the right of people to behave according to their beliefs, even when there are others who disagree with the belief. These Thai international college students are not practicing cultural adjustment due to they did not find themselves immersed in an unfamiliar culture that can cause culture stress. Since they are the majority ethnic group of the multicultural society, cultural adjustment is not a necessity.

ABSTRACT

The paper deals with an analysis of Slovak legislation concerning quality assurance in education. A collection of data indicates a diversity of legislation implication in primary and secondary schools in Slovakia. Research, carried out in 2016-2017, has revealed different approaches to monitoring quality at Slovak schools, particularly a role of self-evaluation processes. Formality and informality of self-evaluation is significantly influenced by engagement and enthusiasm of people involved. Based on good practice in the European Union, specifically in Portugal, a set of recommendations will be presented and discussed.

INTRODUCTION

The current orientation on monitoring and assuring quality in society has reached also the sphere of education. What is and what is not of good quality, what works for the society and contributes to its development, is a difficult question to answer. However, in the Slovak context, quality in education can be declared, when the expected and real results of schools are in agreement, when the school-leavers have the skills to find their place in the labour market, and finally, when the schools have good relation with their environment (Novák, 2012, Valent & Sihelsky, 2014). School quality is often evaluated in comparison. For measuring quality in education, several international measuring procedures (e. g. PISA, PIRLS, TIMMS) were introduced, allowing the participating countries to enter a direct comparison of the quality of their educational systems. The results of these comparisons indicate that Slovakia needs to develop better and more effective conditions in order to assure quality in education. Traditionally, the quality of schools in Slovakia is monitored by an external evaluation system at different levels of schools, in coordination with the thorough work of the State School Inspection. External evaluation reveals a significant disparity between different schools in different regions of the country.

The experience gathered from other European countries, more specifically Portugal, prove that external evaluation of school quality should be supplemented by internal evaluation processes, i.e. self-evaluation of schools and their employees, pupils, material and technical conditions of schools, with active participation of municipalities and stakeholders. Self-evaluation plays a significant role in quality assurance in education and the idea of it was first introduced in Slovakia in the late 1990s, when institutions and informal teacher organizations started to design its implementation to the Slovak educational system. A comparison of different approaches is necessary, as there is no one uniform framework of quality assurance and self-evaluation neither in Europe nor the world. Finding a framework suitable for most schools in the diverse Slovak educational system is therefore viewed as the first step towards quality assurance.

LEGISLATION ON SELF-EVALUATION PROCESS IN SLOVAKIA

Self-evaluation of schools and quality assurance in most European countries is established in a legal framework. In Slovakia, there are several documents on self-evaluation of schools.

The first legal document dealing with evaluation of schools and its teachers is the *Act No. 596/2003 Coll. on State Administration in Education and School Self-governing Bodies* that specifies the roles of all participants of school network in terms of establishing, funding and inspecting school processes. The head teacher of a school is made responsible for evaluation of the school in a written annual report (§5, Stat. 7f) on schools performance. The municipality is responsible for its approval. The Act defines the duties and responsibilities of a school and its head teacher towards other bodies of government (ministry, self-government region, and municipality) as well as the pupils and their parents. Head teachers are responsible for qualification of the teaching staff and their further education (§5, Stat 1d and 1e). All processes at lower secondary schools are supervised by municipalities (§6); higher secondary schools are supervised by self-governing regions (§10). According to the §6, Stat 23, municipalities also monitor and evaluate the qualities of head teachers. The ultimate supervising body is the State School Inspection (§12 and §13). All these bodies perform external evaluation of school performance by monitoring the performance of schools in the sphere of curriculum and its implementation, examination and assessment of students, funding, and material and technical conditions. The Act gives these bodies specific rights and tools to assure the quality of education in local schools.

The second Slovak legal document on self-evaluation, the *Decree 245/2008 Coll. on Upbringing and Education*, is more specific in education practices and governs the following areas:

- the principles, aims, conditions, extent, content, forms and organization of education in schools and school facilities,
- conditions of entry to the school and for completion of study,
- the length and accomplishment of obligatory school attendance,
- curriculum at the national level,
- school network,
- the rights and duties of schools and school facilities,
- the rights and duties of parents or other legal representatives of children.

The law binds the head teacher to create a school curriculum as a principal document of school, which has to comprise also an internal system of evaluation and assessment of teachers and pupils (§7, Stat 4m and 4n). For these purposes, schools create plans for internal audit that covers specific areas of school life, from ensuring the schools perform their educational duties in sufficient material and technical conditions, to evaluation of the pedagogical staff from the perspective of their proper qualification and participation on continuous education. All requirements, duties and rights of teachers and pupils are precisely defined in individual articles, giving the head teachers clear parameters on schools of quality. The organs monitoring school quality are primarily the National Institute for Certified Educational Measurements, the State School Inspection, both responsible for external evaluation, but also the schools themselves (§154, Stat 7a). The paragraphs 155 and 156 treat external testing of pupils.

The final legal document covering the area of evaluation and self-evaluation of schools formulated to assure the quality of education is the *Regulation 9/2006 Coll. on the Structure and Content of School Reports about Activities, Results and Conditions of Schools and School Facilities* and its executive regulation no. 10/2006-R from the 25th May 2006. The head teachers are responsible for compilation of the report and it must be approved by school's parent council before submitting it to the municipality for the final approval. The report must be available to the general public, published online, and schools may select the data they publish, as this report represents the school in the local community and may influence its perception and reputation in the local community. The full report should contain the data on:

- pupils (including the number of pupils with or without special education needs (SEN)
- the number of new pupils and the number of school-leavers entering secondary school; the data on performance and classification of pupils in individual degrees of education),

- school curriculum and the study programmes school provides,
- school employees (the number of teachers and their qualification, the data on continuous education of teachers),
- projects school participates in and activities that present school in public,
- the results of school inspection,
- material and technical conditions of schools,
- financial data (from the ministry, parent's contributions, vouchers for leisure activities, donations and other financial means),
- the annual concept of the school and its evaluation,
- the identification of school's strengths, weaknesses and proposed solutions,
- success rate of the pupils in the labour market,
- optional additional information (a SWOT analysis of the conditions of mental hygiene, leisure time activities, cooperation of school with parents, providing services to children, pupils and parents; relations of school and children, parents, and other stakeholders).

The final legal document on the qualities and qualification of teachers is the *Act No. 317/2009 on Pedagogical and Professional Employees* delimiting:

- the rights and duties of pedagogues,
- requirements for pedagogical activities execution,
- professional development, career degrees, postgraduate certification,
- qualification requirements for employees,
- pedagogical activities of pedagogues including their teaching,
- the extent, organization and completion of different types of continuous education,
- accreditation of programmes of continuous education,
- evaluation of pedagogues,
- care and protection of pedagogues.

The above listed legislative documents are legally binding to all participants of education in Slovakia. The issue of self-evaluation and quality assurance in education is spread across four main legal Acts on education. The relative openness of these documents in this area leaves enough room for their interpretation and implementation in particular schools and municipalities overseeing these processes.

Municipalities therefore issue their own specific regulations identifying the processes that monitor the quality of schools and head teachers. Formally, they have to approve the annual school reports; on the other hand, they have a direct impact on the ongoing processes in schools. Comparing one school to another, there are noticeable differences in the processes of school self-evaluation and quality assurance depending on the municipality managing them. Each school undergoes the processes related to quality assurance differently; therefore the next sections will discuss the formal and informal engagement of teachers, teacher associations and institutions in these processes.

Besides legislative processes, the attempts to design, test and implement self-evaluation processes in Slovak schools were the projects called *Bridges across Boundaries: Cross-disseminating Quality Development Practices for Schools in Southern and Eastern Europe* (2004-2005) and "*External Evaluation of the School Quality Supporting Self-evaluation Process and School Development*" (2009-2013) carried out by the State School Inspection. Both projects proposed their models of school self-evaluation that were not generally accepted; however, they opened the discussion on the topic and helped schools find the ways for improvement.

A COMPARISON OF FORMAL AND INFORMAL SELF-EVALUATION PROCESSES IN SLOVAKIA

The aim of the paper is to analyse the Slovak legislation on quality assurance in education and identify its impact on self-evaluation processes in Slovak schools. As the brief overview of the legislation indicates, there is a room for diversity in its implementation at different schools. The following section of the paper will discuss these processes from two main perspectives: the schools and the municipalities.

THE STUDY

For the purposes of this study, head teachers and teachers from different parts of Slovakia were asked to provide information in semi-structured interviews on different aspects of quality assurance and self-evaluation at their schools. The answers were compared with the contents of the annual school reports (175 schools in total) published online from all regions in Slovakia. The schools are overviewed by eight largest municipalities in Slovakia, situated in the capitals of the Slovak self-governing regions. The key parts of the reports were the SWOT analyses and action plans. The prevailing tendencies in individual categories were quantitatively evaluated and are presented in Table 1. Then, the official information provided online and in the interviews provided by local authorities were analysed in Figure 1. The paper presents the main tendencies in implementing school self-evaluation practices and quality assurance approaches in selected schools in Slovakia.

FINDINGS

Based on the legislation (the Decree 245/2008 Coll.) and the experience achieved in the above-mentioned projects, schools prepare and design a plan to monitor and evaluate the school quality that should be a part of the school curriculum. Annual planning of self-evaluation typically corresponds with the concurrent processes at school. Typically, in September schools coordinate the contents of school curriculum to the national curriculum; in October schools promote the cooperation of parents with school. In November, school analyse the material, technical and financial conditions. In January and June, students are tested before getting their marks. The self-evaluation of teachers typically takes place in May, as teachers reflect on their teaching and participation in various pedagogical activities in the past year. In June, schools collect data on their school-leavers in order to implement their suggestions. In July and August, head teachers prepare plans for the following school year and compile the annual reports (the Act 596/2003 Coll., §5 and the Reg. 9/2006). Complemented by opinions of stakeholders, classroom observations and interviews with teachers and pupils are carried out throughout the whole school year. The implementation of plans, however, varies from school to school.

The schools are given a lot of freedom in choosing self-assessment tools and aspects of focus. The analysed annual reports reveal that most schools evaluate themselves from several perspectives. The main issues of focus comprise the quality of curriculum, pedagogical documentation and its implementation, the school results in external testing and national competitions, success rate in pupils' admission at secondary schools, the qualification and didactical methods of teachers, the quality of social relations of all participants (teachers, pupils, parents), implementation of school developmental projects, teaching pupils with SEN, the view on schools by the community, the material and technical conditions of school, etc. The data are primarily collected using questionnaires (with open or closed items, varying in length), observations, open classes, individual interviews and group discussions, evaluations by pupils and parents, etc., which may be followed by discussions and reflection on the findings.

The schools are obliged to make SWOT analyses (the Executive Regulation 10/2006-R). Only about 50% of schools published the school reports online, and from them, only about 46.25 % published their SWOT analyses. The SWOT analyses reflect on the aspects of school life viewed as the most crucial for their existence. As the collective analysis of the published SWOTs reveals (Appendix 1), the schools view the same aspects of school life differently, i.e. the strength of one school can be a weakness for other one; or an existing weakness of one school can be a possible threat for other school, etc.

As Appendix 1 shows, the financial aspect (e. g. teacher salaries: W = 20.56%, T = 19.99%, operational costs: W=7.99%) dominates most categories of the conclusive SWOT analysis, followed by the assessment of the material and technical conditions of schools. The positives for all schools are the participation in projects and grants. The analysis also reveals the shifting position of education and teachers in society – the motivation of pupils is decreasing and parent participation in school life is becoming less present.

The role of self-evaluation processes in schools is viewed positively by a relatively small number (0.57%) of the analysed schools; however, there are schools perceive it as an opportunity for improvement (12.57%). On the other hand, a number of schools (6.28%) view a lack of clear criteria on self-evaluation and quality assurance as

one of the weaknesses of the Slovak educational system. This may lead to a tentative conclusion that the role of self-evaluation is growing.

After submitting the complete annual reports to municipalities for approval (the Act 596/2003 Coll.), the municipality evaluate them and compare them. The employees know the school and typically take into consideration the specifics of the school. The results of the schools are largely influenced by the structure of pupils and the structure of pedagogical staff, and as well as by material and technical conditions of that particular schools. Statistics and numerical data of the school results are usually not sufficient for the municipality and together they try to find solution for the problems, and also encourage the head teachers in the future work. The Act 596/2003 Coll. §6, Stat 23, gives the municipalities the right to evaluate the head teachers. Municipalities formulate their own criteria, which may be partially used for evaluation of pedagogical staff at the particular school.

A comparison of several approaches to head teacher's evaluation by municipalities might conclude these three main areas:

- the quality of management (the effective use of work time, the quality of abiding by the legislation, following documentation, the quality of work related to specific tasks, etc.),
- school development (contribution and presentation of school in public, head teacher's personal contribution to school, cooperation with parents, organizing leisure time activities, participation in projects, school maintenance, strategic development of school, etc.),
- managerial skills (the use of ICT, resolving conflicts, the use of newly acquired skills, getting additional funding, communication with the municipalities, formulating criteria and evaluation of results of teaching staff assessment, etc.).

The approach of municipalities to quality monitoring and assurance may be judged also by the way they engage in the public discussion and communication of the goals they set for schools. The information published on the websites of the municipalities provides the guiding principles for schools in the region. The quality and content of the information indirectly reflects on the attitude of the municipality to quality assurance at schools. The analysis of the contents of the websites in Figure 1 identifies the priorities of the analysed municipalities:

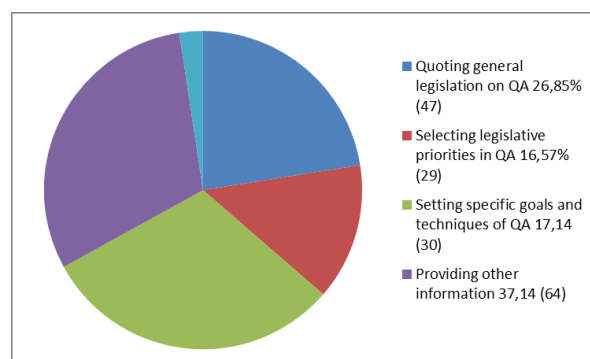

Figure 1 Priorities of municipalities in quality assurance

Figure 1 shows that almost half of the analysed municipalities limits their activities in monitoring school quality according to legislation, and less than 20% of municipalities lead to schools to choose their priorities or even their own goals in quality assurance. More than 37 % of schools do not want to participate in public discussion on the quality assurance in education.

As the overview of the quality monitoring and assurance performed by the self-evaluation suggests, the lack of legislation has an impact on its implementation in the practices at schools. There is not one tool that would be generally accepted and used in all schools in Slovakia, however, the teachers and head teachers regularly meet to share experience and shape the tools and systems for monitoring quality in the Slovak schools.

AN EXPERIENCE ON SELF-EVALUATION AND QUALITY ASSURANCE FROM PORTUGAL

Within the mutual project between the Trnava University in Trnava, Slovakia, and the Porto University in Porto, Portugal, the authors of the study visited several schools around Porto in July 2016. The partners from the university introduced them to experience and practices in quality assurance and self-evaluation of the local head teachers is a series of discussions, interviews and meetings at schools. The legislation on self-evaluation and quality assurance, its tools, methods and impact on education in Portugal (Santiago et al., 2012) are more specific than in Slovakia. As observed, self-evaluation processes have an impact on their daily life at schools. The schools try to engage every participant of school life to take part in self-evaluation, be it teachers, pupils or their parents. Participation of the local community in school life and the impact of school at the local community are not typical for Portugal. Therefore, Portuguese schools make specific action plans with the aim to make parents participate in the life of school, raise interest in the children's performance at school and encourage the children to work hard. The results of self-evaluation are published online specifically for each school, available for inspection to all members of the Portuguese society.

RECOMMENDATIONS AND SUGGESTIONS

On the basis of analysis of the legislation, tools used in selected schools in Slovakia and observation in Portugal, the authors formulate the following recommendations:

- legislative changes,
- making a standardized tool for self-evaluation, formulating criteria and techniques of data collection and analysis,
- explaining the head teachers and pedagogical staff the importance of self-evaluation and quality monitoring,
- motivating the head teachers and pedagogical staff to participate in the aforementioned processes,
- enabling teachers to visit schools with effective self-evaluation processes abroad, especially the countries with good scores in international measurements.

CONCLUSIONS

Self-evaluation as a method for monitoring quality in education has proven to be an important tool on the way towards being effective and achieving good results in international measurements, but also in developing the set of skills for real life and employment in the labour market. The legislation on self-evaluation and self-assessment, or the lack of thereof, provides a great variety of opportunities for each subject of education to adopt and adapt the available tools to their particular needs. Since in Slovakia the approaches towards quality assurance are not uniform, the processes may benefit from looking into the experience of other countries and finding the most suitable approach for Slovak conditions. The collected data in this study indicate that schools around different parts of Slovakia naturally agree on some tools for monitoring school quality and the areas they should concentrate on in search for quality in education. The number of schools that discuss self-evaluation positively is growing steadily and public discussion on quality assurance may bring positive changes to the Slovak system of education.

msari@cu.edu.tr*

ABSTRACT

This study aims to investigate views of prospective teachers attending pedagogical certificate formation about their instructors' level of professional values. The study, which is descriptive case study in nature, involved 52 prospective teachers who received pedagogical formation training in Çukurova University Education Faculty. Data were collected through an interview which included six open-ended questions; and the collected data were analysed using descriptive analysis methods. Results show that prospective teachers found the instructors most competent in the items that included "compliance with professional values in assessing success and giving marks" and "Trying to communicate sufficiently with prospective teachers". While the participants evaluated the instructors positively mostly in terms of "Concern about effective education", the most frequently cited negative view was "ignoring effective education".

Keywords: Professional Values, Instructor, Prospective teachers

INTRODUCTION

Teaching, due to its multidimensional and direct effects, has always been an occupation which is given importance, aimed to be controlled and directed, and discussed in terms of work ethics and professional values as well. Therefore, prospective teachers' attaining professional ethics and values of the teaching profession is one of the fundamental components of the teacher training programs. On the other hand, teacher training programs include no courses for instructing professional ethics and values. Professional ethics and values training is left to the faith of implicit programs of the faculties. As for the explicit programs, they do not go beyond a unit which is included in the Introduction to Teaching Profession book; it is not known whether it is covered or not, or even if it is covered the degree is not known. Hence, a study conducted by Tunca (2012) found that prospective teachers graduated from the faculties without gaining the professional values sufficiently. In fact, as it is emphasized in the literature, it is highly important for a teacher to be qualified in terms of professional ethics and values (Altinkurt and Yılmaz, 2011; Dönmez and Cömert, 2007; Gözütok, 1999; Güler, Yıldırım, Gürbüz and Koç 2016; Şimşek and Erdem, 2016; Tunca, 2012). Otherwise, educating generations with the required skills would not be possible. As emphasized by Levine (2006), who states that the future is in the hands of teachers, quality of tomorrow will be no better than the quality of the teachers army.

Professional values form a special compound of human values (Göbelová, 2011). Tunca (2012, 19) defines the values of teaching profession as the "criteria and standards that guide teachers' feelings and behaviours while planning, organizing and conducting teaching; providing and maintaining students' learning; ensuring classroom discipline; enhancing self-development; and fulfilling professional responsibilities". Professional values as preferences, attitudes, thoughts and views that affect professional decisions, behaviours and practices are considered inseparable part of teachers' becoming professionals (Göbelová, 2011). Campbell (2008) claims that teaching has a number of morally and ethically fed abstract aspects beyond the training program and pedagogic techniques. Campbell states that these abstract dimensions can be perceived from the tone of voice when the teacher talks with students, the fair balance s/he creates with profits and needs, attention in the choice of references, honest and respectful assessment of students' work, and implementation of daily practices in a proud, careful, fair and loving way.

Lisman (1991), in the study that reviewed the studies on the moral aspects of teaching profession, states that it is important to understand moral mission of teaching profession in order to define teaching profession correctly.

However, Campbell (2008) emphasizes that ethics as a moral profession in the teaching field is an interesting but challenging issue. What professional values should a qualified teacher have? In the study conducted by Tunca (2012), values including “being open to learning/ being open to improvements and innovations, having sense of responsibility/taking social responsibility, being honest, respecting differences, having principles, objecting violence, being understanding, being consistent, being loyal to profession, being open-minded, being investigative, giving importance to national language, being democratic, being patriotic, being productive, being patient, being open to cooperation, being humanist, being loyal to Atatürk’s principles, being sensitive about national symbols, giving importance to cultural values” were perceived as professional values that should be possessed by teachers according to both instructors and teachers and prospective teachers. Tunca collected these values under “respecting differences”, “personal and social responsibility”, “objecting to violence” and “being open to cooperation” aspects.

An analysis of the studies about teachers’ pre-service education found that the participants mentioned a number of inadequacies. For instance, in the study conducted by Eret-Orhan (2017) it was reported that prospective teachers could not attain some information and skills in the teaching process well in the education faculties and experienced a number of problems about some aspects of teacher training. Other studies also reported results that emphasized the existence of various problems in teacher education (Buyükgöze-Kavas and Bugay, 2009; Eret, 2013; Eret-Orhan, 2016; Senemoğlu, 2011; Özoğlu, 2010). Although some studies that focused on instructors dealt with communication (Kaya, Sungurtekin, Deniz, 2017; Keçeci & Taşocak, 2009) and democracy (Aydoğan & Kukul, 2003; Duman and Koç, 2004; Erdem and Sarıtaş, 2006; Kaya, Taşdan, Kop and Metin, 2012; Şentürk & Oyman, 2014) issues, none of the studies accessed seemed to focus on the professional values possessed by instructors as educators.

In fact, achieving success in teacher education programs could be possible through a holistic view that involves quality of instructors as well as knowledge, skills, and values. Yıldırım (2013), who investigated studies on teacher education in Turkey, reported that studies focused on some fields, but a number of important aspects were ignored; listed the prioritised areas in teacher education studies; and emphasized the need for research about “teacher educators and their effects on prospective teachers”. These kinds of studies should investigate teachers’ competence in terms of professional knowledge and skills as well as professional values; and in line with these studies it is important to highlight teacher quality as well as the training of teacher trainers. Expecting educators who do not have sufficient professional values themselves to educate qualified teachers in terms of this aspect would only be a dream.

Attainment of this emotional aspect of the teaching profession by prospective teachers completely could be possible through the topics instructed in the courses as well as, may be even more importantly, through an educational environment in which they have good role models in terms of professional ethics and values. This “being a model” becomes more concrete through the instructors’ behaviours towards prospective teachers in and out of classroom. Therefore, just like in the assessment of instructors’ general professional competence, prospective teachers’ evaluations about professional ethics and values are considered to give more accurate data. In this regard, the main purpose of the study is to investigate views of prospective teachers attending pedagogical formation at Çukurova University Education Faculty about their instructors’ level of professional values. In line with this main purpose, the study aimed to find answers to the following questions;

What are the views of prospective teachers about;

1. Their instructors’ general competence in terms of professional values?
2. Their instructors’ commitment to raising qualified teachers?
3. Their instructors’ care and effort to communicate?
4. Their instructors’ giving importance to and respecting students’ personal characteristics, interests, and needs
5. Their instructors’ compliance with professional values while giving marks and assessing academic success?
6. Their instructors’ being role models in terms of professional ethics and values?
7. Their suggestions about graduating as teachers who are equipped with professional ethics and values?

METHOD

This study which aims to investigate views and perceptions of prospective teachers attending pedagogical

formation certificate program in Çukurova University Education Faculty about their instructors' level of professional values, utilised a phenomenological design. Yıldırım and Şimşek (2011, 72) state that phenomenological studies focus on phenomena that are recognised but not explored in depth and in a detailed way. Prospective teachers in the present study were asked to evaluate their instructors in terms of having professional values, and their views and perceptions about the instructors were analysed in the framework of professional values.

Participants

The participants included 52 prospective teachers who were enrolled in the Çukurova University Pedagogic formation certificate program from six different departments (Nursing, Mathematics, Accounting, Turkish Language and Literature, Theology, and Agriculture). Of all the prospective teachers, 36 (69.2%) were female, and 16 (30.8%) were male. Average age of the participants was 26.05 with standard deviation of 6.20.

Data Collection Tools

Data were collected through the "Views about Instructors' Professional Values" Form developed by the researcher. The first section of the study involves questions about the participants' personal features (department, age, gender). The second section composes of six open-ended questions about the participants' assessing their instructors in terms of professional values. Through these questions, the students were asked to assess their instructors on the basis of some dimensions which included level of having professional values, the effort they make in order to help students become good teachers, assessing student success and giving marks, and being a role model for students. Each prospective teacher was asked to indicate the percentage for the instructors in terms of demonstrating the features indicated. An example is as follows:

Some of our instructors are always ready for classes. I believe that they make a lot of effort so that our lessons could be more enjoyable and more effective (about 70% of our teachers show these features). On the other hand, some of our teachers are sometimes late and leave the class early (about 30% of our instructors show these features).

The form also included a question in which the participants were asked to write their suggestions about helping prospective teachers to graduate as teachers who have professional ethics and values.

Data Analysis

The data collected from the forms were analysed using descriptive analysis methods. The data in descriptive analysis are analysed according to a framework identified beforehand. Yıldırım and Şimşek (2011) state that the purpose in descriptive analyses is to present findings in an organized and interpreted way. The questions which were in the data collection form used in this study formed the framework of the descriptive analysis. To do this, responses given by the participants were put in computer to obtain raw data. Then, these data texts were organized in a way the participants' answers to each question are one under the other. Then, the organized data were read carefully for the coding process. The codes were grouped according to their common features in order to form themes. Findings are presented in tables demonstrating the distribution of frequencies and percentages. No interpretations were made in the presentation of the findings; direct quotes from prospective teachers' explanations were included. The participants were referred using codes such as P1, P2, etc. in these quotes.

FINDINGS

Prospective Teachers' Views about their Instructors' Competence in terms of Professional Values

The first finding of the study is about prospective teachers' views about their instructors' competence in terms of professional values indicated in the questions. The ratios in relation to this question were found by calculating the mean scores of the 52 participants. Accordingly, Table 1 demonstrates findings in relation to prospective teachers' views about their instructors' competence in terms of professional values.

Table 1: Ratios in relation to finding Instructors Competent in terms of Professional Values

	Competent %	Incompetent %
In terms of making sufficient effort for educating prospective teachers	72.72	27.27

to become good teachers		
In terms of communicating sufficiently with prospective teachers	80.79	19.40
In terms of respecting prospective teachers by giving importance to their personal characteristics, interests, and needs	67.64	32.35
In terms of complying with professional values in assessing success and giving marks	83.44	16.55
In terms of being role models for prospective teachers in terms of professional ethics and values	71.46	28.53

As it is seen in Table 1, the prospective teachers participating in the study found 72.72 % of their instructors competent and 27.27% of them incompetent in terms of “making sufficient effort for educating prospective teachers to become good teachers”; they found 80.79% of instructors competent and 19.40% of them incompetent in terms of “communicating sufficiently with prospective teachers”; they found 67.64% of the instructors competent and 32.35% of them incompetent in terms of “respecting prospective teachers by giving importance to their personal characteristics, interests, and needs”; they found 83.44% of the instructors competent and 16.55% of them incompetent in terms of “complying with professional values in assessing success and giving marks”; and they found 71.46% of the instructors competent and 28.53% of them incompetent in terms of “becoming role models for prospective teachers in terms of professional ethics and values”.

Findings in relation to the Instructors' Commitment to Raising Qualified Teachers

The first question in the views form was “How do you evaluate your instructors in terms of their efforts to raise you as good teachers?” Findings in relation to the answers given to this question are presented in Table 2.

Table 2: Views about Instructors' Efforts for Raising Good Teachers

Theme	Positive Codes	Participants	f
Concern about effective education (f:68)	Making the required effort (commitment, care) for the effectiveness and efficiency of the course	2-3-5-9-10-11-12-13-15-18-19-20-21-22-23-27-30-37-38-40-41-42-43-44-45-46-47-48-49-50-51-52	32
	Being ready for the lesson	2-3-7-8-10-14-16-17-23-28-40-41-52	13
	Trying to make lessons fun and enjoyable	2-3-5-16-20-14-33-35-43-47	10
	Using the necessary materials	10-14-34-43-44-47-51-52	8
	Associating the topics with life through current and concrete examples	5-33	2
	Being disciplined and organized	9-48	2
	Giving satisfying, explanatory responses to the questions	11	1
	Creating opportunities to involve students in the lesson	5-7-20-33-39-43	6
	Motivating students	7-27	2
	Considering students' needs	17	1
Student-centred Education (10)	Helping them to experience teaching (through giving presentations, responsibilities, etc.)	39	1
	Giving importance to students' views	4-8	2
	Interacting with students like friends	10-24	2
	Showing tolerance to different views	4	1
Democratic environment (f:6)	Caring about students	12	1
General Satisfaction (17)		1-6-9-15-19-22-24-25-26-27-28-33-35-37-38-39-40	17
	General satisfaction about the instructors		
Ignoring	Doing nothing and always asking students to	3-5-4-6-8-9-18-31-43-45-50-51-	13

effective education (f:40)	present the topics	52	10
	Not giving up teaching in a boring and inefficient way	9-18-21-27-30-33-34-41-46-47-51	
	Irresponsibility, showing no care and seriousness for the lesson, not attending classes regularly	12-14-27-34-41-43-46-48	
	Keeping the lesson much longer/shorter than its usual duration	6-8-33-43-	
	Instructing without breaks	4-13	
	Always being unprepared for the lesson	8-41	
	Not giving clear, understandable, appropriate instructions	27	
Humiliating students (f:10)	Not caring about students	1-12-26-27-29	5
	Giving destructive and offensive feedback	8-27	2
	Dealing with something else while students are presenting topics	8-27	2
	Not recognising students, ignoring them	32	1

As it is seen in Table 2, prospective teachers' views about their instructors' efforts for raising them as good teachers are presented under four themes called "concern about effective education", "student-centred education", "democratic environment" and "general satisfaction". Effective instruction theme included the most frequently indicated views as "Making the required effort (commitment, care) for the effectiveness and efficiency of the course" (f:32), "Being ready for the lesson" (f:13) and "Trying to make lessons fun and enjoyable" (f:10). Student-centred education theme involved "Creating opportunities to involve students in the lesson" (f:6) and "Motivating students" (f:2) themes as the most frequently cited items while "Giving importance to students' views" and "Interacting with students like friends" themes under the democratic environment theme were cited twice. Analysis results showed that 17 prospective teachers were generally pleased about the instructors, regardless of a specific feature, rate, or explanation.

An analysis of the negative codes about the views about the instructors indicated that the responses were collected under two themes called "ignoring effective education" and "humiliating students". The most frequently cited features in the ignoring effective education theme were found "Doing nothing and always asking students to present the topics" (f:13), "Not giving up teaching in a boring and inefficient way" (f:10), and "Irresponsibility, showing no care and seriousness for the lesson, not attending classes regularly" (f:8). The most frequently indicated feature in the humiliating students theme was "Not recognising students, ignoring them"

A number of excerpts from students' views are as follows:

Majority of our instructors are always prepared for the lesson. They instruct lessons in an enjoyable way through slights, notes or lectures (90%). There are also some teachers who I think do not teach me anything; most of the time they do not come to lessons (10%). P.14

While some of our teachers do their best in terms of instructing well and teaching us the topics (about 80% of our teachers have this feature); some other teachers make us present the topics, and they do nothing. However, this method is not effective. I think teacher's instruction is important. P.18

Our teachers always instruct the lessons in a way to help us understand and enjoy the course. They help us to have a new point of view by giving examples from daily life. Therefore, solutions are found beforehand. As the courses are interactive, the teachers prevent us from distracting by making us participate in the lesson. 85% of our teachers have this feature. On the other hand, some of our teachers make lessons longer and longer. It causes us to get distracted. 15% of our teachers have this feature. P.33

Findings in relation to Instructors' Care and Effort to Communicate with Prospective Teachers

The second question asked to prospective teachers was for evaluating instructors in terms of making effort for

communicating with students. Table 3 demonstrates the analysis of the responses given to this question.

Table 3: Views about the Instructors' Care and Efforts to Communicate

Positive Codes (f:94)	Participants	f
Being careful and successful in communicating	2-3-4-5-6-7-8-10-11-12-13-14-15-16-17-19-20-21-22-23-24-25-26-27-28-30-31-33-34-35-36-37-38-39-40-41-43-44-45-46-47-48-49-50-51-52	4 6
Giving importance to students' learning, problems, etc.	6-18-23-27-33-34-35-39-40-50	1 0
Using an understanding and affectionate language	6-9-39-41-42-43-44	7
Respecting and tolerating students' views	4-14-15-30-34-35	6
Responding to students' questions sincerely	6-9-10-17-34-39	6
Listening to students attentively	4-9-17-42-50	5
Being open to communication out of lessons as well	42-44-47-48-51	5
Using a praising language	3-9-17-39	4
Showing the	34-39-50	3

importance given to the student		
Being accessible	13-30	2
Negative Codes (f:35)	Participants	f
Being closed to communication with students	1-12-19-20-25-26-27-29-32-39-41-46-49	13
Lack of communication skills (particularly not greeting)	7-31-32-50-51	5
Aggressive attitudes and behaviours towards the student	7-11-31-32	4
Looking down on students	6-7-21	3
Ignoring students	7-18-50	3
Not making an eye contact	7-29-49	3
Not listening to students	18-32	2

An analysis of Table 3 shows that prospective teachers mainly evaluated their instructors very positively in terms of care and effort to communicate. The most frequently stated positive views included “Being careful and successful in communicating” (f:46), which was followed by the most frequently cited views that included “Giving importance to students’ learning, problems, etc.” (f:10) and “Using an understanding and affectionate language” in communication (f:7). The most frequently stated negative views included “Being closed to communication with students” (f:13), “Lack of communication skills” (f:5), and “Aggressive attitudes and behaviours towards the student” (f:4). Following excerpts show prospective teachers’ views:

Majority of our teachers are very good at communication, rhetoric, and interaction; they are competent. However, some teachers' ego is very high; they behave like they are addressing a group they sympathise rather than the whole group of learners; and some other teachers have aggressive attitudes while interacting with students". P.7

All of our teachers are good at communication. However, let alone answering the question, 10% of our teachers start to shout at students without understanding. This attitude should not happen in an institution like university. P.11

Majority of our teachers communicated so well that I enjoyed attending the classes. 75% of our teachers had this feature. However, I did not want to attend the courses with the 25% our teachers; these teachers never made an eye contact and rushed to their rooms as soon as the lesson was over; they never interacted with us P.49

Findings in relation to Prospective Teachers' views about Instructors' Giving Importance to and Respecting Personal Characteristics, Interests and Needs

The third question which was asked to prospective teachers was about their views about their instructors' giving importance to and respecting personal characteristics, interests and needs. Table 4 demonstrates the analysis of the findings in relation to the responses to this question:

Table 4: Views about Instructors' Giving Importance To and Respecting Students' Personal Characteristics, Interests and Needs.

Positive Codes (f:74)	Participants	f
Showing awareness about students' interests, problems and needs	3-6-10-11-17-18-20-22-23-33-42-43-45-46-47-48-50-51-52	19
Respecting students' personal characteristics	3-6-7-9-10-11-13-14-17-18-19-31-33-35-45-46-47	17
Showing care and effort for dealing with students	1-4-5-8-20-23-25-30-33-38-46-47-49	13
Giving importance to students	2-6-8-9-10-13-38-41-47-50-51	11
Considering students' views	4-17-24-28-46-47-50-52	8
Considering individual differences	15-40-41-46	4
Treating students without prejudices and in an equal and fair way	17-27	2
Negative Codes (f:29)	Participants	f
Not trying to know students	1-20-32-38-41-42-44-46-49-50	10
Being indifferent to students	12-18-20-25-30-41-47-50	8
Being indifferent to students' interests, problems and needs	18-24-29-33-40-41-48	7
Allocating no time to students	22	1
Ignoring individual differences	7	1
Being uncomfortable with students	29	1
Not knowing how to know students	34	1

As it is seen in Table 4, majority of the responses were positive regarding the instructors' giving importance to and respecting prospective teachers' personal characteristics, interests and needs. The most frequently cited positive features about this issue included "Showing awareness about students' interests, problems and needs" (f:19) and "Respecting students' personal characteristics" (f:17) while the most frequently cited negative features included "Not trying to know students" (f:10) and "Being indifferent to students" (f:8)

Our teachers respect and give importance to us, they listen to us. This is true for 85% of our teachers. P.6
Some teachers give examples according to our branches, they give importance to our interests (60%). However, some other teachers even do not know that were TDE -= TLL students. Let alone our personal features and interest, they do not care about who we are. P.41

One of our teachers simply assigned the topics and asked us to present it, without even thinking whether we were interested in these topics or not. she did not care about us. However, our other teachers generally gave importance to us; we decided the make-up lessons together. One of our teachers conducted the lesson at lunch time, just for us. He did not even have lunch just for us. P.50

Findings in relation to the Instructors' Compliance with Professional Values While Giving Marks and Assessing Academic Success

The fourth question in the form was about prospective teachers' views about their instructors' compliance with professional values while giving marks and assessing academic success. Analysis of the findings about the responses to this question is demonstrated in table 5.

Table 5: Views about Instructors' Compliance with Professional Values While Giving Marks and Assessing Academic Success

Positive Codes (f:46)	Participants	f
Giving marks fairly	7-9-11-12-13-14-17-20-22-24-26-27-30-44-45-46-47-48-50-52	20
Assessing objectively	6-13-17-21-23-33-40-41-42-43-44-47-49-51	14
Being careful about giving marks and assessing	2-5-10-15-27-33-35-37	8
Not seeing exams as the main goal, not imposing the exams	4-11-34	3
Adjusting the difficulty of the questions according to students	20	1
Negative Codes (f:26)	Participants	f
Ignoring students' level while writing questions	6-25-31-32-35-51	6
Tendency to give low marks	10-19-29-32	4
Giving higher scores than one deserves	14-16-26-43	4
Weak fight against cheating	40-41-44	3
Asking questions about the topics that were not covered in lessons	8-46	2
Giving the same marks to everyone - unfair grading	14-16-18	2
In the exam, requiring the information in the book as it is	29	1
Giving marks carelessly-inattentively	8	1
Not being at the exam place	44	1

An analysis of the instructors' compliance with professional values in the assessment and evaluation process indicated that positive views focused mostly on giving marks fairly and objectively. On the other hand, "Considering students' level while writing questions", "tendency to give low scores" and "giving scores more than one deserves" were the main negative views in terms of professional values.

Our teachers want us to write everything in detail in our exam papers, even full points and commas. If the answers are not how they expected, we cannot get full scores. 65% of our teachers have this feature. P.29

I believe that the assessment was valid and reliable, but some students cheated. Some of our friends quarrelled with the proctors because the teachers were not at the exam place. P.44

Findings in relation to the Instructors' Being Role Models for Prospective Teachers in Terms of Professional Ethics and Values

The fifth question in the form was related to Instructors' being role models for prospective teachers in terms of professional ethics and values. The analysis of the the participants' responses is presented in Table 6.

Table 6: Views about the Instructors' being Role Model for Prospective Teachers in Terms of Professional Ethics and Values

Positive (f:63)	Codes	Participants	f
Generally possessing role model features in terms of professional ethics and values		3-4-5-6-9-10-11-12-15-18-19-21-22-23-24-31-33-35-37-38-41-42-43-49-50-52	26
Effort for instructing the course effectively		6-10-15-27-28-46-47-51-	8
Giving importance and showing love and respect to students		4-13-14-28-44-50	6
Professional competence (in terms of knowledge, rhetoric, classroom authority, getting attention, giving feedback)		7-15-16-23-47-	5
Always trying to communicate with students		12-20-28-44-48	5
Starting and finishing lessons timely		6-14-27-51	4
Demonstrating exemplary behaviours		18-22-47-	3
Trying to make students love the teaching profession		11-47	2
Exemplary outfit and speech		40-47	2
Witty attitudes and behaviours in the lesson		13	1
Giving information about the exam, being at the exam		48	1

Negative (f:25)	Codes	Participants	f
place Possessing no role model features		1-27-29-30-32-46-51-52	8
Not considering students' values and desires		32-44-45-46-47-50	7
Too much tolerance for absence		6-31	2
Making no effort for the efficiency of the lesson		49-50	2
Starting lessons late –finishing lessons early		47-50	2
Saying bad things about students to others		35	1
Inappropriate clothes and behaviours that do not comply with the culture of the profession		40	1
Lack of self-esteem		42	1
Assigning the topics to students and and doing nothing		47	1
Not coming to school on the exam day		48	1

An analysis of the participants' views about the instructors' being role models in terms of professional values indicated that although majority of the participants made positive evaluations, they also mentioned some negative views about their instructors' being role models in terms of professional values. While positive comments focused on "Generally possessing role model features in terms of professional ethics and values" (f: 26) and "Effort for instructing the course effectively" (f:8), negative comments mainly included "Possessing no role model features" (f:8) and "Ignoring students" (f:4). Following excerpts demonstrate students' views on this issue:

Some of our teachers were real role models about this issue, with their teaching, rhetorical skills, clothes, everything. These teachers were the ones who loved their profession and conducted their lessons with utmost efficiency. Approximately 50% of our teachers had this feature. However, some other teachers were always late. Some teachers came, took attendance and left, or instructed very shortly. We never take our teachers who assign the topics to students and play with their cell phones as role models. I think these teachers do not have professional ethics. I am sorry to say so. P.47

In the formation program I had two teachers whom I took as role models in every aspect. These teachers never skipped lessons, always came on time, and always gave information before and after the exams. These teachers

came during the exams and asked if we had any questions. I liked it very much because it was not possible to reach some teachers on the exam day. P.48

Prospective Teachers' Suggestions about Graduating As Teachers Who Are Equipped With Professional Ethics and Values.

The last question in the data collection tool was “What are your suggestions about graduating as teachers who are equipped with professional ethics and values?” “What do you think are the roles of university and faculty administration, instructors, and students about this issue? The participants' suggestions are given in Table 7.

Table 7: Prospective Teachers' Suggestions about Graduating As Teachers Who Are Equipped With Professional Ethics and Values

Suggestion	Participants	f
Formation education should be given free in the undergraduate program	7-19-20-22-25-26-33-46-47-49-50-51-52	13
Instructors should deal with students, empathise, respect, allocate time, and communicate	7-11-12-14-24-26-29-32-33-35-36-42-48	13
Instructors should be given courses about professional values, empathy, communication, knowing students, etc.	7-11-14-24-36-41-43-44-49-50	10
Activities on this issue should be conducted with students	4- 6-15-29-34-35-45-47-48	9
Instructors should be examples about professional ethics and values	8-10-14-15-32-35-40-41-46	9
The program should include courses on this issue	4-10-29-30-43-50	6
Instructors should develop themselves in terms of knowledge and professional values.	4-33-34-43-	4
Instructors and students who do not attend courses should be monitored carefully	6-35-40-48	4
Class sizes should be decreased	31-42-44	3
Teachers should love teaching and make students love teaching	7-34-47	3
Exams should include questions about the topics that were covered	37-38-46	3
Instructors who do not have high professional ethics should not be given duty in the program	11-34- 47	3
The program should be given by instructors who are competent about the topic	40-47	2
Teachers should be present at the exam places	44-48	2
Course hours should be arranged according to students' available times	5-24	2

As it can be seen in Table 7, there are 13 prospective teachers who associated free pedagogical formation education in undergraduate degree with professional values. 13 prospective teachers also indicated that teachers should deal with students, empathise, respect, allocate time, and communicate so that prospective teachers could be equipped with professional ethics and values. Teachers' receiving training on these issues was suggested by 10 participants, and conducting activities with students was suggested by 9 participants.

To help us develop professional ethics and values, firstly our teachers should develop themselves. Then they should teach these issues to their students, or they should organize symposiums or programs about professional ethics and values and raise students' awareness. P4

There should be a formal relationship between teachers and students, but there should be no walls. It should always be kept in mind that students are also human beings. I am telling this both as a student and as a prospective teacher who is at the end of her education. P11

Courses should be given by competent teachers. Some teachers show it so clearly that they are coming solely for money. Teachers who do not attend classes should be identified and warned. P.40

Prospective teachers should be given education about professional ethics and values in a separate course. Same training should also be given to our teachers I think. P43

Teachers who are competent on the issue and who have high professional ethics should teach us. Teachers who do not love teaching should not be given any duty in the program. P47

DISCUSSION, CONCLUSION AND RECOMMENDATIONS

An analysis of prospective teachers' views about their instructors' competence in terms of professional values indicated that the highest competence was in the "compliance with professional values while assessing success and giving marks" item (83.44%). As mentioned by Metin (2013), all teachers regardless of the grade they are teaching should know about assessment methods and be competent about applying them so that they can identify what students have learned and in what areas they are inadequate. Instructors' being evaluated as competent in terms of commitment to professional values in assessment and evaluation issues indicates their proficiency in the assessment and evaluation issue. Hence, an analysis of the findings in this issue show that 20 participants found the instructors competent in terms of "giving marks fairly" issue, and 14 participants found them competent in terms of "giving marks objectively" issue.

The professional value that the participants thought 80% of the instructors were competent was "trying to communicate with prospective teachers sufficiently". An analysis of the detailed explanations about this question indicates that the participants' positive views were cited 95 times while negative ones were cited 35 times. Given that these results which mainly indicated positive views about instructors' giving importance to and respecting prospective teachers' personal characteristics, interests and needs might mean that the instructors at the university where the study was conducted are considered successful in this issue. On the other hand, presence of negative comments of the participants should not be ignored. These kinds of bidirectional findings could be seen in the findings of other studies as well. For instance, prospective teachers who participated in the study conducted by Kumral (2009) evaluated their teachers' communication which indicated 25 competent and 17 incompetent citations. Kaya, Sungurtekin and Deniz (2017) investigated instructor-related communication problems and found that some inadequacies existed related to such factors as being closed to criticism, inconsistent behaviours in and out of classroom, and insufficiency in the effective listening skills. On the other hand, in their review Keçeci and Taşocak (2009) found that the instructors perceived themselves better in terms of communicating than students. Although the participants of the present study made generally positive evaluations about the communication of the instructors; based on the negative views and the bidirectional findings in the literature, more studies are needed on the issue of instructors' communication skills and giving importance to communicating with students.

Findings in relation to instructors' commitment to raise qualified teachers showed that the participants found their instructors sufficient in terms of "efforts for effective education" (f:68), but they did not indicate satisfaction in similar rates for student-centred education practices (f:10) and creating a democratic environment (f:6). The literature also reveals similar findings. For instance, a study conducted by Erdem and Sarıtaş (2006) found that prospective teachers perceived their instructors "generally" democratic at a ratio of 61.4% and "rarely" democratic at a ratio of 36.8%. Şentürk and Oyman (2014) found that the level of instructors' having democratic classroom management behaviours was "yes" for 44%, "partly yes" for 19%, and "no" for 37%. In a similar vein, Duman and Koç (2004) found that instructors' democratic attitudes and behaviours were not sufficient. When all these findings are considered together, it could be said that instructors' concerns about providing an effective education that would include everybody and creating a democratic classroom environment were not perceived high enough by prospective teachers. Hence, this finding is supported by the negative views of the students; "Ignoring effective education" was cited 43 times, and "insulting students" was cited 11 times.

Views about Instructors' being role models in terms of professional ethics and values revealed 63 positive and 25 negative views by the participants. Cio and ML (2014) state that there is a universal consensus that students learn from their teachers through different ways and emphasize that they learn from their teachers' clothing styles, speaking, and behaviours. Teachers' being role models is one of the most important factors in the instruction of values that could be attained through classroom and school life. Teachers should be aware of this issue, and have the consciousness and responsibility that they become role models all the time with their actions and make sure that this role model is a good one. Values education, just like in other education levels, happens every time and everywhere in teacher education institutions, as well.

As stated by Narvaez and Lapsley (2008), teachers teach values implicitly while they are choosing topics, insisting on the correct answer, encouraging students to search the topic, identifying classroom routines, forming groups, and applying the discipline. In this regard, in order to raise teachers with improved professional values, instructors should always keep in mind that they have the responsibility of being role models in terms of professional ethics and behave accordingly.

In line with all these results,

- Activities could be organized to help instructors and prospective teachers to adopt the values of the teaching profession better.
- Instructors could be given in-service trainings on such topics as communication, empathy, time management, and effective instructional practices so that they can give the required seriousness and importance to their courses and to prospective teachers.
- Total number of courses and class sizes could be decreased so that the instructors could better reflect the values they have to students and allocate more time to them.
- Instructors who do not have pedagogical formation or are not competent about the topic should not be given duties in the program.
- Too large groups should be avoided in the identification of pedagogical formation quota as they cause to compromise the quality of the teachers to be raised.

ABSTRACT

In this study, it is focused on the analyzing of the teaching practice of vocational school mathematics lecturers. For this purpose, a mathematics' lecturer pedagogical practice in a mathematics course were examined by using Schoenfeld's framework. In this examining, the relationship of resources and goals to decision-making to analyze of the practice are analyzed via this useful framework. The basic way in the study is describing of the lecturer's goal of teaching students and the teaching methods used to make this lecture rich and more comfortable. At the end of the analyze, we can say that the basic approach of lecturers is to give the basic concept of mathematics rather than to solve a problem.

Key words: mathematics, lecturer, pedagogy, vocational school

INTRODUCTION

In last years, there has been more research that has considered the practice of university teachers, examining of education quality and teachers' beliefs on teaching and learning (Bergsten, 2007; Kane, Sandretto and Heath, 2004; Nardi and Iannone, 2004 & Paterson, Thomas, and Taylor, 2011). However, many of the pedagogical issues about university education are still to be debated (Speer, 2008). In this study, we focused on the issue of how teachers may make teaching decisions and seek to describe the beliefs and goals (Hannah, Stewart and Thomas, 2010).

Schoenfeld has developed a theoretical framework for goal-oriented decision-making in the mathematics classroom (Schoenfeld, 2008 & Schoenfeld, 2011). For shortly, the framework helps teacher to analyze how decisions are made, given that they assist in accomplishing goals that the teacher has planned. We can say that, in mathematics teaching, the goals of lecture are usually prioritized, since one leads to another. Additionally, a goal to motivate the students might be done before or after a goal to use technological applications in a lesson. It is clear that when teacher orients himself and set goals for the subject, he focuses on the direction to achieve the goals. We can say such a process involves complex interactions of resources, orientations and goals (ROG). The decision making that affects how successful a teacher is to reach the goals he has set and the processes of self-monitoring and self-regulation are important in deciding how well education are progressing (Schoenfeld, 2011). we need to add teachers have different set of beliefs and values regarding what understand in learning mathematics, so this situation can cause to make very different choices.

Schoenfeld's method in an analysis of school teaching or of teacher's training. In this study, we apply it to an analysis of a high school mathematics teacher's teaching of a basic mathematics course (Schoenfeld, 2008). One

of our research aim is to obtain some useful information from the framework about the decisions made by the lecturer. And the other is analyze the discussion of the lecturer's ROG to increase the important of the orientations and goals.

METHOD

This study is a research project involving a mathematician (the first-named author referred to as 'the teacher') reflection on practice, and secondly, a case study of his practice by two mathematics education researchers (Hannah, Stewart and Thomas, 2010). The math education researchers are from a state university in Turkey, formed a small community of practice to determine the effectiveness of certain aspects of the teacher's teaching of a basic mathematics course. The study took place in 2016 and involved cycles of planning the relevant teaching material and then reflecting on and evaluating the findings. In this research, the teacher spent a certain time after each lecture writing a detailed reflecting on events that happened in each lecture, totally, for 14 hours lectures. He was also interviewed twice by the two researchers at the beginning and end of the lectures. Some of the discussion focused on teacher's goals for the lecture, and in particular to determine how these goals related to the method of three worlds (embodied, symbolic and formal) of mathematical thinking (Tall, 2004 & Tall, 2008). In addition, other questions dealt with the day-to-day implementation of these goals during lectures.

The first analysis was to use the data from the interviews and lecture notes to construct a description of teacher's ROG for the course. Since some ways of this data were inferred from what the teacher said, it was validated in discussion with him. In performing the analysis, it was often difficult to separate an orientation from a goal, since one usually wants to reach what one sees as important. Sometimes we may obtain an orientation from a goal.

FINDINGS

We found about the teacher's ROG that the orientations could be categorized related to didactics and mathematics. A basic aspect of this method is the ability to aware of that mathematics is not a sequence of independent parts but that there are important and meaningful connections. The two-major orientation here were taken from teacher's oral or written words;

The general view in mathematics is important.

'This course is more about the "the general view" rather than solving a problem'

"To reach the general view involves making connections and analyse between ideas and concepts"

Abstraction is an important learning tool. 'I usually start with something which is graphical or a picture Free and independent thinking is a valuable part of mathematical learning. Concreteness can sometimes cause difficulties with understanding

The teacher explained his observes that "As a guide, what I'm trying to do is get them see that actually there are connections and relations in my presentation. I'm trying to get them into thinking general view (or main subjects)".

In addition, teacher's primary goals were closely linked to the above orientation;

"As a guide, my main goal was I want them to think like a mathematician"

"To help students understand the general view in basic mathematics"

"To show students to the structure of mathematical thinking"

"To help students make connections between mathematical ideas rather than learning procedures (teacher solution methods)"

Written and oral communication is an important part of the teaching - learning process in mathematics.

An example of the kind of important connections that the teacher espoused was when he said that the textbook '... looks after R^3 by functioning to R (so a vector in R^3 become a constant), then using the method we saw the general definition of the function f (Figure 1).

Figure 1: An example of connection between mathematical ideas and examples.

For the mathematical idea, the teacher stressed that “I’ve never declared to the students what big picture is, but I’m hoping that they’ll get the main idea of the lecture that they need from the calculations in the lectures.

“To make familiar students to mathematical formats and symbols”.

In this point, the teacher said that for advanced students in mathematics, they need to become familiar with the procedures of proving some main theorems.

To encourage students with Tall’s ways (resource, orientation, goal) of mathematical thinking.

To make clearer how the teacher’s ROG, described in part above, were involved during in-the moment decision-making, we give one example from lecture.

The one of the main concepts of basic mathematics is solution criterions of

$$ax + b = 0, \quad a \text{ and } b \text{ are constants}$$

The importance of communication and the goal of getting students to communicate are shown in teacher’s reflection; “I have been emphasizing that students need to become familiar with the new concepts such as unique solution, infinite solution and no solution.

On focusing what has developed this level in-the-moment decision we see it was motivated by powerful and insistent beliefs, including some major orientations and some important goals mentioned above.

CONCLUSIONS

In this study, we applied Schoenfeld’s method for provide useful information on lecturing practice, and believe that the construction of a description of the teacher’s ROG determines its position. Effective teaching is not innate but can be learned and developed (Hannah, Stewart and Thomas, 2010). One way to reach this goal is that “The key for new teachers at the tertiary level, just as at primary and secondary, is to encourage the development of the skills of reflective practice” (Kane, Sandretto and Heath, 2004).

Registering the reflections on his lectures and attending in discussions in a community of practice have assisted the teacher to analyze on his teaching. When we examined the teacher’s lecture notes, we met some interesting

and important phrases; "...It's been valuable to see that.... It's interesting but I can tell you're only having my words on the concept....".

One of the main conclusions of this study joint research between mathematicians and mathematics educators is the opportunity for study of teaching and pedagogical approaches (Hannah, Stewart and Thomas, 2010). Paterson stressed that for some mathematicians a tension arises in their lecture between the desire of the mathematics and the ways of mathematicians and the need to be a teacher (Paterson, Thomas and Taylor, 2011).

In this study, this was little finding, with the mathematician's goals. The headlines of the teacher's practice were that visualization was applied through using of models and figures in lectures and experimentation using technology was done.

The teacher had the community of practice a special educational experience. Sharing lecture discussions with mathematics education researchers gave him the opportunity to reflect on his teaching practice. As these people were also teach similar mathematics courses, this corporation were able to include ideas from recent research about teaching, and this led to an increased awareness of his own orientations and goals.

Analysis of a Didactic Experience in Teacher Training: Twitter as a Learning Space

Sonia SANTOVENA

Faculty of Education

Universidad Nacional de Educación a Distancia

Spain

ssantovena@edu.uned.es

ABSTRACT

This paper is a report the findings of a didactic experience in social networks (Twitter) carried out in the academic years 2015-16 and 2016-17. It has been developed with future professors, postgraduate students of the subject 'Curriculum design and development', Master's Degree in Teacher Training at Universidad Nacional de Educación a Distancia (UNED) (Spanish National University of Distance Education). The didactic experience comprised two main parts: participation in Twitter and design of a didactic proposal of RRSS in the classroom. A qualitative (content analysis) and quantitative (descriptive) analysis has been carried out. Students have valued highly the experience. Not only have they acquired academic information and improved their professional knowledge through social networks, but it has also enabled them to generate a community with shared interests. It can be concluded that implementation of a didactic activity based on social networks can constitute a motivational element for students. The students have participated in Twitter with high degrees of satisfaction; also at the end of the course have considered that the effort has been worthwhile, since the activity is useful.

INTRODUCTION

According to some authors different variables could be considered decisive in the learning process: academic engagement, communication process, create a community of interest, importance of analysing students' perceptions about satisfaction, positive assessment and usefulness.

The importance of academic engagement) has been highlighted by several authors, such as: Astin, 1984; Junco, 2011; Kuh, 2009; Rankin, 2009; Evans, 2013. The communication process is an esencial aspect of online learning (DeLotell, Millam, & Reinhardt, 2010; Gunawardena, Linder-VanBerschoot, LaPointe, & Rao, 2010). Academics as Ozturk and Hodgson (2015) have highlighted that develop democratic teaching approaches could facilitate collaboration and communication in the learning process.

Twitter has been considered a communicational and learning space (Andrade, Castro y Ferreira, 2012), which facilitates the creation of a community of interests, which broadens the contacts of its participants, not only inside but also outside the classroom (McKenzie, 2014; Carpenter and Krutka, 2014).

Finally, the importance of analysing students' perceptions about satisfaction, positive assessment and, positive valuation, usefulness has been emphasised by several authors (Gunawardena et al., 2010; Wang y Meiselwitz, 2015; Ozer, Karpinski and Kirschnerb, 2013).

In summary, the main research goal is to know the students' assessment of an educational activity based on the use of Twitter and how it influences the learning process. The specific objectives are:

1. To analyse the fulfilment of students' expectations.
2. To determine how students assessed the activity in terms of quality.
3. To determine how students assessed the activity in terms of satisfaction and usefulness.
4. To study the contribution of social network use to learning.

THE DIDACTIC EXPERIENCE

'Curriculum design and development' is a course of the official postgraduate students of the Master's Degree in Teacher Training at the UNED School of Education (Universidad Nacional de Educación a Distancia - Spanish National University of Distance Education).

Learning is assessed by means of continuous assessment and a summative assessment which combines the results of the final examination in the subject (70%) and the marks obtained in the continuous assessment activity (30%).

In the academic years 2015-16 and 2016-17, a social network-based activity was launched. The activity comprised two main parts: participation in Twitter and design of a didactic proposal of RRSS in the classroom.

The main objective of the first part of the activity was to introduce students to the scope and use of Twitter.

Twitter was used as a space for student work and communication. Briefly, the objectives were:

1. To exchange information on any subject of social and/or educational interest.
2. To create a community of interest.
3. To acquire competence in proficient and effective use of Twitter.

On the other hand, the main objective of the second phase of the activity was that the students integrate the knowledge acquired and share information by TW. It was sought that students generate innovative ideas for their application in the classroom, where the social networks constitute an essential component.

Communication took place through the online course discussion boards and through Twitter. The online course and the discussion boards were hosted on the ALF platform.

With regard to participation on social networking site, the activity lasted 3 weeks and could be completed whenever each student wished in February, March, April, May and / or June. During this period of time, students were to participate actively on Twitter by posting every day or every other day. The minimum required frequency of participation was at least 50 posts from Twitter.

Posts were not solely retweets but also the result of the different forms of communication facilitated by the tool. These included:

- Direct messages (original messages)
- Retweets (RT) of posts from various sources.
- Tweets with @ sign.
- Replying to other posts.

To create a community of interest, students carried out two main actions:

- 1) Communication and interaction with other twitter users through the different means facilitated by the tools: retweeting posts, citing tweeters in posts using the @ sign, responding to posts by others, asking twitter users direct questions, marking posts as favourites and thanking new followers and/or twitter users who retweeted their posts.
- 2) Attracting and managing followers: Creation of the community began by inviting other UNED students also doing the activity to become their followers. To create a community of interest, students first sought followers with shared interests from the course or elsewhere.
- 3) Use of the subject hashtag: all the posts forming part of this activity used the hashtag #D16_UNED or #D17_UNED (depending on academic year) to facilitate communication, follow students and assess their activity on the sites.

METHOD

Study Participants

The population was formed 1340 students: 656 enrolled in the academic year 2015-2016 and 684 in the academic year 2016-17. The sample was formed of students who voluntarily completed the online survey (302). Finally, taking into account the population of 1340 students and the sample of 302 students who completed the online survey, there is a sampling error of 5.06% (0.5).

Research and instrument design

A mixed quantitative and qualitative design was employed based on statistical (descriptive and relational) analysis and content analysis.

An ad-hoc questionnaire was designed to identify students' opinions about the social network-based activity (satisfaction, usefulness and assessment of the activity's contribution to their learning). It can be viewed at: <https://goo.gl/ZT7p4t>. The questionnaire contained 8 Likert-type or open questions.

In sort, two main software was used to analyse the data: SPSS Statistics version 22 and Atlas.ti HM.

Regarding the closed questions a descriptive analysis (frequencies and percentages) was done and it was analysed by Statistical analysis was performed using SPSS Statistics version 22. On the other hand, to analyse the open questions and content analysis was used Atlas.ti HM.

An analysis was conducted of the most important concepts, taking into account their frequency of occurrence, density (the number of codes with which they were related), and the relevance of their meaning in the study

context. First, students' opinions were coded using an identification number (from 1 to 302) and a letter indicating that they are students (S). Subsequently, the texts were analysed to extract general categories and the relationship between these categories. Satisfaction and usefulness were combined since they yielded very similar conceptual maps.

Procedure

The learning activity implemented in the academic years 2015-16 and 2016-17 consisted of the following phases:

- Phase I, October 2015: design of the assessment online survey.
- Phase II, February to June in both academic years: implementation of the activity.
- Phase III, April to June in both academic years: administration of the online survey.
- Phase IV, July 2017: data analysis and report preparation.

FINDINGS

Students' assessment and perception of the social network-based activity

The online survey results showed that in relation to the activity, most students considered that their expectations had been met (74.8%), reported that the expectations had been overtook (7%) and they had been met halfway (13%) (See Fig. 1) On the other hand, the vast majority of students had highlighted the high quality of the activity (73.5%) (See Fig. 2).

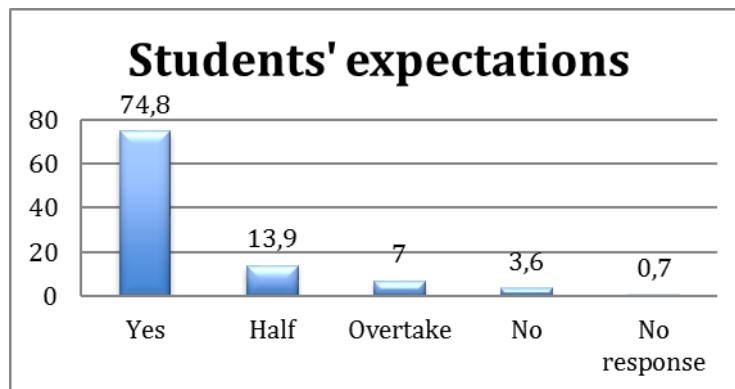

Figure 1. Activity students' expectations

Figure 2. Assessment of the activity: Quality (percentages)

On the other hand, students had reported a high (60.9%) or very high (18.5%) degree of satisfaction with the activity, and rated the activity as being of high (57.0%) or very high (21.5%) usefulness (see Fig. 3).

Figure 3. Assessment of the activity: student satisfaction (percentages)

Figure 4. Assessment of the activity: Perception of Students About the Usefulness (percentages)

To determine highlighted aspects in the students' assessment of the activity, their open answers to the online survey were analysed.

An analysis of student satisfaction and perceived usefulness indicated that there were three main aspects that determined assessment of the activity: its influence on learning, the opportunity offered by social networking sites to and acquire knowledge, and the possibility of communicate with other Twitter users (See fig. 4)

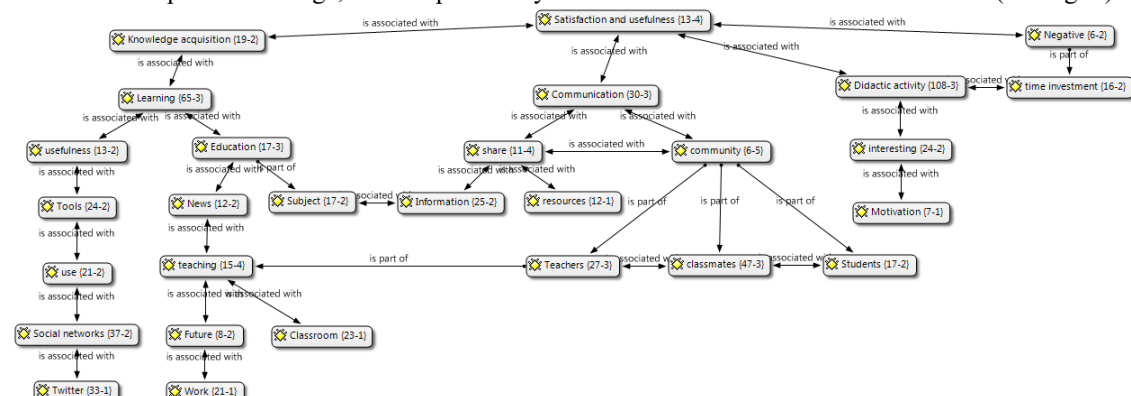

Figure 4. Conceptual map of satisfaction and perceived usefulness

The opportunity offered by social networking sites to acquire knowledge was the main advantage indicated by most students.

Not only were academic aspects emphasized, but also the practical aspects of networks were highlighted.

Learning to use Twitter had been considered a very important and useful aspect for future teachers (“(...) As I have said, it has allowed me to discover new ways of giving lessons and new tools to use. In addition, the same activity itself is another example of how to use social networks to learn” [S09]). In addition, the acquisition of knowledge related to education had been highlighted. Both aspects had been considered essential: subject knowledge and learning innovative aspects of education (“An innovative task, which I have learned many things from as having to develop a subject quite known till now to me now was little known to me. I have had active learning on the subject in question by conducting research work over a long period of time” [S34]; “I am very satisfied because until now I was only able to conceive innovation from a purely theoretical approach. This activity has allowed me to visualize and concretize in real examples what underlies in the notes” [S36])

Learning new ways to teach based on social networks was considered fundamental for future teachers and, above all, to develop innovative methodologies in the classroom: “It has made me think about how to offer content to students in an enjoyable and current way, without falling into boring lessons where teacher speaks and the students listen” [S31]

Secondly, the students highlighted the activity developed on Twitter as a means of communication and generation of a community with shared interests. A community formed by students from UNED, others Twitter users and teachers. Through Twitter they had shared information and educational resources: “It was an attractive activity because has allowed me to learn to research in a different way than I am used to. In addition it generates a community of colleagues, which if in the university in general is already complicated, it is much more in the UNED, where the workmates do not know each other” [S32]

Thirdly, the students emphasized that the activity, in general, is very interesting and motivating. Although they consider that it had some negative aspects, that is: time investment which they needed in order to carry the activity out. Nevertheless, it is possible to affirm that the participation on Twitter is worthy due to the fact that they acquired knowledge and created a community with shared interests.

Finally, it is possible to emphasize as summary of the valuation of the activity with the affirmation of this student:

“This activity has been a work and learning experience in which I had never participated before. It is true that through the forums of the platform and other communities of students I have maintained a more or less active contact in the subjects at UNED, but this activity is the first online experience in which to be an active member in a social network it is valued as part of the learning process (...)”. [S43]

A few criticisms were made. These mainly concerned the time required to use the sites, impinging on time for study.

Contribution of the activity to learning

The contribution of the activity to the learning process was valued according to three variables: acquired knowledge, Innovation in the learning process and communication process.

The students stated that the activity had meant an increase in knowledge, not only content related to the subject, but also had been considered a means of finding out the possibilities of social networks in the educational field.

Mainly, activity had been emphasized as a way to open their perspectives as teachers. The students had highlighted the innovative value of the activity. Students stated that they had acquired very useful information about how to apply Twitter as a teaching tool, as a technological medium and, above all, as a supporting space in the classroom. They claimed to have acquired new ideas of application in the classroom and new technological resources to support teaching.

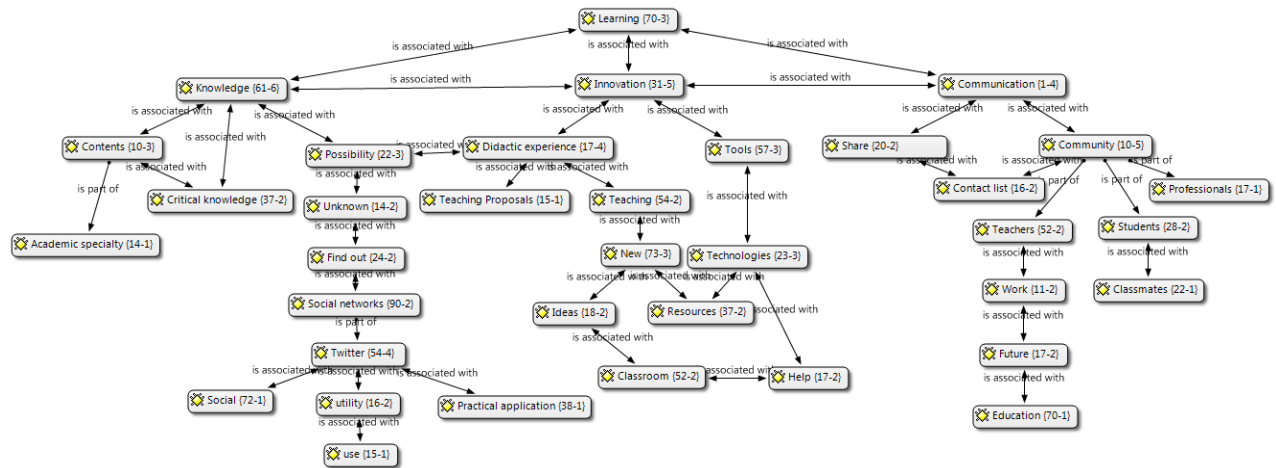

Thirdly, the activity had been a way to be in contact with others teachers, students and professionals. Not only Twitter gave them the chance to share information with other Twitter users, teachers and other professionals, but also it gave the opportunity to create a community with shared interests among them. This community had been valued as a space which facilitate their professional future in educational field.

A student’ opinions can be emphasised in order to summarize these results:

“This activity has facilitated access to innovative content that has allowed me to expand

knowledge about the use of new communication and information technologies. In addition, having been able to exchange and share information related to the activity with the rest of colleagues through Twitter has been a collaborative experience which in an online university like UNED is much appreciated". [S43]

Figure 3. Contribution to learning of the social network-based activity

CONCLUSIONS

The generation of a true communication and interaction process between students should be one of the main objectives of academic activities. Social networks can help us get it. Through creation of a professional community with shared interests, it is possible to design activities which involve real contact with the working world, with the world outside the classroom.

It can be concluded that implementation of a didactic activity based on social networks can constitute a motivational element for students. The students have participated in Twitter with high degrees of satisfaction; also at the end of the course have considered that the effort has been worthwhile, since the activity is useful.

The knowledge acquisition, not only technical, but also academic, has been one of the aspects especially valued by students. The activity has also enabled them to create their own contacts network which opens new working possibilities to them. Both aspects, knowledge acquisition and contacts network, have contributed to the success of the didactic proposal.

To sum up, when designing an academic activity, it is fundamental to propose activities which facilitate the students involvement in the teaching-learning process and, from this point of view, it is necessary to know their interests and their assessment of the work done.

ABSTRACT

The purpose of this research is to analyse Professional maturity levels of candidates who take special talent tests at Erciyes University The School of Physical Education and Sports by some variables. 705 of 1395 candidates, who have taken special talent tests at Erciyes University The School of Physical Education and Sports, have been chosen randomly and attended voluntarily to the research. Professional maturity scale and personal information form prepared by the researcher are used as data collection tools in the research. Acquired data is analysed statistically using SPSS 20.0 packaged software. Personal information and total inventory points and factor points are given by identifying frequency (f) and percentage (%) values. In order to present the relation between points acquired from scales Mann-Whitney U test statistic is used in comparisons by gender and branches while Kruskal Wallis test statistic is used in comparisons by age, field, points of transition to higher education examination and place they live. In conclusion; professional maturity levels of the candidates who take special talent tests are analysed, there is no statistical difference by gender and age while statistically significant differences are identified by field, points of transition to higher education examination, branch and place they live.

Key Words: Professional maturity, special talent, university

INTRODUCTION

In today's modern societies, professions are the most important activities which enable individuals to gain place and status in societies, to become financially independent, help them to realize themselves, make the life meaningful. Selection of these important activities is possible through healthy decisions given by the individuals. Because the primary objective of profession choice which is a milestone in individuals' lives, is to plan a happy future (Gölbahçe, 2007).

The society expects individuals of certain age to show some profession attitude and behaviours. In this respect, professional maturity is the period of having skills that are predicted by some professions to make the profession (Aşkın, 2003: p.28). Bowsbey defines professional maturity as; "an individual's enter into decision-making period, gaining awareness of his own skills, interests and values and having information about professions, specifying profession areas compatible with his qualities and condition he is in and readiness to take necessary steps to reach his goals" (qtd. Dölek, 2008: 108).

When above mentioned definitions' common features' examined, individual's readiness level is emphasized in his coping with developmental tasks, current career development phase and making profession decision by his

age, collecting information about himself and others. In addition, it is seen that attention is drawn to information level on himself and profession types, and level of factuality and consistency of his choice (Oğuz, 2008).

When choosing a profession, it is required to recognize all professions which are open to us entirely, evaluate our needs, expectations, interests and skills and decide to head for the profession which is suitable for us to achieve satisfaction in our career. Such decisions are highly important in human life. Therefore it is inevitable to say that profession choice is the most important decision for us (Sarucan, 2007).

As to Super and Jordan, there are two ways to measure one's professional maturity. First is to compare individual's current place on development line with the professional development grade one should be in that age, second is to see where individual's maturity level is among others' being on the same step in terms of their fulfilment of development tasks (Kuzgun, 2000: 178).

When above mentioned information examined all in all it is seen that professional maturity term can be effective at different sizes and levels in different fields of life. When literature reviewed, it is seen that there are studies which analyse professional maturity terms on various sample groups (Oğuz, 2008, Sekmenli, 2000, Sürücü, 2005). However it is ascertained that there are few studies analysing professional maturity levels in the field of physical education and sports. This study is thought to fill the deficiency in the field of physical education and sports and bring a different perspective. The general purpose of the study in this context is analysis of professional maturity levels of candidates who take special talent tests at Erciyes University the school of physical education and sports.

MATERIAL – METHOD

Model of the Research

This study is of relational screening. This screening model can be defined as, "... research model aiming to assign the presence or degree of covariance among two and more variables" (Karasar, 2007: 49-53).

Research Group

Study group consists of candidates who take special talent tests at Erciyes University The School of Physical Education and Sports. 705 candidates, chosen randomly, attended to the research.

Data Collection Tools

Professional attitude scale and socio-demographic information form are applied as data collection tools in the research.

Socio-Demographic Information Form

Socio-Demographic Information Form includes 6 questions to gain information about participants' age, gender, field, points of transition to higher education examination, branch and place they live.

Professional Maturity Scale

This inventory is developed by Kuzgun and Bacanlı (1996). Reliability is calculated by internal consistency and stability factors. Internal consistency is calculated as α (alfa) = 0,89 from 100 high-schooler at 3rd grade. stability factor is applied to 50 students 5 weeks later. Person- multiplying correlation coefficient calculated as $r = ,82$. Having points below than corresponding to 50th percentage (143): are those whose professional maturity levels are low. Those people should improve their professional maturity levels in order to make accurate profession choice. Having points corresponding to 50-75% (143-155) : are those who have reached professional maturity level. However Those people should also improve their professional maturity levels in order to make more accurate profession choice. Having points above than corresponding to 75th percentage (155): are those who have reached expected professional maturity level. Rise of professional maturity levels are in direct proportion to accurate profession choice. Therefore, those being in the last group are suggested to continue improving their analyse and research behaviours in order to choose profession relevant their skills, interests and values.

Data Analysis

Acquired data from personal information form, general self-efficacy and questioning skill scale are encoded to SPSS 20.0 packaged software and analyses are made through this program. Kolmogorov-Smirnov (Kalaycı, 2009) test is done in order to decide statistic type to be used in the study. Because data don't range normally, nonparametric test statistics are used. In order to present the relation between points acquired from scales Mann-Whitney U test statistic is used in comparisons by gender and branches while Kruskal Wallis test statistic is used in comparisons by age, field, points of transition to higher education examination and place they live.

FINDINGS

Table 1. Socio-demographic features of participants

	Variables	N	%
Gender	Male	422	59.9
	Female	283	40.1
Age	17-21	404	57.3
	22-25	271	38.5
	26 and more	30	4.2
Field	Mathematical	39	5.5
	Non-Math	580	82.3
	Math and Literature	86	12.2
Transition to higher education exam point	180-220	401	56.9
	221-260	282	40.0
	261-300	17	2.4
	301 and more	5	0.7
Branch	Individual Sports	160	24.4
	Team Sports	385	58.8
Place they live	Mediterranean	89	12,6
	Black Sea	11	1,6
	Aegean	6	0,9
	Marmara	18	2,6
	South-eastern Anatolia	30	4,3
	Eastern Anatolia	137	19,4
	Central Anatolia	414	58,7

Socio-demographic features of participants are shown on the Table 1.

Table 2. Evaluation of Participants' Professional Maturity Levels By Gender

	Gender	<i>n</i>	<i>median</i>	<i>min</i>	<i>max</i>	<i>Z</i>	<i>P</i>
Professional Maturity	Bay	422	147,00	100,00	188,00	-1,794	,073

Bayan 283 147,00 89,00 188,00

When table 2 examined; it is determined that there is no statistically significant difference between participants' professional maturity scores by gender.

Table 3. Evaluation of Participants' Professional Maturity Levels by Age

	Age	<i>n</i>	<i>median</i>	<i>min</i>	<i>max</i>	<i>X</i> ²	<i>P</i>	<i>U</i>
Professional Maturity	18-21 ¹	404	147,00	89,00	188,00			
	22-25 ²	271	147,00	100,00	188,00	5,719	,057	-
	26 and over ³	30	145,00	104,00	188,00			

When table 3 examined; it is determined that there is no statistically significant between participants' professional maturity scores by age ($p>0.05$).

Table 4. Evaluation Of Participants' Professional Maturity Levels By Fields

	Field	<i>n</i>	<i>median</i>	<i>min</i>	<i>max</i>	<i>X</i> ²	<i>P</i>	<i>U</i>
Professional Maturity	Mathematical ¹	39	125,00	89,00	187,00			1-2
	Non-Math ²	580	147,00	100,00	188,00			1-3
	Math and Literature ³	86	157,50	122,00	188,00	74,359	,000	
								2-3

When table 4 examined; it is determined that there is statistically significant difference in participants' professional maturity scores between mathematical and non-math , mathematical and math and literature scores($p<0.05$).

Table 5. Evaluation of Participants' Professional Maturity Levels by Transition to higher education exam points

	Transition to higher education exam points	<i>n</i>	<i>median</i>	<i>min</i>	<i>max</i>	<i>X</i> ²	<i>P</i>	<i>U</i>
Professional Maturity	180-220 ¹	401	145,00	89,00	187,00			1-2
	221-260 ²	282	153,00	100,00	188,00	42,531	,000	1-3
	261-300 ³	17	155,00	144,00	188,00			
	300 and over ⁴	5	177,00	144,00	188,00			1-4

When table 5 examined; it is determined that there is significant difference in participants' professional maturity scores between 180-220 and 221-260, 180-220 and 261-300, 180-220 and 300 and over ($p<0.05$).

Table 6. Evaluation Of Participants' Professional Maturity Levels By Branches

	Branch	<i>n</i>	<i>median</i>	<i>min</i>	<i>max</i>	<i>Z</i>	<i>P</i>
Professional Maturity	Individual	433	148,00	101,00	188,00		
	Team	272	145,00	89,00	188,00	-5,296	,000**
	Team	272	20,00	8,00	26,00		

When table 6 examined; it is determined that there is statistically significant difference in participants' professional maturity scores between individual and team sports ($p<0.05$).

Table 7. Evaluation Of Participants' Professional Maturity Levels By regions they live

	Region	<i>n</i>	<i>median</i>	<i>min</i>	<i>max</i>	<i>X</i> ²	<i>P</i>	<i>U</i>
--	--------	----------	---------------	------------	------------	-----------------------	----------	----------

Professional Maturity	Mediterranean ¹	89	152,00	107,00	188,00	15,658 ,016 1-4
	Black Sea ²	11	152,00	101,00	175,00	
	Aegean ³	6	144,50	105,00	179,00	
	Marmara ⁴	18	130,50	106,00	185,00	
	South-eastern Anatolia ⁵	30	147,00	100,00	188,00	
	Eastern Anatolia ⁶	137	147,00	101,00	188,00	
	Central Anatolia ⁷	414	147,00	89,00	188,00	

When table 7 examined; it is determined that there is statistically significant difference in participants' professional maturity scores between Mediterranean and Marmara region scores ($p < 0.05$).

DISCUSSION AND RESULT

In the presented study it is determined that there is no statistically significant difference between participants' professional maturity scores by gender ($p > 0.05$). When literature reviewed, there are studies arguing that there is no significant difference between participants' professional maturity scores by gender variable Kağnıcı, 1999; Mathewson and Orton, 1963; Sahraç, 2000; Saracaloğlu, Karasakaloğlu and Gencel, 2010: 265-283; Sekmenli, 2000; Sürücü, 2005; Taşkıran, 2008; Touma, 1997; Vriend, 1969: 377-380; Westbrook, et al. 1990: 20-32; Yazar, 1997; Zeren, 1999). These studies show parallelism with this research. In different researches, it is encountered that there is significant difference in professional maturity levels by gender (Akbiyık, 1991; Akbalık, 1996; Bal, 1998; Creed ve Patton, 2003: 277-290; Çakar, 1997; Lau, Low ve Zakaria, 2013: 36-42; Kalafat, 1998; Otrar, 1997; Yazar, 1997). The presented study shows that there is no participants' gender change has no effect on professional maturity levels. This situation is thought to be resulted from that, those who have taken special talent test have made their future career plannings regardless of gender differences.

When participants' professional maturity levels by age examined, it is determined that there is no statistically significant difference ($p > 0.05$). There are studies arguing that there is no significant difference in professional maturity levels by age variable in the literature (Çakar, 1997; Kağnıcı, 1999; Kutluğ, 2007; Mathewson ve Orton, 1963). These studies show parallelism with this research. In different researches, it is encountered that there is significant difference in professional maturity levels by age (Creed ve Patton, 2003: 277-290; Patton ve Creed, 2002: 69-85). This is a contradictory situation. In this study, it is thought that because those who are at universal education level have reached specific professional maturity level regardless of age group, there is no difference in professional maturity levels by age variable.

Statistically significant differences are identified between professional maturity scores by participants' fields ($p < 0.05$). When literature examined, there are some studies that analyse professional maturity levels by field variable showing parallelism with our study (Acısu, 2002; Akbalık, 1996). In other studies, the result is that there is no significant difference in professional maturity levels by field variable (Emilova, 2014; Zeren, 1999). The reason why students from Math and Literature field have high scores is because it offers more profession alternatives to the students. The reason why students from math field have higher scores in general self-efficacy levels is because they have competence both in mathematical and non-mathematical field.

Statistically significant differences are identified between professional maturity scores by participants' Transition to higher education exam points ($p < 0.05$). when literature examined, any study analysing professional maturity levels by participants' transition to higher education exam point variable has been encountered. Students having high exam score, have high levels of professional maturity because they are aware that their exam scores are effective in their success and they prefer this department more for their future plannings.

Statistical significant differences are identified between professional maturity scores by participants' branch variable ($p < 0.05$). When literature examined, any study analysing professional maturity levels by participants' branch variable has been encountered. Professional maturity levels are higher in Individual sports branches than team sports branches because in individual sports individuals are conscious of having the full responsibility on themselves.

Statistical significant differences are identified between professional maturity scores by regions where participants live ($p < 0.05$). When literature examined, there are some studies determining that there is no significant difference between regions they live and their professional maturity levels (Acısu, 2002; Akbiyık, 1991; and Kutluğ, 2007). These studies have no parallelism with our study. In presented study, Statistical

differences are identified between professional maturity scores by regions where participants live because profession alternatives offered to the individuals change region by region due to their population level.

In conclusion, when professional maturity levels of whom take special talent tests examined; there is no statistical differences by gender and age while there are statistically significant difference by field, transition to higher education exam scores, branch and regions they live.

SUGGESTIONS

- This research has been practised on candidates who take special talent tests at Erciyes University the school of physical education and sports. In later studies population and sample can be extended. By doing similar researches, the results can be compared.
- Activities should be carried out to improve participants' professional maturity.
- An educational environment can be created by giving the participants chances of selection and self-expression to make them feel more comfortable.

ABSTRACT

Science laboratory lessons are being made in relation to science and biology in faculty of education. In these lessons, experiments are being designed together with students according to the lesson subjects. The aim of this study is to determine the effects of keeping diaries which were written at the end of experiment day and to analyze these diaries using text mining. Diaries were kept by the second-grade students during the course of general biology laboratory I who studies in the Undergraduate Program in Science Education. In the study diaries kept by twenty-five students which contains the experience and feelings of the students about the experiment process were analyzed using text mining. The analysis revealed the most frequently used terms, associations between words, and the similarities among the diaries. The findings showed that the most frequently used words and terms are those which are about the content of the experiments. It was also found that the students sufficiently reflected the content in their diaries. Associations between words reflects the points which students focused on during the experiments. It was also found that similar diaries that produced from one origin can be detected using the similarity analyses.

INTRODUCTION

Data mining techniques are employed to reveal hidden patterns and associations in huge data sources. If the data is text-based than the data cannot be used as in normal text mining. Text mining analyses these non-structural data and transforms these data in a manner to be used with data mining. Text mining is defined as a process to make sense of the non-structural data. In order to extract information from such data certain processes are needed (Kılınç, 2015). Given that textual production does not follow clear rules computers cannot interpret it. The language and goal of texts vary. Traditional ways to extract information from non-structural data include search for key words, statistical or probability algorithms, systems of pattern discovery (Dolgun, 2009). Text mining is used to evaluate text groups produced in different fields. Dolgun (2009) analyzed the performance of different text mining methods. Çalış (2013) analyzed the advertising e-mails written in Turkish using text mining and found that kNN could correctly classifies these e-mails with the accuracy level of 96,5%. Kılınç (2015) used text mining techniques to evaluate software and suggested that both problems and recommendations can be grouped using this technique.

There are numerous studies on the work in science laboratories. For instance, Yurdatapan (2013) analyzed the effects of problem-based laboratory activities on pre-service science teachers' scientific process skills, their self-confidence and self-efficacy concerning biology laboratory. It was found that such activities improved their scientific process skills. Ürey and Aydın (2014) concluded that web-based activities in biology laboratories resulted in improvements. There are also studies on diaries kept by students. Çavuş and Özden (2012) found that diaries kept by students in science courses have positive effects on student achievement and their attitudes towards the course and their teachers. Arslan and Ilgın (2011) found that students' diaries kept in Turkish language courses helped their writing skills and suggested that these diaries can be used to assess students' writing skills. Kasapoğlu (2014) used science diaries to evaluate learning environments in the graduate course of "Science and Technology Teaching I" and found that the learning environment was constructive one. Demirci (2016) found that experimental students who kept diaries improved their higher levels of cognitive skills. İmer (2009) found that

* This research was supported by Afyon Kocatepe University BAP, Project number: 17.KARİYER.92

students could easily express their views about concept maps through diaries. Peker (2014) concluded that diaries contributed to students' reflections of emotions and views and that diaries improved their high cognitive skills. Karaca (2016) found that keeping diaries positively affected the views of the eighth grade students about science course. Akkoç (2010) analyzed the diaries kept by pre-service science teachers about laboratory practices and found that they had trouble in developing hypotheses and in connecting topics with daily life. The views of the pre-service teachers about diaries were examined using content analysis and it was found that following the implementation their positive views about laboratory work increased.

In the literature review, there are studies about laboratory practices especially about method, attitude and cognitive contributions. However, there isn't any studies about using text mining techniques in the analyze process of kept diaries. The aim of this study is to analyze diaries kept by students during "Biology Laboratory I" course using text mining techniques and determine the efficacy of keeping diary.

THE STUDY

The study was designed as a case study, part of qualitative research. Major characteristics of qualitative research include an integrated approach, revealing perceptions, flexible research design and using an inductive analysis (Yıldırım ve Şimşek, 2005)

Within the scope of the study, students kept diaries at the end of each laboratory application during the course period. At the end of course period diaries were examined through various text mining methods. The findings showed the words which were frequently used, the words used together, associations between the words, similarities between text files. Based on these findings efficiency of keeping diaries has been tried to be determined

The study was conducted in the academic year of 2016-2017 and the students were asked to keep diaries reflecting their laboratory experience and processes. Table 1 shows the topics of the experiments as follows.

Table 1. Topics of the experiments

Weeks	Topic of the experiment
1	Laboratory rules and the use of microscope
2	Analysis of cells (onion membrane)
3	Comparison of plant and animal cells
4	Observation of organic ingredients of cells (of starch extracts)
5	Observation of organic ingredients of cells (protein, carbohydrate and fat)
6	Observation of cell organelles (chloroplast in wax plant)
7	Observation of cell organelles (of other plastids)
8	Photosynthesis (food production in photosynthesis)
9	Observation of mitotic and meiosis divisions in preparats
10	Observation of the phases of mitotic division in onion cells

The texts were transferred to computer and data processing was made. In the process, the followings were made: identifying terms, excluding non-textual elements, identifying the stems and stopword cleaning. Then the word categories were identified. In these processes, techniques such as stemming or lemmatization were employed. At the final stage, unnecessary terms were found and listed. Next the weight of each term was calculated and term metrics were developed. Using these matrices several data mining algorithms is used to find similarity rates.

FINDINGS

Table 2 shows the number of diaries analyzed, total number of words and mean word numbers.

Table 2. Info about analyzed diaries

Week	Number of diaries	Total word count in diaries	Average word number
1	19	2974	156.5
2	24	3126	130.2
3	22	2726	123.9
4	20	2509	125.5
5	21	2803	133.5
6	20	2367	118.4
7	21	2329	110.9
8	17	1636	96.2
9	24	2349	67.9
10	14	1583	113.0

Table 2 shows that each week diaries ranging from 14 to 24 were analyzed. The number of the words is the highest

in the first week. The first week diaries mostly reflected students' emotions and excitement that they participated in experiments. The number of the words was the lowest in the 9. week. It may be a result of the fact that in that students did not make any individual or group work, instead they just observed mitotic and meiosis divisions in preparats.

Table 3 indicates the most frequently used words by weeks, their frequency by each week and the number of diaries which the words used.

Table 3. Most used words (weekly)

Week	word	Total count in diaries	Diary count in which words seen
1	microscope	85	19
	course	53	19
	how	31	12
	image	25	11

	experiment	25	14
	microscope	23	14
	mitosis	17	13
10	phase	20	10
	cell	18	11
	diary	13	11
	onion	13	10
	mitosis	11	8

Table 3 shows that the most frequently used words reflect those which are related to the content of the experiments. At the first week, the most frequently used words “microscope, course, how, image” forms a thought about the experiment's content. As these sample, the second week's the most frequently used words “onion, membrane, microscope, image”; the most frequently used words at the fourth week “image, beans, potatoes, microscope” and the most frequently used words of fifth week's “color, fehling, nitric, acid” shows the content of the experiments.

At the seventh week, the most frequently used word was “we analyzed ...”, which emphasizes students’ involvement in the process. At the 9. and 10. weeks the most frequently used word was “phase”, because the experiments were about mitotic and meiosis divisions.

Association rules between words week by week is given in table 4.

Table 4. Association rules between words

Week	Antecedents	consequents	Support	Confidence
1	Microscope	Course	1	1
	Microscope	Diary	0,84	0,84
	Course	Diary	0,84	0,84
	Microscope	Laboratory	0,68	0,68

	phase	microscope	0,52	0,60
	phase	experiment	0,52	0,60
10	cell	diary	0,70	0,82
	cell	onion	0,70	0,82
	cell	phase	0,70	0,82
	onion	cell	0,70	0,90
	diary	onion	0,62	0,73

Support is an indication of how frequently the items appear in the diaries. Confidence indicates the number of times the if/then statements have been found to be true. Support specifies the number of total occurrences of both antecedents and consequents. The percentage of cases which has antecedents also has consequents specified by Confidence. For instance, the word group “onion- membrane” was observed in 90% of diaries analyzed and in

95% of the diaries in which the word “onion” was included there was also the word “membrane”.

Similarity analysis generally gave the values under “0.1”. However, in some weeks the similarity level was bigger than “0.4” among some diaries.

CONCLUSIONS

In this study diaries kept by the second-grade students during the course of “General Biology Laboratory I” who studies in the Undergraduate Program in Science Education were analyzed using text mining. Of the students participating in laboratory work, 24 of them took part in the activity of keeping diaries. Using text mining techniques, the most frequently used words and associations between them were identified.

The findings indicated that the most frequently used words reflect the content of the related experiment (Table 3) and that the participants reflected the content sufficiently in diaries. However, the findings also showed that the participants did not sufficiently evaluate their learning and did not cover their emotions in the diaries. Studies about science laboratory practice are mostly about views and perceptions of teachers and students. For instance, Kaya and Böyük (2011) found that science teachers regarded themselves as efficient in relation to laboratory practices. Özgür (2016) concluded that pre-service biology teachers need assistance in chemistry laboratory practices. Güneş (2013) found that most of the science and technology teachers did not use laboratories in their courses.

Association analyses showed the words which used in pair. The connection between the word pairs can be considered to show those points which students mostly focused on and interested in during and after the experiments.

As stated earlier it was found that similarity rate among diaries was generally under “0.1”. It means that the participants used different words and sentences while writing their diaries. There were also diaries with the similarity rate bigger than “0.4”. When diaries with a similarity ratio of over 0.4 are examined, it was seen that some new diaries were generated by changing the order of some words and phrases in a diary, by removing some sections or by making some additions. It shows that some of the participants used the same diary sheet by changing some of the sections. This analysis has in fact determined that most of the diaries express the feelings and thoughts about experiments using different words and sentence patterns. But in some diaries, it is seen that the similarity rate is high and diaries may be duplicates of each other in some sections. Similarity analyses can be executed in some courses in which the diaries are used to evaluate the students in order to determine the singularity or originality of the work.

This study is one of the first research which analyses student diaries using text mining. Therefore, it may inspire other studies. In the educational system in which open-ended items will be much more important such studies may guide the research. This study can be used as a pre-study to automatic grouping and scoring of diaries by students.

ABSTRACT

Mathematics as a subject of study is usually said to be important as a base for other economic subjects. Problems with understanding mathematics can evoke consequential difficulties with understanding economic theories inferences. The aim of this paper is to compare the study results of Microeconomics and Mathematics subjects of the bachelor students from the College of Polytechnics Jihlava, Czech Republic and find out if there exist any dependence between the results in these subjects. Both subjects belong to the study programme “Economics and Management” and study fields “Finance and Management” and “Travel and Tourism” and they are obligatory for the full time and part time forms of study. The success of students in both subjects was examined depending on the form of study (full-time or part-time), study field (“Finance and Management” and “Travel and Tourism”), and gender. The comparison is based on the data for the period 2007-2015. To find out if the students with problems in Mathematics (no credits or “F” mark) could have also problems with Microeconomics Chi-square test and correlation coefficients were used. The results showed that students having better results in Mathematics achieved also better results in Microeconomics. According to our results we can prove that at least for Microeconomics the mathematical knowledge are necessary.

INTRODUCTION

Mathematics belongs to the subjects that are essential for many other disciplines. It is usually studied at basic and secondary schools but also at higher education institutions, especially mathematically, technically or economically oriented, mathematics belongs to the obligatory subjects. The negative attitude towards mathematics is however evident in many countries. It has been widely studied (Ashcraft, 2002; Chinn, 2009; Núñez-Peña et al., 2013) to find the main reasons for this unfavorable situation. According to Mata et al. (2012), students’ attitudes towards mathematics are closely linked to their motivation and the degree of social support received. Núñez-Peña et al. (2013) described that the math anxiety can be a result of low performance on the course. Mathematics is usually seen as a “hard-to-pass” subject. It seems to be a serious problem not only in the Czech Republic but also in other countries (Chinn, 2009; Matulová, 2016). The study of Zámková et al. (2016b) showed that the success rate in Mathematics has been decreasing since 2006 in all of the monitored study programmes at the College of Polytechnics Jihlava. On the basis of decreasing level of mathematical knowledge and ability to learn this subject the number of math support centers or support subjects were established especially at the higher education institutions to help the students with this subject (Matulová, 2016; Zámková et al. 2016a). Mathematic knowledge are essential for other subject, especially of an economic origin but as Doucek and Maryska showed (2016) it can be connected also with the knowledge of English, so it is possible to expect better results in more subjects for

students with better mathematical performance.

In this paper we decided to compare the results of the students enrolled in the economic study programme (Economics and Management) at the College of Polytechnics Jihlava, Czech Republic, in the years 2007-2017. The main aim is to find out if there are any dependencies between the study results of Mathematics and Microeconomics subjects. Both examined subjects are based on logical thinking. In addition, the mathematical instruments and methods are largely used in Microeconomics. We suppose that success of students in both subjects will be very similar.

We also examine whether the study results of the subjects Mathematics and Microeconomics are dependent on the study field, form of study and gender of the students.

There are two study fields under study programme Economics and Management: Travel and Tourism (TT) and Finance and Management (FM). Study field FM is a discipline that puts more emphasis on logical thinking with comparison study field “Travel and Tourism”. It also contains more mathematically oriented subjects and attracts students who have no problems with mathematically tuned subjects. We expect that the success of these students in both Mathematics and Microeconomics subjects will be higher compared to students of study field TT. With respect to the results of Jameson and Fusco (2014), that showed that adult learners (meaning older than 25 years and usually working) often enter their postsecondary experience with lower confidence than their more traditional peers, we suppose the results of part time students to be worse than the results of full time students. According to the gender we test the hypotheses that men had better results in Mathematics than women. This fact was reported for example by Hyde et al. (1990) although recent data suggest that the gap is closing (Lindberg et al., 2010).

THE STUDY

The College of Polytechnics Jihlava belongs to the 26 public higher education institutions in the Czech Republic. It has 8 bachelor and 2 master fields of study and about 2000 students in full time or part time forms of study. Two of the study fields are economically oriented and belongs under one study programme Economics and Management: they are Travel and Tourism and Finance and Management.

In the article the analysis between the results of the subjects Microeconomics and Mathematics is made. Data was taken from the information system of the College of Polytechnics Jihlava (is.vspj.cz) and covers the results of the examined subjects in the period 2007-2017. The subject Microeconomics is obligatory for both fields of study mentioned above (FM, TT) in the first year and first semester in the study plan. Data connected with this subject contain not only the final result (mark on the scale A-F where A-E means that the student passed the subject, F means that failed) but also if the student passed/failed in the first, second or third term or if he/she studied the subject for the first or second time (only 1 retry of passing the subject is possible at our college). For the subject Mathematics (especially Mathematics I) the data are similar but there is a difference as this subject has been obligatory for the TT study field only since the academic year 2013/14 (till that time it was only voluntary subject). According to this fact it was necessary to change the data to the same scale. The marks A-E of the FM students were changed into “passed” to be able to compare it with the “get credits” of the TT students. Data also includes the information about the field and form of study or gender of each student. The sample contains data of 3148 students (1720 students of TT study field and 1428 of FM study field) for both full time and part time study. Full time study means the attendance and learning during the 5 days in a week for 14 weeks in 1 semester, part time means that the courses are attended by student only during Saturdays and the rest learning and studying is based on the e-learning system (the Learning Management System Moodle is used). Details are shown in Table 1.

Table 1: Number of students in analysis

	Travel and Tourism	Finance and Management	Total
Full time study	1102 (64.1%)	721 (50.5%)	1823 (57.9%)

Part time study	618 (35.9%)	707 (49.5%)	1325 (42.1%)
Total	1720	1428	3148 (100%)

As the analysis was aimed also at the differences of results according to gender, Table 2 and 3 describe the number of female/male students. More women than men studied in both fields of study and more students were enrolled in the full time form of study than for the part time. But in FM study field the number of students of both forms of study are close to each other and in the last years a little bit more students are enrolled in the part time form of study – it might be caused by the fact that more people start to work and simultaneously they wish to study at the higher education institution and the study field Finance and Management is more “multi-purpose” for various works than Travel and Tourism could be.

Table 2: Number of student at study field Travel and Tourism by gender

	Travel and Tourism		Total
	Female	Male	
Full time study	829 (75.2%)	273 (24.8%)	1102 (100%)
Part time study	506 (81.9%)	112 (18.1%)	618 (100%)
Total	1335 (77.6%)	385 (22.4%)	1720 (100%)

Table 3: Number of student at study field Finance and Management by gender

	Finance and Management		Total
	Female	Male	
Full time study	507 (70.3%)	214 (29.7%)	721 (100%)
Part time study	467 (66.1%)	240 (33.9%)	707 (100%)
Total	974 (68.2%)	454 (31.8%)	1428 (100%)

Based on the previous research and our knowledge, four hypotheses were set:

- ▶ Students of the Finance and Management study field were better in Mathematics and Microeconomics than students of Travel and Tourism study field.
- ▶ Students of the full-time study were better in Mathematics and Microeconomics than students of the part-time study.
- ▶ Men were more successful in Mathematics and Microeconomics than women.
- ▶ Students with problems in Mathematics (failed) had also problems in Microeconomics.

The **Goodness of fit** test as one of the Chi-square tests was used (Gravetter, Wallnau, 2004; Hendl, 2004). Measures of goodness of fit typically summarize the discrepancy between observed values and the values expected under the model in question. We test a hypothesis

$$H_0: F(x) = F_0(x) \quad \text{vs.} \quad H_A: F(x) \neq F_0(x),$$

where F is the cumulative distribution function for the distribution being tested. There was detected n_i frequencies for the observed variable. We assume that the probability distribution of the variable is determined by the probabilities of p_i . The difference between observed and expected frequencies is given by the test statistics

$$\chi^2 = \sum_{i=1}^k \frac{(n_i - n p_i)^2}{n p_i}$$

Where n is the total sample size, p_i is the hypothesized proportion of observations in level i , n_i is the frequency for the observed variable in level i , k is the number of possible categorical values.

The degrees of freedom (DF) are equal to the number of levels (k) of the categorical variable minus 1: $DF = k - 1$. The P -value is used to interpret the results. The P -value is the probability of observing a sample statistic as extreme as the test statistic.

For the comparison of the dependency of the subject successfulness according to the field of study, form of study and gender the **Chi-square test of independence** was used. The χ^2 coefficient has the disadvantage that its value depends both on the dimension of the contingency table and on the sample size. For the elimination of the sample size dependence, the Pearson's contingency coefficient C was added to the analysis (to see the strength of the association):

$$C = \sqrt{\frac{\chi^2}{n + \chi^2}}$$

Other measure of the association of two binary variables that can be used in the given situation is the Φ coefficient for binary contingency table (Minařík, 2013). Φ coefficient in case of 2×2 table for two random variables x and y , that describes the association of x and y , is calculated as:

$$\phi = \frac{n_{11}n - n_{1*}n_{*1}}{\sqrt{n_{1*}n_{*1}n_{0*}n_{*0}}}$$

where n_{11} , n_{10} , n_{01} , n_{00} , are non-negative counts of number of observations that sum to n , the total number of observations – details are in Table 4.

Table 4: Description of 2×2 table necessary for the Φ coefficient calculation (Source: Minařík, 2013)

	$y = 1$	$y = 0$	Total
$x = 1$	n_{11}	n_{10}	n_{1*}
$x = 0$	n_{01}	n_{00}	n_{0*}
Total	n_{*1}	n_{*0}	n

For the final marks comparison (only for the FM students where both subjects Mathematics and Microeconomics were finished by exam in all selected years) the Spearman's rho was chosen. This is a nonparametric measure of rank correlation (for ordinal variables). We want to compare marks (the change of the marks into numbers is given by the college rules as follows: A=1, B=1.5, C=2, D=2.5, E=3, F=4) of Microeconomics and Mathematics 1 (only for Finance and Management). The Spearman correlation coefficient is defined as the Pearson correlation coefficient between the ranked variables (Myers, Well, 2003). For a sample of size n , the n raw scores X_i , Y_i are converted to ranks rg_{xi} , rg_{yi} and r_s is computed from:

$$r_s = \rho_{rg_X, rg_Y} = \frac{\text{cov}(rg_X, rg_Y)}{\sigma_{rg_X} \sigma_{rg_Y}}$$

where ρ denotes the usual Pearson correlation coefficient, but applied to the rank variables, $\text{cov}(rg_X, rg_Y)$ is the covariance of the rank variables, σ_{rg_X} and σ_{rg_Y} are the standard deviations of the rank variables.

FINDINGS

First of all, the comparison of results for both subjects by the field of study was done. Table 5 describes the numbers of passed/failed students in the Microeconomics subject. It is visible that the structure of the numbers of passed/failed students of TT and FM is similar and this fact was confirmed by the P -value that is equal to 0.372. There is no significant difference between the results of TT and FM students. When we test if the success is dependent on the field of study the P -value is 0.511 which signify the independence on the study field.

Table 5: Microeconomics – number of students in TT and FM study fields (Source: Authors' computations)

Microeconomics	TT	FM
Failed	1070 (62.2%)	872 (61.1%)
Passed	650 (37.8%)	556 (38.9%)
Total	1720 (100%)	1428 (100%)

The results of the analysis of Mathematics are different. Table 6 shows the number of students that passed/failed this subject. First, we can see that the total number of students is smaller than 3148. It was caused by the fact that some of the students did not attend Mathematics in their first semester of study and because of the bad results the first semester was also the last for these students. Second, the percentage of “failed” is higher for the FM study field – this is also confirmed by the p -value ($p = 0.0004$) meaning the different structure of results between the study fields. Also the p -value from the dependence analysis is low ($p = 0.012$) and so the success in Mathematics is dependent on the study field and the students of TT were more successful. But the $\Phi = 0.05$ signifies nearly no dependence on study field. We cannot confirm our first hypothesis that the FM student were better in Mathematics than TT students.

Table 6: Mathematics – number of students in TT and FM study fields (Source: Authors' computations)

Mathematics	TT	FM
Failed	709 (58.5%)	811 (63.5%)
Passed	502 (41.5%)	467 (36.5%)
Total	1211 (100%)	1278 (100%)

Next part of our analysis was aimed at the form of study (full time / part time). For both subjects the Chi-tests showed that the success was dependent on the form of study (for Microeconomics $p < 0.01$; $\Phi = -0.211$; or Mathematics $p < 0.01$; $\Phi = -0.179$). Full time students in both subjects were more successful than part time students which is in accordance with our second hypothesis. Table 7 shows the details for Mathematics where the passing rate for the part time students was lower than 30%.

Table 7: Mathematics – number of students in full time and part time forms of study (Source: Authors' computations)

Mathematics	Full time form	Part time form
Failed	680 (52.7%)	840 (70.1%)
Passed	611 (47.3%)	358 (29.9%)
Total	1291 (100%)	1198 (100%)

Third part of the comparison was connected with gender. We supposed that men should have better results in Mathematics and Microeconomics than women. But the results showed that it was not possible to confirm this hypothesis. In Microeconomics the strength of the dependence of the success on gender is almost none but the p -value shows dependence ($p < 0.01$; $\Phi = -0.109$). The rate of passing for women was higher (41.5%) than for men (29.6%) – Table 8. The same situation was in Mathematics ($p < 0.01$; $\Phi = -0.15$; passing rate for women 43.3 and for men 26.7).

Table 8: Microeconomics – number of student according to gender (Source: Authors' computations)

Microeconomics	Female	Male
Failed	1351 (58.5%)	591 (70.4%)
Passed	958 (41.5%)	248 (29.6%)

Total	1840 (100%)	649 (100%)
-------	-------------	------------

The last part of the analysis was related to the mutual dependencies between Mathematics and Microeconomics study results. As in previous comparison we first analyze the structure of the passed/failed number of students in these subjects, then we compared it in a view of study field, form of study and gender. As FM students had exam in both subject we also measured the correlation of marks.

The percentage of passed/failed students was nearly the same for both subjects (Table 9) which the Goodness of fit test confirmed ($p = 0.524$). By the chi-square test of independence the strong positive dependence between the success in Microeconomics and Mathematics was confirmed ($p < 0.01$; $\Phi = 0.735$) so it is possible to say that the students that were successful in Mathematics were successful also in Microeconomics (and also a lot of them failed in both subjects) – Table 10. These results are in line with our last hypotheses that students with problems in Mathematics (failed) had also problems in Microeconomics. But we wanted to analyze it deeply – by field of study, form of study and gender. As for the field of study the Chi-square test of independence confirmed dependence between the success in Microeconomics and Mathematics in both fields of study (stronger for FM where $\Phi = 0.773$, for TT $\Phi = 0.702$, in both cases $p < 0.01$). Table 11 shows the number of students from this point of view where it is evident that higher number of students failed in both subjects or passed both subjects.

Table 9: Number of students passed/failed in Microeconomics (MIE) and Mathematics (MAT) (Source: Authors' computations)

	MIE	MAT
Failed	1942 (61.7%)	1520 (61.1%)
Passed	1206 (38.3%)	969 (38.9%)
Total	3148 (100%)	2489 (100%)

Table 10: Comparison of passed/failed number of students in Microeconomics (MIE) and Mathematics (MAT) (Source: Authors' computations)

	MAT Failed	MAT Passed	Total
MIE Failed	1361	155	1516
MIE Passed	159	814	973
Total	1520	969	2489

Table 11: Comparison of passed/failed number of students in Microeconomics (MIE) and Mathematics (MAT) from the field of study point of view (Source: Authors' computations)

Field of study			MAT		Total
			Failed	Passed	
Finance and Management	MIE	Failed	712	41	753
		Passed	99	426	525
	Total		811	467	1278
Travel and Tourism	MIE	Failed	649	114	763
		Passed	60	388	448
	Total		709	502	1211

The same situation was detected when we took into account the form of study (Table 12). Again, the dependence between the success in Microeconomics and Mathematics in both forms of study was confirmed. For full time study form the strong dependence was found ($p < 0.01$; $\Phi = 0.763$), for part time study the strength of dependence was moderate ($p < 0.01$; $\Phi = 0.674$). The last comparison view from the gender point of view confirmed the same results with strong dependence between the success in both subjects for both female and male (Table 13).

Table 12: Comparison of passed/failed number of students in Microeconomics (MIE) and Mathematics (MAT) from the form of study point of view (Source: Authors' computations)

Form of study			MAT		Total
			Failed	Passed	
Part-time	MIE	Failed	785	104	889
		Passed	55	254	309
	Total		840	358	1198
Full-time	MIE	Failed	576	51	627
		Passed	104	560	664
	Total		680	611	1291

Table 13: Comparison of passed/failed number of students in Microeconomics (MIE) and Mathematics (MAT) from the gender point of view (Source: Authors' computations)

Gender			MAT		Total
			Failed	Passed	
female	MIE	Failed	933	128	1061
		Passed	111	668	779
	Total		1044	796	1840
male	MIE	Failed	428	27	455
		Passed	48	146	194
	Total		476	173	649

Finally, we studied the marks of the students. As it was mentioned above the subject Mathematics for the TT students was till the year 2013/14 finished only by getting credits. We compare mark from Mathematics and Microeconomics for the FM students only. The correlation coefficient (Spearman's rho) of the marks in Microeconomics and Mathematics is 0.689 (the coefficient is significant at the 0.01 level) which means the moderate strength of dependence between results of these subjects. This fact showed us that the better/worse were the students of FM in Mathematics, the better/worse they were in Microeconomics. The same results we obtained when the dependence between marks of two forms of study and gender was measured (part time: $\square\square\square\square\square\square\square\square$ full time $\square\square\square\square\square\square\square\square\square\square$ female: $\square\square\square\square\square\square\square\square\square$ male: $\square\square\square\square$ 0.725 $\square\square\square$)

CONCLUSIONS

The subjects Mathematics and Microeconomics belongs to the obligatory subjects in the first semester of the bachelor study programme Economics and Management (study fields Finance and Management, Travel and Tourism) at the College of Polytechnics Jihlava. As there is often a high percentage of students leaving the college because of the poor results (not only in these two subjects) and as the level of knowledge of students (especially in mathematics) is getting worse (Zámková et al., 2016b) we decided to analyze the dependence between the success and marks of these two subjects. For the analysis results of 3148 students in the period 2007-2017 were used.

We tested three hypotheses. Our first hypothesis about the more successful FM students in Mathematics and Microeconomics was rejected – the reason for this might be caused by the fact that till 2013 this subject was not obligatory for TT students and it was finished by getting credits only. The second hypothesis assuming that the full time students were better than part time ones was confirmed. It might be caused by the fact mentioned by Jameson and Fusco (2014) about adult learners less confidence but it is also caused by the lower number of direct education and higher necessity of self-study. That is why the extra hours and summer mathematical seminar was added to help the students pass the subject. The third hypothesis expecting men to be better than women in Mathematics and Microeconomics was rejected. In both study fields more women than men were admitted to study as especially Travel and Tourism is more popular among girls. The economic scope of the study fields is also more attractive to women (men usually prefer technically oriented study programmes). This might be the reason why women were

better than man (women are more diligent too). The last (but the most important) hypothesis telling that better/worse results in Mathematics means better/worse results in Microeconomics was confirmed. This is very important for us because it proves not only the necessity to help the students with Mathematics but also the fact that the better mathematical knowledge can contribute to the better results in Microeconomics (and maybe other economical subjects).

ACKNOWLEDGEMENTS

The paper was supported by the contribution of long term institutional support of research activities by the College of Polytechnics Jihlava.

SUMMARY

In this article, we present a descriptive research, carried out at the University of Granada. With the objective of analyzing university students' self-perception about their role as university leaders, a mixed methodological design was developed in which a questionnaire was passed, semi-structured interviews were conducted and discussion groups were given to a total sample of 80 students University professors who held positions of representation and actively participated in the various governing bodies of the University. This research is justified on the need to encourage the participation of the majority population, the student, in the curricular, organizational and political decisions of the university. At the same time, the fact that students are the main affected in these, further support the realization of this study. The results show a gradual increase in the level of involvement of university students to access the University management and participation bodies. However, at the same time and, we want to highlight the lack of diffusion and promotion of this figure of leadership, by the different positions of university government.

Keywords: leadership, student leadership, higher education.

INTRODUCTION

Leadership can be defined as the influence that one or more people have on a particular group to perform a particular action (RAE, 2014). Leaders are usually characterized by good social and communicative skills, often charismatic, assertive, and resolute people (Leithwood, 2009, Harris, 2014). These abilities that often they have are the responsible that the rest follow their actions. The study of leadership began to develop in the business world. However, thanks to other research currents such as that of Learning Organizations, it was transferred to other areas such as education.

Leadership and University Micro-Politics

Influence as an inherent aspect of leadership may be due to the position (strategic or not) that occupies the leader or leaders within the organization or by the power that has within it. Power and influence are the two main factors that will characterize the relationships between the different members of an organization. At the same time, the network of relationships that emerge in any organization, a consequence of the confluence of particular interests, ideological and institutional between the different levels and even among the workers of the same rank in the institution, outline the micro politics underlying any company (ElHomrani, 2014).

The educational field, like any organization formed by a group of people with individual needs, characteristics and interests, who in turn work based on common objectives, is not an exception. The educational micro politics is a reality that must be studied in depth if the intention is knowing and analyzing the organization as an integral way. In fact, the interests and the conflicts that arise by the power and the negotiations where is the true functioning and the real identity of any institution. To detach all the

peculiarities that make it up is the best way to implement changes and to influence in the correct development of the same one.

On the other hand, human interactions and relationships between staff influence the achievement or not of the objectives or purposes pursued by the institution as a whole. Around the conjugation between the individual and group interests, certain practices or others will be developed. An analysis based on the rules established within the institution, that is, the micro-politics will identify different human groups with contradictory interests that will struggle to put their objectives before the rest. Far from a pejorative conception of conflict, they will help the organization evolve in order to achieve the best for all (Ball, 1990; Lindle, 1999, cited by El Homrani, 2014). Related to this, access to this characteristic political framework in every democratic institution is usually subject to certain options.

In the Spanish university context, for example, to give voice to the entire university community, especially those people whose opinion is usually restricted or silenced, that is, students, we find the participation bodies, which are composed of all Representatives of the University community.

Both for access and for achieving adequate performance, leadership skills gain significant added value. Good communicative skills, assertiveness, empathy, resilience, or ability to lead groups of indeterminate extent are just a few examples of skills and abilities assigned to effective leaders (Pont, Nusche and Noorman, 2009, Leithwood, 2009). Therefore, an analysis of the university and its internal functioning is unthinkable without assuming the importance of leadership on the performance of the working groups and the micro-politics that accompany it.

At the same time, within the great variability in the types of existing leadership transferred to the educational environment, the work we present we will focus on the political leadership (El Homrani, 2014; El Homrani, Conde-Lacárcel y Ávalos, 2016). Focusing on existing participation bodies within the university, in this case, the University of Granada, we will analyze the degree of leadership that student representatives exercise through their rank and the position they occupy at some point in their passage through Higher education.

University Students, Potential Leaders

Although our educational system has certain limitations, such as the rigidity of organizational structures or the lack of continuity of curricula, there have been notable improvements in recent years. The promotion of participation to the entire university community has contributed favourably to the implementation of certain improvement actions on university organizational functioning and that consequently affect the teaching and learning processes themselves.

Thanks to this, the largest sector of the university, students, has a large cast of representatives distributed among the different governing bodies and University participation.

This sector, through its representatives, exerts their influence on questions related to the teaching and learning processes, the faculty, elections to Rectorate, Dean or Department, as well as more specific ones that concern the Faculty to which they belong. Although the number of student representatives is not very high (around 24%), their vote is often decisive in making important decisions, so they are participants in the micro political dynamics that take place at the university. Through their positioning on the issues raised above, students become an equal player, on equal terms with other levels (department directors, deans, faculty, management and services personnel ...), political leaders, with the ability to exercise their power (and influence) and to satisfy the interests of the population they represent within the organization.

This student leadership is a type of institutional leadership, whose arises within the University and it must be interpreted as a technical, interpretative and transformative process (Lorenzo, Hinojo, Aznar, Cáceres & ElHomrani, 2008), articulated around the characteristics and conditions that surround the context where it takes place.

The University is a micro society, where live and interacts socially different people, with different needs, interests and motivations. In turn, the university institution can also be conceived as an entity that pursues a clearly established purpose: to offer a quality education and training, to enable its graduates to insert themselves in the social and labour world satisfactorily. As for the functioning, as it happens in lower educational levels, it presents a deep hierarchical organizational structure, analogous to the private enterprise (Firestone & Riehl, 2005). The vertical arrangement of the governing bodies makes the possibility of participation in them is desirable. At the same time, it responds to the imperatives of social

justice, which highlights the need that all the groups that make up the university community have voice and vote in decisions that affect the future of their institution.

As far as the student sector is concerned, in the literature we find numerous investigations carried out in the international field, which have been endorsed by the importance of student participation (or student leadership) in the governing bodies, on the proper functioning of the institution (Pareja, López, ElHomrani & Lorenzo, 2012; Inman, 2014; Bennetts, 2009; Lorenzo, Cáceres, Hinojo & Aznar, 2013). In the same, the focus has been on different factors, such as gender (Cáceres, Lorenzo & Sola, 2009; Sola, Cáceres & Trujillo, 2010; Cáceres, Trujillo, Hinojo, Aznar & García-Carmona, 2012); The development of managerial skills in university students (Laborda, 2006); The micro politics generated in the different organs of the universities (Murphy and Curtis, 2013); The management of teachers in relation to leadership (TLópez-Yañez, 2009); The development of ethical, social and transformational values of university politics (Alvarado, Prieto & Betancourt, 2009; Terzioglu, 2011; El Homrani, 2016) or the promotion of quality (Lorenzo, Hinojo, Aznar, Cáceres & El Homrani 2008)

In this sense, it seems convenient to point out some defining characteristics of the University of Granada, in order to give more representation both to the object of study that we present and to the data and results that we have found during the study.

METHODOLOGY

The methodological approach of this research has been designed according to the parameters offered by the object of study. With a view to providing a complete overview of the participation of university students in the various bodies of the University of Granada, we have taken as a reference the three sites subscribed to it: Granada, Ceuta and Melilla.

Specifically, this research tried to analyze the degree of participation of the university students in the different organs of government, emphasizing especially in the type of leadership that they exerted in the same ones. To unravel this crossroads, we raised a series of questions that guided the design and development of the instruments used to obtain our answers (see Table 1)

Investigation questions	Purpose
Who are the university student leaders? As they are? What are their traits and attributes?	Identification of leaders
Why have they been chosen?	Attributions of the leader
What have they been chosen for? It's duties?	Leadership Expectations
How do they perform their functions? What difficulties do they encounter? What are your responsibilities?	Leadership practice
What is your experience? How do they look? What do you think is expected of them?	Satisfaction and shortcomings

Table 1: Research Questions. Own elaboration

In order to respond to the questions raised, a non-experimental descriptive and interpretive design was followed, on a final sample of 80 student representatives in the University of Granada (Department Council, Center Board and Faculty Cloister), selected from the different degrees, courses and areas of knowledge applying stratified random sampling without agreeing any way to distribute the surveys for each stratum. This is due to the complex task of accessing the sample; It was more convenient to avoid a fixed number for each stratum in order to achieve greater representativeness.

The total population is 719 students. But it must be clarified that this is a very fluctuating population, which is not very helpful to the representative bodies in which they should perform their functions. There are some and some students who can hold up to 6 positions in the different representation bodies. That is why it was decided to locate and pass the questionnaire mainly to those students attending the faculty of the university (maximum governing body), whose composition is 71 members representing this sector and in which all members of the university are represented. The university community. Finally, we only obtained the participation in this research of 62 of the 71 members of the university faculty, in addition to 18 significant students in the University of Granada based on the position they occupy. Thus, we get representatives or leaders from all the Faculties of the University of Granada (El Homrani, 2016).

The collection of information was carried out through 3 instruments: the first one is the questionnaire 'Student Leadership at the University of Granada.' developed by Lorenzo, Torres-Martín, Pareja, Hinojo, López-Núñez, Cáceres, El Homrani, Moreno & Lorenzo (2007), with a reliability of 0.877 Alpha of Cronbach for 67 elements, and a Lickert scale of response of 1 to 4 where one corresponds with 'totally disagree' and four With 'total agreement'. This instrument follows a mixed structure, with a first part composed of 30 closed questions; And the second part with five open questions. For the treatment of the obtained data, we use the statistical program SPSS.

The technique of the two halves of Guttman was equally applied to him; The Spearman-Brown Coefficient test and the correlation between forms, as well as an expert judgment with the following results, as we can see in Table 2:

RELIABILITY-METHOD OF THE TWO HALF-			
Cronbach alpha	Part 1	Value	0.814
		Number of elements	34 (a)
	Part 2	Value	0.831
		Number of elements	33 (b)
		Total number of items	67
Correlation between forms	0.593		
Spearman-Brown Coefficient	Length equal		0.744
	Uneven length		0.744
Two halves of Guttman	0.743		

Table 2: Reliability of the questionnaire. Source: Lorenzo et al. (2007)

The second of the instruments used was a semi-structured interview, based on the different dimensions of the questionnaire, made to the most significant student regarding the position of student representation that occupies, which allowed us to follow an analytical script of the same based on our Research needs while offering the respondent sufficient freedom of response.

For the analysis of the information obtained with this instrument, we have performed biographical-narrative discourse analysis techniques (Fernández Cruz, 2008; Gijón 2010). Content analysis was crucial for the interpretation of collected data: coding, categorizing, indexing tables (categories, definition, traits, etc.). Finally, we held a discussion group for Centers, the student representatives in the Department Council, Center Board and Faculty Cloister, since its open and flexible nature allowed us to centralize research in the most significant aspects. At the same time, it facilitated the participation and motivated collaboration, and the expression of their thoughts, attitudes, beliefs, etc. Which together with the quantitative data have allowed us to have a global and complete vision of the reality to be investigated. The script used in both semi-structured interviews and focus group, answers the following questions:

- What are the causes (personality, your way of being, the absence of candidates, etc.) for which you consider that your partners have chosen to you as their representatives?
- Do you think that the gender condition can be a conditioning factor to be elected or not? Who occupies, in currently, the higher charges that a student can reach as representative of the student body (the Governing Council)?

- What dimensions or qualities (being, knowing, doing) can be more decisive when voting for a representative?
- What is it that gets students involved in the "university micro politics", that is, in the representation functions?
- With what difficulties (confrontation with teachers, students, PAS) have you faced to develop these functions? How have you solved it?
- What does success in student representation depend on?
- What mechanisms do you use to "mobilize" your partners and the rest of students? ¿Do you think are there differences between mechanisms used by men and women?
- What learning gaps do you think should be improved to perform the task of excellence with excellence student?
- What have been your greatest satisfactions or disappointments as student representatives?
- How do you think that student participation in university life could be improved (economic remuneration, academic benefits, etc.)?
-

In the next section, we present a summary of the most significant data found in the instruments. The results obtained from the three sources are presented to account for the similarities found and to reinforce, in the last resort, the starting hypotheses that we handled at the beginning of this study.

Results

The results presented below have been analyzed according to the degree of participation of the student representatives. To facilitate their understanding, the sample has been divided by areas in areas of knowledge, as reflected in Figure 1:

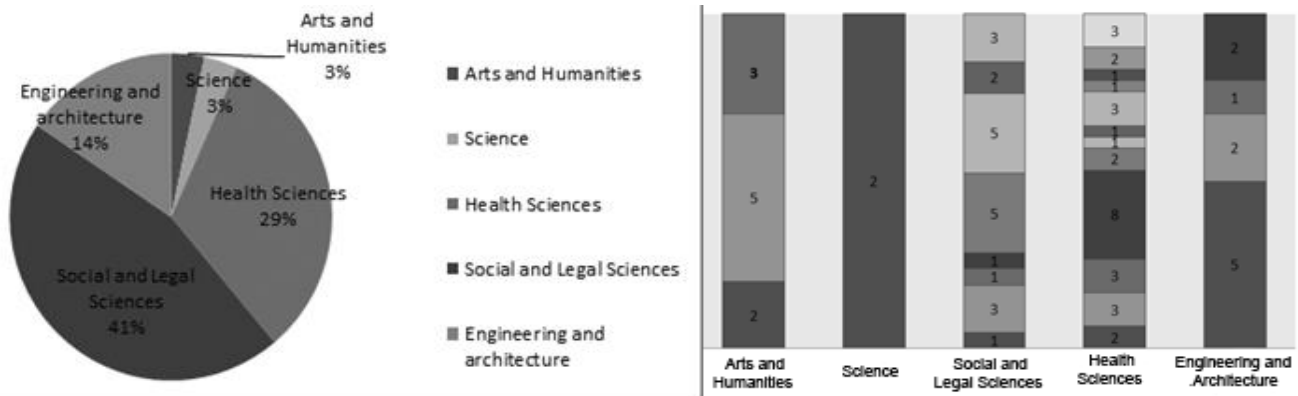

Figure 1: Student participation by knowledge and Centers of the University of Granada. Source: El Homrani (2014)

Once the sample obtained is delimited, by areas of knowledge, we will present the most significant findings. To do this, a Quartimax Analysis was performed, which resulted in five major conceptual components of university student leadership (see Table 1). Obtaining similar results, these same components have also been identified when we set out to analyze the discussion groups. Hence we decided to present the results together.

Defining Components of Student Leadership
Identification of leaders
Attributions of the leader
Leadership Expectations
Leadership Practices
Satisfaction and shortcomings

Table 1: Defining components of student leadership based on a Quartimax analysis. Source: ElHomrani (2014)

On these components will rotate the presentation of the results obtained both in the questionnaire and in the discussion groups. Thus we find that the first component of the analysis corresponds to the **"Identifying the leaders."** It contains the desirable features that a student leader must meet. According to his opinion, 'Personal values' and 'know-how' are priority characteristics that a leader must possess for all branches of knowledge, followed by the 'lack of candidates' and 'persuasiveness' of these (with scores of agreement between 3 and 3.5 on 4), as we can see in Figure 2. In turn, similar features emerge in some comments produced in the discussion groups. Some samples of this are inserted after the following graph.

Figure 2: Identification of University Student Leaders. Source: ElHomrani (2014)

In contrast to these results, we find a subject that underlines the importance of doing in a leader, along with consideration of the majority opinion in decision-making and its consequent, co-responsibility. Thus we extract the following passage: *"For my part, I think it was due to have prior involvement being representative of the class. My colleagues have seen that I have "worked", I asked their opinions and they have seen results. All this makes you earn the respect of others and popularity"* (Subject 6, E, lines 9-11).

In the case of students in the branch of science, we find that aspects such as 'intelligence', 'charisma', 'good grades', a 'strong personality' (with a 3 agreement on 4) or 'previous experience'. However, students in the rest of the branches of knowledge obtain inferior results in these traits.

On the other hand, it is observed how the lowest scores are obtained in reference to 'gender' and 'physical aspect'. However, by analyzing the discussion groups, we see how some discourses do not quite match, with the scores of the questionnaire. Thus, for example, some participants suggest that *"there are internal and external factors influencing the gender factor. There are stereotypes that condition this situation. In the government team who is in charge is a man and has been like this all his life and the second in command is a woman and probably, who is doing the work is the woman, but never valued. It is external things that influence, but we have it so assumed that we see it normal. However, in representation, the number of women is greater than that of men, but men are still more representative than women."* (Subject 3, lines 35-37 J).

Regarding the factors that motivate the choice of some leaders or other, ie, the **"powers of the leader"**, " shows that the 'need', 'trust' and 'ability' are the main reasons for choosing their Representatives/university leaders for all branches of knowledge, with very similar percentages of agreement in the answer, as we can see in Figure 3. In contrast, some of the answers obtained in the discussion groups are exposed, since according to the students :

Subject 1; A; Line 1: *There was no one who wanted to be the delegate. In my school, there is no one to get wet."*

Subject 6; E; Lines 65-68.: *I also think it's because of the popularity, though I differentiate various types. The first, the initial, is when no one knows you. It is based on the grace that you have, the physical attractiveness, the one that you go to class, ... but that does not reflect in fact if you are apt or not for the position. The other is acquired popularity, which occurs when you have already been involved, you do things, you convey your concerns to the other government bodies ... Now people know you for "this is the one who made such."*

Figure 3: Attributions and Beliefs about Election Leaders / University Student Representatives. Source: ElHomrani (2014)

The lowest scores in agreement on the response are obtained in 'escudo' (leaders/representatives act as 'protectors' in situations of conflict within the institution, department or with teachers mainly) and 'gender' again (with 1, 5 according to the answer on 4). The branch of Arts and Humanities also emphasizes the desire to 'improve the conditions' of students (with a 3.5 in agreement on the statement on 4); The desire to 'change things' and 'avoid conflicts with teachers', repeating the 'lack of candidates'.

Regarding the **"Expectations about leadership"** and the reasons behind the choices of students, we find unanimity in all areas of knowledge. They all advocate the importance of being 'Communicator between the institution and the students'; To be a 'good mediator in conflicts' and 'to defend the students of arbitrariness' (with percentages of agreement in the answer above 3) as we can see in Figure 4.

Figure 4: Expectations About the Functions of Leaders / University Student Representatives. Source: El Homrani (2014)

Significant is the branch of science, which scores with 1.5 in agreement on the answer on 4 to 'collaborate with the teacher in the preparation of the training' and that the representatives fulfill a function of 'agenda of activities'; Also aspects such as 'informing what happened' or 'ensuring academic interests' do not seem

to be a priority for this student among the functions that must be fulfilled by their representatives as opposed to the data obtained in the other branches of knowledge. For the area of Engineering and Architecture, the aspect punctuated with a lesser degree of agreement is what to make reference to 'improving the relationship between teachers and students' with a 3 out of 4. In this respect we find different answers:

Subject 2, JM; Lines 124-129): *"Since I finished high school and while in college I spent four years doing nothing of this. What prompted me to re-enter was that there was a lack of information, to see how the Bologna Plan was applied and that I did not agree at all. I was talking to all the teachers and we had many discussions in which nothing was solved. I did not even know that there was student participation and saw that nobody did anything".*

Compared with the fourth component, **"Leadership Practice"**, we see that their Higher scores, respond to 'ethical coherence, honesty, and values' on the part of university student leaders/representatives and the 'learning of representation functions through practice'. Specifically, the highest valuation is found in the branch of Arts and Humanities (with 3.7 in agreement on 4), followed by the branch of Sciences, Engineering and Architecture, Social and Legal Sciences and, lastly, the students of Health Sciences. Other aspects that score significantly high are 'the exhaustive knowledge of the university institution' and the idea that 'is not born university leader but learned to be' (with response rates around 3 out of 4).

However, more controversial aspects such as the 'partisan use of office'; 'Difficulties or facilities in subjects' or 'personal injuries' score with a scant 2 out of 4. On the basis of the results, it seems that the representatives themselves do not reach a consensus on these consequences of exercising their different positions. Proof of this is the opinion of this man, who says: *"It is true that being a student representative opens doors, teaches you to move, to better understand the institution."* (Subject 5, D Line 130). However, no evidence has been found to indicate that these advantages are reflected at the academic level.

In terms of the lowest scores, as it is observed in the graph 5, the item of 'advantages in grades' stands out (with a mean of over 4 disagreements). By branches of knowledge, Sciences does not believe that the charge involves a possible scholarship (with a 1.5 disagreement with this statement); Health Sciences emphasizes in this sense the one that supposes 'advantages in the qualifications' (with 1.62 of disagreement on 4); And Social and Legal Sciences does not believe that a 'use of the position for the interests of other groups' is made (with a disagreement of 1.7 on 4).

Figure 5: Leadership Practice by University Student Representatives. Source: ElHomrani (2014)

Finally, the last component analysis, "**Satisfaction and shortcomings**", we highlight some consensus on the claim that the performance of leading students has positive effects on students. In this sense, items such as 'reinforcing self-concept and self-esteem' by student leaders or students representatives of the branch of science receive a score of 4 (out of 4); Followed by 'tolerating opposing points of view' and 'learning to listen' by the Arts and Humanities branch (3.6 and 3.5 out of 4 respectively). In the same trend, although with slightly lower scores, are student representatives from the branch of Social and Legal Sciences, followed by Health Sciences, on these issues.

A controversial finding is played by the items of 'facing new challenges' and the need to 'reward academically'. While the students of the Engineering and Architecture branch score it positively (with a 3.4 out of 4 response), the rest of the branches of knowledge show great disagreement (with response rates between 1 and 2.5 according to 4).

However, all of them consider that representation should be exercised in a coherent and ethical way in which work done well on an external reward that could lead students to present themselves to these positions for academic or economic interests, not service and commitment.

The lowest scores obtained in this component correspond to the 'percentage of representatives', with scores between 1 and 2 over 4 (see graph 6). This unanimity is based on the belief that student representation is insufficient, demanding a greater number of representatives, in order to reach a certain balance between the different agents of the university population.

Figure 6: Satisfaction and Lack of Student University Representatives. Source: El Homrani (2014)

CONCLUSIONS

This research has tried to answer many of the questions that accompany the figure of the student representatives as university leaders. In the same, it has been tried to establish differences between the opinions of the university representatives, subscribed to different faculties and areas of knowledge. However, based on the results, we found a convergence in most of the responses. Except for exceptions such as the "advantages of being a leader", most respondents have a similar idea about the implications, functions, duties, and compensation of being a student representative.

A collation of the results obtained in our context (University of Granada, Spain), university student leadership is outlined around a two-fold. On the one hand, the practicality of representatives who know how to carry out their tasks and possess qualities such as intelligence, charisma, persuasiveness or a strong personality; And on the other hand, with ethical and personal values, so that they can be trusted. In short, an ethical leadership.

The desire to change things is present in the election of these people as leaders within the various positions of representation of governing bodies of higher education by the students themselves. However, with reference to data analysis, we believe that collaboration between teachers and students should be strengthened, as well as the relationships between students for a better functioning and organizational climate in the different representation and government bodies.

On the other hand, participation and satisfaction respect the position they have is not very high. In this regard, we believe it is necessary to promote opportunities for training on the various aspects that make up the micro and organization at universities; and continue to set different types of recognition.

Similar investigations had contributed to making visible good practices and possibilities of action of the student's as great protagonists of the university institutions. Promoting and building participatory channels and platforms, with spaces where they are given voice, is the best way to improve the quality of universities, from the institutions that become the protagonists of their own development.

The aim of this study is to analyse the underlying constraints affecting the choice of Building as a major course. The objectives of the paper are to assess the awareness of students on Building as a course in the institution, identify the percentage of students willing to study Building as compared to other related courses, identify constraints of students who chose Building. Secondary and primary data were obtained. Data was obtained by the administration of questionnaire, and interviews of students studying building technology in Covenant University. A sample size of 150 students comprising of students from the 5 levels of the programme partook of the survey. Purposeful sampling technique was used and the data obtained was analyzed using a 5-point Likert scale.. The factors affecting the choice of building in varying degrees include Poor awareness of the course, Inappropriate advice, Method of teaching, Demands of the course, Gender differences, Tuition fees, Basic Technological skills, Learning Environment, Method of teaching, Prospects for students in studying the course. However, majority of the students' constraint was lack of awareness about the course; therefore it is recommended that proper awareness of Building Technology as a profession should be done via workshops and seminars in secondary schools so as to broaden the view of students about the course even before entering into the higher institution. . Building technology skills acquisition is declining in many institutions in the country, therefore it requires serious attention at national level. The National Institute of building (NIOB), Council of registered builders of Nigeria (CORBON) that have been tasked with a detailed assessment of the construction / building skills shortage should address these inadequacies.

Key words: Building Technology, Course, Institution, Profession, University

INTRODUCTION

A Building can be defined simply as permanent or temporary structure enclosed within exterior walls and a roof, and including all attached apparatus, equipment, and fixtures that cannot be removed without cutting into ceiling, floors, or walls. Building can be defined as the process or business of constructing something the process of constructing, shaping, developing, or forming a particular thing (Businessdictionary). Building development in Nigeria has a long history going back to the pioneer period where arranging training in the nation is moderately recent. The provincial government for case authorized the Town Improvement Ordinance in 1863 and built up the Lagos Executive Development Board (LEDB) taking after the episode of bubonic plague in Lagos somewhere around 1925 and 1928 (Abiodun, 1985). The Board was built up amid this period to clear the ghetto zones influenced by the sickness and to

build up lodging units in Lagos. Then again, the greater part of the arrangement creators and system implementers comprised chiefly of common hirelings.

The number of students enrolling for building courses at universities has decreased substantially. The resulting reduction in the number of new graduates, along with the current and projected shortages of skilled professionals in almost all building fields, has been noted with alarm, not only by academics at universities, but by officials in various state bodies in many countries of the world. The impact of lower student numbers has resulted in some universities reducing the number of academic teaching and research positions in building departments, and even in a few cases, the closure of such departments. With such a large number of higher organizations of adapting now offering mixed bags of natural courses and this combined with the opposition in the building business, this study is set to explore the level of enthusiasm for Building Technology in students of covenant university.

The aim of this research is identifying constraints affecting the choice of building as a major with Covenant University as a case study. The objectives are given below:

- To assess the awareness of students on Building as a course in the institution
- To identify the percentage of students willing to study Building as compared to other courses relating to construction
- To identify the constraints of students who chose Building

Identifying factors which influence career choice, and the differences in the factors influencing different groups of students, will assist us in identifying underlying causes for low student enrollment. This will also allow us to make recommendations regarding how recruitment and advisory resources can be used more effectively and how campaigns can be focused appropriately in order to attract students. This study would help us realize how many building technology candidates are finding fulfilment in the course of study and how it can be improved. The various aspects considered for improvement can promote the willingness of students to study the course and the ways to reduce or totally eliminate these constraints on the long run.

2.0 RELATED STUDIES

Career selection is one of many important choices a person will make in determining future plans. This decision will impact them throughout their lives. The essence of who the student is will revolve around what the student wants to do with their life-long work. It then follows that how the student perceives their environment, personality, and opportunity also will determine the career choices students make. The decision-making processes of students at the entry point to higher education have been the focus of several research projects. Studies conducted since the early 1990s have examined intrinsic motivations such as interest in an area of knowledge and related career opportunities (Sugahara, Boland, & Cilloni, 2008), as well as the more general reasons for attending a particular university: for example, reputation, campus environment, academic programs and services (James, 2001; Elsworth et al., 1998).

Some studies have been carried out on factors influencing students' choices of careers. In their study on the retail career choice, Soyeon and Goldberry (undated) identified three broad factors namely: intrinsic, extrinsic and lifestyle. The intrinsic factors include the nature of the job itself, enjoyment of the job as a whole, variety of jobs, intellectual stimulation, pleasant work environment and fit of job to personality. The extrinsic factors identified by the authors are salary, benefits, job security/stability and prestige of career field while lifestyle factors include flexibility of working hours, ability to manage home/family, time for leisure and preferred geographical location. In another study by the College of Occupational Therapists (2000), awareness was found to be a major factor in career choice. The study showed that around a third of the students made the decision to become occupational therapists while studying in years 12 and 13 (16%) or after taking A level/higher (15%). Only 5 percent made the decision before GCE/Scottish equivalent level. The study identified the respondents' friends and family (40%) as the most influential source of career advice. University prospectus, school career staff, college careers' pack and local career services are other sources.

3.0 METHODOLOGY

This research is based on the case study which is Covenant University. Field data was obtained by the administration of questionnaire, and interviews of students studying building technology in Covenant University. The population of Building Technology students from 100 to 500l studying building technology in Covenant University was a total of 283. A sample size of 150 students comprising of students from the 5 levels of the programme partook of the survey. Purposeful sampling technique was used. The data was analyzed using tables and a 5-point Likert scale.

4.0 ANALYSIS OF DATA

The survey was carried out on the Building technology students in Covenant University. The total population of students that participated was One hundred and fifty (150) in number. The males that participated were 102 in number while females were 48. The population was a total of 283 students while 30 students per each level of 100 to 500level was the sample size.

Analysis of data was done using the Likert scale. The scores were obtained by assigning weights to the 5 – point Likert scale, that is, from strongly Agree = 5 points to Strongly Disagree = 1 point, then summing the scores for each item and them dividing by the number of respondents to each item. The mean score was then grouped as follows to arrive at consensus opinion about each item: Strongly agree= 5.0-4.50, Agree =4.49-3.0, Neutral= 2.99-2.50, Disagree= 2.49-1.5 strongly Agree=1.49-1.0.

4.1 BACKGROUND OF STUDENTS

The students that participated in this research are all Building technology students from all levels.

Table 1: Students' Background.

Variable	Characteristics	Percentage
Sex	Male	68%
	Female	32%
Was Covenant University your choice?	Yes	82%
	No	18%
Did you know about Building Technology as a course?	Yes	24%
	No	76%
Was Building Technology your first choice?	Yes	28%
	No	72%
Do you like the course Building Technology?	Yes	94%
	No	6%
Would you chose building technology over again if you had the chance?	Yes	70%
	No	30%

From the questionnaire survey carried out, majority of the respondents were male because they are in majority in all the classes. That notwithstanding the researched showed that 56% of the students that took part of the survey were not aware of Building as a course of study and 72% claimed it wasn't there first choice of study. Despite the lack of awareness of the course of study most still found it interesting, 94% of the respondents attested to the fact that they presently like and enjoy the course and major reason given for that was the lucrative nature of the course and practical nature as well. 70% of the respondents said they would choose building Technology as a course of study again, should they have to do it over. On whether the students chose Building technology as a course, 28% claimed Yes and while 72% said no, mainly because there was no awareness of building as a course.

4.2 STUDENT'S ATTITUDE TOWARDS BUILDING PROFESSION

Table 2: Student's Attitude towards Building Profession

S/N	PERCEPTION OF BUILDING TECHNOLOGY	Strongly Agree (%)	Agree (%)	Neutral (%)	Disagree (%)	Strongly disagree (%)		Implication (Using the highest %)
1	Building technology is a good course	70	24	6	0	0	4.64	Agreed
2	Building technology is a tedious course	38	40	16	6	0	4.10	Agreed
3	Building Technology is a lucrative course	34	58	8	8	0	4.26	Agreed
4	There are many successful builders out there	24	38	30	4	0	3.78	Agreed
	ABOUT LEARNING AND PRACTICE							
5	I understand building technology concepts	38	48	8	0	6	4.12	Agreed
6	The lecturers of the course are knowledgeable	36	46	14	4	0	4.04	Agreed
7	The learning environment is conducive for learning	28	32	22	14	4	3.56	Agreed
8	Practicing building is what I will do after the university level	14	28	34	20	4	3.28	Agreed
9	Other professionals have better advantage of being established than a builder	4	10	28	36	11	2.5	Neutral

Source: Authors' Field Work (2016)

Table 2, shows that in spite of the fact that majority of the students were either forced into the discipline or entered into the discipline as the last resort, about 42% of them saw their future prospects as bright and promising. Only 4% of the students claimed not to find the course interesting while 34% were unsure.

High salaries are considered important therefore “good money/benefits” was noted as being important almost seven times more often than any other factor. It was also found that high salary and job security were rated most highly, and that job availability was close in importance to these top two. These are similar to findings for accounting students. Myburgh (2005) carried out a study amongst students in a various universities and found that availability of jobs, followed by job security, were top in importance.

Majority of the students, 36% of the respondents to be precise, disagreed to the fact that other professionals have a better chance of being established, while overall outcome being a neutral stand point. This a pointer to the fact that although they believe in the good of the course, there is an idea that it may not be as profitable as earlier anticipated.

4.3 CONSTRAINTS AFFECTING STUDENTS' CHOICE OF STUDYING BUILDING

There are several constraints as described through oral interview which accompanied the questionnaire distribution that affect the choice of students studying building technology, ranging from

- Poor awareness of the course
- Advice
- Method of teaching
- Demands of the course
- Gender differences
- Tuition fees
- Basic Technological skills
- Learning Environment
- Method of teaching
- Prospects for students in studying the course

- **Poor awareness of the course**

The survey showed that students who left the secondary level as at 2012/ 2013 and presently in 400 to 500 level of the course (building technology) were not properly informed about the course before formal contact with the university itself. The lack of awareness made them to initially dislike the course as there was a feeling of studying a subordinate course as compared to others.

- **Advice**

Advice emanating from parental quarters contributed greatly to the decision of studying Building Technology as a course. Only a few students had advice from a professional's stand point which engendered a bit of interest in the subject itself.

- **Demands of the course**

The false idea in the minds of students who were poorly informed about the course was that it is a very tedious course, which was hard to comprehend due to the different aspects of it. They felt it would take so much out of them. So many did not choose the course for this reason,

- **Gender differences**

Generally, the construction industry is a male dominated environment, basically due to the heavy lifting and the necessity of being up and doing at all times. The terrain, location and duration of projects undertaken are significant factors as the female students are concerned.

- **Tuition fees**

The tuition fees for building like engineering courses are usually the highest. For a school like Covenant University, the cost of enrolling a student for such a course in the institution placed challenges on some families and they initially considered sending their ward/children on the study for a lower priced course and this period allowed for delays in choosing building as a course of study for their ward/children.

- **Basic Technological skills**

To study Building technology the student must be well grounded in 'Technical Drawing' and must have offered and passed it at the WASSCE stage before entering the University but not all students were privileged to be exposed to this subject, that is why some did not even consider studying the course at all.

Also IT software skills in applications such as AutoCAD, AutoCAD Revit, BIM needed to be learnt at least in its basic form as it will be used during the course of study of the students, and usually they lack any knowledge about the use of these applications.

- **Learning Environment**

The learning environment matters a lot. Not all Universities have the facilities to enroll students for this course and this limits the students' choice of universities. Students surveyed did not really have much idea of the facilities put in place for the study of Building Technology in Covenant University and some testified to have been reluctant in choosing both the institution and the course of study.

- **Method of teaching**

The method of teaching involves a lot of theoretical work and face-face method. The online model perhaps would have helped in gaining more ground as regards students that are willing to learn and understand what the course was about. Students opined that sufficient visits to factories of production and manufacture of construction products have not fully been met and in fact just started in recent years. Nevertheless, town and gown seminars have been introduced in Covenant University to take care of these challenges.

- **Prospects for students in studying the course**

Several students attested to the fact that they knew nothing about Building Technology as a course and a profession as a Builder. They were given and transferred to study the course when they could not meet up the cut off mark for the initial course of study that they chose. They had not idea concerning the prospects for the course not until they fully enrolled for the programme which helps them discover how broad the Building profession was.

4.4 STUDENTS' PERCEPTION OF THE PROFESSION BASED ON INTERVIEW

The students of Building Technology that were interviewed revealed that they had not applied for building technology originally (70%), but later retired for the course. Most of them disliked the course at first, but began to enjoy it later, a considerable number are still indifferent.

When asked about lecturers' attitude and knowledge of the course 66% claimed that the lecturers were in fact knowledgeable on the course, the only problem is the poor communication skills proper. Although some students said that they believed that the lecturer liked to get at par with the students and make sure they understood concepts, which they liked. Others lamented the approaches of certain lecturers, such as leaving students to teach themselves.

When asked if they would recommend the course to others, they generally agreed and are shown by the 70% of the respondents. They however stated that Building Technology would be recommended over Civil Engineering and other related courses because of the breadth of Building Technology in relation to other courses. These are similar to findings for accounting students. Myburgh (2005) carried out a study amongst students in a various universities. It was also found that High salaries, availability of jobs, followed by job security, were top in importance.

PERCEPTIONS OF BUILDING AS CAREER

- Although solution provision and service to the public are the reasons why some of the students would like to venture into the profession, profit or finance remained the major reason why the students would like to become professionals in the industry. Some of the students are interested in the profession in other to proffer solutions to the existing methods of construction such as the use of sustainable buildings, green buildings, dry construction, prefabricated systems, and other methods of construction.
- Many of the students perceive building as a vast and versatile profession in the sense that it is a very wide profession and has a lot of areas in which one can venture into such as; building production management, building construction, project management, facility management, feasibility and viability studies, building maintenance management, building surveying, project monitoring and evaluation, and arbitration, mediation and expert witness. More

specialized jobs are also available in the building industry, such as building services like plumbing, electrical works, wood works, iron works, tiling, painting, other finishes and many other works. This availability of so many jobs in the industry provides job opportunities for lots of individuals.

- It is an interesting and essential profession as it tends to meet one of man's basic needs which is shelter. Some students enjoy the industry because it entails working on site most times, and they love the practical aspect of the job unlike white collar jobs which entails working 24/7 in offices or on computers.
- Some students appreciate the fact that the profession is very profitable and lucrative, but also acknowledge that it could be cumbersome if one is not careful, experienced, smart and has appropriate knowledge of the rules guiding the profession.
- Students also enjoy the fact that one gets to work with lots of different professionals in diverse industries. They acknowledge that the industry cannot go to the dust, which means it will continue to grow and add values to the human life.
- The profession entails innovation, and it is very dynamic. It requires hard work, good efforts and labour. It is very tasking, stressful, demanding and most times, requires long hours of work. Some students also feel that it is a boring profession; it is redundant and very political.
- They believe that the profession is revolutionary and contains the potential to lead the way in national development and growth. It is solution driven, resourceful, and renders services to the public in different areas of building.
- It is an adventurous profession, a profession that also involves dirty works
- Many of the students who have had an experience of working in the industry or with a professional believe that, although what is taught in their classrooms relates to what is done on site, there is still lots more to the profession. To summarize, students' perception of Building Technology is mixed or generally indifferent, which may indicate that students do not yet have a well grounded idea of the course.

5.0 CONCLUSION AND RECOMMENDATION

Building is an interesting and essential profession as it tends to meet one of man's basic needs which is shelter. However, majority of the students' constraint was lack of awareness about the course; therefore it is recommended that proper awareness of Building Technology as a profession should be done via workshops and seminars in secondary schools so as to broaden the view of students about the course even before entering into the higher institution. . Building technology skills acquisition is declining in many institutions in the country, therefore it requires serious attention at national level. Since the building industry is believed to be a very significant contributor, both directly and indirectly, to national economies. Several agencies, such as the National Institute of building (NIOB), Council of registered builders of Nigeria (CORBON) that have been tasked with a detailed assessment of the construction / building skills shortage and should propose initiatives to address inadequacies.

ABSTRACT

Sustainable development (SD) is a complex idea, based on environmental, economic and social dimensions. In line with SD, education for sustainable development (ESD) is an approach to teaching that combines cognitive and affective domains and aims to build empowerment abilities. The Chinese government has not only adopted sustainable development as a fundamental national policy, but it also attaches much importance to Education for Sustainable Development and tries to deliver the concept of ESD to the future generation with a call for their action. China began its curricular reform of basic education in 2000 and the awareness of sustainable development is intended to be integrated into the existing subjects. Based on the above reasons, the research objective of this paper is to analyze the expression content of sustainable development education in geography textbooks in junior middle school with the textbooks as research objects.

INTRODUCTION

At the end of the United Nations Decade of Education for Sustainable Development (2005–2014) (aka the Decade) and the beginning of the United Nations Educational, Scientific and Cultural Organization (UNESCO) Global Action Programme (GAP) on Education for Sustainable Development¹ (ESD), many nations are poised to begin scaling up ESD (UNESCO, 2014). During the Decade, ESD matured and grew. Efforts began with raising awareness, moved to capacity building, then to experimentation and finally, implementation of good practice. In effect, the Decade provided proof of concept for formal education and non-formal educational settings, including public awareness and training. Now, with the advent of the GAP, UNESCO and the ESD community are aiming towards expanding successful projects and involving more schools and institutions in ESD. In spite of widespread implementation and success of ESD, the expansion of ESD in primary and secondary education will require the ESD community to provide evidence that ESD is effective and contributes to the overall quality of education.

As ESD Ten-year Plan (2005-2014) of U.N. progressed forward, it is growingly the focus of international society for education, as the impetus, to promote sustainable development reform. Also of note is that series international conferences were held frequently during 2014-2015.

As proposed in the national education conference at Muscat, Oman on May 12 to 14, 2014, ESD was one of the seven global educational goals after 2015; in November, 2014, Global ESD Road-map was issued on the World ESD Conference at Nagoya, Japan; then in May 2015, World Education Forum was convened at Incheon, South Korea, reiterating(reiterating) the objective “to cultivate the skill, value and attitude that enables public to live a healthy and satisfied life, to make wise decisions and to cope with local and global challenges, through ESD and global citizenship education”. In May 2015, World ESD Ministerial Consulting Conference was held in Paris. Unexceptionally, all these conferences have indicated an important signal: ESD is on its way becoming a new power to stimulate educational innovation.

UK, for example, one of the first countries advocating ESD, proposed 7 key concepts related to ESD at the ESD Symposium, namely integration, citizen, descendant, diversity, life quality and equality, development and bearing capacity and change, uncertainty and prevention. These concepts constitute the conceptual framework and theoretical basis of ESD in UK. Having been emphasizing the core ability cultivation, the German “ability-oriented pattern” highlights more of students’ emotion and the ability to grasp the future.

While in America, the fundamental education attaches great importance to practice and connection with real life, and its course system is perfect with clear targets and systematic evaluation and monitoring measures, which is highly worthy to be learned worldwide.

In 2005, Australia published a report named “ESD Re-positions the Sustainable Future and Australian School” for its “core course integration mode”. Due to this report, Australian educational concept and practice have made changes toward the goals specified in the sustainable development agenda. These changes are reflected on course construction on the multidisciplinary basis, teaching strategy and improvement of students’ ability of solving problems.

Then, “government-oriented pattern” in Japan: As an island country, Japan is short of resources and thus pays more attention to protecting environment, saving resource, keeping sustainable development of economy. Therefore, Japan can be said to be a successful example in ESD field throughout the world. Under this pattern, it gradually establishes an environment education system from primary school to university, and the approach to cultivate public’s sustainable development awareness through school education has effectively promoted the sustainable development of teenagers.

Obviously, ESD has become a new research field highly emphasized globally. Based on the above reasons, education for sustainable development (ESD) is an approach to teaching that combines cognitive and affective domains and aims to build empowerment abilities. The Chinese government has not only adopted sustainable development as a fundamental national policy, but it also attaches much importance to Education for Sustainable Development and tries to deliver the concept of ESD to the future generation with a call for their action. China began its curricular reform of basic education in 2000 and the awareness of sustainable development is intended to be integrated into the existing subjects.

In this case, the research problem was set as follows.

How did ESD developed in China?

why should we choose geography textbook for junior school students?

DEVELOPMENT OF EDUCATION FOR SUSTAINABLE DEVELOPMENT IN CHINA

The notion of education for sustainable development (ESD) has resulted from increasing global awareness of the decisive potential roles that the education system could play in preparing citizens, and the younger generation, for a sustainable future. Following the official request of China's State Council in 1978, environmental protection has been a selective subject in secondary education since the 1990s, and a teachers' guideline on teaching and learning for sustainable development was published 1996 by the People's Education Press, the most authoritative textbook publisher in China.

In truth, ESD in China is evolved from environmental education. Thus, it is generally classified into the following four phases.

Phase 1: infancy (1973-1977)

Environmental education sprang up firstly in western countries in 1950s-1960s. Influenced by Stockholm conference and faced with international environmental education, the environmental protection cause began advancing in China in 1972, followed by environmental education. In the meantime, Decisions on Environment Protection and Improvement (Trial) was formulated by the State Council, which symbolized the start of Chinese environmental education officially. During this period, environmental education was extended to a narrow scope with simple style and methods, and it centered on comfortable education and had a small coverage.

Phase 2: developing (1980s-1990s)

The year from 1982 to 1992 witnessed the rapid development of China in politics, society, economy and culture. It was a period of transition when education highlighted quality-oriented education for all-round development and paid unprecedented attention to environmental education. Still, environmental education largely includes publicity education for environmental protection, and education department allied with environmental protection bureau are involved in it. Although people are aware that education for environmental protection is one of the most important means, it lacks a systematic and united theory and practice guidance as a support despite of individualized education mode on different basis. As a result, education effect is unsatisfactory.

Phase 3: primary stage of ESD based on environmental education (later period of 1990s)

After experiencing a period of stable development, the curriculum offered by environmental education at China's elementary and secondary school has formed an education style that gives priority to "penetrating" courses with independent course arrangement as complementary by the later period of 1990s. It can be seen that people have realized its interdisciplinary, penetrability and correlation to other disciplines. Thus, the penetrating ESD is carried out combined with related disciplines, which is considered as an effective strategy to propel ESD. In addition to environmental protection knowledge, ESD is also added other contents such as humane sustainable development ideas and harmonious lifestyle. When it comes to education, especially school education, active actions and surefooted environmental education are likely the direction to keep global education for environmental protection forward.

Phase 4: ESD under the guidance of scientific outlook on development (the early 20th century to present)

Views, like people foremost and continually accelerating economic, comprehensive, coordinating and sustainable development, are applied to comprehend and work out development problems. ESD, by definition, is to re-position education with sustainable development as oriented so that education can better serve for sustainable development. Under the new curriculum background, education reform and development in China should furnish teenagers and all citizens with ESD on the basis of thinking over the ways to implement student-centered quality education, vigorously impel education reform and innovation and adhere to coordinated education development.

It is stated clearly in the *Outline for Ten-year Education of China* that China should take ESD seriously. In spite of its short history in China, people have soon realized importance. Some relatively developed areas have adopted ESD in relevant disciplines of elementary and secondary schools. However currently, it is only slightly applied into some extracurricular activities of primary schools, but fewer in disciplines of middle school under the strain of secondary school entrance exam. The Beijing Municipal Education Commission also sets concrete measures for the smooth regulations for implementation, undertaking school capacity for ESD intervention, undertaking theoretical enquiries and supervision for field practice, developing resource centers and encouraging extensive cooperation, maintaining accountable quality evaluation and disseminating good practice. The schools have been encouraged to relate their ESD efforts closely to the curriculum structure and learning processes, not merely with new content but also with alternative teaching and learning approaches to involve students in developing their approaches and practical skills through thematic enquiry and problem-solving procedures. Local schools found it stimulating to involve students to examining real development issues and lifestyles and their impact on sustainable development. Teachers can consult an additional document on the concrete content in each subject in relation to ESD (Beijing Municipal Education Commission 2007). This document has laid down a framework for the integration of ESD across school education. Since its release, the document has become a key guideline for ESD implementation in China.

ANALYSIS OF CURRICULUM OBJECTIVES OF EDUCATION FOR SUSTAINABLE DEVELOPMENT IN BASIC EDUCATION CURRICULUM

In this study, the practice of sustainable development begins with recognizing issues related to sustainable development. It also means that individuals realize that each individual is the subject of future generations, and that his behavior affects the sustainability of society and the sustainability of the environment, fostering the ability to foster an integrated mindset to find ways to solve a problem, and to develop an active society to create a sustainable society. But now, we are faced with the urgent need to recast our ways of living, away from ones that rely on the unsustainable consumption of resources, the degradation of ecosystems and the exploitation of people, towards a model that strives to enhance the well-being of all human beings within the limits of our planet. While the need for sustainable development is clear, the ways to approach it may differ and will evolve. It is widely held that the development of sustainable societies is a continuous learning process and one in which issues and dilemmas are commonplace and appropriate answers and solutions may not be definitive.

Education should play an important role in enabling people to live together in ways that contribute to sustainable development. However, at present, education often contributes to unsustainable living. This can happen through a lack of opportunity for learners to question their own lifestyles and the systems and structures that promote those lifestyles. It also happens through reproducing unsustainable models and practices. The recasting of development, therefore, calls for the reorientation of education towards sustainable development.

Even as education for sustainable development (ESD) raises awareness of the complexity and dynamism of issues, it also plays a key role in making sustainable development understood and that it is applied in a concrete way. ESD helps to develop the capacity for critical reflection and systemic and futures thinking, as well as to motivate actions that promote sustainable development.

Advances in sustainable development education have started as follows in the German Government's " Sustainable Development Education " concept of sustainable development education. Sustainable development is aimed at developing the ability to support human beings in the context of global perspective and to develop economically capable environments and to actively create environmentally sound environments. As a result, the Commission recognized the ability to recognize the sustainability of the school's education as one of the goals of the school's education, and to establish the ability of students to recognize the problems of education and organizational sustainability as one of the objectives of the school's education.

While schools are supplemented increasingly by other aspects of social life, they remain essential for developing young people's understanding of the world through academic learning and the promotion of the norms and values of society. Too often, however, school education fails to create a reflective ethos and a sense of responsibility for a shared humanity and the future of our planet. There is an increasing consensus today on the need to reorient education to meet the challenges of the 21st century. Our proposal is to begin by taking the concrete step of transforming textbooks – the teaching and learning resources that are most prevalent around the world and the ones closest to students.

The recent basic education reform is also the eighth curriculum reform in China since 1949. It is an extension of the popularization of the nine-year consecutive compulsory education that was undertaken by the central government in late 1980's. The former vice-minister of education Mr. Wang Zhan (2009) argued that as the leitmotiv of this reform was to improve the quality of basic education, substantial change in 'curriculum' could be the key as well as the grip to a fundamental change in education.

In June 2001, the Program on the Reform of the Basic Education Curriculum (Experimental) was launched with a concrete curriculum agenda for the nine-year compulsory education (grade 1-9). Two years later the experimental curriculum for senior secondary education (grade 10-12) was ready. The following changes were expected to be achieved through curriculum transformation (Zhu, 2007; 教育部[MoE], 2001):

- Curriculum function: from 'knowledge transmission' to 'student's active learning within a balanced triangulation of knowledge & skills, process & methodology, and emotions & values'.
- Curriculum structure: from 'compulsory and subject-centered' to 'elective and cross-disciplinary'.
- Curriculum content: from 'complicated, obscure, antiquated and difficult text-book-based' to 'integrated, social-scientific-related, interest-experience-based and lifelong learning-oriented'.
- Learning methods: from 'individual, passive, competitive' to 'autonomous, inquiry-based, collaborative'.
- Evaluation methods: from 'sole exam-based evaluation' to 'development-oriented assessment'.
- Curriculum administration system: from 'a highly centralized, two-tiered framework' to 'a distributed, three-tiered structure'.

The curriculum reform is by its nature a step towards educational modernization that empowers students with more autonomy of their own learning. It also entails more autonomy for teachers and schools in curriculum development. Zhong (2009), a prominent scholar in curriculum and instruction, explained the rationale of the basic education reform as such, the key in education reform is the curriculum; the core of curriculum reform is classroom practice reform and the crux to classroom practice reform is teacher's professional development. Therefore, the teacher as a professional should not only be a knowledge-transmitter. He or she should be able to play the role as 'learning-stimulator' and 'education-researcher'. Students are motivated by teachers to take learning initiatives through self-directed, collaborative and inquiry-based learning.

In light of the new curriculum policy, the curriculum scheme for the nine-year consecutive compulsory education and the three-year senior secondary education were proposed subsequently. In both schemes the following aspects were addressed in response to the intended changes advocated by the new curriculum (Zhu, 2007):

- The reformed curriculum retains the basic structure of past academic courses, but removes the complicated, obscure and irrelevant elements. New dimensions, such as 'knowledge & skills', 'process & methodology' and 'emotions, attitudes and values', are introduced.
- Integrated practice activity courses are added to stimulate 'learning by doing', occupying 8% of the total school hours in compulsory education and 13% of compulsory credits in senior secondary education (indicated with the grey color in Table 1).
- Local and school-based courses take 10-16% of the curriculum space (indicated with the pink color in Table 1).
- The three-level curriculum for senior secondary education contains fields, subjects and modules, which is intended to improve the integration of the learning of different disciplines and stimulate cross-disciplinary teaching.

- The elective modules provide a spectrum of choices so that student can choose to learn what they are interested in. By doing so it is hoped to increase the individual accountability of students for what they are going to do in school.

Table 1: The new curriculum scheme for compulsory education (grade 1-9)

Grade								
1	2	3	4	5	6	7	8	9
Chinese Language & Literature								
Mathematics								
Arts (Music, Fine Arts)								
Morality & Life	Morality & Society					Ideology & Morality		
						History & Society (History, Geography)		
	Science					Science (Biology, Physics, Chemistry)		
	English					English		
	Integrated Practice Activity							
Physical Education/Sports						Sports & Health		
Local & School Courses (10-16% of school hours)								

The UNESCO Strategy for ESD aims to equip people with knowledge, skills, understanding, attitude and values compatible with sustainable development. To this end it calls specifically for the development of educators' competences in order for them to engage in ESD(UNESCO, 2007).

It is as stated in the above text. After the reformed curriculum, new dimensions, such as 'knowledge & skills', 'process & methodology' and 'emotions, attitudes and values', are introduced. This is consistent with the views proposed by UNESCO.

The education for sustainable development may be as if the green ideological trend against with vital force and energy, blazes a new way and gives a fresh viewing area on the study of the new curriculum of the elementary education territory in our country and also endowed with one kind of brand-new thinking method.

HOW TO EMBED ESD IN GEOGRAPHY TEXTBOOK OF CHINESE MIDDLE SCHOOL

Embedding is about enabling students to develop a keen understanding of academic content and to apply their knowledge and skills to problems not just in the classroom but in their communities, careers and their civic lives. There is no school subject for which ESD is not relevant. Each subject takes its own unique approaches to embedding, showing myriad ways through which it can take place.

In recent years, a number of resource materials have been developed to provide guidance on integrating ESD and related education into school curricula. Guidance materials on integrating ESD and related education into the school curriculum abound. Helpful for the approach of developing competency-based learning units is Education for the Sustainable Development Goals: Learning Objectives (UNESCO, 2017a)

Whereas calls for 21st-century skills or transversal competencies have increased in recent years (UNESCO, 2015c), competency-based learning is neither established in all national curricula nor applied equally in all subjects. Some countries focus on academic standards, while others concentrate on topics and learning objectives. Textbook

authors will have to consider different lexicons and conventions in different educational systems. It is also important to note that the specification of ESD competencies is just one of many exercises towards more effective ESD implementation. Through an embedding approach, textbook authors can support teachers in their role as learning facilitators by incorporating cues for creating such an environment. Textbooks can be an aid for teachers to implement ESD in their classrooms while teaching core academic coursework.

It is widely understood that although ESD is applicable across all school subjects, monitoring performance and evaluating assessments may differ from subject to subject, and some disciplines may be able to address ESD more directly than others. The knowledge, skills, dispositional and behavioural learning outcomes called for by ESD and related education can be embedded in the general learning outcomes of a particular school subject.

A geography that follows the vision of SD has the power to reshape places and spaces and create alternative worlds. Whether it is through appreciating the beauty of Earth, the immense power of Earth-shaping forces or the often-ingenious ways in which people create their living in different environments and circumstances, studying geography helps people to understand and appreciate how places and landscapes are formed, how people and environments interact, the consequences that arise from our everyday spatial decisions, and Earth's diverse and interconnected mosaic of cultures and societies. Geography therefore is a vital subject and resource for 21st century citizens living in a tightly interconnected world. It enables us to face questions of what it means to live sustainably in this world. Geographically educated individuals understand human relationships and their responsibilities to both the natural environment and to others. Geographical education helps people to learn how to exist harmoniously with all living species.

Geographical investigation both satisfies and nourishes curiosity. Geographical perspectives help deepen understanding of many contemporary challenges such as climate change, food security, energy choices, overexploitation of natural resources and urbanization. Teaching geography serves several vital educational goals. Building on people's own experiences, learning geography helps them to formulate questions, develop their intellectual skills and respond to issues affecting their lives. It introduces them not only to key 21st century skills but also to distinctive investigative tools such as maps, fieldwork and the use of powerful digital communication technologies such as Geographic Information Systems.

And then, Maps and graphics can be a basis for inquiry, as well as a result of it. They are powerful tools in understanding the spatial dimension of an issue as well as synthesizing and communicating complex and sometimes contradicting data. This emphasis on the visual synthesis of geography makes a key contribution to tackling the complex issues inherent in ESD.

School geography has the potential to contribute greatly to ESD through its content and pedagogical approach. To maximize geography's potential, it is important to achieve the right blend of content and pedagogy from the outset. Subject-centred and learner-centred approaches must be considered together, not as opposing poles. The examination of the ecological-social relationship and its dynamics within space can be enhanced through a pedagogy that allows learners to question, examine, discuss and have different opinions, even on geography itself. This enables geographical education to contribute to greater democracy at local and global levels and to work to achieve ecological sustainability and peace.

Then, why should we choose geography textbook for junior school students?

This is because geography for junior is closely associated with ESD. As geography is a subject exploring geographical environment and the mutual relation between human activities and geographical environment, it should be the main platform to carry out ESD in new curriculum. Given that almost all fields involved in geography such as the nature and human have a close relation to the strategic goal of sustainable development, how can ESD be realized through geography textbook in Chinese school education?

1. From the perspective of time educated

ESD can be interpreted from its goal and contents implemented in junior high school of China. It is stipulated in geography textbook Special Topic Education Syllabus that environmental education should cover 12 lesson periods.

2. From the perspective of teaching objective

As stated in Guideline for Implementing Environmental Education in Elementary and Secondary School, environmental education encourages students "to actively participate in decision making and actions supporting sustainable development, and to be a citizen with social practice ability and responsibility", and meanwhile puts forth specific training objectives from three dimensions: emotion, attitude and value; process and method;

knowledge and ability.

It can be seen from the above objectives that current ESD in primary schools has broken through the traditional concept of environmental education, and instead, it is positioned to be “an environmental education for sustainable development”.

In the new curriculum reform, the subject of geography is required to fully promote quality education; its course arrangement should lay emphasis on students integrated and lifelong development, establish new geography learning method, construct open geography course, fully make use of modern information Techno and cultivate students’ practical geography capability and inquiry awareness.

FINDINGS

In order to train teenagers to be capable of social practice and responsible, the paper analyzes how ESD content in the geography textbook is realized from three dimensions: emotion, attitude and value; process and method; knowledge and ability.

1. Emotion, attitude and value: reflected on the man-land sustainable development

Refer to the “Human’s Place of Residence--Settlement” in Chapter 4, Volume 1, Grade 7.

ESD is intended to know the thought evolution of man-land relation and various sustainable development problems our mankind faces. It comes to realize that coordinating man-land relation and taking the sustainable development path is the inevitable choice for mankind. In the course of sustainable development, it’s necessary to develop an attitude and responsibility that individual should possess for sustainable development. Abundant contents pertaining to ESD are shown in the new geography textbook of PEP edition for Grade 7&8. When preparing geography lessons, teacher should fully comprehend the ESD contents in the textbook based on the actual situation, thereby flexibly applying them into teaching practice. Although ESD cannot be accomplished simply in classroom within a short time, we have reasons to believe that students will realize its importance absolutely through geography teachers’ unremitting efforts. Also definitely, a sustainable development in population, resources and environment will become a reality in the future work and life.

2. Process and method: reflected on the sustainable development of resource

Refer to the related countries and regions in the geography textbook of Volume 2, Grade 7, Natural Resources in China in Chapter 3, Volume 1, Grade 8, and related materials in chapters of Volume 2, Grade 8. Chapters in the Volume 2, Grade 7 is an important part of regional geography. To build correct views on resource, environment and sustainable development, sustainable development should be learned deeply and extensively. This learning is aimed at understanding the classification of natural resources, and China’s position of total resources and personal average resources in the world so that students are able to take corresponding measures for protecting and saving natural resources and take actions; knowing the using status and distribution characteristics of Chinese land resource, and being capable of assessing the matching of land and water resources with the region; knowing time-space distribution features of water resources and effective measures adopted to resolve uneven distribution of water. Besides, the survey on using water helps foster students’ water-saving awareness. Refer to the “We Need Clean Air” in Chapter 3 themed Weather and Climate, Volume 1, Grade 7 for the contents of sustainable development of environment; related information listed in Chapter 3 themed Natural Resources in China, Volume 1, Grade 8.

The objectives of ESD are to understand the reflection of environmental problem and its global and regional characteristics; to recognize the essence of environmental problem and find out its main causes through analysis; to comprehend the mutual relation between environment, population and resource after exploration into environmental problem people faced and its serious consequences, thus enhancing students’ sense of crisis, urgency and duty.

3. Knowledge and ability: mainly reflected on the sustainable development of population

Refer to Section 1 Population and Race of Chapter 4 Resident and Settlement, Grade 7; “Continent with Largest Population” in the Section 2 Cultural Environment of Chapter 6 themed The Continent We Live--Asia; Section 2 Large Population of Chapter 1 themed Know China from the World, Grade 8; “Abundant Resources and Uneven Per Capita”, etc., in Section 1 named Abundant Total Natural Resources and Uneven Per Capita, Chapter 3 China’s Natural Resources.

The goal of ESD is to enable students to have a understanding on different races in the world, population growth, distribution characteristics and population problems. By studying the heavy pressure of resource and environment caused by large Asian population, students are capable of realizing that to solve problems resulted from fast population growth, it’s imperative for mankind to control themselves and implement birth control, making

population growth adaptable to social and economic progress, and coordinated with environment and resources. Furthermore, through ESD, students are expected to grasp the total population of China and its status globally, to master general population distribution and population growth tendency, to comprehend population policy and the impact of sustainable development of population on resource, environment and social economy.

CONCLUSIONS

ESD is involved in geography textbook for junior high school students. Included on the contents are sustainable development reflected on man-land relation, resources and population. It is intended to train students to be capable of practice and responsible from three aspects: emotion, attitude and value; process and method; knowledge and ability. Yet, it is simply imparting knowledge, making it hard to remember profoundly. In the China's Century Agenda issued by the State Council, we are easy to find that geography education should also be covered in extracurricular activity in addition to classroom teaching, considering from the fields and requirements for teenagers to participate in national and regional sustainable development. As well as involving ESD in geography textbook for junior high school, extracurricular activity should also be a crucial part in open geography teaching mode. The objectives to foster a sustainable development awareness for junior high school students cannot be achieved only relying on classroom teaching. Instead, it should combine classroom teaching with extracurricular activity so that students can master basic knowledge, improve their awareness, and have correct behavior of sustainable development. In this way, the objectives of ESD are ultimately fulfilled.

ABSTRACT

In recent years the rapid development of MOOC has formed a new trend for e-learning. The teaching design of course is always been the greatest factor influencing the learners when using MOOC course contents. This research focuses on analyzing the existing foreign contents analysis of MOOCs teaching design checklist. We have analyzed the influences of various aspects in the checklist on the course development of MOOCs teaching design. The results show that the aspect of information gets a lower score, while the structure and design acquire higher scores which are the critical for course content development. Thus, when teachers design course content, the course structure and course content planning will be the essences of course teaching design

INTRODUCTION

In October, 2011, professor of the University of Stanford makes the "Introduction to Artificial Intelligence" course open to public on the Internet, which attracts tens of thousands of people to register online; at the same year, the same professor also make his own courses open to public on the Internet, which also attract tens of thousands of people to register and have access to online courses. In 2012, the three online learning companies Udacity, Coursera and edX was set up by Sebastian Thrun, Andrew Ng / MIT and Harvard, and the courses established by the three online learning companies have the characteristic of large-scale, open and online, thus they are collectively referred to as "large-scale open online courses" (Massive Open Online Courses, abbreviated as MOOC (Liu Yifu, 2013))

The main spirit of MOOCs is the "learning from everywhere", which learner use online learning find their own professional knowledge by diverse learning methods, and design their own way of individual learning by the multiple way of leaning and curriculum. In the teaching design program of MOOCs, the course is an unit system, with each unit lasts 5 to 15 minutes, while online discussion, collaborative learning, online practice, real-time feedback and online simulation are available so that the learners can learn through these diverse methods. The spirit and theme of MOOCs curriculum are unlike other traditional courses or online courses: MOOCs not only enhance the interaction between learners and their co-learners, but also increase communication with the teachers through diverse courses, curriculum planning, design and teaching strategies. By discussion, communication and coordination, the learners can have a good interaction between their co-learners; the teachers can understand the learning results of the learners according to the real-time feedback and online quiz, etc. Currently the development of the global open course is mainly based on the MIT Open Course, starting from 2002. The course of MIT has reached more than 2150 by 2013, and has attracted more than 1.25 million views from around the world (MIT OCW, 2013). The high education sector includes South Korea University, Tokyo University of Technology in Japan have also began to plan the open curriculum.

Teaching design program of MOOCs corporate the application of digital multimedia and the diversified design, and cultivates the ability of the learner's professionalism and self-learning. Through the function of the network platform and the concept of online learning, it is able to explore whether learners can effectively achieve learning independently. This study will conduct the content analysis at the existing MOOCs teaching design checklist at home and abroad to study the important facet of its teaching design. The purpose of the study is to review and discuss the important facet of the MOOCs teaching design checklist by the existing teaching design checklist abroad.

Literature Review

MOOC (Massive Open Online Courses)

Bryan Alexander & Dave Cormier (2008) had proposed the term MOOC, which contains the open mind, socialization and online leaning. Daniel (2012) MOOCs is a large-scale open online course, which is a teaching model combining teaching technology and diverse teaching design, to cultivate the professional ability and the self-learning ability. Thus the interaction can be more interactive between the teachers/the learners, and within the learners than the traditional one way information delivery by teachers; the interaction with the peers by the internet resources is also encouraged.

Sebastian Thrun, a professor at Stanford University in the United States, makes his own course open to public on the internet, attracting 16 million people around the world to enroll. In addition, Andrew Ng (Professor Wu Enda) also made the course open on the internet, which also attracted about one hundred thousand registered from around the world. They set up the online learning companies Udacity & Coursera in 2012, respectively; MIT and Harvard University also set up Edx online courses collectively. Until now, MOOCs had been designed, planned and taught by professional professors based on the US higher education courses (Liu Yifu, 2013).

Siemens (2005) proposed that today's MOOCs can be divided into cMOOCs and xMOOCs. The xMOOCs are more stringent and systematic in their curriculum design; the designers arrange the curriculum design and portion in a systematic way, and they point out the learning objectives and teaching outline clearly so that the learners can achieve learning objectives in a systematic way. cMOOCs designed the curriculum based on the relevance; the learning objectives depend on the learning, and the learning is from the perspective of the learner, which produces different learning results and learning outcomes (Jin Jing, Feng Rui, 2009). MOOCs provide a diverse learning environment for learners to interact with each other, and to improve the outcome and the independent learning of the learners through diverse content of teaching design.

Teaching Design

The curriculum was planned according to the teaching design instead of teaching arbitrarily. In the curriculum, teaching design is a very important part, it is a systemized process which transforms the rules of learning and teaching into teaching materials, teaching activities and curriculum content; if there is no perfect plan and arrangement, it will continue to amend itself and affect the learning outcomes of the learners. A complete teaching design should include four elements: learning object, learning goal, learning method and learning assessment (Smith & Ragan, 2005).

Gagne '(1988) proposed that the teaching design is a systemized way of arranging teaching, the systematization is the most effective arrangement of teaching resources and curriculum process. Any organization and institution can be included in the teaching, as long as it is to develop one's potential. Systematic teaching design includes: analysis, design, development, implementation and evaluation (ADDIE) (Molenda, 2003).

Each stage of ADDIE has its own task and result, sorted as follows:

Analysis: The process of analyzing teaching content, including the analysis of needs, learner analysis, teaching content analysis. It is mainly to determine the curriculum goal and content.

Design: The process of developing curriculum content activities, including the writing of teaching strategies, curriculum assessment. It is mainly to develop appropriate teaching activities.

Development: The process of producing curriculum, including the establishment of curriculum rules and teaching materials, etc.

Implementation: The teaching strategies, activities and assessment used in the curriculum design.

Evaluation: The formative assessment and conclusive assessment to determine whether the teaching results have achieved the desired result.

The effective development of the curriculum relies on the profession of the teachers. Based on the effective teaching design to stabilize the course, the teaching design of the course determines whether the course content is good or bad, it also affects the learning outcomes and learning motivation. This study will compare and analyze whether current MOOCs teaching design checklist at home or abroad contains the principles of the important facets based on the summarized principles of teaching design in this section.

Literature of MOOCs teaching checklist

The MOOCs is developing rapidly nowadays. Recently, MOOCs are a new teaching trend and indicator in this rapid development stage. Because of the rapid development of MOOCs, the teaching design and techniques of MOOCs are the key points the teachers and the designers need to re-consider. The teaching design of MOOCs will be summarized by the following three articles. The articles are as below, and the reasons for choosing these three articles are also explained.

How to Mooc? – A pedagogical guideline for practitioners

This article is the teaching instruction for the participants. The content of this article describes the effects of current development in this digital technology era on the digital teaching design, and the type and architecture of xMOOCs on the important aspects of MOOCs teaching design. Besides, the author mentioned the checklist aspects such as core requirements, structure, participant needs, tasks, media design, communication and resources. Thus this article was chosen as one important point.

Creating MOOC Guideline Base on Best Practices

This article is the basis for the MOOC instruction. The article analyzes the six platform: edX, Udemy, Coursera, FutureLearn, Udacity, Iversity, analyzes the content of curriculum on these six platforms, analyzes its structure, the ease of use of the mobility, task, the possibility of downloading, accepting analysis. In addition to analyzing the structure aspects, the article also compares and analyzes the problems, files and hyperlinks in the content of the curriculum. this article was chosen as one important point.

edX MOOC Development Checklist

This article is a checklist for edX development, the content of which is the requirements that the edX requires the teacher to fulfill when they are developing their curriculum regarding the curriculum content in teaching design. It includes curriculum announcements, introduction, structure, teaching materials, assessment, curriculum management and learner participation. Thus this article was chosen as one important point.

These three articles mentioned, the online large-scale courses become the largest academic trends in the recent academic community. Many Learners are attracted and improve their capability. MOOC can divided into xMOOC and cMOOC. A typical xMOOC design should include the following elements: Course structure, learning objectives, video lectures (recordings or new products), the extra learning content according to the video lectures, the possibility of heterogeneous communication (such as forums), self-assessment according to video lectures, completion of the course to obtain a certificate, information system, etc.

The Coordinating Service Center (CSC) of Northwestern University of the United States proposed a general guideline for the establishment of a online large-scale course (MOOCs). The usual course structure is to keep more students as possible as they can, while MOOC aims at teaching as much as possible in a short period of time. For this purpose, CSC suggested the curriculum duration to be about 8 weeks, and allow the MOOC curriculum to be variable. However, in the Northwestern University, there is MOOC course lasting between 6 and 12 weeks. The 8 weeks MOOC course content is no longer deemed as a burden for the learners. The average course time for the Coursera MOOCs provided recently is 8.7 weeks. CSC made a few suggestions: Each week MOOC applies single theme or single lesson to specify the learning achievement.

The content of the course materials can at all time be used and applied by the learner around the world, and will not be limited by time, place or space. Each MOOC course must be qualified by quality assurance and rigorous teaching design process Communicate clearly and specifically with learners, establish a course content that the learners are expecting. If the confusion occurs during the course of study, the learner will leave the learning environment. Forums and discussion areas can improve the content of the course and the communication and connection between the teachers and learners, the teaching materials can also be delivered.

Therefore, we will use the literature summarized as above to analyze the content, and to conclude the important aspects of the teaching design mentioned in the 3 articles, and to investigate the affects of these important aspects on the designer and the learners.

Method

The study adopts content analysis, and it is an objective, systematic and quantized description towards the content of human communication (Berelson, 1954). Cartwright (1953) argued content analysis and coding could be applied to each other because they both described sign behavior in an objective, systematic and quantized approach.

Content analysis can classify the relevant research data collected by researchers, and it is usually conducted by sampling, such as random sampling. In the past, content analysis was often used in the relevant areas of journalism or mass communication where social phenomenon was explored and researched through content analysis.

Consequently, the study will use content analysis to explore and research the relevant literatures and discuss the important relevant dimensions on MOOCs instructional design.

FINDINGS

After the research of content analysis, the researcher summarizes and concludes three relevant literatures of How to Mooc?- A pedagogical guideline for practitioners(1), Creating MOOC Guideline Base on Best Practices(2), and edX MOOC Development Checklist(3). Seven important dimension results are summarized through the dimensions on the instructional design checklists mentioned in the three articles. The results are as following:

Table1: MOOCs Instructional Design Check List

	(1)	(2)	(3)
1. Core demand			
Participants' attendance	✓	✓	
Select team member (such as TA, video producer, researcher...)			
Select proper course language	✓	✓	✓
Select suitable platform	✓		✓
Select proper tool	✓	✓	✓
Distinguish heterogeneous audience	✓		
2. Participant demand			
Course announcement (time, notice, welcome speech)	✓	✓	✓
Course objective each week	✓	✓	✓
Certificate demand	✓	✓	
Peer evaluation	✓	✓	
Provide feedback	✓		✓
3. Structure			
Course content differentiation	✓	✓	✓
Establish course objective	✓	✓	✓
Establish task	✓		✓
Establish test	✓		✓
Provide learning tool	✓	✓	✓
Test all of the learning activities, tasks and tests	✓		
4. Design			
Select media according to the course content	✓	✓	✓
Design task strategy	✓		
Design question pattern	✓		✓
Insert questions on the video	✓		✓

Establish discussion topic	✓	✓	
5. Task			
Define task according to different learning demands	✓	✓	✓
Pay attention on gender-sensitive vocabulary on the task	✓		
Define task in a clear and understandable approach	✓		✓
6. Communication			
Establish communication channel (such as forum)	✓	✓	
Encourage participants to own their own open space (such as WIKI)	✓	✓	✓
Announce relevant course information on the platform		✓	✓
Contact participants by E-mail		✓	✓
7. Resource delivery			
Devote more time to set up multimedia content and improve course quality	✓		
Ask participants to provide course feedback	✓	✓	
Use additional time to check the content of coursework and reply the demand from participants	✓		
Put videos on the internet for participants to download		✓	
Upload teaching materials onto the platform, including examination question database, articles, links and feedback		✓	

Dimensions include core demand, participant demand, structure, design, task, communication, and resource delivery; seven items in total. Among them, the two dimensions of “structure” and “design” scored the highest, followed by “core demand” and “participant demand”, and then “communication”, “task”, and “resource delivery”.

In the dimension of structure, distinguish course content, establish course objective, establish task and test, and provide learning tool scored the most because the most important learning experience during the learning process for participants are the differentiation of the objective and the establishment of the course task for course structure. In the dimension of design, select media according to course content, design task strategy, design question pattern, and design discussion topic are the most important parts because the application of media, topic and task of course discussion, and questions are closely related to the course content. Applying suitable and proper media and discussion topic helps learners get into the learning situation faster during the learning process. Tasks and questions that comply with course content guide learners familiar and master with course content during learning process and through after-class practices.

CONCLUSIONS

The two dimensions of “structure” and “design” are found with the highest scores during the research process because structure and design are the core elements for course design. Select suitable media to match different course topic while classify the topic into clear and understandable unit and select proper discussion topics and questions according to course content to provide learner for discussion and practice during the course or after class enhance learners’ impression towards course content as well as help learners getting more familiar with the knowledge learnt from the course.

Gange' (1988) addressed instructional design was the teaching process arranged in a systematic approach, and its process was to make favorable arrangement for teaching. Systematic instruction includes five stages- analysis, design, development, implementation, and evaluation, and the five stages all have their own task and result. Structure and design are included in the design of ADDIE. During the process of design, teaching strategy, teaching objective, course regulation, teaching material, learning tool, media, task and assessment formulation, and discussion topic establishment need to be set up. These design items are very important for the course design. Teachers must consider these details during the design process in order to avoid problems appearing during development and implementation stages; the continuous revision needed will affect the learning effectiveness of learners' (Seel & Glasgow, 1990).

ADDIE proposed by Molenda (2003) included the analysis of learners and teaching content, and we can see from the checklist that the dimensions of core demand and participant demand scored the second highest. The purpose of the demand analysis is to confirm the course objective and content, select proper media and tool, understand participant demand such as analysis of certificate demand. It helps teachers to understand how to design and develop the course content better before designing the course.

We can see that the five stages of analysis, design, development, implementation, and evaluation are very important during the model of instructional design. Instructional design is to use a planned systematic approach to achieve a more smooth and target-oriented teaching. A comprehensive instructional design will enhance learners' learning effectiveness and motivation.

We found the dimension of "evaluation" is not listed on the checklist during the process of research analysis. According to the outcome of the analysis, teachers use task to replace evaluation because the task in the course can also develop the outcome of learners' learning effectiveness. According to the theory of instructional design proposed by scholars of Seel & Glasgow, Gange', and Molenda, it is an absolutely necessary dimension on the checklist. If the dimension of task is to be used to replace the dimension of evaluation, the detailed descriptions for task must be stated clearly so that teachers could evaluate learners' learning effectiveness and course content through them.

Another reason is the insufficient evidence of literature review. Due to the time restraint, only three articles are used for summary, conclusion and analysis. The dimension of evaluation is not found out probably because of the fewer articles used.

Therefore, it is suggested instructional design theory should be used when designing the course content as well as applying the structure of ADDIE for instructional design of the course. Checklist should be used to review whether the course content meets the detailed requirement of each dimension and effective evaluation method must be set up, such as learning sheet of each topic and after-class questionnaire in order to understand the suggestions and opinions from learners through the feedback after the completion of each topic. After the end of all courses, a general comment should be made and all the data should be integrated to form the database of the course. Whether the course is useful for learners and whether learners' learning effective improved can be understood through the course evaluation.

Furthermore, the content of checklist could meet the demand of instructional design more closely by referencing other relevant literatures and adding the dimensions on the checklist.

ABSTRACT

Taking into account the Science, Technology, Engineering, Mathematics (STEM) integration, it is important to investigate teachers' understandings, perceptions about STEM and how STEM practices should be incorporated into the classroom in order to explore the perceptions of science teachers on this subject and provide important information to teachers and researchers in connection with how STEM applications can be applied at high quality. The purpose of this study is to analyze the views of the science teachers about in-class integration of stem applications. 5 science teachers working in the province of Denizli participated in the study. The teachers received STEM training for 5 days in 2015-2016 school year. The training provides instructional strategies to assist Science Teachers in the implementation of STEM integration in the classroom environments and in the development of an understanding of the connection between the various STEM domains. All five teachers in this study have participated in the training given. A case study was conducted to describe the teachers' views on STEM integration and the situations related to the in-class practices on this topic. Teachers in general have described STEM integration as a way of problem solving, and stated that the They also think that the STEM integration will give students a variety of 21st century skills they can develop. They think that when solving a real life problem, these skills provide them to create their own methods instead of the things given to them. Moreover, teachers have identified STEM integration as an approach that develops problem-solving skills.

Key words: *STEM Education, STEM Integration, Teacher Education*

INTRODUCTION

As the scientific knowledge gradually increase, technological innovations move at a great speed, and the effects of science and technology are clearly seen in all areas of our lives nowadays, it is clear that science and technology education play an important role in the future of the societies. It is therefore seen that all societies, including developed countries, are constantly making an effort to improve the quality of science and technology education (MEB, 2005). STEM education which aims to educate students holistically and give them twenty-first century skills is one of these new approaches. In particular we can say it has been pointed out here that from the early ages the students need to be given the skills of the twenty-first century. At this point, the question whether the trainers who are going to upskill the students are sufficient for these skills becomes the main topic of conversation.

Our country's 2023 Vision and the aims of the Ministry of National Education (MEB) strategic documents demonstrate the necessity of defining science-technology-engineering-mathematics STEM education across our country (Corlu, Adiguzel, Ayar, Corlu, Ozel, 2012). However, studies done in this field are on the onset (Cavas, et al., 2013; Corlu, at al., 2012; Marulcu&Sungur, 2012). Therefore, the scope, theory and practice of science-technology-engineering and mathematics education, which is at the center of reforms aimed at raising a generation capable of innovation, should be studied at the level of schools and universities (Corlu, et al., 2012). In this sense, it may be seen important for teachers to fully understand the content and scope of the STEM and to have knowledge and experience of how to implement it in the class. Hernandez (2014) at his study towards determining the teachers' self-efficacy perceptions on STEM disciplines, he stated that teachers need professional development courses for STEM in order to give qualified STEM skills to students, such professional development courses have improved the teachers' self-efficacy perceptions and this is effective on students gaining the Stem skills. Hence, teachers' knowledge and experience in this field can be considered important both for their professional development and for their students to gain twenty-first century skills. For

example, in a study by Avery (2009) that aimed to investigate the impact of teachers participating in STEM professional development courses to their students' academic achievement, he ascertained that the students of teachers who integrate STEM activities into the curriculum have a higher perception of competence of their academic achievement and STEM disciplines than other students. In another study paralleling this one, Satchwell and Loepp (2002) reached the conclusion that when the content taught with STEM-based projects a significant increase has been seen in the learning level of students. Likewise, Thompson (2009) suggests that STEM-based learning reflects a positive change in mathematics and science education. As a result of the study done by Farior et al. (2007) it has been concluded that students experiencing design-based problems had some difficulty in transferring knowledge and that they succeeded in achieving the potential to use and retain knowledge when encountering problems through STEM-based training. Gallant (2010) concluded that if students work together in a collaborative group on real-world problems their interest towards STEM education and success would increase. Also, Fantz and Grant (2013) and Stohlman, Moore and Roehrig (2012) state that focusing on mathematics and science subjects to expand students' interests and awareness towards the school will be beneficial. In this context, when examined the studies conducted, Venville, Wallace, Rennie and Malone (2000) researched the implications of the integrative teaching of science, mathematics and technology in traditional discipline-based school environments, and the effect of integrative teaching on students' learning. Therefore, they have provided a learning environment in which the students can apply what they learn in science, mathematics and technology through "Solar Boat (Boat using solar energy)." As a result of the study, it has been revealed that the students raise their interests to learning and the integrative approaches of STEM lessons should be applied in the environments of constructivist education rather than the traditional discipline-based school environments. Bingolbali, Monaghan and Roper (2007), at their study, determined that the implementation of project-based learning activities integrated with STEM have a significant influence on the positive attitudes of students to STEM and their choices of profession in the future. The study carried out by Dewaters (2006) showed that the students are pleased with the lessons of STEM integration and these lessons assist to solve the daily life problems. In this study, the students asserted that STEM [lessons] integration have up-skilled their learning. The results showed that the students need to learn many types of advanced STEM disciplines in order to meet the engineering and technology needs in the future. Additionally, several counties, currently, by drawing attention to the students' learning environments, hope that STEM teaching can be improved with appropriate environment designs. Thus, we are in need of effective teachers. Accordingly, Cunningham, Knight, Carlsen and Kelly (2007) designed an in-service training program for teachers. Teachers have had knowledge and experience about the engineering design and then become experienced in how to use and incorporate the engineering design into the lessons plans during the program. The priority aim of STEM initiatives is to increase the number and quality of STEM teachers. In this way, well-trained teachers can help students up-skill and increase their innovativeness capacities in the twenty-first century (Corlu et al. 2014). In this regard, it is probably not possible to expect teachers to carry out activities for up-skilling the students' STEM without having their own skills or taking education for improving these skills. As a result, Taking into account the Science, Technology, Engineering, Mathematics (STEM) integration, it is extremely important to investigate teachers' understandings, perceptions about STEM and how STEM practices should be incorporated into the classroom in order to explore the perceptions of science teachers on this subject and provide important information to teachers and researchers in connection with how STEM applications can be applied at high quality. It is seen that countries such as America, England and South Korea are the leading states where the studies on the implementation of STEM education for teacher training and primary institutions are conducted. It is tried to make the concepts including in the education programs of these countries more understandable with the courses, congress and symposium activities for prospective teachers and teachers. Therefore, it can be easier to implement STEM activities in schools. In the countries having such good applications, determining the position of STEM concept in education programs, how it is reflected to teacher training, and with what kind of activities are trying to provide students with skills, attitudes and behaviors during the lesson in secondary schools will help to eliminate the problems. Taking into account teaching STEM disciplines as an integrated approach, science teachers need to develop new teaching strategies and techniques, and upskill in order to have content knowledge about STEM subjects and apply STEM integration in the classrooms. The studies show that using of integrated approach in education has a positive effect on students' success. Ozdilek and Ozkan (2009), at their study, researched the effect of instructional design prepared by an integrated approach with many teaching strategies on the students' learning levels and determined that the students who are applied to the instructional design developed as a result of the

research had a higher achievement compared to the students who are educated with the current program. Developing an integrated program and creating an environment suitable for STEM education in our schools provide students to establish a connection among disciplines, be enthusiastic about learning, increase their success of mathematics and science, and improve STEM education and learning (Gallant, 2010; Riskowski et al., 2009; Satchwell and Loepp, 2002). In a study performed by Elliot, Oty, McArthur and Clark (2001), integrating mathematics with science, technology and engineering has enabled students to create meaningful connections with these disciplines. Hartzler (2000) specified that science and mathematics which are taught based on an integrated understanding have enhanced students' success, interest, eagerness to learn and self-efficacy in a meta-analysis study that he conducted among his thirty individual studies related to effect of integrated teaching on students' achievements. In this sense, continuing vocational education of science teachers in order to gain information and experience to teach STEM integration is considered as a crucial reform emphasizing the problems about implementing Science, Technology, Engineering and Mathematics integration in the science classrooms (Loucks-Horsley, Love, Stiles, Mundry and Hewson, 2003). It is important to investigate teachers' understandings, views about STEM and how STEM practices should be incorporated into the classroom in order to provide important information to teachers and researchers in connection with how STEM applications can be applied at high quality. Other researchers placing importance on this study needed to emphasize the effects of these trainings after the education of STEM practices for teachers. In this sense, the results of this study are important with regard to give information to the future teachers with the professional development programs aiming sustained changes in science classrooms. This study focuses to answer the following two research questions:

1. What are the general views of teachers about STEM integration after receiving STEM education?
2. Is there any connection between the views of teachers about in-class STEM practices and STEM integration?

METHODOLOGY

A case study was conducted to describe the teachers' views on STEM integration and the situations related to the in-class practices on this topic. Yin (2011) explains that case studies are appropriate when the research questions address a descriptive inquiry (e.g., "What is or has happened?") or an explanatory question (e.g., "How or why did something happen?").

Techniques to establish credibility consist of members checks and the triangulation of the survey instrument, focus individual interviews. Member checking consists of allowing participants to review the transcription of the interview and correct any errors in interpretation (Creswell, 1998). Triangulation of data consisted of comparing the three data sets: the survey data, interviews from individuals. Through the triangulation of sources, we can determine the consistency of the data sources (Angen, 2000). Triangulation makes it possible for the researcher to learn and fully understand what is being studied. In addition, the researcher communicated with the participant teachers to check whether the interpretations brought to themes and themes were correct in order to further enhance the reliability of the study.

The interviews were carried out, analyzed and thematically coded by the researchers.

Data collection was carried on in order as follows: 1) training teachers about STEM integration before interviews and classroom observations, 2) having pre-interviews with teachers before starting in-class STEM integration lessons, 3) making teachers' classroom observations when they start to STEM integration lessons, 4) having interviews again with teachers after completing STEM integration lessons. Two interviews, one of which is pre-interview and the other post-interview, were conducted with the participants.

Each interview lasted about 40 minutes. The pre-interview is a semi structured interview carried out before the participants start STEM integration lessons. The pre-interview questions focused on five significant areas. 1) The views about STEM (Science, Technology, Engineering, Mathematics) disciplines, 2) The views about STEM integration, 3) The past experiences on STEM integration, 4) Preparation the students for 21st century skills and 5) The challenges and obstacles of STEM integration.

The final interviews were conducted after the participants completed STEM integration lessons. The aim of final interviews is to enable teachers to explain and detail STEM integration applications in the classroom and to clear the connection between teachers' views and in-class practices.

Participants

Five teachers were purposefully selected for STEM integration training. All five participants were middle school science teachers. Participant acknowledged that they did not have experience STEM integration.

The Application of STEM Activities

A story emphasizing the STEM activities about Electrical Unit, lesson plans, worksheets and engineering design process steps at the beginning of the Unit was prepared in this study. It was provided STEM training for 5 Science teachers working in three different schools located at Denizli and was asked to integrate these applications into this unit. The applications have taken totally 48 hours, including intra-and out of lesson and intra-class observation has been conducted.

In this study, 6 different STEM activities have been used. The activities have been prepared in accordance with the engineering design process.

1. Series Circuits
2. Parallel Circuits
3. Toy Workshop
4. Wind Turbine Work
5. Electricity Saving Work
6. Poster Preparation

Classroom observations

The principal focus of classroom observations was to observe in-class practices that the teachers used STEM integration. For this purpose, the classroom observations were made during STEM integration lessons of the participants. In order to provide the recording of classroom observation data, detailed field notes have been used. The purpose of field notes is to provide the detailed description of classroom practices including the contents such as lessons' content, and teacher-student interaction. The data analysis method in this study can be summarized briefly as follows: (1) open coding, (2) description of templates and categories and (3) setting themes and models for cross-case analysis.

During open coding, data sources were tried to be organized by taking the frequently-used words into consideration. The purpose of using open coding is to explore each participant's views about STEM integration.

STEM Integration Training

STEM integration training has been given to 5 science teachers working in the province of Denizli. The training provides instructional strategies to assist Science Teachers in the implementation of STEM integration in the classroom environments and in the development of an understanding of the connection between the various STEM domains. All five teachers in this study have participated in the training given. The general purpose of STEM integration training is to enable teachers to understand the subjects they have taught thoroughly and analyze the relationship between STEM disciplines. STEM education lasted 5 days in 2015-2016 school year. The training activities have been designed for teachers to think deeply about what they learn during the training and to share experiences they have learned while applying in the classroom. The training subjects and content have been given at Table 1.

Table1

Title	Content
What is STEM?	STEM education in Turkey and in the world, the importance of STEM training, the nature of STEM
What is engineering? And what is engineering design process?	Engineering as a separate discipline, the relationship of engineering between Science and Mathematics and Engineering Design Process
Mathematics, Science and Design	The points making engineering different from Mathematics and Science
Problem solving, Project-based and Problem-based learning	The relationship of STEM between Problem Solving, Project based and Project based learning
Preparation of STEM lesson plan	Preparing STEM activity and its integration with current units
Technology Integration	Technology integration in teaching of Science, Mathematics and Engineering

The STEM training given to the teachers emphasizes on the integration of STEM disciplines and the quality of these disciplines.

Study Findings

Five major themes emerged from an analysis of the interview data. These themes were the following:

1. Understanding of STEM integration
2. Challenges and obstacles
3. 21 st century skills
4. Learning outcomes
5. Implementations of STEM integration

The researcher further refined these themes, which came from textual descriptions (see Table 2).

Table 2

<i>Themes</i>	<i>Textual Descriptions</i>
Teacher's understanding of STEM integration	STEM integration is problem solving (Real world problems) STEM integration is like a way in which scientific process skills Engineering desing process Creating their own product
Challenges and Obstacles	Time constraints Experiences for STEM Students' STEM ability
	Units
21st century skills	Solving problems Learning from failure creavity Defining, Formulating and Solving Problem
Learning outcomes	become independent thinkers Use engineering design process. Opportunity to use their theoric knowledge Relate to real World problems
Implementations of STEM integration	Problem solving is a component in a STEM integration lesson Content knowledge is important for STEM integration Engineering design

Teacher's understanding of STEM integration

The problem solving has become the most common concept that the teachers use to define STEM integration. As P1 stated, one of the teachers, "STEM integration is to use Science and Mathematics in order to solve the real life problems, and in my opinion, STEM integration is a way to use problem solving skills and develop these skills." On the other hand, P2 defined STEM integration as follows;"STEM integration is a solving problem which mixes the current theoretical information related to Science and Mathematics with Engineering design processes."And, P3 stated as following;"STEM integration means that different disciplines come together in order to solve an existing problem."

The teachers have associated STEM integration with the problems faced in real world. For instance, P1 mentioned about this subject as the following;

"We are speaking about a situation related to real life in a STEM activity. There is a real problem that should be solved. The students face this problem and try to produce a solution for this situation."

And, P2 said as follows:

“STEM integration brings students together with the problems of real life. It provides them to use the information of Science and Mathematics in order to produce ideas about these problems and come up with the solutions.”

Most of the teachers (P1, P2, P4 and P5) believe that solving a problem using STEM integration will assist the students to understand better about what engineers work in fact. P1 said “The engineering, all by itself, is a STEM integration. This provides students to develop a point of different views to real life problems and use the theoretical information that they have learned in the lesson.”

And P2 said “Personally I think, STEM integration is like a way in which scientific process skills are used. It exhibits almost real life situations about what the engineers do depending on their carriers since each subject of science is, indeed, a field of study of the engineering discipline.”

P2, on the other side, said “I ask the students to create a product in a STEM activity because I want them to use their imaginations and creative ability in order to create a product. The fact that the students create a product is extremely important for their permanent learning.”

And, P2 described the application method of engineering in the activities as follows; “Engineering have existed in all activities including the series and parallel circuits.” P3, also, stated about incorporating the engineering into the activities; “Engineering have been suitable for 7th grade acquisitions and is an activity including engineering design process.” And, P5 said “Engineering is in the last part which the students have created products.” P4 defined this as the following “It was important that the concepts which the students learned about the subject connected to the engineering design process.”

When asked about the focus point of STEM integration, P1, P2 and P3 mentioned about the engineering design process. P1, demonstrating Wind Turbine activity as an example, said “In my opinion, the engineering design process is highly important in teaching STEM integration. The Engineering design process allows us to solve the problem. P2 stated her opinions as follows “Using the engineering design process on behalf of organizing the information for a problem solution and allowing for testing and retesting is the basis of STEM integration.”

And, P3 said “In my opinion, the engineering design processes are pretty valuable for STEM integration. This is relatively important with regard to emphasizing the engineering discipline and presenting its relationship with the other disciplines.”

P1, P2 and P3 believe that the students should learn the engineering design process and practice on this subject. According to them, what makes STEM different is the design processes. Also, since the students are accustomed to immediate information, they have emphasized that the students should solve the problem using and applying their own views. This is also related to the fact that the teachers desire to help the students to develop their own independent thinking abilities.

For instance, P1 said “In order that the students can design their own products and transform their ideas into products and find creative solutions to the problem, the problems should be open-ended, since the students were always conducting experiments like prescription before.”

At this point, P3 said “The engineering design processes assist the students to carry out the problem solving by using their own ideas.”

On the other hand, P5 and P4 have not directly mentioned about the engineering design during the interviews. On the contrary, they have emphasized the importance of integrating the engineering into STEM integration. One of the biggest reasons that P5 believe that the activities are accomplished is to try to integrate both science and engineering into the activities. He said “I feel that the activities are successful STEM integration due to incorporating the engineering by emphasizing its difference from the other disciplines. According to P4, she also believes that engineering is a part of STEM integration. Considering the basic concepts of science in STEM integration, P4 has asserted that and the engineering integration process and mathematics are the means providing quantity assurance and the technology is the thing finally acquired. In order to conduct a STEM activity, all STEM activities should be integrated into all units. She also said “As far as I am concerned, integrating STEM completely is also to systematize it. Therefore, when talking about STEM integration, it has not only made any special effort to mention about engineering.

Studying based on product-focused is another concept including the engineering design. Most of the teachers believe that they allow the students to transform their ideas into real and concrete products by applying STEM integration. For instance, P1 said about this subject “Conducting engineering type works or doing projects are that it is because the students have to practice those again and again. In this way, they can use what they have learned about science and mathematics in order to do something related to engineering and to build something.

P2 had asked her students to create and present a poster in the activity about electricity saving. We are discussing instead of testing in the engineering design process and the students are sharing and discussing the data they have acquired. Of course, what everyone has done is not necessarily be similar to each other. Everyone can share their ideas and data. P4 thinks that existing of a problem to be solved in product-focused activities is the crucial point. According to P4, the “testing” areas, such as testing different materials or solutions, is substantially important in order to find the best solution in a project of STEM integration. She said “The students should design a product that can be tested physically for STEM integration. This provides them to learn, and in my opinion, the children should learn to think. They should touch something, play with something, and reach to a solution trying their ideas or conducting an experiment with materials.

Teachers' views of STEM integration and their application in the classroom and the role of problem solving in STEM activities are strong links. Findings also show that teachers believe that helping students to think independently and work on the project as a true engineer is a valuable feature in an STEM event. Both teachers' views and classroom practices suggest that teachers see STEM integration as one of the most important factors in problem solving.

All teachers have given an engineering design problem or challenge to their students to solve. In this case, it can be referred to as a context without problem solving. On the other hand, they also expressed that students want to be independent thinkers using their own ideas to solve a problem. For this reason, problem solving is also used as a process in STEM activities.

Challenges and obstacles

We will discuss the difficulties that the teachers have faced in applying STEM activities in this theme. This theme, unlike the others, has not been presented by following the models, since the difficulties or problems that the teachers have met after applying STEM activities in this theme have been particularly discussed. This theme is related to the teachers' views, however, they have not been ever observed in the applications of STEM activities. This theme will be handled using the reflections of all teachers after practicing STEM activities. There are four issues or problems especially related to STEM integration that the teachers mentioned about after applying STEM activities. Firstly, most of the teachers (P1, P2, P3 and P5) agree that the students' abilities on STEM subjects have a big effect on how they design and apply STEM activities. Also, the same teachers suggested that the students who have a highest academic achievement have not volunteered in STEM activities; on the contrary, the students who have a low academic achievement are at the forefront in the STEM activities. P1, P2 and P3 are concerned about determining how the students ask for support in order to comprehend and complete the project of STEM integration. Secondly, all of the teachers believe that some science units/subjects such as energy, force and speed are easy to use those with STEM integration. However, the other teachers, like P1 and P5, think that the science units/subjects such as biology or chemistry are not too easy. Thirdly, most of the teachers (P1, P2 and P3) STEM integration felt uneasy because they did not have experience. They have stated that this situation is threatening the classroom management. Additionally, time, material and curriculum are the ones of biggest problems affecting the application of STEM activities.

The teachers are also worried about how they give instructions to their students in order to describe STEM activities. P1 said “The students try to correlate all the information with what they desire and do. I should directly teach all of the theoretical information required for the students. And, P2 said “Since the students are not exactly sure about what they will do in what phases, the situation is getting complicated. While introducing such an activity, mostly, I have to assist. P3, on the other side, said “The students need to be guided too much. It seems like what we do for STEM integration, even partly, depends on your students' levels. I am only a secondary school teacher. My students needed to be guided much more in order to complete their activities. Also, engineering requires to write and to design for drawing. My students do not like writing and drawing. They want to try the ideas in their mind. Another concern related to the students' abilities is that some teachers (P2 and P5) believe that some students need more time than others to complete the STEM projects. And this has made planning much more difficult for the teachers. P2 mentioned the followings “Some groups can carry out the activities early but other groups have not started yet. Therefore, I have difficulty in balancing between them. P5 said “The [students] study in different periods of time. It is quite difficult to tell them “Be fast, you fell even further behind.” Some of them cannot use the time well. And, some are unaware about what they will do. In general, STEM activities were complex. The students talked with their group friends about their designs, walked around the classroom to test their products or wasted time, and did not do anything that they had to do. One of

the contradictory subjects in STEM integration lessons was the “fun learning” factor.” The teachers thought that this factor overshadowed the students’ learning required to complete the lesson. P1 said that “The students liked STEM activities. For some reason, they did not study the worksheets despite being motivated and if they had not written their views and notes, I would not have known what they did learn on that day. I thought that they tried to join the parts together without thinking in detail.”

P2 believed that she thought the [students’] ideas in detail and did not want to move carefully. They do not want to talk about the strengths and weaknesses of the products. They like to finish the products as immediate as possible and compare their products with the other group. P3 stated that the greatest difficulty was to have the [students] do unfunny parts such as having them write their ideas. The measurement part is not funny for them. Therefore, they take half measures. The time was a big problem for the teachers to apply STEM activities. P2 asserted that she needed time rather than regular lessons for STEM integration. Time is always a difficulty for me.” She said “The students need much time than I expected from them.” In order to carry out STEM integration, much more time is required. P1, P3 and P4 stated that they really had to think how much time is needed for the lesson while planning STEM integration lessons. P3 and P4 pointed out that if they had much more time for STEM integration lessons, they could have taught the lesson more comprehensively.” P4 said “Time is a big factor. I would like to give theoretically information; however, time is the biggest problem.

The teachers have mentioned about how materials could change STEM lessons. P1 and P3 explained the subjects related to the materials. P1: “In my opinion, the most difficult part I faced in STEM integration was materials, since there are not enough materials in our school.” P3: There were not enough resources that I can use in our school. P4 particularly stated that the materials have affected what she desires to do in STEM activities. She said “The materials are a big problem for such activities. I need materials which are easy to access and use.

Also, the teachers have stated that the curriculum is complied with STEM integration. All of the teachers have agreed on this subject. They have expressed that they have to manage the curriculum and do not show tolerance on this subject, and according to this, the curriculum should be organized in order to carry out STEM integration without having a problem. Moreover, all of the teachers have stated that they will not apply STEM integration due to 8th grade TEOG exam.

21st century skills

All of the teachers believed that STEM integration could teach the students a number of 21st century skills to need out of the science class. The teachers think that the students are more eager to try their ideas since they know that the students do not know the correct answer, but search the best answer. P3, P5 and P4 are of the opinion that STEM activities especially assist the students to look at their mistakes from different aspects. P3 suggested “Learning from the errors/mistakes is a 21st century skills for the students. If something does not work, it is highly important to keep going without giving up and understand that mistakes are human. A STEM activity is extremely important in teaching students not to give up when they have failed.” P5 said “The students do not realize that if things are not going well at their will, they can find out its value and benefit from this situation. This is the most crucial problem of the children, personally I think. And, STEM activity assists the students to understand the value of re-trying. P4 stated “I want [my students] to recognize that when they reach an answer they do not expect, this is an ordinary situation, and ask them to try. This is a process to assist them. These things are those that the students should understand even after finishing the school. When considering P2 and P1, they have suggested that the students feel disappointed when they cannot solve a problem. P1, on this subject, said “The students really got disappointed, but when they started to accomplish in fact, the victory they gained is the most important. P2 said “Stem integration is like life skills, such as overcoming a problem or disappointment. STEM integration is a study conducted with the levels of the students’ disappointment. P1 and P2 believe that the problem solving in STEM integration assists students to understand how to study using different ideas in spite of their disappointments.

Most of the participants stated (P1, P2, P5) that STEM integration improves the problem solving skills and creativity of the students. In this regard, P1 said, “STEM integration offers students the opportunity to solve problems through creative ideas.” In short, “STEM integration suggests that students develop creative thinking.” P5 says, If you want to educate a creative generation, you must achieve STEM integration in your courses. "

From the teachers' viewpoint, these themes are very closely related to helping students to think independently. Teachers have encouraged students to use their ideas and try different solutions when solving problems at all STEM events. They believe that the problem-solving part of STEM activities enables students to realize that

even the methods they think are wrong can come to the right conclusion. Students also see the value of making mistakes. They need to keep trying to be successful and not be afraid of it even if they get an answer they do not want. This is especially observed in the practice of teachers. For example, P1 said that “when designing a toy car for his students, it is completely natural and correct to create many different ideas. You will also decide on how to act your P1 students in the same activity. So check your materials well and make your decision on how to play your game. P3 also encouraged his students to examine materials provided to them before deciding how to design the Turbine in the event of the Wind Turbine. This is what he says: “If you want to look at materials before you start designing turtles, you can come here and look at the ingredients. In the redesign part of the Wind Turbine effect, he again encouraged students to think about different design methods; -Maybe your turbine is very durable, but its wings are too small to generate energy. How can you make changes to your design to produce more energy? P4 encouraged his students to think about different solutions to the Toy car event. He reminded his students that they should design their car as cheap as possible. And then - the very thoughtful group generally gets better results. You have to plan ahead and that's what you need to work on. In another example. After a group of students completed their design, P4 told the situation, and he said: “Think about how you can make changes in your design.”

In general, all teachers also think that an STEM effect naturally creates a learning environment that helps students insist on continuity and continuity while trying to solve a problem. Dealing with failures and mistakes is an important life skill that students need to master and develop, even if they do not choose an STEM area as a career in the future.

Learning Outcomes

According to the participants, the integration of STEM provided many opportunities for learning to learners.

P3 raised concern about this point “One of STEM integration purposes is to provide students to really understand about what the engineers practice in their works and to become self-aware about vocational career related to this fields. And therefore, when you provide an environment which is authentic and connected about what the engineers work, you can awaken students’ interests and provide students to face to the fields of this discipline.”

P4 build STEM integration on the idea about how the students gather the information that they have learned. She, also, mentioned on this subject “In this way, the students actually practice what they have learned rather than reciting or repeating. STEM integration allows the students to use the information obtained theoretically instead of reciting them.”

The teachers think that incorporating the problem solving into STEM integration makes a big contribution to students to think independently. The fact that the students can produce their own ideas through brainstorming and respect to the ideas of their group friends has been also valuable for the teachers.

As P1 emphasized “I enable the students, on their own, to find the solution of real life problem given in the scenario at the beginning of the lesson through brainstorming.

P2, on the other side, said “I ask the students to create a product in a STEM activity because I want them to use their imaginations and creative ability in order to create a product. The fact that the students create a product is extremely important for their permanent learning.”

Also, P3 said “Using the problem-solving skills in STEM integration allows the students to try new things. The students’ learning by trial and error makes the learning more permanent. STEM integration gives students the chance to be a part of the scenario and motivates them to solve the problem.”

P4 build STEM integration on the idea about how the students gather the information that they have learned. She, also, mentioned on this subject “In this way, the students actually practice what they have learned rather than reciting or repeating. STEM integration allows the students to use the information obtained theoretically instead of reciting them.

P5 believed that the teachers should encourage the students to think autonomously and emphasized that the students should become independent and be creative instead of guiding them, and then said about this subject as follows, “While the students find solution to the existing problem, instead of giving instructions, we should tolerate and not restrict them in order to put their own ideas into practice. This provides the students to produce authentic products which are independent and different from each other.”

Teachers' views correspond to classroom practices in this theme. They want to think among different solutions for a problem that their students need to solve. In classroom practice, teachers encourage their students to try their own ideas to solve a problem / challenge. Students are asked to think about different ideas and solutions

even when they produce a product that meets or addresses the difficulty. Teachers think that thinking and experimentation, which are closely related to the engineering design of an STEM-enabled one, can help students approach their mistakes differently. These teachers' hopes helped them learn how to cope with the situations they perceived as failures in their lives by implementing STEM integration.

Implementations of STEM integration

According to P1, STEM integration is a teaching strategy that students can use to teach problem solving. It focuses on problem solving skills or problem solving processes from theoretical knowledge or STEM topics. I am emphasizing in my lessons that STEM is composed of problem solving processes which are the common goal of all, not in the way that different disciplines come together.

An open-ended real-life problem is a necessary component of P5 and P4 STEM integration course. P5 says: "I do not give answers [to students] when we do problem-solving work, even though students are accustomed to doing prescription experiments. We solved the problem for them. "And at these STEM events we brainstormed about real life issues and problems and tried to solve real life problems, not just at school or textbooks.

According to P2, "The STEM integration indicated that the way of use depends on how it fits with the content that it wants to teach. The implementation of the STEM integration also required consideration of science and engineering disciplines. He said: "Look at the content I want to teach. Then I think of whether to incorporate STEM activity into "and" STEM activities or integration is a tool that can be used by me to relate the learning of my students to what I can adapt to the content. In other words, STEM integration is an approach that contains many methods and techniques and I use it as a tool to teach content."

Most of the teachers (P1, P2, P3) emphasized that the engineering design process is important for STEM integration. According to P2 "Successful completion of the application was due to the full implementation of the engineering design process" In this regard, P3 said: "The most important feature that distinguishes STEM integration from other approaches. It is necessary to follow the steps of the engineering design process to make a successful integration."

Teachers' views correspond to classroom practices in this theme. They want students to use engineering design processes at all activities.

Conclusions

The purpose of this study is to analyze the views of the science teachers about in-class integration of stem applications. A series of interview questions addressed the teachers' views of STEM integration and views of teachers about in-class STEM practices.

The participants believed that problem solving real life problems played an important role in STEM integration. All of the teachers thought that engineering design process were key of STEM integration. When the researcher compared the participants' responses, the following terms were frequently identified from the analysis: STEM integration is solving real world problems, STEM integration is like a way in which scientific process skills, Engineering design process, creating their own product. For example, P1 described "STEM integration is to use Science and Mathematics in order to solve the real life problems". P2 defined "STEM integration is like a way in which scientific process skills are used." P3 defined this as the following "the [engineering design processes] are pretty valuable for STEM integration." P4 thinks that "existing of a problem to be solved in product-focused activities is the crucial point." The literature reviews supported these findings for example 3 teachers, participating in STEM program in this setting understand the STEM integration and how STEM integration is applied to the classroom (Wang, Moore, Roehrig and Park, 2011) the researchers have identified similar themes. Teacher's challenges and obstacles are time constraints, Experiences for STEM, Students' STEM ability. In support of these obstacles, time was a key factor reported by Gencer and Ozel's (2012) study, which identified problems teachers faced during the implementation of STEM instructional process.

All of the teachers believed that STEM integration could teach the students a number of 21st century skills to need out of the science class. That strategy should include all the STEM disciplines and address the need for greater diversity in the STEM professions, for a workforce with deep technical and personal skills, and for a STEM-literate citizenry prepared to address the grand challenges of the 21st century Vann (2013) contended that teachers are a critical key to preparing students for the future workforce. Therefore, teachers need practical experience with STEM integration in the form of real-life, problem solving experience, so they can better encourage the students and help them develop the 21st century skills.

According to the teachers an open-ended real-world problem, problem solving process, and Engineering design process are necessary components of STEM integration. As outlined in the literature review. Examples of relevant definitions, as determined in the literature review. The National Research Council (2011) believes increasing the visibility of engineering and technology in STEM education is vital for the interconnections of teaching and learning. The outcome of integrative teaching by using engineering design is transdisciplinary learning through an authentic context that promoting student STEM literacy and readiness for STEM-related employment, which contributes to their own economic success as well as the nation's (NRC, 2011).

ABSTRACT

The undeniable advantage of simulation technologies is the fact that their implementation allows specialists to get away from the traditional forms of the educational process (where the teacher is in the center of attention) and shifts the focus to the student, giving him the opportunity to practice skills, admit and correct mistakes, analyze the situation and draw conclusions.

The main goal of the training was to prepare graduates for non-conflict interaction with patients in a polyclinic and a hospital.

The training involved the implementation of quasi-professional activities at 3 “stations” in the simulation technologies center:

- 1) Office of a doctor-therapist in a polyclinic (verbal and non-verbal technologies of non-conflicting communication, reducing the energy of the conflict were worked out);
- 2) Inpatient department of the hospital (the skills of productive interaction, the determination of attitude to the disease type, the type of the conflict personality, and response in an unconventional situation were worked out);
- 3) Office of the chief doctor (the analysis of complaints was carried out and the skills for resolving the conflict were worked out).

The 6th year students of the Clinical Psychology Faculty played the roles of patients and professionally represented vivid images of conflict characters.

The training provided two types of results.

On the one hand, the students of the medical faculty trained the ability to distinguish behavioral manifestations of different types of attitude to the disease and to realize response manifestations in situations of communication with them in the conditions of quasi-professional activity.

On the other hand, students of the Clinical Psychology Faculty, playing the roles of both the patient and the psychologist-supervisor, expanded their representation in the field of practice and methods of counseling in a hospital.

INTRODUCTION

Modern universities are focused on increase in level of graduates training. In this regard they introduce the existing mechanisms, models, techniques of an assessment of quality which allow developing various activities of the organization, to increase effectiveness and efficiency of the work. It leads to increase in competitiveness of the educational organization that, in turn, opens the new educational horizons for students.

One of the widespread teaching methods in universities of a medical profile is the method of simulation training. Simulation or modeling in education is the tool for practical teaching in the situation reminding reality. Simulation models allow students to make a mistake and to carry out the correcting actions of this mistake thanks to the feedback communications (debriefing) (Balkizov & Semenova, 2015). According to the references of Association on medical education in Europe, the simulation training is understood as “... any educational action reproducing clinical conditions for the purpose of training, mastering, estimation, repetition or research...” (Blashentseva, Boyarintsev, Balkizov & Baranova, 2013).

THE PRINCIPLES AND OBJECTIVES OF DEVELOPMENT OF THE MEDICAL PROFESSIONAL CLINICAL SKILLS AND SKILLS OF COMMUNICATION

The main approach to development of the best expertise in the field of forming and strengthening the medical professional clinical skills and skills of communication in condition of performing procedures safety rising, coordination and professionalism is presented in large-scale introduction, taking into account the cultural, ethical and humanistic principles, new medical educational technologies on the basis of modeling.

The application of a medical simulation training method provides:

- Active and controlled training of medical experts.
- Formation of necessary professional knowledge, abilities and skills.
- Individualization of training process.
- Situation of training in crew.

- Possibility of modeling various extreme situations.
- Existence the feedback communications.

This is the reproduced, standardized, purposeful training aimed on prophylaxis of professional medical mistakes. The implementation of this method provides the conditions for high-quality training, professional growth, self-changing, coeducation (Loginova & Chupina, 2011). Simulation (imitating, not imitating, game, etc.) training methods give opportunities as for improvement of professional training quality, so for students' self-realization and life self-implementation in different types of educational activity. It becomes possible as this method is a way of students' joint activity in which participants of educational process interact with each other, solve problems in crew, model situations, estimate actions of each other and own behavior, plunge into the real atmosphere of cooperation in situation of solving problems (Sidorenko & Loginova, 2014; Loginova, 2017).

The list of specific training actions is being implemented for the aim of formation among future medical stuff of such clinical and practical skills as manipulative, crew and communicative, as well as readiness for an occurring with unexpected clinical cases. The training actions are as follows:

1. Application of a wide range medical simulating technologies:

- Modeling of patient's systems and organs.
- Up-to-date simulators.
- Use of actors ("the standardized patient").
- Imitation of real clinical situations and typical cases.

2. Constructive discussion:

- Analysis of typical mistakes.
- Use of video registration equipment.
- Benevolent atmosphere.
- Process of training with use the simulation technologies.

As a result of the long-term data analysis it was revealed that the quantity of professional mistakes made by medical stuff was sharply reduced after this type of training (Egorova, Shevchenko, Kazakov & Turzin, 2012).

In the system of medical education simulation is the cornerstone of a series of the techniques designed to reproduce clinical situations with the purpose of training, repetition and assessment. Simulation is the art to imitate reality, sequence of events and actions, or thinking process.

The efficiency of pedagogical simulation, as well as of other methods of training, depends on specific features of its application. Simulation has to be applied in combination with clinical training. It is important to define the expected results of simulation use, feedback is extra important for successful training with simulation use; it has to rely on individual educational requirements.

The indisputable advantage of simulation technology is the fact that their implementation allows to refuse from traditional forms of educational process where a teacher is in the center of teaching process and attention. But it allows shifting the focus to the student, giving him an opportunity to fulfill skill, to make and correct mistakes, to analyze the situation and to draw the conclusions.

Along with formation of medical skills during the university study, special attention is paid to so-called "flexible" skills. The anti-conflict behavior belongs to the range of such skills.

In recent years the quantity of the conflict situations arising between patients and the medical organizations which are connected with delivery of health care (medical services) has significantly increased. There is a real set of reasons for this situation: change of social and economic conditions, growth of legal knowledge of the population, increase in a share of expensive medical services, and also prevalence of psychosomatic diseases, in particular depressions and depressive states having stress in the basis. By the lack of elementary knowledge in the field of psychology, concerning mechanisms of relationship and perception effects, the population loses the health, gets into artificially exaggerated stressful situations, writes complaints to all instances, including complains on doctors of policlinics. Psychologists understand that neither doctors, nor patients are guilty as each person with adequate mentality seeks for the same: safety, health, happiness, material welfare to him/herself and to the relatives. But different people behave differently; they do as they can, because of heredity and the environment of education. For this reason the urgency of health preservation of the population, improvement of health care quality and decrease of conflict situations (and as a result decrease of complaints quantity addressed to doctors and experts of social sphere services) was specially sharpened.

THE EXPERIENCE OF ANTI-CONFLICT BEHAVIOR TRAINING

The main objective of the training is preparing graduates for non-conflict interaction with patients in the conditions of an out-patient department and a hospital.

The training assumes exercise of quasi professional activity at 3 "stations" in the center the simulation technologies:

- 1) Therapist's office in an out-patient department (verbal and nonverbal technologies of non-conflict communication, decrease of the conflict energy are fulfilled),
- 2) Reception of a hospital (skills of productive interaction, skills of defining a patient's attitude towards illness, type of the conflict person, reaction in an unusual situation are fulfilled),
- 3) Office of the chief physician (analysis of complaints is carried out and skills of conflict resolution are fulfilled).

Sixth year students of the Clinical Psychology Faculty professionally represented bright images of conflict patients.

The first stage of the training (the therapist's office in policlinic)

The major objectives of this training stage are as follows:

- To understand the sources (factors) of the conflictogenic and conflict situations emergence;
- To record available for students - future therapists constructive response to conflict patients;
- To show the psychological technicians promoting decrease in “energy” of the conflict.

Within one training hour 3 conflict situations in policlinic are given. For example, the patient came to the therapist, but aggressively reacts to the reception, long queue, to service not on time fixed according to the coupon, to side effects of drugs, or even appearance of the duty therapist, etc. After each play situation the psychological analysis is given: information provided for group discussion and the explanation of the teacher conducting group. Psychological information contains the following techniques and approaches of working in a conflict situation:

- “Psychological depreciation”;
- “Reflection of feelings”;
- “Informing with / without the choice”;
- “Yes ..., but ...”;
- The poses and the gestures of the therapist which are reducing/increasing “energy” of the conflict.

The second stage of the training (reception of a hospital)

Within one training hour 3 conflict situations in office of a hospital are given. At this stage the major attention is being paid to the doctor’s abilities to take into account the fact that behavior of the patient, his internal decision to be treated or not, as well as patient’s idea of how to be treated if he is ready to receive treatment is determined by both personal features, and the type of the patient’s attitude to a disease. Both the doctor and the patient can be active parties of the “Doctor/ Patient” conflict, the guilt can be measured equal. In this case it is important to make ready the future medical university graduates for recognition of the specific features of the patient’s identity and the choice of the most effective ways of interaction in hospital conditions.

Here an example of the supervisor analysis describing the situation of interaction “Doctor/ Patient” is given.

Actions of the patient: the patient Ekaterina has headache complaints (2-3 times a day). The head aches during one or two hours, then ceases. The patient is worried and afraid that she can have a severe disease; asks for some pills that will stop the pain. The patient declares that she has visited another doctor already, but the doctor’s help wasn’t effective. The patient demands to be examined only by the best doctors. She presses to get much more doctor’s attention in comparison with other patients, as she is sure that things are going to worsen and she can suffer from a sudden stroke.

Actions of the doctor: the doctor excessively attentive to the procedure of previous treatment (who treated, where the patient was treated, why the treatment wasn’t effective). The coping strategy which was used first by the therapist wasn’t effective with this type of the patient, an attempt to calm the patient by the phrase “Don't worry, everything will be good” has just caused bigger nervousness.

The requirement of exclusive care, aversion for other patients, who are also requiring attention and care are manifestation of egocentric and anxious types of the relation to a disease. Such patients reveal their personal exclusiveness concerning a disease, are emotionally unstable and not predicted, uneasy and hypochondriac concerning an adverse course of disease, its possible complications, treatment inefficiency and even danger of treatment. They are inclined to search of new ways of treatment, additional information about a disease and methods of its treatment, frequent change of the attending physician.

Recommendations: during the anamnesis collecting it is necessary to speak in active, detailed and structured style, it is useful to perform inspection and prescribe necessary inspections. Demonstration of confidence, speaking quiet, calm voice reduces uneasiness of the patient.

Mistakes were explained to the student playing a role of the doctor; ways of effective interaction with this type of patients were recommended. They were: to occupy the leading position, to speak by a quiet, calm voice, to lead firmly and surely; to give exact instructions and to come into corporal contact (blood pressure and pulse measurement).

After discussion of interaction mistakes future doctors master the new ways of non-conflict communication with patients taking into account their type of the attitude to a disease; as well as personal features of the doctor: the doctor’s management style as a model containing a leader position in all aspects of relationship with the patient; partnership, as the behavioral model, assuming active participation of the patient in the course of treatment; the confidential relations when the doctor provides to the patient big freedom of activity, that from the other hand impose high level of responsibility on him.

The third stage of the training (office of the chief physician)

While developing this stage of the training of anti-conflict behavior the most frequent reasons of conflict situations in the health care system were initially defined:

1. Insufficiently attentive attitude towards the patient;

2. Character features of a doctor and a patient;
3. Lack of coherence in actions of doctors of different specialization, as well as team nature in treatment scheduling;
4. Defects of maintaining medical documentation;
5. Lack of the informed patient's consent to treatment;
6. Professional incompetence (unreasonable extension of indications to surgical treatment).

For the purpose of mastering the effective skills of conflict situations overcoming, referring to the most frequent reasons of conflict situations, we have simulated complaints of patients to doctors. During implementation of training occupations students - psychologists played roles of both the chief physician and the patient. The task of medical students was to work out the given conflict situation as if it happened in reality and of course to try finding the compromise. Students were highly motivated and active being involved both in process of playing the role of the therapist, and in the general discussion. It is important to note that the more experience students have practical activities (for instance work in a hospital as the hospital attendant), the bigger their academic progress, the higher students' competence in overcoming different conflict situation in medical practice. Students spoke out about difficulties which haven't allowed them to lose a role and to compromise. We have received the mass of positive comments upon termination of the training implementation and request for the more prolonged training program. As one of training results the instruction for doctors concerning anti-conflict behavior was developed.

Ways of conflict prevention

1. To follow the rules of health care service culture.
2. To track quality of medical documentation guiding as well documentary information on the patient is the main method of doctor's self-defense. To inform the patient on the offered treatment entity, character and possible complications, this is obligatory.
3. To agree on the plan of treatment with the patient and to make out it documentary.
4. To adhere to orders and standards of health care delivery accepted at the regional level or in specific medical institution.
5. To remember the importance of "conflict vigilance" and to carry out express diagnostics of psychological type of the patient identity
6. To try resolving the conflict on the place "here and now".
7. To carry out analysis of a conflict situation in professional team obligatory.

Summing up the work result at this training stage, it is possible to come to the conclusion that the most effective method of conflicts prevention and resolution is increase in law culture of health stuff and development of the adequate behavior models of medical stuff in the conflict conditions allowing not only to provide realization of the citizens' rights as patients and consumers of medical services, but also to protect conscientious experts from cases of patients' abuse of their rights.

THE RESULTS OF ANTI-CONFLICT BEHAVIOR TRAINING

The general assessment of the anti-conflict behavior training efficiency contained the analysis of anti-conflict competences formation among future doctors. The following competences have been marked out for the analysis:

- Readiness and ability to reduce the energy of the clashing patient;
- Readiness and ability to inform on the actions accurately;
- Readiness and ability to coordinate actions and the plan of treatment with the patient at each stage.

The data assumed an assessment on 5-grade scale: from 1 to 5.

The test card has been developed for the assessment of future doctors' anti-conflict competences formation. The arithmetic average number on scores of all students – participants of the training was calculated and compared.

The mathematical processing of the received results was carried out by means of the software package of SPSS Statistics 21.

The dynamics of anti-conflict competences formation results among future doctors before and after the training on the basis of expert estimates is presented in the Figure 1.

Figure 1. The results of anti-conflict competences formation among future doctors before and after the training

CONCLUSION

Thus, the training of anti-conflict behavior provided the following result. In the conditions of quasi professional activity students of medical faculty trained abilities to distinguish behavioral implications of the patients' various types of the attitude to illness; and to realize reciprocal implications in situations of communication with them. It is revealed that this training promoted rising of anti-conflict competence that has to entail more free entry into professional sphere of medical university graduates.

On the other hand, students of the Clinical Psychology Faculty, playing roles both the patient and the psychologist-supervisor dilated their representation in the field of practice and methods of consultation in the conditions of a hospital.

ABSTRACT

Memorization of hadith is one of the tasks assigned by lecturers to students in hadith-related subjects. However, an exclusive method in memorizing hadith which can be applied by the students of this subject does not exist. This paper aims to introduce a practical method in the memorization of hadith to facilitate the teaching and learning process, apart from being used as a teaching aid. It is a combination of methods conducted by selected lecturers at the Faculty of Islamic Studies, National University of Malaysia. A number of hadith subjects would include assignments involving memorization, namely those from the Department of Usuluddin and Philosophy, as well as the Department of al-Quran and al-Sunnah. The methodology of this study is qualitative, which includes field study covering interviews and observations. The findings of this study show that the students of the hadith subject from the Faculty of Islamic Studies, specifically from the Department of Usuluddin and Philosophy as well as from the Department of al-Quran and al-Sunnah, apply a variety of methods in the process of memorizing texts of hadith. The students would memorize the hadiths in their own effort and styles as well as instructed and designed by their lecturers. This paper proposes a general hadith memorization method that can be applied by each of the hadith subject lecturer as their teaching aid.

INTRODUCTION

Hadith is the second source of reference for Muslims after the Quran. Therefore, the Muslims must faithfully refer to prophetic traditions (Sunnah) and authentic Hadith (al-Qaradawi 2000; Ibn Qayyim al-Juziyyah 1995), as hadith assists them to recognize Islamic rulings (*halal* and *haram*) (al-Khatib 1988).

As hadith has special position in Islam, the Muslims use various ways to preserve it. One of the methods used by early traditional Muslim scholars is the method of memorization of hadiths. This method is practiced and passed on from one generation to another. It was started by the companions of Prophet Muhammad. At first they memorized the Quran. Yet, there were a number of them who were given permission by the prophet to write and memorise hadith for an example a companion named Abdullah bin 'Amru bin al-'As. The successors of the companions (*tabi'in or salaf al-Soleh*) followed the same method of memorization of hadith (Fauzi Deraman 2012). They memorized the hadith comprehensively from the texts to the chains of transmitters.

As the method of memorization of hadith is one of the ways to preserve and learn hadith, it is practiced by many scholars and teachers in this field. This article attempts to examine the approach of teaching hadith and learning

through memorization of hadith applied by a number of lecturers at the Faculty of Islamic Studies, The National University of Malaysia. This study aims to evaluate the their practice in teaching and learning hadith, their effectiveness and at the end suggest a new form of teaching hadith method which might useful for teachers and learners.

THE STUDY

For the purpose of evaluation, students' assignments as well as teachers/lecturers views were gathered. Short reflection sessions of individual and group discussions were conducted. The aim of the sessions was to compile as much information and hand-on experience from the practitioners. It is discovered that the lecturers used a variety of ways in approaching their students and making them memorize selected texts hadith relevant for their courses. The courses that involve hadith teaching are PPPH3163 The Contemporary Study of Hadith offered by the Department of Theology and Philosophy, PPPN3333 Hadith I, PPPN 3453 Hadith II and PPPN 3373 Hadith III. The last three courses offered by the Department of Quran and Sunnah Studies. Each of the courses has its own learning outcomes. For an example, the learning outcomes for the course of Hadith I aim to produce students who are able to recognize and use hadith primary sources as well as their commentaries. The students are anticipated to comprehend hadith texts related to the Muslim pillars of faith and knowledge.

FINDINGS

It is discovered that the lecturers or teachers apply a variety of methods in teaching and learning hadith. Every lecturer interviewed prepared different types of assignments and teaching methods that are helpful for memorization of hadith process. Basically there are three categories of memorization of hadith tasks given to the students. First, the students are asked to memorize directly the selected texts of hadith for each semester. Second, the students are given with tasks in the classroom or in groups and the tasks is part of the processes that helps them to master the understanding of hadith as well as memorize the texts. The latter category implicitly directs the students to understand the content and the texts of hadith comprehensively. The final category discovered that the lecturers allow their students to learn selected terms (like any abnormality terms/*gharib*) in the original texts first and deliberately then comprehend the texts and context of hadith. This category of teaching and learning hadith provides students an opportunity to search for specific terms first and then memorize the whole texts.

Lecturer A, who is a senior lecturer at the Department of al-Quran and al-Sunnah studies, explains his aims and method of teaching that directly assigns and instructs his students to memorize texts of hadith in each semester. He set a target that the students or the graduates from the department at least must attain or memorise '*Matn al-Arbain*', a compilation of forty hadith book written by al-Nawawi. . This task is helpful as a preparation for the graduates to master hadith teachings as a complement for Quran skills and knowledge. As an experience academic, Lecturer A has been facilitating three courses (Hadith I, Hadith II and Hadith III) as well as science of hadith (Ulum al-Hadith) course for more than twenty years. As for the end of semester evaluation and continuous assessment, students have to sit for written and oral examinations. Instruction for memorization of hadith is given at the beginning of new semester.

According to Lecturer B who conducted other Hadith courses at the same department, teaching hadith must adopt '*tahlili*' approach that requires the lecturer to provide main course content of hadith textually and contextually. He weighs on understanding the hadith first as the objective of learning than memorizing task. He believes that the latter would be acquired by the students after understanding the texts well. To facilitate the learning, he explains the hadith first to his students and asks them to search for any abnormality or uniqueness of the texts. By doing so, his students are interacting with the texts while trying to understand the meaning of specific terms and sentences. In expounding his method, Lecturer B assists his students to seek for other narrations related to the assigned or discussed hadith. As for the assessment, the students have to sit for the final examination where a specific question on writing the texts of hadith is tested.

Lecturer C applies another method of teaching and learning hadith courses conducted at the department. Alike, her colleague Lecturer B, she does not directly assign her students to memorize hadith texts. Yet, through Jigsaw Method, she facilitates discussion and sharing among her students through systematic group work. Each group has at least 6 members and they are given with a topic or texts of hadith to work with. The groups complete small and specific tasks related to the content of the course. Yet at the end, they collaboratively contribute to the understanding of the course contents. The main aim of the application of Jigsaw Method is to fill the course and learning outcomes which are to introduce and familiarize students with variety of hadith resources, assist them to understand the hadith textually and contextually.

The students are intended to study the hadith textually in their groups. The first process involved describing and

discussing of the topic. Each group member has to understand the texts or the topic given. After that, each group must select their representatives who they called as ‘the experts’ of the team. The role of the experts is to teach other groups’ members who are assigned to approach the rest of the groups by asking question and note taking. The experts have to pitch or repeat their groups’ main points for at least 4-6 times within a specific time. During these sharing sessions, students (students who play role as listeners) ask questions, discuss issues, do notes taking and find connection with the tasks from the rest of the groups. They move from one group to another as instructed by the lecturer. At the end the listeners complete their rotation and re-group with their original members. The listeners of each group will take the turn to represent their findings to the experts of the group. The diagram aims to portray the process of teaching and learning hadith through Jigsaw Method applied by Lecturer C. The implementation of the method gives opportunity for the students either they are the presenters or group members; to remember the texts of hadith directly and implicitly. As for the on-going assessment and final examination, she made observation on the students’ progress during the sessions and in the final examination. In the final, students are asked to write down the hadith they had learnt and shared.

Diagram 1: The Application of Jigsaw Method and Processes of Hadith Memorization

Repetition is a basic strategy for teaching. All of the lecturers use this technique as an approach for teaching and learning. Students are instructed to complete their tasks either individually or in group. Lecturer D from the Department of Theology and Philosophy instructs his students to memorize hadith in one of the assignments given. Yet, he applied Service-Learning method of practice which is one of the high impact educational practices (HIEPs). The course he facilitates which is Study of hadith and Contemporary Issue course involves activities in selected communities. His students are exposed to community work through Problem Based Learning strategy. The students focused on children and teenagers (aged 7-17 years). Each student must assist two children or teenagers to learn and memorize hadith. S/he also navigate them to understand the hadith and teach them how to apply the texts in their daily life. In less than an hour, the teenagers can memorize nearly 60% of the texts of hadith. During the community activities the students apply their knowledge on hadith in the real life setting. Here, lecturer D complements the classroom learning with experiential learning.

Apart from the abovementioned, lecturer D combines classical and modern methods in teaching and learning hadith. According to him, there are five classic methods in preserving the hadiths from listening, understanding, remembering or repeating, recording to delivering the texts of hadith from one person to another. These methods can be re-applied with the information and technology developments such as by using of audio and listening methods effectively and practicing psychological approach through constant repetition. Additionally, his students are encouraged to make use of I-Mind, an online tool to assist the understanding the hadith contents. Lecturer D also develops an IP copyrighted website registered as (<http://hafazanhadis.wordpress.com/blog/>) as another proactive step to simplify the process of memorizing the hadith. The website provides explanation with practical recommendations on how to memorize hadith step by step. It also has audio recordings of forty Hadith of Imam Nawawi's composition with the summarized translation by I-Mind to facilitate his students and other users during the learning process.

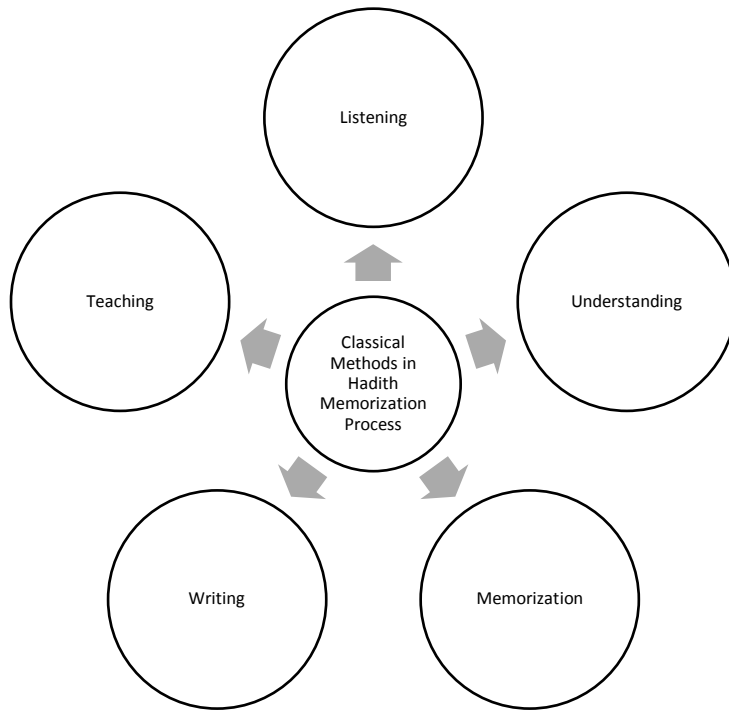

Diagram 2: Classical Methods in Hadith Memorization Process

Diagram 3: Modern Methods in Hadith Memorization Process

The above discussions and diagrams clearly show multiple ways used by the lecturers to assist their students' learning and memorizing hadith. The table below summarizes their methods of memorization in teaching and learning hadith.

Practitioners	Courses	Methods of Hadith Memorization	Assessment Strategies
Lecturer A	Hadith I Hadith II Hadith III	Assign specific memorization assignments (Every year a certain number of hadith has to be memorized).	Lecture Assignments Oral Test Final Examination
Lecturer B	Hadith I Hadith II Hadith Hukum	Provide contents of hadith texts through lecture sessions and discussions. Students are assign to find the 'uniqueness' of the texts.	Assignment Final examination
Lecturer C	Hadith I Hadith II	Apply Jigsaw Method in teaching and learning that gives students the opportunities to gather, discuss, share	Group works Written Assignment Final examination

		and memorise the texts of hadith.	
Lecturer D	Study on Contemporary Hadith	Apply Service-Learning, (students learn and share the knowledge with the stakeholders/ communities) Use of audio aid Constant repetition Website source	Reports Final Examination

Diagram 4: Summary of Methods of Memorization of Hadith

CONCLUSION

This article concludes that memorization task is an important assignment given by the lecturers as a way of preserving hadith. The assignment itself portray the identity of Islamic teaching in preparing new generation to learn and re-learn their second source of religion. Each course has specific learning outcomes. Yet most of the courses share same goal that is to empower students learning and facilitating the students to memorize their Prophet's sayings. This article has discovered that the courses' assessment strategies are vary therefore students are exposed to diverse methods of learning and memorizing the texts of hadith. This article suggests that, due to the significance of hadith in Islam and current Muslim communities' needs, students majoring in Islamic study must master hadith and the science of hadith and regard this knowledge as vital as the subject in Quran studies and sciences.

ABSTRACT

The paper deals with the possibilities of applying a metacognitive strategy in the teaching of subject Economics in the environment of Czech secondary education. It is based on the research of OECD on the level of financial literacy and empirical studies. Using the model of multiple regression analysis, the dependency of school success of 138 Czech students with an above-average intellectual level on the personality of the teacher and the time preparation of students is examined. Research has led to the following conclusions: (a) the school success of students is dependent on the teacher's expertise; (b) there is a strong correlation between pedagogical skills of the teacher; (c) it is desirable to lead gifted students to deeper understanding through *analysis, problem solving and creativity*.

INTRODUCTION

In the Czech economic education a memory learning strategy prevails and is often used by teachers of economic subjects at secondary schools. They typically lead students to memorize and understand the key facts, to find information in trusted on-line web-based portals where applications enabling working with legislation are built. The choice of one or another strategy of learning is primarily influenced by the cognitive goals we want to achieve in our students and their learning prerequisites (Ozturk, 2017). For example, if a teacher wants to develop problem solving ability for students, they need to use a meta-cognitive strategy that carries indicators appropriate to the development of this competence (Safari, Meskini, 2016). In the conditions of Czech secondary education this type of strategy has not been developed yet (Berková, Králová, 2015; Pasiar, Berková et al., 2015). The reason may be the fact that it is not taken into account that the teacher has been teaching differently capable students who have their real abilities different regardless of the current school success. The difficulty of the subject is usually adapted to the average students, and the talented individuals who are losing motivation because of the lack of deeper knowledge they ask for, they stand aside. At the same time it was proven for the Czech economic education that in the learning process students with an above-average intellectual level are motivated by getting deeper knowledge, i.e. the application of cognitive and metacognitive learning strategies, or the guidance of students to in-depth learning style (Berková, Krejčová, 2016). The teacher should take these factors into account and adapt the chosen learning strategy to their needs. This way they will lead the education process according to students' real educational needs (Little et al., 2003; Kiliyanni, Sivaraman, 2016). The topic studied is currently being discussed in expert groups of scholars, teachers and psychologists, and is one of the most pressing issues in the development of Czech education.

The aim of the empirical study is to study the possibilities of applying a metacognitive strategy in teaching the subject of Economics in the conditions of secondary education in the Czech Republic on the grounds that the ability to solve financial problems by realizing the thinking operations and processes and arriving at the right conclusion while engaging creative thinking was proven by the OECD (2014) survey of 15-year-old students from around the world. For these purposes the authors quantified the influence of teachers' professional competencies (i.e. communication and presentation skills, development of economic thinking, the ability to explain the curriculum and expertise) that the authors consider to be key things (Pasiar, Berková et al., 2015) and the time preparation of Czech students at the age of 16-17 with above-average intellectual level for their school success in the subject of Economics.

LITERATURE REVIEW

Learning strategies are generally defined as determinants of learning outcomes. They can be understood as: "The procedures of a larger boom by which a student performs a particular plan in a particular way in solving a task, wants to achieve something and avoid something else" (Mareš, 1998, p. 58). The strategies of learning determine the approaches of the teachers, who influence the student's learning style, or how and by using which of the mental processes (*analysis, synthesis, generalization, concretization, abstraction, deduction, induction, observation* etc.) the student will study the curriculum.

The role of metacognitive strategy is important in education. Sternberg (2009, p. 215) defines metacognition as "the ability to think about own processes of thinking and ways to improve their thinking." The executive functions are an important neuropsychological correlate of metacognitive processes enabling the control and coordination of cognitive and behavioural processes in the implementation of a task, such as ability to concentrate and distribute attention, selective focus on key elements of the task and filtering of irrelevant factors, planning and sorting of activities or working memory (Krejčová 2013). The metacognitive strategy was dealt with by leading teachers Škoda, Doulik et al. (2016) who empirically verified the application of this strategy based on the IBSE (*a rather frequently applied strategy of directing learning activities in teaching science subjects*) in direct teaching at 332 secondary school students for five months. The highest learning outcomes were achieved in students who used active information processing. According to the authors, this result is influenced by the use of metacognitive strategies in the learning system and by leading students to meta-cognitive knowledge as opposed to memory strategies that develop learning (i.e., lower level of Bloom's taxonomy - *remembering, understanding, and applying*). Learning strategies are closely related to the revised taxonomy of cognitive levels by Bloom (Anderson, Krathwohl et al., 2001) and always develop a specific level illustrating the student's ability (Figure1).

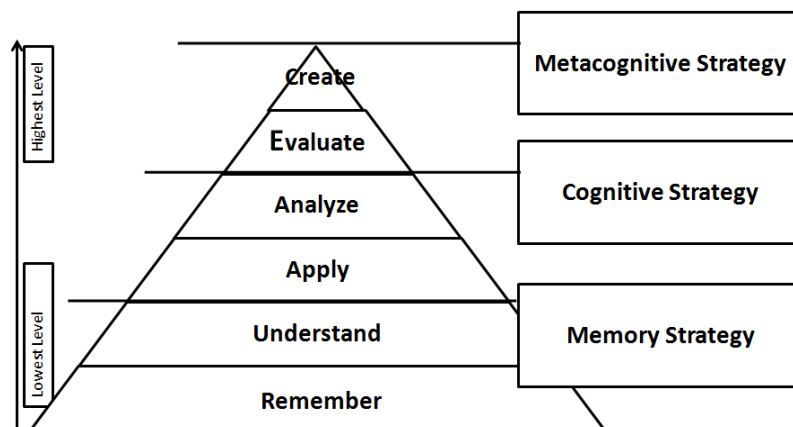

Figure 1: Learning Strategies in the Revised Taxonomy of Cognitive Process Dimensions by Bloom
Source: Authors' Modification according to Andreson, Krathwohl et al. (2001)

Figure 1 shows that memory learning strategies develop in students the lowest levels of ability - *remembering* and *understanding*; Cognitive learning strategies can develop *application* and *analysis*; the highest dimension of the cognitive process - *evaluation* and *creativity* - develops metacognitive learning strategies. The development of higher dimensions of the cognitive process is nowadays very popular abroad, where metacognitive strategies are widely used as a means to develop creative thinking and guide students to creativity in problem solving (Corgnet, Espín, Hernán-González, 2016; Karadeniz, 2016; Ras, 2014; Krpálek, Krpálová Krelová, 2016).

According to the OECD (2014), 15-year-old Czech students within the level of financial literacy through a PISA survey are above the OECD average level. Czech students are able to analyze and make decisions in normal financial situations. But they are not able to solve more complex financial problems in the long term run and creative thinking is not developed. These results show the status of students in compulsory education. Students who study economic subjects are supposed to have their economic skills being evolved continuously. In the given context, the teacher's pedagogical abilities are a factor which is a powerful element influencing the motivation and school success of the students. An empirical study, focused on the factors influencing the motivation of 277 Czech students aged 16-17 to study an economic subject, found out that different teacher's abilities have impact on students with different intellectual levels (Berková, Krejčová, 2016). Students with an above-average intellectual level are mostly motivated by the teacher's expertise, a weaker connection has been demonstrated in the ability to explain the curriculum and to develop thinking. This is because all abilities are

correlated and mutually interacting. From the point of view of the motivational potential of talented students, it is necessary to offer them deeper, more interesting knowledge of the issue by the way of active processing of information and problem solving (Cheung, Jhaveri, 2016). However, the question remains whether these pedagogical abilities of a teacher will also enhance the school success of a group of gifted students as a result of greater involvement in learning, i.e. due to an increase in their motivation potential and if a meta-cognitive strategy that includes the indicators of deeper knowledge development - *active information processing, problem solving* - a prerequisite for increasing the efficiency of the student's learning process.

When examining the relationship between the student's intellectual level and the efficiency of his cognitive processes, the definition of intelligence needs to be defined. In this study the authors understand intelligence in accordance with Sternberg's cognitive-contextual definition as "(1) the ability to achieve one's goals in life, given one's socio-cultural context; (2) by capitalizing on strengths and correcting or compensating for weaknesses; (3) in order to adapt to, shape, and select environments; (4) through a combination of analytical, creative, and practical abilities" (Sternberg, 2005, p. 189). One of the dominant functions of intelligence diagnostics is the prediction of school success, so the relationship between the intellectual level and the school assessment is the subject of a number of empirical studies. Neisser's research, Bouchard et al. (1996) demonstrated a correlation between the level of intelligence and school achievement .50, with the relationship between intelligence and school benefits being reciprocal (students with higher IQ are more motivated to school learning than lower IQ students). Rindermann and Neubauer (2004) have demonstrated in their research the superiority of the speed of information processing that influences the level of intelligence (and creativity as well) that affect school performance, so the processing speed indirectly influences school performance as well. On the basis of these conclusions, we can expect higher data processing speed for students above the average intellectual level, which is likely to place greater demands on the teacher's expertise.

RESEARCH METHODOLOGY AND DATA

In relation to the goal - to apply the metacognitive strategy of learning to the teaching of Economics in the conditions of secondary education in the Czech Republic - this hypothesis is verified:

H: *The school success rate of students with an above-average intellectual level in the area of abstract-visual thinking in the subject of Economics depends on the teacher's expertise.*

The research sample was created on the basis of deliberate selection, the main criterion of which was the above-average intellectual level of the student, regardless of the teaching strategies used by the teacher. The research was attended by 138 students of economic fields aged 16-17. (45% of the sample were 16-year-old students and 56% of the sample were students at the age of 17). Students are traced to a number of characters - the intellectual level (over 110 IQ points), the school success rate measured by the mark from the subject of Economics and weekly preparation. This age range was chosen to find adequate learning strategies in economic education for older students with above average intellectual levels, as the OECD survey (2014) shows that the results of Czech 15-year students in financial literacy are above the OECD average. The structure of respondents according to their school success and intellectual level is shown in Table 1. Among the above-average intelligent students are also those who, according to the school success in the given subject, do not conform to their prerequisites (In this group, there appear up to 40.5% of individuals with worse school success with marks 3, 4, 5)

Table 1: Structure of Respondents by School Success and Intellectual Level.

School success in subject economics (mark)	Students with above-average intellectual level	
	Absolute Frequency	Relative frequency
1	31	22.5 %
2	51	37 %
3	40	29 %
4	10	7.2 %
5	6	4.3 %
Total	138	100 %

For **data collection** the following methods were used (a) *method of questioning*, (b) *method of testing* (in cooperation with the *Testcentrum* organization in the Czech Republic). The method of questioning identified students' attitudes towards the personality assessment of the teacher of subject of Economics. For the measurement of the intellectual level, a *Viennese Matrices Test of pencil-paper version* was chosen. The test allows to quantify the general level of intellectual performance in the level of abstract-visual thinking, while perception, thinking, attention and memory are applied in the overall strategy (Forman, 2002, p. 8). The approximate distribution of students to groups is a matter of teacher's diagnostic competence based on the

observation, product analysis and thought strategies, etc. Students can also be distributed by means of psychodiagnostic methods. The questionnaire was structured into the following sections: (a) *student data* (gender, secondary school, student identification number, mark from the subject of Economics); (b) *weekly student preparation time* (identified by the codes on scales 1 - 5 representing the following time intervals) - not preparing for the subject at all (1), less than 60 minutes (2), 1-2 hours (3), 2 - 4 hours, (4), more than 4 hours (5); (c) *teacher's personality evaluation*. The personality of the teacher is evaluated on a scale of 1-5, followed in five categories representing the key professional competences (1) *communication* (pronunciation, engagement, pace and melody, keeping attention, giving attention, and listening); (2) *presentation* (examples from practice, good actor, eye contact, nervousness management); (3) *explanation of the curriculum* (practical meaning of the subject, acceptance of unusual ideas, explanation of mistakes); (4) *development of economic thinking* (interest in the course of work, leading to thinking); (5) *expertise* (answering correctly and consistently to all questions).

The data was analyzed with the support from the NCSS statistical program (version 2007). Verification of the zero hypothesis was performed at a 5% significance using a multiple regression model via the t-parameter test and the F-test model. For the purpose of verifying the hypothesis by statistical tests, the zero hypothesis states that there is no dependence between the variables:

$$H_0: \beta_1 = 0$$

School success rate of students with above-average intellectual level in the level of abstract-visual thinking in the subject of Economics does not depend on the studied factors.

The normality of quantitative data was determined by the Kolmogorov-Smirnov test. Reliability of the test increases with the number of measurements ($n > 100$). This condition is met by the research. The data distribution was verified by Probability Plots. A multiple linear regression and correlation analysis method was used to verify the hypothesis. Thus, the dependence of the explained variable y (mark) on the seven explanatory variables $x_1, x_2, x_3, x_4, x_5, x_6, x_7$, where x_1 represents the *intellectual level*, x_2 *weekly preparation*, x_3 *communication*, x_4 *presentation*, x_5 *explanation of the curriculum*, x_6 *development of economic thinking*, x_7 *expertise*. Selective partial regression coefficients are an estimate of the theoretical regression coefficients that can be obtained by the least squares method. Partial regression coefficients represent the average change of the dependent variable y corresponding to the unit change of the independent variable x_i , provided that the other explanatory variables are constant. The regression coefficients b_0 and b_i quantify the effect of each independent variable on the dependent variable. This determines the greatest and smallest influence of the independent variables on the dependent variable and also if they are in a positive (+) or negative (-) relationship. Variables included in the multiple regression model must be as minimally dependent on one another as possible (Draper, Smith, 1998). For this purpose, *Stepwise method* will be used to determine the multi-collinearity. Furthermore, the magnitude of the correlation coefficient R^2 , which shows the dependence force, will be monitored. Explanatory variables must be in a linear dependence that can be measured by a Spearman correlation coefficient which value should be greater than 0.4.

Based on a sample of 138 observations, an empirical function estimation with these parameters will be performed. The model of multiple linear regression can be mathematized in the following way (Draper, Smith, 1998; Weiss, 2012):

$$Y = f(x; b_0, b_1, b_2, b_3, b_4, b_5, b_6, b_7), \quad (1)$$

where: b_0 – constant, $b_1 - b_7$ – are the values of the empirical function (estimates of the theoretical regression function).

The estimate of the regression function can be written as:

$$Y = b_0 + b_1x_1 + \dots + b_7x_7, \quad (2)$$

providing that the conditions of the multiple regression model are met.

RESULTS

Kolmogorov-Smirnov test at 5% signification did not confirm the normality of the dependent variable. The rate of deviation of the data distribution from normal distribution is very small, although it is not significant ($P = 0.053$). Data distribution has therefore been verified by exploration analysis to determine the extent to which file data distribution is close to normal distribution (Figure 2). The data is not too deviated from the line (in the middle), which can be considered as a boundary result.

Based on the results of the normality test and the exploration analysis, the data was transformed with no significant improvement after the transformation. Despite the above mentioned results, the model residue are approximately constantly dispersed around the zero, which means they have no tendency and the model can be considered correct (Figure 3). To verify the zero hypothesis, the default data is used with respect to the boundary result of normality test.

Figure 2: Exploratory Analysis.

Figure 3: Residue Analysis.

Multiple regression and correlation analysis model to apply metacognitive strategy

To verify H_0 , the multicollinearity between the explanatory variables $x_1 - x_7$ was evaluated using the Spearman correlation coefficient with using the correlation matrix. The following results were found: (a) *communication* strongly correlates with other explanatory variables (correlation coefficient was higher than 0.4); (b) *presentation* correlates with other explanatory variables (correlation coefficient was higher than 0.4), at the same time the strongest correlation between communication and presentation abilities (0.856) were found; (c) *explanation of the curriculum and developing economic thinking* are also in a strong correlation relationship; (d) *expertise* is also in the correlation relation which is the least strong and the correlation coefficient is in the range between 0.687- 0.544. At the same time, the significance of the correlation relationship for all combinations of linear dependence of explanatory variables at the 5% significance level ($P < 0.01$) was confirmed. By the method of multiple linear regression analysis, the linear dependence of the school success of the above-average intelligent students on the factors studied was quantified. Estimates of partial regression coefficients b_i and regression analysis results by the Stepwise method are presented in Table 2.

Table 2: Multiple Regression Analysis Model.

	Regression Coefficient b_i	Standard Error Sb_i	T-Value to test $H_0: B(i) = 0$	Prob Level	Reject H_0 at 5 %
intercept	2.8924	1.6297	1.775	0.0783	No
IQ	0.0234	0.0137	-0.296	0.7675	No
time	-0.0041	0.1027	0.228	0.8199	No
communication	-1.2137	0.9484	-1.280	0.2029	No
presentation	0.3729	0.8118	0.459	0.6468	No
explanation	-0.2465	0.6040	-0.408	0.6839	No
development of thinking	-0.3608	0.6320	-0.571	0.5691	No
expertise	1.0942	0.4888	2.239	0.0269	Yes

The average school success of students without the influence of independent variables is 2.89. This value does not correspond to the above-average intellectual level of the students, which is due to the presence of 56 pupils (40.5%) with the subject rating of marks 3, 4, 5. Only 59.5% of students who were marked 1 and 2 are in the study group. At 95% reliability of the test, there is a positive correlation between the school success rate of students with an above-average intellectual level in the subject of Economics and the teacher's expertise ($P = 0.0269$), thus by increasing the teacher's expertise there will increase the school success of these students. At the same time, with a 5% risk, it can be stated that the school success of these students is not dependent on the other variables. Less variability is explained in the model. The value of R^2 is 0.0506. This means that other variables that have not been included in the model are affected by school success. The regression model of multiple dependence for $n = 138$ can be described as follows:

$$Y_i = 2.8924 + 1.094 x_{7i} \quad (3)$$

If the expertise of the teacher of subject Economics increases by 1 rating degree, the school success rate of students with an above-average intellectual level will be improved by 1.094 (by 1 mark).

DISCUSSION AND CONCLUSIONS

A model of multiple regression analysis found that the school success rate of 138 gifted students with an intellectual level above 110 IQ scores is achieved due to the teacher's expertise at the significance of 5%. (In the research, this ability was defined as answering factually correctly and consistently to all students' questions.) In the other variables (communication, presentation skills, curriculum explanation, development of thinking and student preparation time) no significant influence was demonstrated. This group was mostly affected by the detailed and deeper interpretation of the teacher, which corresponds to the intellectual level of students and their educational needs (Little et al., 2003; Kiliyanni, Sivaraman, 2016). The authors estimate that the value of the partial regression coefficient ($b_7 = 1.094$) is significant because with 95% reliability of the test it can be stated that if the students perceive the teacher better by 1 rating degree (1 - 5 scale that was used for the research), then the school success of gifted students will increase. That means the teacher must not only maintain and deepen their economic expertise and therefore respect the didactic principle of science, but also use their expertise to work with this group of students in a problem-solving way and develop higher cognitive levels (Anderson, Krathwohl et al., 2001), thus respecting the didactic principle of active students' participation. It should not only develop so-called *situated learning* by using the memory strategies that are often used in the Czech Republic (Berková, Králová, 2015; Pasiar, Berková et al., 2015). Despite the proven dependence of school success on the teacher's expertise and the value of the partial regression coefficient, less variability is explained in the model ($R^2 = 0.0506$), indicating that no other variables affecting school success have been included in the model.

The authors' study has shown that the average mark of 138 gifted students in the subject of Economics is 2.89. The value confirms that it is desirable for the teacher to use a deeper, problematic interpretation in teaching when working with this group of students, which will lead to active processing of information and attracting students to real-life situations. This can lead students to an in-depth learning style that is firmly associated with higher thinking processes that students have to use in a given context, such as *analysis, problem solving, creativity*. These indicators of development of this learning style are included in the metacognitive strategies that lead to the development of higher thinking processes and awareness of their own processes, further developing the ability to concentrate and distribute the attention, selective focus on key task elements and filtering of irrelevant factors, planning and sorting of activities and working memory (Safari, Meskini, 2016; Krejčová, 2013; Corgnet, Espín, Hernán-González, 2016; Karadeniz, 2016; Ras, 2014). Metacognitive strategies also lead to higher learning outcomes (Škoda, Doulik et al., 2016) and at the same time motivate talented students with above-average intellectual level (Berková, Krejčová, 2016). These procedures can be used for students aged 16-17, based on the very good results of financial competencies for Czech students at the age of 15 completing compulsory school attendance (OECD, 2014). The level of financial literacy of Czech students is above the average of OECD results - students are able to analyze and decide in normal financial situations. This creates a prerequisite for the development of higher cognitive levels through a metacognitive strategy - from problem solving to the level of creativity (Cheung, Jhaveri, 2016; Krpálek, Krpálová Krelová, 2016). These skills should also be included in the classification, because the reason for the relatively poor results of talented students from the subject of Economics may also be the fact that the marking is only memorising facts-oriented.

With regard to the fact that the research was not focused on the quantification of the influence of all the abilities describing the whole personality of the teacher, for the application of metacognitive strategy in the teaching of Economics in the conditions of the Czech secondary education the study brought the following practical conclusions, which can be summarized as follows:

- School success of talented students aged 16-17 with above-average intellectual level can be improved at secondary schools in the subject of Economics by increasing the teacher's expertise through the transfer to the teaching process. On the other hand, to improve the benefit of gifted students, it does not affect if the teacher will pay more attention to students if they try to keep their attention, if they improve pronunciation, the attractiveness of interpretation, if they become good actors. There is also no significant improvement in school success in improving the teacher's explanation of curriculum and the development of economic thinking and the student's preparation time.
- In spite of the above mentioned facts, the correlation of the teacher's abilities was confirmed, as evidenced by the fact that the most powerful factor influencing the marks of the gifted student in the subject of Economics is teacher's expertise. This can be explained by the fact that the teacher's expertise is an embodiment of all these abilities that are strongly correlated. To improve school success, the teacher must, however, improve all the studied pedagogical competences in order to achieve the

appropriate effect from the teaching units and thus increase the learning outcomes of students with above-average intellectual levels.

- Although these 138 gifted students surveyed have an intellectual level higher than 110 IQ points, the average mark from the subject of Economics was 2.89. This value is surprising and signals possible problems in the methodical management of lessons by Czech teachers, who rather use memory strategies of learning that develop lower cognitive levels - *remembering, understanding*. Average school success indicates this finding, as gifted students can experience a higher sense of boredom by lower cognitive levels and decrease their motivation to learning and interest in the subject.
- To remedy the conditions the authors recommend applying a metacognitive learning strategy in teaching the subject of Economics in secondary education to this group of students in a similar way that is used abroad. With this strategy the teacher will use the problem-solving method with the use of real-life stories. Students will thus be drawn to a deeper understanding of the reality they demand and they will be able to use higher thinking processes to identify and solve the problem, i.e., *analysis, evaluation, or creativity*.

Other research studies will be focused on the analysis of ways of developing higher cognitive levels of gifted students in economic education in the Czech Republic.

Aspiration and Determination in College-Level Mathematics

Gheorghita M. FAITAR

D'Youville College, Buffalo,

New York, United States

faitarg@dyc.edu

ABSTRACT

The scholarly educational studies prove that there is a direct correlation between students' tracking during middle and high-school formation and success in STEM disciplines at the post-secondary education level. The present article will continue analyzing this idea while taking in consideration the students' views and aspirations toward general education formation. Sophomores and juniors are questioned in the process of knowledge acquisition as to what their career aspirations are. The majority of the students (two-thirds girls) were able to accurately assess their future goals and educational career possibilities. The undecided students, as well as the ones who knew already their future career goals, were part of the first and second semesters groups involved in Mathematics 101. This was offered by one Upstate New York college as part of the core requirements for any high-school student interested in pursuing a health, STEM, or even a liberal arts related career. Their individual endeavors and level of preparedness were quantified through exams and daily tasks throughout the course. The end of course results were interpreted and analyzed in connection to their initial career goals.

INTRODUCTION

In a study realized in 2004, researchers proved that mathematics self-efficacy and outcome expectations are predictive of students' interest in math and science courses (Lopez, Lent, Brown and Gore, 1997). The ideas of the afore-mentioned study are conducive to the conclusion formulated by Turner, Steward and Lapan (2004); both mother's support and father's support positively affected adolescents' math efficacy, nonetheless, only mother's support affected their math outcome expectations. In conjunction with the previously formulated conclusion another major finding was highlighted; "children who perceive that math and science careers are appropriate gender-equitable pursuits have greater math self-efficacy and greater expectations that math will be useful and valuable to them in their future careers" (p.48).

There is another interesting study by Moritz Rudasill and Callahan that highlights how out of a comprehensive grades 5 to 12 study, the girls' self-perceptions of ability scores to the most important Math and English annual scores were always higher than boys' scores in these different areas. The findings illustrate the direct relationship between students' self-perceptions of ability and their future plans for careers. Although girls have the same intellectual abilities regarding 'hard core' Mathematics and Science courses as boys, they plan on taking courses leading to the careers suitable for women, such as social sciences, biology, health, and education careers.

As previously mentioned, female students chose to a great extent the health careers (76%), education specialization (83% professional choice), and social/human services (82%). "Male students as per general statistics chose professions such as computer science (83% male), engineering (86%), and manufacturing (87%)" (Conklin, as mentioned in Rudasill and Callahan, 2010, p.203).

Recent scientific evidence points out that there is a significant difference between the 'masculine' and feminine choice occupations. Engineering, technology, computer science versus accounting, social sciences, education, elementary education, in particular are strictly identified and embraced based on the student's gender. Whereas girls are more prone to choose the ones that fit their inclinations and gender interests, the boys chose occupations that resonate with their self-perceptions as being suited or adapted to their professional choices (White & White, 2006). Counting all past and present research evidence, it is proven that both average and high-ability students always consider mathematics as a 'masculine' activity (Halpern, Benbow, Geary, Gur, Hyde, and Gernsbacher, 2007).

Along the same lines the importance of self-perceptions of intellectual abilities for course choices stands as paramount in choosing a career path, especially at the high-school level (Eccles and Wigfield, 1995; Farmer, Wardrop, & Rotella, 1999).

Nonetheless, maybe, it is important to start understanding the deficit in mathematics, and scientific base knowledge from the beginning of the contemporary, last century's, seventies educational revamping efforts. The whole preparation for the STEM careers starts at the elementary level. As explained by specialists, "the basic treatment of content in the elementary grades has not changed for decades" (Wattenberg, 2014, p.22). In the report "*A Nation at Risk*", 1983, the National Commission on Excellence formulated the now famous report on education, decrying the American education that was present at the national stage level, as well as the inadequate content offered to elementary students (Wattenberg, 2014). As mentioned in the article, the US elementary schools in the 1980s were characterized by a really thin content. Since then, the change has not been done to improve. In the table provided in the article regarding minutes spent per day on science and social studies, it is specified that in 1977, K-3 social studies amounted for twenty-one minutes, 4-6 social studies accounted for 34 minutes. In 2012 the K-3 social studies totaled sixteen minutes and the 4-6 social studies accounted for twenty-one minutes. The same stats were formulated for science; K-3 science in 1977, 17 minutes and 4-6 science, 28 minutes. In 2012, K-3 science meant nineteen minutes, and 4-6 science accounted for 24 minutes (Wattenberg, 2014, p.23). Indeed, not an important transformation regarding minutes dedicated to training for the most important elements of STEM practice, sciences and certainly, the defining mathematics apparatus. In the article the author mentions how the squeeze on content was prevalent for the struggling students. An impressive 60 percent of the elementary teachers recognized that students who needed extra instruction in English language arts, were pulled from social studies, or 55 percent admitted that they were excused from the science classes. The regress in explanation of basic science principles and applications could amount for the loss in interest, especially regarding STEM specialties.

In order to have a better curriculum, with improved mathematical and scientific achievable standards for all elementary, middle, and high school students, it is quintessential to work for revamped frameworks, course outlines and classroom materials amounting to extended periods of instruction.

In regard to the subject treated, mathematics achievement could be also tied to poor math skills (Beilock, and Willingham, 2014). As mentioned in another study, the authors investigated the fact that math anxiety could be related to the 'bad at math' perception. The authors expressed the idea that math anxiety implies more than being 'bad at math'. It also explains this anxiety is conducive to a loss of a portion of the working memory. The article concludes with the idea that a loss in the working memory which is important for solving problems could be addressed in the years of training for the pre-service teachers. The authors saw relevant to offer in the pre-service teaching years more instruction on how to teach math concepts rather than a course on math concepts themselves (Beilock, and Willingham, 2014, p.31). An interesting conclusion also prevails in regard to the fact that negativity about math could develop due to parents, teacher's influence, but also media. Therefore, it is important to focus on teacher training in lessening in-class anxiety through a more encompassing testing procedure, including ways in which they assess the students. It is suggested in the article to try reducing math anxiety through a writing exercise in which students have the opportunity to write about their emotions and feelings regarding testing on-course for a short period of time.

As a conclusion, it is anticipated that teachers at all levels need common planning time, targeted time built in the schedule to discuss, understand and improve student learning in any institutional formatting. Conventional and non-conventional methods of increased learning through diversification of methods of teaching might constitute the ticket to a more productive process.

THE STUDY

An initial career survey was applied in the department of Mathematics and Natural Sciences at an Upstate New York College for the sophomore and junior students enrolled in the offered academic disciplines of LSK (Learning Skills) and Mat 101 during the 2016-2017 AY. The eighteen students (seventeen girls and one male student) of grade ten and eleven were initially asked what was their general option regarding future careers. Some of the students acknowledged their options with great determination, others were undecided. Out of the eighteen students asked,

two were certain about a medical (doctor) career, one aimed for architecture, one for engineering, five for nursing and health sciences, one liberal arts, one IT, one student for a teaching profession, one envisioned an accounting career option, another one opted for forensic sciences, and the rest four were undecided.

Amidst all of the LSK (learning skills for math) and MAT 101 core teaching, students were taking quizzes and mid-term exams, as well as a final exam after each section taught. Therefore, at the completion of the LSK, all of the students were tested for the assessment of knowledge level acquired. A final grade was formulated for all of the subjects in the class.

The two separate sections of LSK and MAT 101 followed the same learning and assessing structure. The students, who took LSK and finished with grades C or above, continued with MAT 101.

In the process of grading, we did not have specially formulated subjects, or individualized lessons' plans aiming for capturing the skills or interests of any individual students. All students were taught and tested the same, with the mathematical core knowledge and concepts presented on a classic blackboard/white board combination during the allotted time course for the subject.

At the completion of LSK we identified grades for all students establishing a connection between grades and professional goals. The ones aiming for the medical degrees at the conclusion of the LSK session managed A's and A minus grades. The architecture vocation student finalized the class with an A grade. The engineering option resulted in an A minus. The students aiming for health sciences and nursing professions obtained grades such as 2 Bs, A minus, B plus, and 2Cs. The IT aspirant got a B. The liberal arts finalized the LSK with a C, the accountant with a B, the aspiring teacher totalized the average for an A grade. The ones who were undecided, with the exception of one who got an A minus for LSK, and then never returned for MAT 101, all of the rest failed to pass this introductory course in skills for mathematics.

As already mentioned the students who passed the LSK section, continued with MAT 101, a college level mathematics introductory course. In analyzing their final results for the course, I came to the conclusion that all of the students who initially were prepared to take the strenuous road toward a high demand-high rewarding career such as the ones promoted by STEM, including the medical doctor field, managed to finish the college course with much desired A's and B's grades. The aspiring medical doctors finished with A minus, respectively, A grades, the architect with an A, the engineer one with an A also, the ones aiming specializing in health sciences, nursing, totalized the averages for C pluses and a D plus. The IT aspiring student got a B plus. The liberal arts failed this MAT 101, the accountant aspirant (school athlete as well) failed, and the teacher in preparation totalized the average for a B plus.

CONCLUSIONS

In the conducted study it was obvious that the students who aimed for specializations in highly regarded careers such as the ones emphasized by the STEM disciplines, including biological and medical sciences were more able to constantly prepare to a greater extent for the demands and rigors of the mathematical requirements. They were continuously devoting time and attention to the core course requirements, being more involved in a higher mathematical knowledge and understanding. All of the students specializing in STEM and medical fields were able to acquire the best grades in both sections. The students who were undecided from the beginning dropped or failed the first level LSK class, to never return, and the ones that were aspiring to become involved with the liberal arts or accounting didn't show the high persistence in analyzing, understanding and qualifying for a passing grade in the end. The grades for the health sciences, nursing aspiring students decreased a level, whereas the accountant aspiring student failed the MAT101, probably, due to substantiated time in preparation, or re-directed interest. She was a student athlete, and, therefore, always in training for competitions at her school. The future teacher aspirant, nonetheless, with adamant determination and consistent preparation got very good results in both mathematical sections.

As it can be seen from the afore-mentioned study, the best indicators to student success in both LSK and Mat 101 courses was student initial identification of their vocational aspiration, followed by the consistent training required for the completion of mathematical core knowledge at each level.

Once that initial vocational aspiration identified, the students imbued themselves in all of the much needed study time and preparation for the desired level of mathematical accomplishment.

For a better approach to teaching and learning in class, students should supposedly be well informed about the professional path leading to their desired careers. They should certainly search for the best vocational career in accordance to their talents, inclinations, qualifications. The counseling, consultation, and orientation promoted in each level at school will help toward finding the most appropriate careers and vocations in the general student population. Once their aspiring vocation determined, the students will be able to continue with sustained effort and determination in completing the necessary training leading to the final vocational goal. In regard to increasing the level of knowledge, it is quintessential that teachers devote more time in finding ways to address the needs of testing and assessing all students through various methods so that every student will take the required tests with the anxiety and stress testing levels diminished to a minimum. All teachers may want to address the needs of diverse student population and interests in their classes, by designing individualized lessons, lesson plans for their students.

ABSTRACT

This study aim to (a) validate the framework for assessing the mathematical problem solving skill, and (b) assess the students' mathematical problem solving skill by using the innovative Lesson Study and Open Approach in the classrooms. The samples were 520 fifth and sixth grades students from 18 primary schools in the northeastern region of Thailand. The construct modelling approach was used to develop and validate the framework for assessing the students. The data were collected and analyzed by using mixed methods design in the second semester of the academic year 2016. The qualitative design used to understand how students process mathematical problem solving and develop the assessment framework. The quantitative design used to validate and assess their mathematical problem solving skill through the 4-level learning progress map as a conceptual framework. The research tool was the open-ended questions consisted of nine items in six tasks. The framework for assessing mathematical problem solving skill is high quality evidences in validity and reliability indices which fit and appropriate in the real contexts assessment of the students provides the information for formative feedback to students how they learning progress, particularly knowing what students know and can do, and knowing what students need to know and can do. The finding is very beneficial for teachers to improve the students' learning and their instruction. The study suggests the application of the Lesson Study and Open Approach in teaching and learning management to guide the practitioners how to improve the effectiveness of their teaching and help researchers to develop the tools for assessing the students' learning progression in the future study.

Keywords: Lesson Study, Open Approach, Problem Solving, Mathematic Education, Rasch Model, Construct Modelling

INTRODUCTION

Mathematics is complex and abstract subject, yet it is inevitably involved in daily lives. According to the Partnership for 21st Century Learning (2015), mathematical problem solving skill (MPSS) has drawn educators' growing attention

as it is required in creativity, innovation, critical thinking, communication, and collaboration that prompt students to embark on their future career path.

Also, problem solving process can stimulate students' mathematics learning (The National Council of Teachers of Mathematics (NCTM), 2000 as cited in Pizzini et al., 1989). This notion is consistent with the educational reform in Thailand mentioning that one of the mathematics learning objectives is to develop students to become effective problem solvers.

However, the result of National Achievement Test of Thailand in recent years showed that the mathematics achievement of nationwide students was below 50 percent in most contents (The Office for National Education Standards and Quality Assessment (ONESQA), 2015). Also, the result of Ordinary National Education Test (ONET) in mathematics presented that average score of students in grade 6, 9, and 12 was 43.47, 32.40, and 26.59, respectively (the National Institute of Educational Testing Service (NIETS), 2016). According to the report of the Trends in International Mathematics and Science Study, TIMSS) (2015), Thailand's mathematical achievement was ranked the 26th among the total 39 countries. Moreover, the OECD Program for International Student Assessment (2015) revealed that Thai students' mathematics literacy and problem solving were ranked the 55th among the 72 countries.

From all reports mentioned above, it can be indicated that quality of education in Thailand has declined. Problem solving skill is one of the major concern since it builds thinking process leading to solving non-mathematical problems in other subjects. Most students have difficulties in developing their mathematical solving problems (Phonapichat & Wongwanich, 2014). As a result, many educational researchers proposed alternative mathematics teaching approach to enhance students' mathematics learning achievement. For example, Sotirhos (2005) adopted lesson study approach to enhance de-privatizing teaching practice by building teacher collaborative learning communities. Furthermore, the Open Approach has been implemented in teaching mathematics to develop thinking and problem solving process based on individual student's ability (Nohda, 2000; Inprasitha, 2015). Knowing and understanding what students know and can do provides the information for formative feedback to students how they learning progress. Moreover, knowing what students need to know and can do it also very beneficial for teachers to improve the students' learning and their instruction (Wilson & Sloane, 2000). Therefore, assessment is part of learning process. It is the most important thing which educators and teachers can do to help their students.

Educators are looking for the sound framework for MPSS. Assessing MPSS not only on the product of teaching but also on the process of thinking (i.e., product-process-oriented approach). The objectives of this study are to (a) validate the framework for assessing the MPSS, and (b) assess the MPSS of 5 and 6 grades students by using the innovative Lesson Study and Open Approach in the classrooms. The MPSS was analyzed by using ConQuest 2.0 software (Wu, Adam, Wilson, & Haldane, 2007) along with the construct modelling approach (Wilson, 2005) as a conceptual framework to monitor students' learning progress as suggested by Junpeng, Wilson, Inprasitha, and Marwiani (2016). The finding from this study is important because they provide a framework for assessing MPSS with the flexibility and appropriateness for assessment in the real-world context.

THE FRAMEWORK FOR ASSESSING THE MATHEMATICAL PROBLEM SOLVING SKILL

The constructing modelling approach (Wilson, 2005) was used to develop the framework for measure and assess the students' mathematics learning progress in this study. The framework comprises of the Four Building Blocks as described below:

Progress map

The framework for assessing the MPSS containing the progress map is based on synthesizing the definitions of

Polya (1965), Schoenfeld (1985), the National Council of Teachers of Mathematics (NCTM) (2000), and the Organization for Economic Co-operation and Development (OECD) (2012, 2016) according to this following statement:

“Mathematical problem solving skill is a student’s ability to explore, conjecture, and reason logically in cognitive processes to understand how to solve math problems, apply and adopt appropriate strategies to solve the problems and reflect on the process used to solve the problems. It involves the acquisition and application of mathematics concepts and skills in a wide range of situations, including non-routine, open-ended, and real-world problems.”

The progress map was developed based on the study of learning standards and indicators for mathematics learning area 1 based on the Basic Education Core Curriculum B.E. 2551 (A.D. 2008) (Ministry of Education, 2017) to develop measurement scale of the progress map of learning which it is focused on mathematical procedures (see Figure 1).

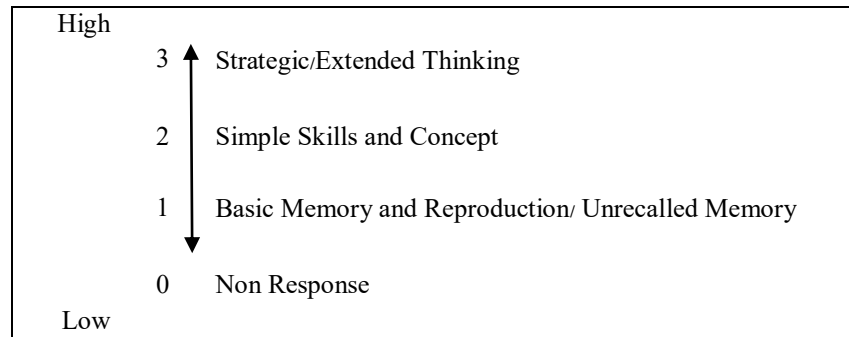

Figure 1 Progress map for assessing MPSS

Item Design

Design the items for the open-ended tasks to assess students' skill in solving numerical and procedural mathematics problems consisted of the following 3 steps:

(a) Design the test with multiple-choice items aiming to monitor how students develop their problem solving and mathematical procedures with possible diverse answers. The items of the assessment test were developed by the 42 pre-service teachers who voluntarily participated in the study. Each pre-service teacher proposed one item; as a result, 42 items were produced.

(b) Validate the quality of the test and determine 2 sets of the test; 5 items each set. The pre-service teachers collaboratively selected 10 items out of 42 items.

(c) Finalize test with the qualified 9 items in 6 tasks.

Outcome Space

The stage was identify scoring guide for assessing MPSS. The score was rated in 4 levels, from 0 to 3 (see Table 1).

Table 1 Scoring guide for assessing students' mathematical problem solving from taking the tasks

Level	Score	Learning progress level	Description (What students know)	Examples
-------	-------	-------------------------	-------------------------------------	----------

Level	Score	Learning progress level	Description (What students know)	Examples
4	3	Strategic/Extended Thinking	Students require investigation, complex reasoning, developing the plan or a sequence of steps for more than one possible answer e.g. What is the equation for the sum of any set of three consecutive odd numbers? The answer is $n+(n+2)+(n+4)$.	A man walking upstairs for 6 floors, and another 2 floors, then walking downstairs 8 floors and walking upstairs again 6 floors. How many steps did the man walk? The answer is $6 + 2 + 8 + 6 = 22$. If one floor has 10 steps, how many steps have the man walked? Thus, the answer should be $(6 + 2 + 8 + 6) \times 10 = 22 \times 10 = 220$ steps.
3	2	Simple Skills and Concept	Students engage mental process using information or conceptual knowledge and require one or two steps to completely solve the problems in all stages. However, the misconception may be occurred e.g. students answer $2+3 \times 8 \div 4-3 = ?$ by starting from mutilation before division, then addition and subtraction which results in the wrong answer. This is explained by their misconception or miscalculation.	The man walked 6 floors, 10 steps = $6 \times 10 = 60$, The man walked 2 floors, 10 steps = $2 \times 10 = 20$, The man walked 8 floors, 10 steps = $8 \times 10 = 80$, and The man walked 6 floors, 10 steps = $6 \times 10 = 60$. So, the man has walked in total $(6 \times 10) + (2 \times 10) + (8 \times 10) + (6 \times 10) = 60 + 20 + 80 + 60 = 220$ steps.
2	1	Basic Memory and Reproduction or Unrecalled Memory	Students can answer simple problems and seen problems from the textbook by applying one step of thinking. However, they are unable to recall appropriate concepts or rules to solve complex problems.	-Students present the incorrect procedure, resulting in the incorrect answer. e.g. The man was at the 6 th floor (10 steps each floor) and walked up 2 more floors, so the man has walked $60+2 = 62$. Therefore, the answer is incorrect.
1	0	Non Response	Students cannot apply any related concept to answer the open-ended problem. The urgent improvement is required.	- No response on the mathematical procedure presentation - Irrelevant answer to the open-ended problem

Measurement Model

The model used in this study is the Multidimensional Random Coefficients Multinomial Logit Model (MRCLM) (Adams, Wilson, & Wang, 1997). It is an extension of the Rash Coefficients Multinomial Logit Model (RCMLM) proposed by Adams and Wilson (1996). The RCMLM and MRCMLM allow for Rash-family models to be specified by two matrices, termed the design and scoring matrices. The RCMLM approach allows, and even encourages, a sensitivity to the real-world context and the construction of models that are built specifically for particular applications (Wilson & Adams, 1995).

Measurement model analysis using ACER ConQuest 2.0 software developed by Wu et al. (2007) was employed to analyze the learning progress of student by considering the Wright Map.

RESEARCH METHODS

Research methodology The mixed method research was used by combining quantitative and qualitative methods to answer the research questions. The qualitative design used to understand how students process mathematical problem solving and construct the progress map. The quantitative design used to validate the framework for assessment. Moreover, the quantitative design used to cut the scores for assigning the students' skill in each level and assess their MPSS through the 4-level learning progress map as a conceptual framework. We assessed 520 students by using this framework. However, this study showed the deep finding only 7 case studies for teachers' application to real life situations and new learning.

The population and sample

The population of this study was students participating in the project of advanced mathematics development in the northeastern region of Thailand. The targeted samples were 520 students in grade 5 and 6 in the second semester of the academic year 2016 of 18 primary schools participating in the project for standard setting by cutting the scores to assign the students' skill in each level. By using purposive sampling technique, 7 students were selected for deep study and discussion of the MPSS assessment in this study.

Research tool

The initial tool contained seven open-ended tasks that consisted of five item bundles that share common open-ended questions. The tool was redesigned based on the feedback from teachers, content experts and an initial empirical analysis of the pilot testing, particularly the validity (Wright map, item fit, and step fit) and reliability information (SEM, internal consistency, and the split-half reliability coefficient). We deleted some items that overlapped the content knowledge between items and some that were inappropriate for 5 and 6 grades students. Consequently, this study uses 9 items that were nested in 6 open-ended questions.

Data analysis

The measurement model adopted 3 models—the MRCML model (Adams, Wilson, & Wang, 1997), the Rasch model (Rasch, 1960), and the Partial Credit Model (Masters, 1982). The data were analyzed by using ACER ConQuest Version 2.0 (Wu et al., 2007).

FINDINGS

Validating the framework for assessing mathematical problem solving skill

Reliability and validity indices

Fit indices and reliability

Based on the application of ConQuest 2.0 software (Wu et al., 2007) in this study, the result of Cronbach's coefficient alpha and Expected-A-Posteriori (EAP/PV) reliability is presented in the test information (see Figure 2).

Figure 2 Test Information from ConQuest 2.0 Software

From Figure 2, the result of test information indicated the highest y-intercept of -0.5 meaning that the difficulty level of the test was medium to easy. The quality of the overall assessment development was tested by using ConQuest 2.0 software with the Cronbach's coefficient alpha (α) of 0.83, consistent with the result of the Expected-A-Posteriori (EAP/PV) reliability of 0.827. Therefore, the quality of the overall assessment was highly reliable. Then, the quality of the overall assessment and each item was analyzed as presented in Table 2.

Table 2 The result of the quality analysis of the overall assessment and each item

Domains		Quality of the assessment of each item	
		Acceptable range	Actual Value
Each item	Difficulty Level (Estimate: b)	-3 to 3	-0.886 to 0.761
	Discrimination level, based on Classical Test Theory (CTT)	Over 0.2	0.53 to 0.71
	Errors	MSNQ value of Weight Fit in the range of CI	7 items have MSNQ of Weight Fit in the range of CI
	Effect size	0.75 to 1.33	0.88 to 1.17
	T-Value	-3 to +3	-2.1 to 2.8
Overall assessment	Cronbach's coefficient alpha (α)	Over 0.7	0.83

From Table 2, the assessment analysis of each item in terms of difficulty level, discrimination level, based on Classical Test Theory (CTT), errors, effect size, accepted T-Value, and Cronbach's coefficient alpha (α) of the overall assessment of 0.83 was in the acceptable range. Therefore, the quality of the assessment is acceptable that can be used as a research tool to measure students' learning progress in the proposed progress map in this study.

Construct validity

The assessment of students' mathematical ability must retain the standard of reliability with high-quality evidence. Thus, the construct validity was examined by using Rasch-family models. The result of the qualitative data analysis showed the cut score in Wright map divided into 5 levels; ranging from 1 to 5.

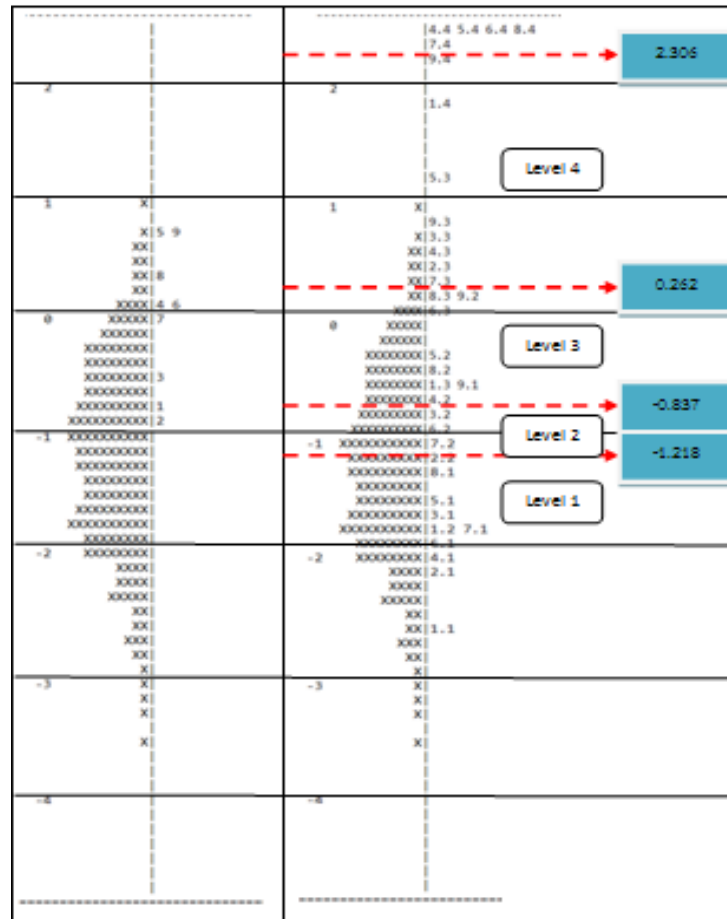

Figure 3 Wright map with thresholds in each level for the initial assessment framework

Figure 3 presents the thresholds of the 0-1 level at -1.218, followed by the 1-2 level at -0.837, the 2-3 level at -0.262, and 3-4 level at 2.306, respectively. The cut scores at level 2 and level 3 were close to each other at -1.218 and -0.837; thus, the level 2 and level 3 were merged into one level, resulting in the progress map consisting of 4 levels in assessing an individual student's learning ability as presented in Figure 4.

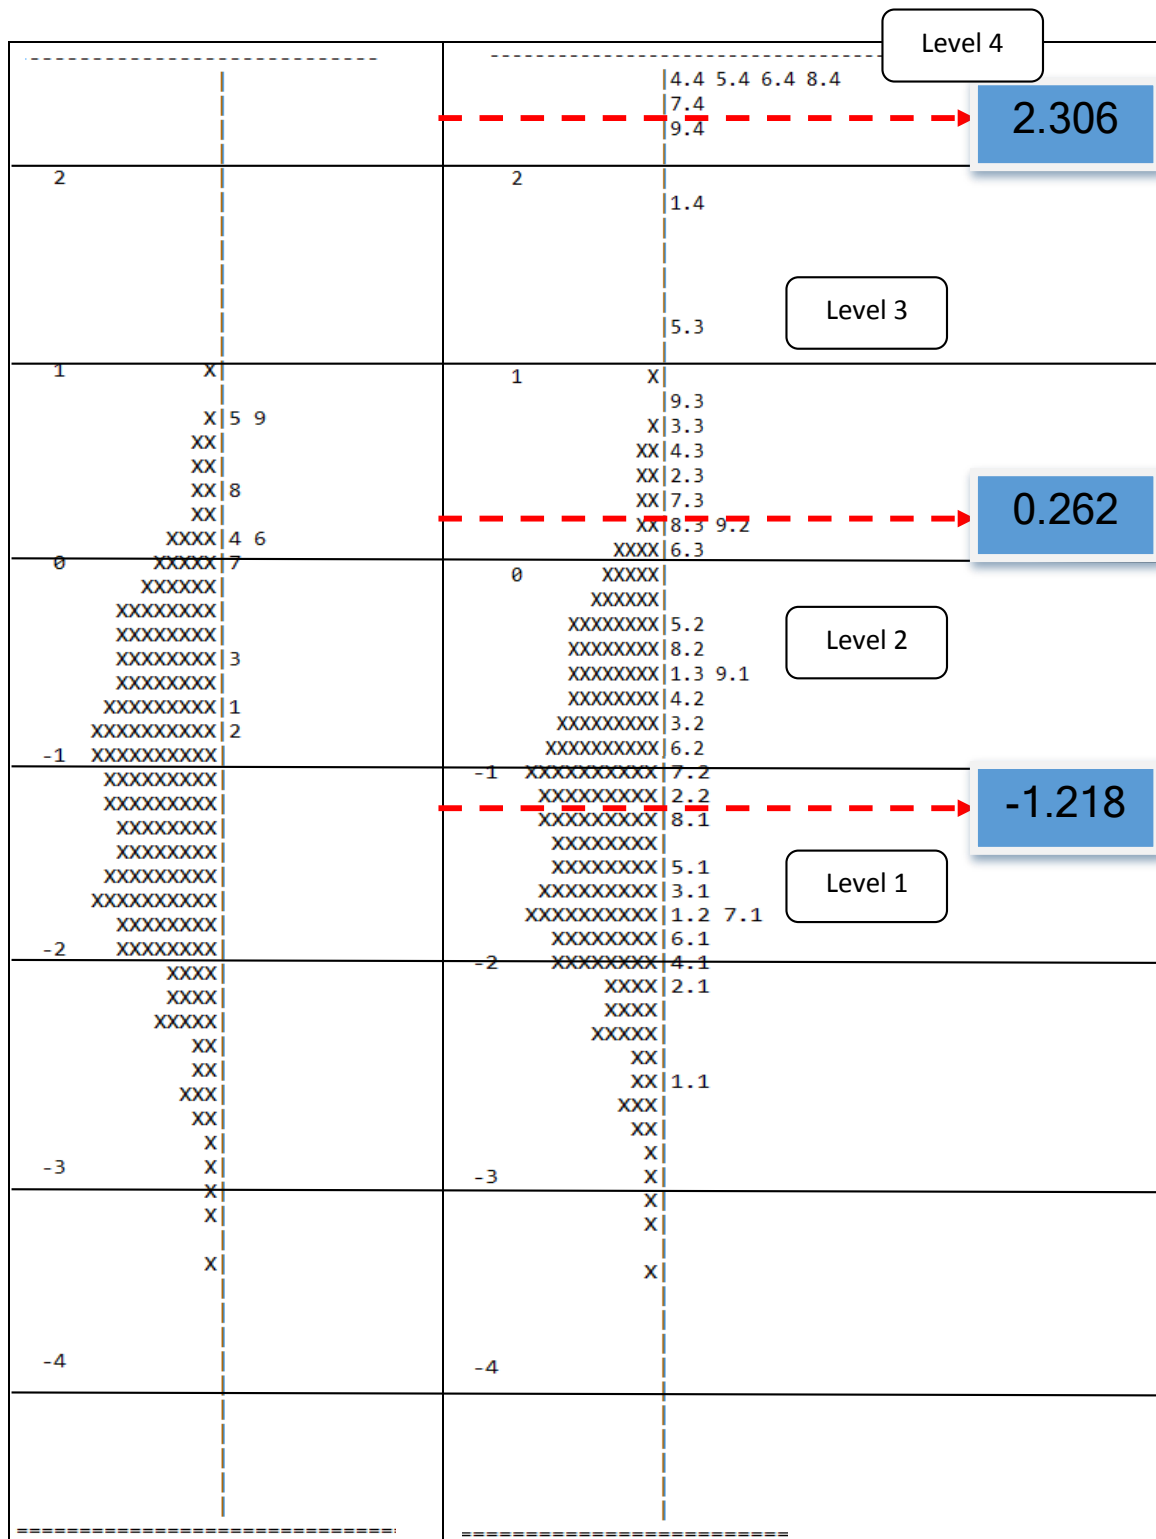

Figure 4 Wright map with thresholds in each for the redesign of assessment framework

Assessing the students' mathematical problem solving skill: 7 case studies

Due to the assessment by using this framework, the result of the students' mathematical ability assessment presented “what students know and can do, and what students need to know and can do” to develop their ability. The finding showed the whole-class mathematical skill and individual student's mathematical skill as follows:

The whole-class assessment

The whole-class assessment of the solving problem ability was examined with the 7 students, 2 male and 5 female, in grade 5. The assessment had the total score of 36. The assessment result showed the average score of the whole-class solving problem ability in mathematical procedures of 13.86, falling in level 2. This can be interpreted that the level of simple skills and concept was below standard score as shown in Figure 5.

Figure 5 Examining the ability levels of 7 students with the standard score

The individual assessment

The assessment of the individual students' solving problem skill, reflecting their learning progress was scored by using the progress map, and analyzed by using ConQuest 2.0 software. The result showed the solving problem ability of an individual student in mathematical procedures with the average standard score of 50. This can be described that students were able to use their mathematical knowledge in solving basic mathematical problems. Thus, the result reflected that students' mathematical knowledge needed to be improved in order to solve advanced mathematical problems as well as present wider mathematical procedures in acquiring an accurate answer.

CONCLUSION

The framework for assessing MPSS is fit and appropriate in the real contexts. The assessment of the solving problem skill based on mathematical procedures of the students was conducted by using lesson study and open approach based on the progress map as suggested by Junpeng et al. (2016). The result of the assessment showed that all 7 students had solving problem ability in mathematical procedures at level 2. This can be interpreted that the students had simple skills and understood a simple concept to solve basic to slightly complex mathematics items. Most students' learning progress reflected that they could apply taught principles and theories in explaining the mathematical procedure and use logical reasoning for the answer. They could also present the relationship of numbers by writing, drawing, and calculating various possible procedures to acquire the answer for each item. However, the students could not solve the advanced mathematical problems in all steps completely which can possibly be explained by their misconception.

The implications of this study indicate the skills that students need to be improved, so-called 'what students need to know' including (1) ability to comprehend basic knowledge, (2) ability to recall formulas, rules and basic theories, (3) ability to apply rules and basic theories in solving simple to difficult mathematical problems, (4) ability to interpret items to eliminate misconception, (5) ability to describe with logical reasoning to acquire an answer, (6) ability to recheck the answer, (7) ability to calculate precisely, and (8) ability to use number, symbols (i.e. picture, graph, diagram to develop answer).

ACKNOWLEDGEMENT

The authors cordially thank Professor Mark Wilson at Graduate School of Education, University of California, Berkeley, USA, Associate Professor Mitree Inprasitha and staff at the Faculty of Education, Khon Kaen University, Thailand for their valuable suggestions on this manuscript and an opportunity to participate in the Project for Developing the Advanced Mathematical Thinking of Students to Reduce Inequality in Education of Thailand as well as the Project Inculcating the Researcher for Creating the International Research Findings 2010 (the Second Time). The authors would like to thank numerous persons of Ku Kham Pittayasarn School and Khon Kaen University Library for their kind assistance throughout the projects.

ABSTRACT

It is no more news that the 21st century world is been driven by sustainability goals. However, this goals has not been able to permeate every nooks and cranes of the world especially the developing world. The impermeability of the sustainability drive in the developing nations can be traced to lack of knowledge of the tools through which sustainability goals can be achieved. This have however warrants the study to build facts from literatures on how education can be used to enlighten and awake the conscious mind of the populace on how sustainable tools like Public-Private Partnership (PPP) works toward achieving the sustainable goals. The study adapts the theory of environmental determinism to establish the necessity of education to promoting the sustainability drive in Nigeria.

Keywords: Sustainability, Education, Public-Private Partnership, Developing countries, Environmental determinism.

INTRODUCTION

It is no more news that the world is driving towards sustainability as the principles of sustainability is gradually permeating all field of human endeavors. The world quest for sustainability is evidenced in the United Nations sustainable development goals which aimed at making the world a better place. Plessis (2002) refer to sustainability as a state which is concerned about man preservation and continuity. Sustainable pursuit without considering man continuity is a goal which cannot be attained. It signifies that man is the center of sustainability drive because the latter (sustainability) is initiated by the former and for the former (man). The quest for sustainability has prompt Governments across the globe to prioritize sustainable practice in their decision making. Such is evidenced in the adoption of a sustainable tool like Public-Private Partnership (PPP) by governments across the globe due to its sustainable capacity in all field of human endeavors. Public-Private partnership as the name implies define the relationship between the Public (government) and the private body (investors) towards achieving a common goal. PPP has proved to be veritable platform through which the world sustainability goals in all fields of human endeavor which includes; health, education, commerce and infrastructure among others can be attained. Its massive impact in nation building has made it attractive to countries across the globe. However, the rate of adoption of PPP does not equal its acceptance in all countries across the globe especially in the developing countries of the world. Developing country like Nigeria has been advocating for the wide spread of PPP in all areas of her society, however, there has been a low patronage of this sustainable tool in the country and such can be traced to the insufficient or lack of knowledge on how the tool works. Such has however warrants the need to use education to enhance PPP knowledge and promote it

at the local level. United Nations Educational, Scientific and Cultural Organization (2002) affirmed that education is very crucial for achieving economic awareness and empowerment. Education has been found to be a potent means of reorienting the minds of the populace towards adapting the requisite knowledge to advance humanity. The need to use education means for achieving the reorientation of the society lies in its societal acceptance and attractiveness. The historical significant of education is visible in its use to break barriers of discrimination of HIV patients and to control the pandemic in developing countries across the globe. Education contribution in sanitizing the people to controlling the widespread of AIDS and discrimination of victims has been a laudable one. Considering the education role in boosting the awareness level and knowledge on how to control the AIDS pandemic, such have however warrants the study to assess the significant of education to educating the people on the relevance of Public-Private Partnership tool to achieving the sustainable development goals.

APPRAISAL OF PUBLIC-PRIVATE PARTNERSHIP (PPP)

The call for partnership is no more limited to business relationship between individuals as it has found its way into governance under the platform of Public-Private Partnership. Public-Private Partnership (PPP) simply refer to partnership between the public body (government) and private investors (people). PPP emanate from the government idea due to her inability or slow response to the peoples need. Public-Private Partnership (PPP) emergence has been a blessing to the inelastic social needs that are visible in our present world. It has been able to meet the demand in health, business, telecommunication and above all construction infrastructures. The wide coverage of PPP tool across all field of human endeavors has made it difficult to cap it into a single definition. However, the World Bank Institute (2012) define PPP as a long-term contractual relationship between private party and government agency towards public asset or service provision, in which the private party is charged with the management responsibility. In the same vein, Akhmetshina and Mustafin (2015) also define PPP as a formal agreement for a fixed or infinite period of time between the Governments and the private investors by collaborating in decision, financial and human resources towards achieving a specific goal in science, business and engineering and innovation among others. The bedrock of operation of PPP lies in the synergy between the government and the private sector to meeting the global needs. Partnerships is highly prioritize towards meeting the sustainable development agenda as it is affirmed by United Nations (2016) as a means through which sustainable development goals can be realized. The paradigm shift in procurement of infrastructures and services among others experienced globally can be attributed to world insatiable search of a sustainable route that can guarantee continuous delivery of services in the face of government's financial short fall. The innovative discovery of PPP as a sustainable tool lies in its technical-know-how and financial edge. PPP platform provides room for international collaborators and such avails the locals the benefits of adapting the technical skills and other vices. The transfer of technical-know-how via the platform of PPP no doubt guaranteed self-sustenance of the locals thereby meeting one of the vital goals of world governing body. The consistent finance and technical know-how accessible through this platform has changed the face of infrastructures, health and commerce among others that are pivotal to meeting the sustainable development agenda. Public-Private Partnership (PPP) sustainable capacity is vivid in developed nations of the world as its application contributed to the great transformation seen in their infrastructure, power generation, commerce, telecommunication and medicine among others

APPRAISAL OF EDUCATION AS A TOOL FOR SUSTAINABLE INFORMATION

It is an undoubted fact that education acceptability and popularity among men is without compromise. Man and education are inseparable as the latter harness the former potentials as to positively impact its environment. Campbell (2006) opined that education provides the basic knowledge and experience crucial for human engagement in society reformation. Education has been found to be necessary for large scale transformation. This is evidenced in the inclusion of education among the key goals necessary to achieving the sustainable development agenda which aimed at transforming our world. Education necessity in meeting the sustainable development goals lies in her consistence relevance in informing the populace. Sound education is very crucial to achieving a knowledge base environment which is key to transforming our world. Knowledge acquisition has been the priority of world leaders and that has contributed to the need to advocate for quality education as pivotal tool to attaining the United Nations world sustainability drive. A quality education is the education that is dynamic in meeting the need of the environment. Education is very crucial in achieving the sustainable development goals and it is a fundamental tool which drives advancement of a society in all spheres of life. Its relevance in nation building is without limitation as it helps to awake consciousness for sustainable innovations. Bloom, Carring and Chan (2006) further affirmed that education training is second-to-none as an instrument used in promoting economic sustainability. Duncan (2011) opined that educational capacity of a society determines her prosperity, economic competitiveness and her sustainability. Education is very foundational to the transformation capacity of nations, it is a medium through which nations are informed for economic

reformation. Economic reformation reality lies in the appreciation of sustainable medium like Public-Private partnership (PPP) which is one of the deliverables of sustainable or quality education. Odia and Omofonmwan (2007) affirmed that education is the pinnacle of development in any society around the world. Education is the pride of nations across the globe due to the enormous benefits that are derived from it. Good education sharpen the mind towards sustainable thinking and appreciation of sustainable pathway. It is evidenced from the forgoing that appreciation of a sustainable tool like PPP can be achieved under a sound education system.

ESTABLISHING THE THEORY FOR ADAPTING EDUCATION FOR PROMOTING SUSTAINABLE TOOL (PPP)

The scope for using education to promoting PPP in this study is rooted in the environmental determinism theory as cited by Fekadu (2014). The theory state that environment is the dominance force responsible for human attitude. Sign (2007) further buttresses the environmental determinism theory by retreating the fact that man and environment are inseparable. The connection between man and the environment is not debatable as man attitude or reaction is directly dependent on the force from the external context. Likewise, Hardin (2009) in his Doctoral study also refer to environmental determinism as the external force responsible for human behavioral shift. The theory of environmental determinism as defined by Fekadu (2014) and sustainability as defined by Plessis (2002) both have a common feature which is ‘man and the external environment’. The former emphasis on man adjustment or shift as a result of external forces while the latter emphasis on man continuous existence which is attainable by maintain dynamic balance between societal conditions. It is evident from the forgoing that man cannot be separated from its environment or societal demand. It is further affirmed by Zbokova and Dvorakova (2011) that man co-existence with the society necessitate him to maintaining equilibrium with the external forces or demand which includes social, economic and environmental. The focus of the world or society is tending toward sustainability and every institutions initiated by man must recognize or prioritize environmental demand that can guarantee man sustainability. Among the various institutions initiated by man education institution has been found to be pivotal in diffusing sustainable tools to actualizing the global sustainable goals. Idunmange and Nwaeke (2008) however asserted that education should be driven by change in the external world for her to continuously impact the world and this is in consonance with the theory of environmental determinism which proved that institutions direction is as a result of external or environmental impact. Therefore, it is not normal for education institution to be indifferent to external change or forces as it form one of the fundamental reasons for its creation. As such, it is pertinent for education institutions to drive the sustainability demand (Public-Private Partnership) which is necessary in meeting the world transformation goals.

CONCLUSSION

The attention and attraction of the world toward sustainability goals is visible in the drive and action of countries across the globe to attain the goals. Many countries have adopted and fully implement sustainable tools like Public-Private Partnership (PPP) in their bid to meet the proposed sustainability goals. However, the developed and developing countries perception differs on the sustainability goals pursuit as its full implementation is visible in the developed world while the developing countries are yet to imbibe the culture of sustainability in their ways of life. The need to incite the culture of sustainability in developing countries like Nigeria through the instrument of education has however been established from critical review of literatures. Education capacity to inciting the culture of sustainability in the developing countries is drawn from the theory of environmental determinism. It is however established from the theory that education institutions relevance lies its adaptation to changing society demand. Society call for imbibing culture of sustainability in all works of life cannot be promoted better without the use of education institution. Therefore, it is necessary to use education institution to promote sustainable tools like Public-Private Partnership (PPP) as to enlighten the populace on its capacity in other to encourage its adoption in developing nations across the globe.

Assessing the Teaching and Learning Situations in Secondary School Turkish Language and Literature and English Curricula

Gürbüz OCAK

Afyon Kocatepe University

gocak@aku.edu.tr

ABSTRACT: Like in the other fields of education, the language education is continually being updated because of the changes and developments in educational theories and the opportunities provided by the improving technology. Following it, the curriculum of the Turkish Language and Literature (TLL) course that is the secondary education part of the mother tongue education was updated by Talim ve Terbiye Kurulu (Board of Education and Discipline) in 2015. Similarly, English course curricula had been revised and updated in 2014 by the board. Although the teaching of the two courses are different in nature as one is the mother tongue while the other is a foreign language, their curricula are similar in the way that teaching and learning processes focus on communication. When updated curricula are examined, the teaching process in TLL curriculum is explained as happening in three phases that are “reading, writing and oral communication” while English curriculum states that the main focus is on “the integration of functions of the language and four basic skills.” The aim of this study is to evaluate the teaching and learning processes of TLL and English curricula after the changes through the teacher opinions and find their strengths and weaknesses. The study employs survey method. The data was collected in the end of 2015-2016 academic year from 70 TLL and 41 English teachers that worked at Afyon and were chosen through convenient sampling method. The five-likert type scale that was used to collect teacher opinions was developed by Ocak, Ocak and Boyraz (2016) and consists of two parts, part one for demographic information such as age, working year, in-service training background etc. and part two for the assessment of teaching and learning situations.

Key words: Turkish Language and Literature curriculum, English curriculum, curriculum evaluation, teaching and learning situations, teacher opinions

INTRODUCTION

Although the behaviors of a child that acquires his/her mother tongue -in other words the language of the place where s/he lives- gradually are not completely parallel to the behaviors of a student that intends to learn a foreign language, teaching existing languages presupposes that there is a similarity among them. These two behaviors are similar to each other in some terms as all learnings are similar in a broad sense (Kara, 2004). Mother tongue teaching lesson is not information but skill and habit based. The habit formation and mastering skills require practice and application (Özdemir, 1983). The expectations from foreign language teaching is not different either. Besides Çiftçi (1993) benefiting from the mother tongue of the child in foreign language teaching and setting a tight relation between different languages studies are among the principles to be benefited in foreign language teaching (cited by Çelebi, 2006). Therefore, teaching mother tongue and foreign language are not interrelated.

Turkish Language and Literature curriculum that was revised in 2015 employs a student-centered approach. The main aim of the curriculum is improving students’ reading, writing and oral communication skills through literary texts. In this curriculum that is based on literary genres and skills education, the relations among reading, writing, listening and speaking studies is turned into an integrated structure by carrying out literature and language-expression studies simultaneously. The reading tasks are structured in a way that supports the improvement of students’ writing and oral communication skills. For example, a student that can analyze a story successfully in reading tasks uses this cumulated knowledge while writing a story and as a result s/he can produce better quality texts (MEB, 2015).

For the majority of the people, especially for those living in foreign language contexts, language learning is a demanding and long lasting process. In this process, except from different materials and strategies used, time allocated, learning contexts, and many other affective factors are highly influential (Harmer, 2015). Widdowson (1978) states that “we do not only learn how to compose and comprehend correct sentences as isolated linguistic units of random occurrence; but also how to use sentences appropriately to achieve communicative purposes.” Once they are offered with tangible blueprints, students might be equipped with more passion and enthusiasm to

invest on oral English learning (Tao, 2017) . Following Stern (1992) curriculum refers to a comprehensive plan of language teaching which organizes the objectives, content, teacher development, teaching strategies, learning strategies, timing, and evaluation into a unified whole (cited by Ostovar-Namaghi, 2017). With the wide use of English language, various teaching methods has been emerging from one to another, among which the communicative language teaching method is deeply around because it can focus on the whole teaching environment, social and learners' needs (Ma, 2017). Another method that is widely used in the world today is Content Based Instruction and aims to help students not only learn different culture(s) and cross-cultural communicative patterns and skills, but also use the target language meaningfully, and thus accelerate acquisition (Tseng, 2017). The Ministry of National Education (MEB) in Turkey also regularly revise English curricula in order to keep up with current scientific information and trends. The main aim of the secondary school English curriculum that was revised in 2014 is explained as to engage learners of English in stimulating, motivating, and enjoyable learning environments so that they become effective, fluent, and accurate communicators in English (MEB, 2014).

Aim

The aim of this study is to assess the teaching and learning situations of TLL and English curricula for grades 9-12 through teacher opinions. This assessment will present strengths, weaknesses and deficiencies of the above mentioned curricula.

Problem and Sub-Problems

What are TLL and English teachers' assessments of the teaching and learning situations of their lesson's curricula that were updated in 2013?

Sub-problems

1. What is the distribution of teachers' opinions about the teaching and learning situations of the Secondary Education TLL and English Curricula?
2. How appropriate are the teaching and learning situations according to teacher opinions?
3. Is there a significant difference between teachers' assessments by field?
4. Is there a significant difference in the evaluations within the subject field depending on participating or not participating an in-service training on the curriculum?
5. Is there a significant difference in the evaluations of those who have participated an in-service training on the curriculum within the subject field?
6. Is there a significant relation between the assessments of TLL and English teachers?

METHOD

Since the aim of this study is to evaluate teachers' opinions of the teaching and learning situations of the TLL and English curricula, this study employs survey method, which is usually used to measure or evaluate general characteristics of a subject, population or a program (Cohen, Manion & Morrison, 2007).

Data Analysis

The teachers' assessments on their curriculum was explained through frequencies and percentages. Besides, t-test was used to determine whether there was a statistically significant difference between teachers' assessments when the data had a normal distribution and there were two variables. The normality tests were done separately for each sub-group of each variable (Can, 2014). The Kolmogorov-Smirnov and Shapiro-Wilk tests were used with groups of more than 50 and less than 50, respectively (Field, 2009). This study's data had normal distribution.

Population and Sample

This study was carried out in Afyon. The study employs convenient sampling in order to reach a maximum sample. After receiving the necessary permissions from Afyon's Provincial Directorate for National Education, the researcher distributed the scale to TLL and English teachers. The scales were collected from 70 TLL and 41 English teachers.

Table-1. Demographics of the Sample

Institution	TLL		English	
	N	%	N	%
Anatolian High School	13	18.6	12	29.3
Anatolian Health Vocational High School	3	4.3	2	4.9
Multi-Program High School	7	10.0	4	9.8

No	39	55.7	13	31.7
Total	70	100.0	41	100.0

Data Collection Tool

The validity and reliability study of the data collection instrument was carried out by Ocak, Ocak & Boyraz (2016). The scale consists of 34 items under a single factor. A statistical comparison of the scale in the development and current study can be seen in Table-2 below.

Table-2 Statistics on the Scale

	Scale Development Study	This study
Sample	Secondary school teachers	TLL and English teachers
Sample size	357	111
KMO	.971	.928
Barlett	.000	.000
Cronbach's alpha	.976	.978

FINDINGS

Sub-problem-1: What is the distribution of teachers' opinions about the teaching and learning situations of the Secondary Education TLL and English Curricula?

Table-3. Descriptive Analysis Results of the TLL and English Teachers' Assessments of their Curricula

Item	Field		DA*	AA	MA	A	SA	X	Result
1- The sample activities are student-centered.	TLL	F	3	1	18	26	22	3.90	Agree
		%	4.3	1.4	25.7	37.1	31.4		
	English	F	0	1	13	17	10	3.87	Agree
		%	0	2.4	31.7	41.5	24.4		
2- The activities are consistent with the content.	TLL	F	3	1	22	23	21	3.82	Agree
		%	4.3	1.4	31.4	32.9	30.0		
	English	F	1	2	9	16	13	3.92	Agree
		%	2.4	4.6	20.0	36.4	26.6		

		%	2.4	4.9	22.0	39.0	31.7		
3- The activities are at a level that can be applied.	TLL	F	4	7	28	17	14	3.42	Agree
		%	5.7	10.0	40.0	24.3	20.0		
	English	F	4	3	17	9	8	3.34	Moderately Agree
		%	9.8	7.3	41.5	22.0	19.5		

(*DA: Don't Agree; AA: A bit Agree; MA: Moderately Agree; A: Agree; SA: Strongly Agree; X: Mean)

When TLL and English teachers' evaluations for the first three items are examined, it seen that while TLL teachers agree with all, English teachers agree the first two and moderately agree with the last one. TLL teachers' mean score (3.90) is higher than English teachers' mean (3.87) for the first item, it is vice versa in the second item (TLL X=3.82; English X=3.92).

Table-3. Descriptive Analysis Results of the TLL and English Teachers' Assessments of their Curricula (cont.)

Item	Field		DA	AA	MA	A	SA	X	Result
4- The teaching and learning experiences are consistent with learning acquisitions of the curricula.	TLL	F	1	5	28	21	15	3.62	Agree
		%	1.4	7.1	40.0	30.0	21.4		
	English	F	1	7	11	14	8	3.51	Agree
		%	2.4	17.1	26.8	34.1	19.5		
5- The curricula's teaching and learning approaches suit the subject focus.	TLL	F	1	1	27	24	17	3.78	Agree
		%	1.4	1.4	38.6	34.3	24.3		
	English	F	0	3	14	18	6	3.65	Agree
		%	0	7.3	34.1	43.9	14.6		
6- The curricula's activities include outcomes such as discussion questions, field trips, observation, experimenting, summarizing and producing learning experiences that guide teachers.	TLL	F	3	7	24	19	17	3.57	Agree
		%	4.3	10.0	34.3	27.1	24.3		
	English	F	4	6	15	12	4	3.14	Moderately Agree
		%	9.8	14.6	36.6	29.3	9.8		

For the next three items, it seen that TLL teachers agree with all again (X=3.62, 3.78 and 3.57) while English teachers agree with items 4 and 5 (X=3.51 and 3.65) while they moderately agree (X=3.14) with the item number 6.

Table-3. Descriptive Analysis Results of the TLL and English Teachers' Assessments of their Curricula (cont.)

Item	Field		DA	AA	MA	A	SA	M	Result
7- The activities support learning through practice and experience.	TLL	F	3	11	25	19	12	3.37	Moderately Agree
		%	4.3	15.7	35.7	27.1	17.1		
	English	F	2	9	19	8	3	3.02	Moderately Agree
		%	4.9	22.0	46.3	19.5	7.3		
8- The activities take students' interests, needs and desires into consideration.	TLL	F	6	15	26	11	12	3.11	Moderately Agree
		%	8.6	21.4	37.1	15.7	17.1		
	English	F	4	8	18	7	4	2.97	Moderately Agree
		%	9.8	19.5	43.9	17.1	9.8		
9- The learning and teaching process improves critical thinking skills.	TLL	F	4	12	23	19	12	3.32	Moderately Agree
		%	5.7	17.1	32.9	27.1	17.1		
	English	F	5	8	17	5	6	2.97	Moderately Agree
		%	12.2	19.5	41.5	12.2	14.6		

When TLL and English teachers' evaluations for the next three items are examined, it seen that both groups moderately agree with all three items (TLL X: 3.33-3.11 and 3.32; English X: 3.02-2.97 and 2.97). TLL teachers' mean scores are higher than English teachers' means in all three items.

Table-3. Descriptive Analysis Results of the TLL and English Teachers' Assessments of their Curricula (cont.)

Item	Field		DA	AA	MA	A	SA	M	Result
10- The learning and teaching process improves creative thinking skills.	TLL	F	4	15	22	17	12	3.25	Moderately Agree
		%	5.7	21.4	31.4	24.3	17.1		
	English	F	2	9	19	7	4	3.04	Moderately Agree
		%	4.9	22.0	46.3	17.1	9.8		
11- The learning and teaching process improves the skill of researching, questioning, and decision-making.	TLL	F	4	15	21	19	11	3.25	Moderately Agree
		%	5.7	21.4	30.0	27.1	15.7		
	English	F	2	11	16	8	4	3.02	Moderately Agree
		%	4.9	26.8	39.0	19.5	9.8		
12- The learning and teaching process improves the skill of problem solving.	TLL	F	4	14	28	14	10	3.17	Moderately Agree
		%	5.7	20.0	40.0	20.0	14.3		
	English	F	3	7	20	6	5	3.07	Moderately Agree
		%	7.3	17.1	48.8	14.6	12.2		

According to teachers' evaluations for the next three items, it seen that both groups moderately agree with all three items (TLL X: 3.25, 3.25 and 3.17; English X: 3.04, 3.02 and 3.07).

Table-3. Descriptive Analysis Results of the TLL and English Teachers' Assessments of their Curricula (cont.)

Item	Field		DA	AA	MA	A	SA	M	Result
13- The learning and teaching process improves communication skills.	TLL	F	3	12	20	19	16	3.47	Agree
		%	4.3	17.1	28.6	27.1	22.9		
	English	F	0	7	20	9	5	3.29	Moderately Agree
		%	0	17.1	48.8	22.0	12.2		
14- The learning and teaching process improves the skill of using Turkish properly, effectively and well.	TLL	F	5	4	22	20	19	3.62	Agree
		%	7.1	5.7	31.4	28.6	27.1		
	English	F	4	7	17	10	3	3.02	Moderately Agree
		%	9.8	17.1	41.5	24.4	7.3		
15- The learning and teaching process improves entrepreneurship skills.	TLL	F	3	10	29	15	13	3.35	Moderately Agree
		%	4.3	14.3	41.4	21.4	18.6		
	English	F	3	11	12	11	4	3.04	Moderately Agree
		%	7.3	26.8	29.3	26.8	9.8		

When physics and chemistry teachers' evaluations for the next three items are examined, it seen that while TLL teachers agree with items 13 and 14 (X: 3.47 and 3.62), English teachers moderately agree with them (X: 3.29 and 3.02). Both groups moderately agree with item 15 (TLL X: 3.35; English X: 3.04).

Table-3. Descriptive Analysis Results of the TLL and English Teachers' Assessments of their Curricula (cont.)

Item	Field		DA	AA	MA	A	SA	M	Result
16- The teaching and learning process improves the skill of using information technologies.	TLL	F	2	10	21	19	18	3.58	Agree
		%	2.9	14.3	30.0	27.1	25.7		
	English	F	1	5	13	16	6	3.51	Agree
		%	2.4	12.2	31.7	39.0	14.6		
17- The teaching and learning supports the 5E Model.	TLL	F	2	7	31	21	9	3.40	Agree
		%	2.9	10.0	44.3	30.0	12.9		
	English	F	3	5	15	15	3	3.24	Moderately Agree
		%	7.3	12.2	36.6	36.6	7.3		
18 - The teaching and learning process leads to the use of discussion methods (debate, panels and open discussions).	TLL	F	2	6	24	23	15	3.61	Agree
		%	2.9	8.6	34.3	32.9	21.4		
	English	F	2	9	16	9	5	3.14	Moderately Agree
		%	4.9	22.0	39.0	22.0	12.2		

As seen above, both groups agree with item 16 (TLL X: 3.58 and English X: 3.51). While TLL teachers agree with item number 17 (X: 3.40) and 18 (X:3.61), English teachers moderately agree with both (X: 3.24 and 3.14).

Table-3. Descriptive Analysis Results of the TLL and English Teachers' Assessments of their Curricula (cont.)

Item	Field		DA	AA	MA	A	SA	M	Result
19- The teaching and learning process uses group-teaching methods.	TLL	F	1	7	31	19	12	3.48	Agree
		%	1.4	10.0	44.3	27.1	17.1		
	English	F	2	7	15	14	3	3.22	Moderately Agree
		%	4.9	17.1	36.6	34.1	7.3		
20- The curricula's methods and techniques are consistent with their objectives.	TLL	F	2	6	27	23	12	3.52	Agree
		%	2.9	8.6	38.6	32.9	17.1		
	English	F	1	4	16	16	4	3.43	Agree
		%	2.4	9.8	39.0	39.0	9.8		
21- The curricula's methods and techniques are consistent with their content.	TLL	F	2	4	26	27	11	3.58	Agree
		%	2.9	5.7	37.1	38.6	15.7		
	English	F	1	4	11	21	4	3.56	Agree
		%	2.4	9.8	26.8	51.2	9.8		

In next three items, it seen that while TLL teachers agree with item 19 (X: 3.48), English teachers moderately agree with it (X:3.22). Both groups agree with items 20 (TLL X: 3.52 and English X: 3.43) and 21 (TLL X: 3.58 and English X: 3.56).

Table-3. Descriptive Analysis Results of the TLL and English Teachers' Assessments of their Curricula (cont.)

Item	Field		DA	AA	MA	A	SA	M	Result
22- The activities can be performed in and out of school.	TLL	F	3	13	27	15	12	3.28	Moderately Agree
		%	4.3	18.6	38.6	21.4	17.1		
	English	F	4	12	15	5	5	2.87	Moderately Agree
		%	9.8	29.3	36.6	12.2	12.2		
23- Teachers direct students, guide them and improve themselves.	TLL	F	7	5	18	25	15	3.51	Agree
		%	10.0	7.1	25.7	35.7	21.4		
	English	F	4	3	11	17	6	3.43	Agree
		%	9.8	7.3	26.8	41.5	14.6		
24- Materials for performing activities are suggested.	TLL	F	2	9	27	20	12	3.44	Agree
		%	2.9	12.9	38.6	28.6	17.1		
	English	F	1	8	13	6	6	3.36	Moderately Agree
		%	2.4	19.5	31.7	31.7	14.6		

When the two groups' evaluations for the next three items are examined, it seen that both groups moderately agree with item 22 (TLL X: 3.28 and English X: 2.87) and agree with item 23 (TLL X: 3.51 and English X: 3.43). While TLL teachers agree with item 24 (X:3.44), English teachers moderately agree with it (X:3.36).

Table-3. Descriptive Analysis Results of the TLL and English Teachers' Assessments of their Curricula (cont.)

Item	Field		DA	AA	MA	A	SA	M	Result
25- The materials to be used in the teaching and learning process are easily accessible.	TLL	F	8	9	29	17	7	3.08	Moderately Agree
		%	11.4	12.9	41.4	24.3	10.0		
	English	F	2	6	15	13	5	3.31	Moderately Agree
		%	4.9	14.6	36.6	31.7	12.2		
26- The sample activities are suitable for the levels of the students.	TLL	F	4	11	30	18	7	3.18	Moderately Agree
		%	5.7	15.7	42.9	25.7	10.0		
	English	F	3	10	16	9	3	2.97	Moderately Agree
		%	7.3	24.4	39.0	22.0	7.3		
27- The learning experiences interact with other learning experiences.	TLL	F	0	11	29	19	11	3.42	Agree
		%	0	15.7	41.4	27.1	15.7		
	English	F	2	7	15	12	5	3.26	Moderately Agree
		%	4.9	17.1	36.6	29.3	12.2		

According to teachers' evaluations for the next three items, it seen that both groups moderately agree with items 25 and 26 (TLL X: 3.08 and 3.18; English X: 3.31 and 2.97). While TLL teachers agree with item 27 (X:3.42), English teachers moderately agree with it (X: 3.26).

Table-3. Descriptive Analysis Results of the TLL and English Teachers' Assessments of their Curricula (cont.)

Item	Field		DA	AA	MA	A	SA	M	Result
28- The activities can be performed in and out of school.	TLL	F	2	15	25	16	12	3.30	Moderately Agree
		%	2.9	21.4	35.7	22.9	17.1		
	English	F	3	8	15	10	5	3.14	Moderately Agree
		%	7.3	19.5	36.6	24.4	12.2		
29- The learning experiences specified support subsequent learning acquisitions.	TLL	F	3	12	24	18	13	3.37	Moderately Agree
		%	4.3	17.1	34.3	25.7	18.6		
	English	F	0	7	13	16	5	3.46	Agree
		%	0	17.1	31.7	39.0	12.2		
30- There are examples about Education Information Network usage in the teaching and learning process.	TLL	F	5	8	27	16	14	3.37	Moderately Agree
		%	7.1	11.4	38.6	22.9	20.0		
	English	F	9	9	9	10	4	2.78	Moderately Agree
		%	22.0	22.0	22.0	24.4	9.8		

When TLL and English teachers' evaluations for the next three items are examined, it seen that both groups moderately agree with items 28 (TLL X: 3.30 and English X: 3.14) and 30 (TLL X: 3.37 and English X: 2.78). While TLL teachers moderately agree with item 29 (X: 3.37), English teachers agree with it (X: 3.46).

Table-3. Descriptive Analysis Results of the TLL and English Teachers' Assessments of their Curricula (cont.)

Item	Field		DA	AA	MA	A	SA	M	Result
31- The learning and teaching process directs teachers to use digital materials.	TLL	F	0	4	25	26	15	3.74	Agree
		%	0	5.7	35.7	37.1	21.4		
	English	F	2	3	8	16	12	3.80	Agree
		%	4.9	7.3	19.5	39.0	29.3		
32- The learning and teaching process directs students to use digital materials.	TLL	F	1	4	27	22	16	3.68	Agree
		%	1.4	5.7	38.6	31.4	22.9		
	English	F	1	6	10	14	10	3.63	Agree
		%	2.4	14.6	24.4	34.1	24.4		

When the two groups' evaluations for the items 31 and 32 are examined, it seen that both groups agree with them (TLL X: 3.74 and 3.68; English X: 3.80 and 3.63). While TLL teachers' mean is lower in item 31; the opposite is true for the item 32.

Table-3. Descriptive Analysis Results of the TLL and English Teachers' Assessments of their Curricula (cont.)

Item	Field		DA	AA	MA	A	SA	M	Result
33- Classroom seating arrangement are specified for the activities.	TLL	F	15	17	20	11	7	2.68	Moderately Agree
		%	21.4	24.3	28.6	15.7	10.0		
	English	F	8	11	12	6	4	2.68	Moderately Agree
		%	19.5	26.8	29.3	14.6	9.8		
34- The curricula include explanations about classroom management.	TLL	F	7	15	25	16	7	3.01	Moderately Agree
		%	10.0	21.4	35.7	22.9	10.0		
	English	F	6	6	15	9	5	3.02	Moderately Agree
		%	14.6	14.6	36.6	22.0	12.2		

When TLL and English teachers' evaluations for the last two items are examined, it seen that both groups moderately agree with them (TLL X: 2.68 and 3.01; English X: 2.68 and 3.02). Besides, the means of the two groups are very close to each other for the two items.

Sub-problem-2: How appropriate are the teaching and learning situations according to teacher opinions?

Table-4 Overall Assessment Results

	TLL	English
N:	70	41
Moderately Agree:	15	23
Agree:	19	11
X:	116.41	110.85
Standard Deviation:	27.98	26.25
Minimum:	38	63
Maximum:	150	155

Of 34 items, TLL teachers agree with 19 and moderately agree with 15. On the other hand, English teachers moderately agree with 23 and agree with only 11. Accordingly, the mean of TLL teachers (116.41) is higher than English teachers' mean (110.85). While the maximum scores of the two groups are close to each other (TLL: 150 and English: 155), there is a big difference in minimum scores as TLL groups' minimum is 38 and English groups' is 63. The standard deviation of the two groups are also close to each other (TLL: 27.98 and English: 26.25).

Sub-problem-3: Is there a significant difference between teachers' assessments by field?

Table-4. T-Test Results Comparing Teachers' Assessments of the Curricula by Field

Field	N	X	SD	d.f.	t	p
TLL	70	116.41	27.98	109	1,033	.304**
English	41	110.85	26.25			

**p<.05

The t-test results indicate that there is not a statistically significant difference in teachers' evaluations on the teaching and learning situations of secondary education TLL and English curricula depending on the fields ($p=.304$; $p>.05$) while overall evaluation of physics teachers is a bit higher.

Sub-problem-4: Is there a significant difference in the evaluations within the subject field depending on participating or not participating an in-service training on the curriculum?

Table-5. T-test Result Comparing Teachers' Assessments of the Curricula by Field and In-service Training

Field	In-service Training	N	X	SD	df	t	p**
TLL	Yes	31	117.22	27.97	68	.215	.831
	No	39	115.76	28.33			
English	Yes	28	115.28	23.85	39	1.618	.114
	No	13	101.30	29.55			

**p<.05

The t-test results indicate that there is not a statistically significant difference in teachers' evaluations on the teaching and learning situations of secondary education TLL and English curricula depending on attending an in-service training on the new curricula (TLL $p=.831$ and English $p=.114$; $p>.05$) while overall evaluation of those who participated an in-service training is a bit higher than who did not in both groups.

Sub-problem-5: Is there a significant difference in the evaluations of those who have participated an in-service training on the curriculum within the subject field?

Table-6. T-Test Results for Assessments of the Curricula by Teachers Participating an In-service Training by Field

Field	N	X	SD	df	t	p
TLL	31	117.22	27.97	57	.285	.777**
English	28	115.28	23.85			

**p<.05

The t-test results indicate that there is not a statistically significant difference in teachers' evaluations on the teaching and learning situations of secondary education TLL and English curricula depending on attending an in-service training on the new curricula ($p=.777$; $p>.05$) while overall evaluation of TLL teachers who participated an in-service training is a bit higher than English teachers in the same situation.

Sub-problem-6: Is there a significant relation between the assessments of TLL and English teachers?

Table-7. Correlation Results for Assessments of Two Groups

Pearson Correlation	Field	N	X	SD	r	p**
	TLL	70	116.41	27.98	.022	.889
	English	41	110.85	26.25		

According to the Pearson correlation results, there is not a statistically significant relation between TLL and English teachers' assessments of their revised curricula ($p=.889$; $p>.05$).

RESULTS AND DISCUSSION

While TLL teachers moderately agree with 15 items and agree with the remaining 19, English teachers moderately agree with 23 and agree with 11 items. These findings may tell that neither group thinks the teaching and learning situations in their curriculum is good enough. The items with lowest means in TLL teachers' assessments are about that the materials used in teaching and learning situations are easily reachable in every region, the curriculum presents a seating plan appropriate to the activities and provides explanations on classroom management. The last two may be because of the idea of giving teachers a freedom through the curriculum by not limiting them. The items with highest means in this group's assessments are about that the example activities are student centered and consistent with the content and teaching-learning approaches provided by the curriculum are chosen appropriate to the subject field. These results reveal that the curriculum is designed appropriate to the constructivist approach whose main principles include taking student to the center of the education and choosing subject-specific content and activities.

One of the items with lowest mean in English teachers' assessments is about that the activities can be carried out both in and out of the school. It is understandable as the opportunities of communicating in English are very limited; so activities of the course may not be done out of the school. The other two items are about that there are examples of using EBA in teaching and learning situations and that the curriculum provides a seating plan appropriate to the activities. As mentioned before, the idea behind new curricula (MEB, 2013) is to provide flexibility to teachers by giving them an opportunity to make decisions according to the conditions within the class. The items with highest means in this group's assessments are about that the example activities are student centered and consistent with the content. This result is similar to TLL teachers' assessment and indicates that the English curriculum is consistent with the principles of constructivist approach. In their study evaluating 2012 curriculum according to teacher opinions, Merter, Kartal, & Çağlar (2012) find out that the teachers moderately agree with the item "The curriculum includes student-centered activities." Another item with highest mean is about that the teaching and learning process directs teachers to use digital materials. The curriculum both states the importance of using technologic tools in teaching and includes units whose topic is technology or that includes technology within.

Although English teachers' overall assessment mean score is lower than TLL group, the difference is not statistically significant. Similarly, there is not a statistically significant difference between those who have received an in-service training and who have not in either group. Besides, the difference between those who participated in an in-service training on their revised curriculum in the two fields is not statistically significant.

Finally, there is not a statistically significant relation between TLL and English teachers' assessments. The two revised curricula should be thought over again in the light of these findings.

ABSTRACT

When the purpose of a thing is not known, abuse becomes an inevitability. Education for Sustainability, as promoted by the United Nations is an essential tool for achieving sustainable development. This method of education is expected to foster creative thinking that will provide solutions to exiting societal problems. For sustainable development to occur, there has to be the proper transfer of knowledge and technology through teaching and other classroom activities. In the teaching of structural analysis, one of the encountered challenges has to do with the students' poor performance in the course in the first place. This study sought to identify the response and perception of students of structural analysis. A survey of three institutions was carried out and data was obtained through the distribution of well-structured questionnaires to students that offered structural analysis from Covenant University, University of Lagos and Yaba College of Technology. Data obtained from this survey were analyzed using SPSS, and then the agreement ranking of responses and perceptions were determined. The results were presented in form of frequency tables using relative importance index to get a clearer view of the most significant factors. The result showed in the response of students to structural analysis, that they acknowledge the importance of the course, despite any difficulty they might be facing, and also, they approach the course with fear and anxiety. The results also showed that even though the students understand the importance of the course, they are not interested in it. It was recommended that teaching methods that build interest in the students should be adopted such as the use of software and other technologies. This will demystify the learning of structural analysis. Problem based methods of learning should be adopted to as to build up interest and problem-solving capabilities in the students.

Keywords: Education for sustainability, teaching, structural analysis.

INTRODUCTION AND RESEARCH OBJECTIVE

There are several factors that have been identified as the contributor to students learning difficulties in which include, peer pressure, parental and home background, teacher's attributes, school environment, students interest in the subject, and socio-economic status of the student (Rilwani, 2014). However, most of the attention on students' academic performance has been placed on the teachers shoulders so that they are responsible for the success or failure of the students (Sabitu and Nuradeen, 2010).

According to Herr, (2013) the main challenge of structural education in architecture are the students trying to incorporate structural design into their applied design skills.

Furthermore, the school environment is also another critical factor affecting learning especially in the developing nations of the world, due to poor facilities and lack of appropriate teaching aids. for examples, there are some public schools in Nigeria that cannot afford enough chairs for their students, hence some of them have to stand for hours stretch receiving lectures, some institutions do not even have the right textbooks and resources to stimulate the interest of the student, also other environmental factors like improper ventilation, inadequate lightning and a host of them contributes to the difficulty in learning. This singular factor is what distinguishes the

performance of students in Africa to other developed nations of the world; (Rilwani, 2014). This has led to the question of what the responses of students in civil engineering and environmental sciences to structural calculations are?

The objective of this study was to assess the response of students offering structural analysis as a course.

LITERATURE REVIEW

There is hardly a general definition of learning that is acceptable in all circles (Shuell, 1986). Likewise, students also vary, and hence there are differences in the difficulties encountered by them. Rebecca & Richard (2005) suggested that motivation exists at different levels for students just as students have different approaches to learning. The diversities of student's approach to learning and orientation to studying were examined by Marton and Saljo, (1976), they came up with three different approaches in which they called the surface, deep and strategic approach to learning.

There are two broad factors that affect students' academic performance. These are internal and external factors, in which the internal factors include class size, learning facilities, environment of the class, innate ability of the student, motivation, complexity of the course material, teachers' role in the classroom, technology used in the class and the exam system (Irfan and Shabana, 2012). The external factors constitute social economic factors, extracurricular activities, family problems. Further research studies show that students performance depends on others such as gender and age differences (Hansen, 2000).

From several researches done, it has been seen that attitude plays a key part in successfully learning courses (Gilbert, 2001; Brandl, 2002; Desmarais, 2002; Doherty, 2002; Murday & Ushida, 2002)

According to Singh et al., (2017) achievement goal includes obtaining good grades, being appreciated by instructors, and recognized in peer groups and the feeling of accomplishment after solving critical problems. To get the best out of their students, instructors have been motivating their students for better performance and encouraged them to be competitive.

School environment when analysed has a great role to play in difficulties students' encounter, the more conducive the environment, the lesser the difficulties students' encounter. Social environment could mean a conducive learning environment, availability of good teaching aids (computers, teachers, laboratories, libraries etc.)

Students should be provided with facilities that enhance the learning environment because according to Fencil and Scheel, (2005), the right learning environment and pedagogies used by a teacher play an important role in students learning. Learning environment is made up of instructors teaching capability, class engagement, student- teacher ratio and student-student interaction, which influences an individual's motivation towards learning (Brophy, 1998; Pintrich & Schunk, 1996). Students will tend to be more engaged and connected in the learning process when they are trained in the proper environment (Brooks & Brooks, 1999).

Studies on the effect of teacher experience on student learning have found a positive relationship between teachers' effectiveness and their years of experience. The evidence currently suggests that inexperienced teachers are less effective than the more senior teachers Rivkin, Hanushek and Kain, (2000).

External factors constitute an environment that comprises factors that significantly affect students' academic performance. These environments may be physical or socio-physical such as sports, fraternities, clubs, cults, family relationships, romantic relationships, membership of organizations, or some form of extracurricular activities. These usually have a direct or indirect effect on academic performance.

Jayanthi et al. (2014) discovered that Student involvement in extracurricular activities lead to an improvement in cumulative GPA scores while Levine et al. (2014) observed that Most student-athletes held positive personal attitudes towards academic achievement, but their peers did not

METHODOLOGY

Area of study

The study was conducted in Covenant University, Ota and two Lagos universities, the first one which is University of Lagos, Akoka and Yaba School of technology. The reason for choosing these other two institutions in Lagos state universities was because one represented a federal government institution while the other represented a state institution.

Population of study

The targeted population for this study were students in 100-500 level studying any construction related courses basically architecture, building technology, Civil Engineering and Quantity surveying in covenant university, university of Lagos, and Yaba College of technology.

Data collection instrument

Data used for this research were obtained from using multiple choice structure questionnaires to answer the question of student's response to calculation based courses. The questionnaire was adopted from a rigorous review of the literatures used. The questions were in a 5-point Likert format ranging from (SD= strongly Disagree, D=Disagree, U= Unsure, A=Agree, SA=Strongly Agree) which were used to measure the respondent response and factors affecting the learning of structural analysis as a case study. the questionnaire consists of two sections.

Sample size

A sample consists of selected elements, subjects or observations from a given population. It is a finite part of statistical population of which properties are studied to gain information about the whole population. For the purpose of this research work, a survey was conducted and it was realized that all together in the three institutions there were more than a thousand students in the courses. Therefore, for this research work 195 questionnaires were distributed and 164 were retrieved which is 84.10%.

Research instrument for data analysis using Statistical package for social sciences (SPSS)

Statistical package for social science (SPSS) was used to process and analyse the information obtained from the questionnaire survey. Mean and agreement ranking were used to achieve objectives 2 and 3 as stated in chapter one by the use of SPSS. The result gotten would be made in a pictorial form for example pie chart and also frequency table for clarity of the analysis of the obtained data.

Descriptive tools

These are the tools used for describing the entire population or samples. This helps to show the relationships among the variables and other significant features. These tools are very useful in conveying quick impression of any clustering variations and possible trends in the value of variation. An example of such tools collected in the analysis of this data includes charts, frequency, percentages and measure of central tendency.

ANALYSIS AND DISCUSSION OF RESULT

In the first section, the personal data of structural analysis students were acquired through the self-administered questionnaires. Information such as gender, institution, levels and departments were analysed. The following were discovered

Covenant University had 77 respondents; university of Lagos (UNILAG) had 47 respondents while Yaba School of technology had 40 respondents. The following data shows that Covenant University had the highest respondent for the study, owing to the fact that it was the researcher's institution.

In order to get accurate information, and views from different sides, the entire department offering structural analysis were included in the research work. From the figure above building technology had 36.27% of the respondents, followed by civil engineering with 33.33%, also Architecture had 25.49% and lastly quantity surveying with 4.90% of the total respondent. The department of building technology has the highest number of respondents for this research work.

It was also observed that 100 level respondents had the lowest percentage at 4.90%, followed by 200 level respondents with 7.84%, 300 level respondents with 17.65%, 400 level respondents at 24.51%, then 500 level respondents which carries the largest percentage at 45.10%.

The reason 500 level respondents had the largest percentage was because the researcher assumed that, the respondents had spent quite a considerable time doing structural analysis, therefore with their experience they could provide accurate information.

The gender distribution of the respondents was as follows; it indicated that the male gender has 65.69% while the females have 34.31%. From this distribution, the male gender has a greater population than the females, the reason for this is not far-fetched as the construction industry is male dominated.

Table 1: shows the overall perception of students to structural analysis.

RESPONSES	MEAN	RANKING
Structural analysis is important because it feeds into other	4.24	1
I feel the lecturer has adequate knowledge and understanding of the course	3.87	2
There are student tutors who help my understanding of the course	3.81	3
I look forward to attempting the assignment given to improve my knowledge	3.73	4
I belong to a study group which helps my understanding of structural analysis	3.44	5
Structural calculation classroom is conducive for learning	3.34	6
I understand the lecturer and I am able to contribute often	3.3	7
I usually anticipate the course lectures because I enjoy it so much	3.11	8
I have difficulties transferring the knowledge I gain from examples treated in class to other equivalent structural analysis problems	2.55	9
I feel that this course is only necessary at the post-graduate level not undergraduate level	1.87	12
I prefer to sit at the back of the class because I would rather not be in class	1.92	11
I approach the course with fear and anxiety	2.49	10

Table 1 shows the overall response of students to structural analysis. From the table 1 the response “Structural analysis is important because it feeds into other civil engineering, building and architecture subjects I study” has a mean item score of 4.24. this ranked the highest. It was followed by “I feel the lecturer has adequate knowledge and understanding of the course” has a mean item score of 3.87. The third ranked response was “There are student tutors who help my understanding of the course” with a mean item score of 3.81. “I look forward to attempting the assignment given in order to improve my knowledge” had a mean item of 3.73. “I belong to a study group which helps my understanding of structural analysis” had a mean item score of 3.44, Structural calculation classroom is conducive for learning had a mean item score of 3.34, I understand the lecturer and I am able to contribute often had a mean item score of 3.30, I usually anticipate the course lecturer because I enjoy it so much has a mean item score of 3.11, I have difficulties transferring the knowledge I gain from examples treated in class to other equivalent structural analysis problems has a mean item score of 2.55, I approach the course with fear and anxiety has a mean item score of 2.49, I prefer to sit at the back of the class because I would rather not be in class is with a mean item score of 1.92, finally I feel that this course is only necessary at the post graduate level not undergraduate level had the least mean item score of 1.87.

Structural analysis is important because it feeds into other civil engineering, building and architectural subjects studied, had the highest mean in the table, therefore it was the most significant response.

From the data obtained, 141 out of 164 respondents agreed that structural analysis was important to them. This did not come as a surprise because most construction programs started structural analysis from their first year, to give them a good foundation and understanding of other structural related courses. This singular reason could have helped the respondents to figure out how vital the course is to them. More so the respondents attesting to the importance of the course shows that they regard it of inestimable value to their career regardless of any difficulty or challenge they might be facing in it.

The second significant response was that, their lecturers have adequate knowledge and understanding of the course. This implies that they have well learned lecturers with the right criteria and qualifications to pass across information to them.

Coming in third place is the presence of student tutors who help the respondents' understanding of the course. The effect this has on the second response is that, the lecturer having an adequate knowledge of the course doesn't guarantee that he passes on the knowledge to the understanding of the student, due to this the students organise tutorial amongst themselves to understand better what was not understood in class. According to research student understands more from their colleagues than from the lecturer.

As there are positive responses gotten likewise also are there negative responses. These are responses that ranked least on the table, the most significant of which is fear and anxiety towards the course. This is a generally accepted notion, that most student faces anxiety and fear when it comes to calculation based courses, because they feel it is hard and hence they might not understand it, even before attending the class. The second negative response is that student prefers to sit at the back, or they would rather not come for the class. This shows that they are very uninterested in the course even though they acknowledged its importance, also anxiety and fear could cause them to want to sit at the back or not attend the class.

Table 2: Agreement of responses amongst covenant university respondents, University of Lagos and Yaba tech respondent respectively.

Responses	Covenant university	Rank	University of Lagos	Rank	YABA College of Technology	Rank
I do not see the necessity of this course in the curriculum	1.6	13th	2.07	12th	1.58	11th
I have difficulties transferring knowledge I gain from examples treated in class to other equivalent structural analysis problems	2.63	9th	2.9	8th	2.08	10th
I prefer to sit at the back of the class because I would rather not be in class	1.81	11th	2.41	10th	1.58	11th
I feel that this course is only necessary at the postgraduate level not undergraduate level	1.69	12th	2.38	11th	1.54	12th
I look forward to attempting the assignments given to improve my knowledge of the course	3.58	4th	3.34	4th	4.42	2nd
Structural analysis classroom is conducive for learning	3.33	5th	2.93	7th	3.75	7th
I belong to a study group which helps me in understanding this course	3.21	6th	3.41	3rd	3.83	5th
There are student tutors who help my understanding of the course	4.04	3rd	3.41	3rd	3.79	6th
I feel the that the lecturer has adequate knowledge and understanding of the course	4.08	2nd	3.48	2nd	3.88	4th
Structural analysis is important because it feeds into other civil engineering, building and architecture subjects I study	4.25	1st	3.97	1st	4.58	1st
I approach the course with fear	2.33	10th	2.79	9th	2.42	9th
I usually anticipate the course lectures because I enjoy it so much	2.92	8th	2.92	6th	3.58	6th
I understand the lecturer and I can contribute often	3.04	7th	3.04	5th	3.92	3rd

From the table 2, it was observed that regardless of the institution, all students accepted that structural analysis was important, as this response ranked first amongst the three institutions visited. Furthermore, in agreement Covenant University and University of Lagos, ranked their lecturers having adequate knowledge and understanding of the course in second places respectively, likewise again, both have in third places that they have student tutors who help in their understanding of the course. In conclusion Covenant University and University of Lagos have agreement of response. The table also showed the general agreements between groups from the three institutions.

CONCLUSIONS

The study has explored the students' response and the factors affecting their learning of structural analysis. It was revealed that students are well informed of the importance of the course to their career; also, they know that their lecturers have adequate knowledge of the course, and furthermore they agree that practical examples are given in class. Students looked forward to assignments to help them do better at the course. Despite these positive responses, some students still approach the course with fear and anxiety, and prefer not to attend the classes, or sit at the back. Though this ranked least of the responses of students to structural analysis as a course. The responses were similar across all institutions surveyed.

RECOMMENDATIONS

1. Despite the students knowing the importance of the course and the lecturer being knowledgeable in the subject area, creative methods of imparting knowledge should be employed by the lecturers despite their knowledge of the courses. This will reduce the fear experienced by the students and develop the interest students in structural analysis.
2. Students should be encouraged to attend classes more regularly and efforts should be made by instructors/lecturers to allay the fears and anxieties the students experience. More assignments should be given to help with their understanding of structural analysis.
3. Public universities should admit the number of students they have enough resources for, so as to reduce the class sizes. Should in case they want to admit quite several students they should ensure that they are divided into groups and given different lecture times.

ABSTRACT

The purpose of this research is to show the advantages of Mobile-Learning in the process of learning a language, using the app Quizlet. Said application is used as a resource in the elaboration of shreds of evidence of the partial feasibility of the mobile learning to support the acquisition of partial linguistic competencies of a foreign language. The Literature demonstrates that the combination of Mobil and traditional media generate favorable conditions to create a motivator and active environment which it helps strengthen learning outside the classroom. This also allows students to interact with the learning material in a different context. The present qualitative case study includes the different characteristics; observation, content analysis and self-administered questionnaire of twenty-one students in a beginner's course in German as a foreign language.

Keywords: Mobile Learning, language course, higher education, attitudes

INTRODUCTION

It is not a novelty that electronic media are used in German as a foreign language (GfL) and it is also known that learning and teaching (L-T) offers multifaceted opportunities for individual and collective learning. The offers to achieve a successful and sustainable learning require a didactic design with diverse means. Those means could be the starting in the process of learning and teaching (L-T) of a foreign language. The presence of electronic media such as texts, images, videos, audios, mobile applications, platforms and electronic boards were important impulses in the process of L-T and for the language acquisition. Learning management using social media for communication between participants and facilitators, or participating in open-access, mass-media courses for different practice and learning.

Despite that, there are a lot of online courses in the market for any language and particularity GfL, conventional classes of language acquisition are still common. Nevertheless, the integration of information technologies and communication are indispensables in the process of L-T for this language. There are phases, where the content is presented online or disconnected, just as you can organize and manage the class preparation program with synchronous or asynchronous. However, in order to link learning with the culture of young participants and thus motivate formal and informal learning, the inclusion of mobile applications in and outside the classroom is an option. (Biebighäuser, 2015; Strasser, 2016; Seipold, 2013)

Motivation, purpose and study objectives

This study has the purpose to collect evidence of the practical feasibility of mobile learning using Quizlet to favor the acquisition of partial linguistic competencies grammar, writing and reading in the German language.

Proposes:

1. Create learning units for a deeper insight of content according to the program of the German language course, level A1, using the Quizlet application.
2. Motivate the students to use Quizlet as an autonomous learning tool of out of school activities.
3. Determine the use of the application by the participants.
4. Determine the advantages of using Quizlet in the acquisition of partial languages skill, such as grammar, reading, and writing.
5. Determine the using of mobile devices in GfL course.

The following assumption is raised: The use of the Quizlet application promotes the achievement and development of linguistic provisions in the students of A1, ALE in using grammatical structures, reading and writing.

THEORETICAL FRAMEWORK

For language teaching, electronic media plays an important role. A retrospective look at the foreign language class reminds us, for example, of language laboratory technologies in the 1960's with a tape recorder, record player, overhead projector, laboratories with tape recorder cassette, educational videos, floppy disc players and DOS programs in the eighties of the last century, then multimedia programs in the 1990's in CDs, or courses that were installed on the computer for self-learning and the combination with hypermedia (Roche, 2013, 245). Times have changed, the multimedia concept has been around for more than twenty years, and the term of E-Learning in semi-virtual and virtual scenarios has given a shift to mobile learning with device portability, with its independent connectivity of place and time to cultures and languages, since the teaching of a language is closely related to a culture. Mobile devices complement the lives of many young students and learning is not limited to formal spaces (Strasser, 2016; Biebighäuser, 2015; Rösler, 2010; Keegan, 2005). The term E-Learning refers to multifaceted learning and teaching arrangements with different electronic and digital media in classroom, virtual and semi-private spaces, independent of time and place, formal and informal, with individual, participatory or cooperative learning phases, with instructional or network structure for self-determined learning. (Arnold, P. et al, 2015, position on Kindle 575-1040). Authors like Baumgartner, Häfele & Maier-Häfele (2002, 14-15) understand E-Learning as "...a superior term for software-supported learning, as well as learning through Internet." When it comes to the topic of E-Learning in foreign languages, it is not enough to "think only of the virtual place, where information is acquired, instructions are fulfilled and questions are asked to the instructor..." (Rösler, 2010, 9). The term Blended-Learning refers to mixed learning with digital media in virtual spaces, which are complemented by face-to-face phases. The presence can also be performed online with webinars or conferences. (Arnold, P. et al, 2015). With mobile devices, E-Learning evolved into the Mobile-Learning mode, which combines concepts of distance education, virtual communication and collaboration in synchronized or synchronized time, with portable and mobile technology independent of the place of students and instructors (Castaño Garrido, C. & Cabero Almenare, J., 2013, 43). Using the mobility factor, the independence of energy sources, connection to the permanent network is possible access to knowledge at any time. New possibilities are integrated in the learning and work scenarios by the comfortable access in the moments needed (De Witt, C., 2015).

The development of ICT has directly affected the way the new generations communicate and relate. The area of education has not been exempt from its effect allowing the generation of virtual and face-to-face environments rich in multimedia content. In this sense, mobile devices, being accessible, smart, small, portable and comfortable to take them anywhere at any time, are a good resource for learning in any area of knowledge and for particular languages. Students, through learning activities supported by M-Learning, have the opportunity to construct their learning actively, rather than passively waiting for the information to be received from the teachers. Mobile devices allow students to have easy access to multimedia information (images, sounds, videos, books and documents), but in the same way they attract their attention to spontaneous learning environments where he decides when, where and what to learn (Pei -Hsun, Ming-Kuan, 2013).

To generate these learning environments requires an E-A process planning. Friedrich et al suggests the six didactic vertices to plan and analyze the class. Linked to the objective of the present work, the point is to generate media-based learning contexts. The mobile device enables students and teachers to create new EA contexts in the interface that connects the convergence of internet media, real-world entertainment media, and creates bridges and communication chains between everyday life and school (Friedrich, Bachmair, Risch, 2011, 9) In this way, formal learning in the language class becomes important and informal at home or elsewhere (Strasser, 2016). But it is not always possible to motivate students to out-class activities using applications or social networks for learning and vacancies are necessary to learn anywhere and at any time. (Tran, 2016; De Witt & Reiners, 2013). It is necessary that students have positive learning attitudes to mobile learning (Chien, 2015).

METHOD

This study has a mixed approach since it explores, collect and analyze evidence in a qualitative behavior of the partial feasibility in the mobile learning using the Quizlet application. In a quantitative form, it realizes the content analysis of exercises and assignments.

Context

The study was conducted in a GfL-course which offers a language center within an institution of higher education. The duration of the course lasts one semester, since January until June of 2017, which gives a total of 120 hours of face-to-face classes. It is worth mentioning that the use of the application is independent of the

classroom course and the tool can provide a space for independent learning. The participants are enrolled in a GfL language course level A1 between January-June 2017 (N = 21). Students were informed of the study and the anonymity of their personal data.

Limitation of the study

The total of twenty-one participants presents a limitation for the study and the results cannot be generalized.

Instruments

The content analysis is based on the number of times in which each participant use the application. For each lesson seen in class, the participants have to carry out exercise that improves grammar and vocabulary skill that facilitate individual learning. For content analysis the simple count is used. The Quizlet application offers seven practice modes: flashcards, vocabulary writing, spelling and listening, blending terms in two forms, test and live connecting (see image 1).

Implementation

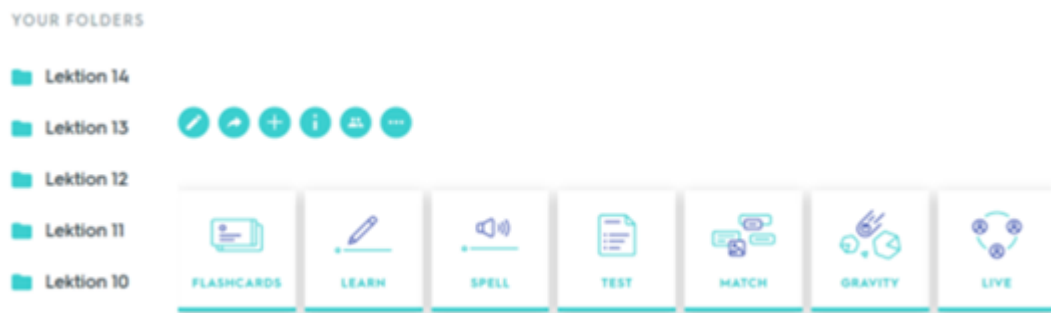

The Quizlet application is free for students and with basic functions for the teacher as well. Quizlet was executed as a supplementary device in the second phase of the course, after the first written exam. Once registered and enrolled in the course inside the Quizlet application, members choose one of the six exercise modes: learning terms, vocabulary, spelling and listening, mixing terms in two ways and a quiz like a figure 1 representation. The teacher is the bound of the content of the application and is associated with the included of the curse. Students have the opportunity to learn vocabulary in a visual and hearing was, as well as reinforces grammatical structures and finally you can go to two types of games to find pairs and sort terms with pictures and /or their descriptions. In a test type, the application allows the student to place his knowledge to the test. Each mode can be used several times and as often as is required for learning. The most representative data of the study approach will be shown below and the results are understood as preliminary.

RESULTS

Objective 1: Create learning units

During the semester five folders with fourteen learning units were developed, which are only available for the participants registered in the course.

Image 1. Example of learning units and exercise modes

Source: own, <https://quizlet.com>

Objective 2: Motivate the students to use Quizlet

The way that all the 21 participants (100%) of different faculties were motivated to use Quizlet was thought personalized invitation in the classroom and by e-mail. To all this encouragement to motivate students to use Quizlet, only eight students (38%) respond, been registered and used in the mobile application as members of the group for level A1. Of the eight students, 50% are women, and 50% are men. The age of the participants is between 17 and 19 years. All the participants are full-time students.

Objective 3: Determine the use of the application

Image 1 shows the seven modes of operation, which participants can choose for more intensive learning of the content of the units in progress. Of the seven modes only five were used. An average of eighteen records per mode is displayed. The Match mode is the unit that most performed with 43.3%. The Flashcard mode for vocabulary and grammatical structures with 24.4% and Testing 22% was selected. The Writing mode was rarely chosen with 8.9%, which may have its reason in adverse conditions for specific contents on a mobile device with decreased touch screens. The Spell and listening mode was little used by students with three entries corresponding to 3.3% and finally the Gravity and Live modes were not used.

Table 1. Activities realized with Quizlet

Mode	Absolute Frequency	Relative Frequency (%)
Flashcards Vocabulary	22	24.4
Writing	8	8.9
Spell and listening	3	3.3
Test	18	20.0
Match	39	43.3
Gravity and Live	0	0.0
Total realized activities	90	100

Source: own, June 2017

Objective 4: Determine the advantages of using Quizlet

In written examinations, participants test the acquisition of partial grammar, writing and reading skills, which are assessed on the scale of 0 to 100, where high values indicate greater compliance in the test and suggest a major acquisition in competition. The results show differences in the three partial competences. In addition to a notable increase in grammar, writing and in reading (see table 2).

Table 2. Student results in Tests

Resultados	Value	Grammar	Writing	Reading	Average
Learning with	Media	81.6	89.1	93.4	77.0
Quizlet support	N	8	8	8	8
Without support	Media	75.1	83.6	88.8	85.3
Quizlet	N	8	8	8	8

Source: own, June 2017

Objective 5: Determine the using of mobile devices in GfL-course.

In questionnaire 95% of students respond to use a mobile device. In figure 1 can be seen that 38% of participants used the mobile devices for learning German and this percentage corresponds with amount of students using Quizlet outside course to trained language competencies. Other 43% of learners respond to used the mobile device sometimes and 19% no used the application for learning german.

Figure 1. Use of mobile devices in GfL-course

Source: own, June 2017

Figure 2 shows how students learning vocabulary and 30% definitely are using digital flashcards and 40% sometimes there are using too. A total of 15% remain who do not use Flashcards definitely and other 15% no really do it.

Figure 2. Learning resources for vocabulary

Source: own, June 2017

The participants were also asked if they only used the course book (figure 3) and 29% of students definitely not only learned with course book and 47% do it not really. But 10% only used the course book and 14% of participants answered that sometimes are study only with textbook.

Figure 3. Learning with textbook

Source: own, June 2017

Discussion of results

We hoped to motivate and engage more participants in out-class activities with Quizlet, although it was not obligatory to use it. The data provides information about a specific group of students and to the extent that their participation in mobile learning with Quizlet outside of the classroom class seems to arouse little interest in them. Here the input conjecture that motivation is greater for autonomous learning in students using mobile apps, cannot be confirmed. Several students fulfill various extracurricular activities such as the training of a sport, learning other languages or dedication to the projects and exams of the career they study. Learning the German language for the participants in the course of this study does not necessarily present a priority, but is part of a medium-term project in their professional career. It may be that the material used in the classroom course is sufficient to achieve personal goals. Participants are missing information about their study habits and use of mobile and social media tools for learning, leisure time use. There is also another question about students' learning habits and teacher dependence. If the Quizlet tool is implemented formally within the course, it will be returned to a teacher-controlled, heteronomous mode. The test mode was little used for learning, since it can reveal those cracks that apparently were tried to close. It may be that the students lacked time to feel safe and sufficiently prepared to present the test. However, it is the idea of an application of this kind to show the gaps in knowledge to close. The mode of gravity, where one plays with terms like a puzzle against time at no time was chosen for learning. That the application was seldom used and can also have its reasons in the frequency of the classroom, since every day students are in the course and there is no need, not enough time to devote even more to a course that does not part of the curriculum.

CONCLUSION

The study was based on the purpose of collecting evidence of mobile learning with the Quizlet application and the assumption that using a tool for mobile learning favors the acquisition of partial language skills grammar, writing and reading in the language German. The purpose and the assumption can be partially confirmed. It should be emphasized that the study does not cover the acquisition of partial competences as indicated by the Common European Framework of Reference for Languages for level A1, but a small part. The improvements in grammar, writing and reading allow the consideration that the Quizlet app helps to trained partial competences. However, other studies are suggested considering factors such as motivation and orientation to the future, attitude towards learning and towards the teacher, emotions in learning as the availability of time and customs of the use of devices for language learning.

ACKNOWLEDGMENTS

The project was supported by the students Yolanda Lopez and Anheli Salinas.

ABSTRACT

The number of females moving into professional field is remarkable and almost as equal as the statistics of men entering into professional field. However, anecdotal and empirical evidences show that the construction industry is still male dominated. The construction industry is experiencing serious skill shortages and the current male dominated workforce is aging. It is believed that women can be relied on to bridge the skill gap and the aging population. Tertiary institutions have been identified as gates through which future entrants enter into any industry of choice. Yet, evidences reveal that female enrollment in construction related programs is abysmally low. This paper is aimed at identifying strategies for attracting and retaining female students in construction related programs. The paper adopted a desk research approach. The major strategies for attracting females in construction related programs include: adequate career counseling, a gender inclusive learning environment, exposure to female role models and personal motivation from the student. For female students to be retained in construction related programmes there has to be obvious changes in the industry. Hence the two effective strategies for retaining female students are: improving the image of the industry and improving work life balance. The findings have implications for the construction industry. Given reported cases of skill shortages and the existing aging population, females can bridge the gap. Hence, construction stake holders and indeed educators need to adopt the identified strategies for attracting and retaining females in construction related programmes.

Key words: attraction, construction programs, female students, gender, retention

INTRODUCTION

A lot of changes have taken place in the world of work. Women are now moving into professional fields once considered strictly for men particularly banking, insurance, retail trade, education and health services sectors because of perceived high level of social status (Gurjao, 2006). However, the construction industry is still dominated by men. Certain factors have been found to discourage women from the construction industry. These factors include: poor image of the industry which is portrayed as one requiring brute strength and a good tolerance for outdoor conditions (Agapiou, 2002); the culture and environment of the industry been amongst the most chauvinistic with an extremely macho culture which is hostile and discriminatory towards women (Bagihole *et al.*, 2000); work-life conflict (Wentling, 1996) and a general lack of information about the industry, the career opportunities it can offer and the qualifications required (Fielden *et al.*, 2000).

Presently, the construction industry worldwide is experiencing serious skill shortage (Watson, 2012; Darren, Mark and Christopher, 2012; Oseghale, Abiola-Falemu and Oseghale, 2015; Windapo, 2016). In many EU countries there are reports of acute skill shortages as such many contractors rely on immigrant workforce in order to meet work demand (Clarke, *et al.*, 2005). For instance, the UK construction industry ranks the second highest reported case of skill shortage among EU nations (Gurjao, 2006). Moreover, the male dominated population is aging (Attar *et al.*, 2012; Ng and Chan (2015) with fewer young people seeing construction as a career of choice. Gurjao (2006) predicted that the population of male workforce aged 65 and over will be 23% of total work force population by 2031. This prediction has serious implication for the global construction because older people are more susceptible

to musculoskeletal challenges and other occupational health hazards which can negatively affect project performance. The industry is yet to fully utilize its full competencies (*i.e. the competencies of minorities particularly women*). Engaging more women in the industry has socio-economic benefits. For instance, employing more women will reduce the cost of immigration issues involved in the use of immigrant workforce - an alternative to the problem of skill shortage. It is the belief of the author that attracting and retaining more women in the construction industry, would help in reducing the skill shortage challenge faced in many countries. Moreover, retaining more women in the industry meets with social sustainability requirement which portrays the industry as pluralistic. However, the big question remains how can the industry attract and retain female students who will someday choose to make a career in construction. Hence, the aim of the paper is to identify strategies for attracting and retaining female students in construction related courses.

METHODOLOGY

The study adopted a desk research approach. It reviewed several literatures on attracting and retaining women in construction. The major findings are documented below:

Attracting female students into construction related programmes

For female participation/retention in the industry to improve, more females have to be attracted into the industry. Several factors have been identified as necessary for attracting female students into the industry and they are discussed below:

Adequate career counsels – According to (Fielden *et al.*, 2000) there is a general lack of information about the construction industry and the career opportunities it can offer. Prospective and present students need to be adequately counseled about a career choice in construction. Firstly, it is important for counselors and teachers to be knowledgeable about construction career. It has been found that some teachers and counselors have inadequate knowledge of non-traditional disciplines like construction and are unable to advise students accordingly (Reynolds, 2014). Adequate skill is required for counseling female students into pursuing career in non-traditional disciplines. Female students can be encouraged by their teachers or counselors into non-traditional careers through verbal persuasion (Ericksen and Schultheiss, 2009). Counselors and teachers put in a lot of effort to convince students about career choices in the construction industry because of the poor image it has earned itself as a result of the prevalence of a macho culture, gender discrimination and poor work life balance. Adequate career enlightenment programmes by various construction related professional bodies and regulatory bodies to secondary schools can also promote knowledge about the construction industry thereby, attracting more female students into construction related disciplines (Adogbo, Ibrahim, and Ibrahim, 2015). Moreover, counselors and students need to be aware of the entry requirements into construction related discipline. Fielden *et al.*, (2000) noted that there is a general lack of information about the qualifications required for studying construction related disciplines. (Adogbo *et al.*, 2015) noted that the determinant for entrance into a construction discipline is to sit for and obtain credits in science subjects that include, but are not limited to, Mathematics, Physics and Chemistry. Hence, more females have to be encouraged to embrace STEM in order to choose careers in construction related courses.

Gender inclusive learning environment – Globally, inequalities in educational access, retention and performance still exists despite efforts to promote quality education (IREX, 2016). Learning environment refer to hard and soft facilities in a school. Hard facilities are physical facilities like classrooms, hostels, laboratory and libraries while soft facilities include teachers, counselors and other human assets in the school environment. A gender-inclusive learning environment is one that recognizes the possibility of the incidence of gender inequality and attempts to overcome it (Shevli, 2009; Du and Kolmos, 2007). Teachers have a key role to play in fostering gender inclusive learning environment which attracts and retains female students particularly in non-traditional disciplines. Some strategies for creating gender inclusive learning environment include: addressing both male and female learners a balanced number of times and for all subjects, giving both female and male learners equal opportunity to present their work to the class, giving both female and male learners equal opportunity to write on the writing board a balanced number of times, giving similar duties to both male and female learners, supporting and encouraging both female and male learners to be class leaders, possibly having one female and one male as co-leaders (IREX, 2016).

Personal Motivation – Female students need to be personally motivated to choose a career in construction otherwise counseling and enlightenment efforts will be wasted. According to Hazley (2016) female students who have successfully completed their study in a male dominated programme like computer science, have been able to engage in positive self-regulation strategies and committed to adaptive goals during and prior to college that helped

them succeed in this rigorous academic atmosphere. Moreover, (Schunk & Zimmerman, 2012) noted that positive performance outcomes in schools such as higher grades, adaptive behavior in the face of challenges, sustainable study habits, promotion of knowledge development and retention, and positive views of ability could be achieved by self - motivation and self-regulatory behaviors of students

Exposure to female role models – Same-gender role models are helpful for women who are already in non-conventional fields like STEM and construction (Drury, Siy and Cheryan, 2011). Women who are in non-conventional fields contend with negative stereotypes that inhibit their performance in these fields (Spencer, Steele, & Quinn, 1999). Female role models can inoculate women in male dominated fields against the discouraging effect of negative stereotypes (Stout, Dasgupta, Hunsinger, & McManus, 2011).

Retaining Females in Construction Related Programmes

Rossiter (1982) noted that educational progress for girls, does not automatically translate into career progress for them. Gurjao (2006) raised concerns about the ease of female graduates securing work placements, ease of being incorporated into the work place and ease of the entire transition. Several strategies have been provided to encourage female retention in the industry including improving the image of the industry and improving work life balance in the industry.

Improving the image of the industry – Females especially new entrants into the construction industry want to see practical improvements in the poor image of the industry. The most obvious image of the industry is that of male domination. The industry is seen as one that requires brute strength with little realization that it is becoming high-tech and simply requiring mental strength, commitment and the determination to succeed (Ginige, Amaratunga and Haigh, 2007). A male dominated industry discourages new female entrants and like Gale (1994a) noted male students are more likely to consider a career in construction than their female counterparts. More females will be retained in construction if the industry takes deliberate steps to improve the masculine nature of the industry. For instance, more females should be given opportunities to supervise work on construction sites instead of keeping women in the office with believe that construction is for the brutally strong alone. Furthermore, there is a need to change the traditional perception of the industry from one that is all about manual labour to one that is process oriented (English, 2006) which incorporates high level mechanization and uses pants and equipment than a crafts industry (Ginige, *et al.*, 2007). The litigious nature of the industry needs to be improved upon. Scenes of labourers arguing with superiors over wages are common on construction sites. Poor project performance in terms of cost, quality and time further encourages disputes between construction stakeholders which portray the industry as highly adversarial. Moreover, females are generally put off by disputes. Peaceful working environments create a safe ambiance which will ultimately attract and retain more females in the industry. The adoption of relationship marketing in construction business can improve working relationship between construction stakeholders and minimize the occurrence of disputes (Ginige, *et al.*, 2007). Furthermore, the working environment on many construction sites leaves a little to be desired. English (2006) noted that on-site welfare facilities are inadequate. In addition, separate site conveniences should be provided for both male and female supervisors. Situations whereby a male worker barges into a female convenience should be discouraged. Construction stakeholders need to make conscious effort to portray an image of competent management efficiency, safety, environmental awareness and neighborliness through different media such as editorial campaigns, national construction week and exhibitions (CIB, 1999). On a project level, every project should have best practice guide with the necessary tools to eliminate or reduce the impact of construction works on the environment, neighboring residents and local businesses so as to enhance the image of construction industry among the public within the surrounding communities (Smith, 2002).

Improving work life balance in the industry

Meeting the demands of work and family for women particularly those in construction can be very challenging. In the industry, employees work for long hours with demanding and inflexible work patterns. Yet, the home front must be maintained, which is a major role for most women (Lingard *et al.*, 2007). Balancing work and family thus becomes a real challenge for women with career aspirations (Wentling, 1996). Retaining women in the construction industry, require that organizations review their working policies to be more employees friendly. Family and work should not be treated as separate entities (Fielden *et al.*, 2000) instead, employees should be given the impression that their personal lives also matter. Positive gestures like showing concern for employees' personal life have been found to increase employees' organizational commitment and ultimately increase organizational performance (Harrington and Ladge, 2009; Parkes and Langford, 2008). Therefore, transforming the industry from one that is oblivious of the personal issues of workers to one that is concerned about the welfare of employees will improve the

work life balance of the industry. The industry has also been described as one where its employees work hard and long (Dong, 2005) making it difficult for workers particularly women to cope with family commitments. Developing flexible work hours can improve work life balance of employers (Francis and Lingard, 2004) especially women. Another source of work life conflict stems from assigning a task to a person below his/her capabilities (Chun, Arditi and Balci, 2009). This reduces job interest and commitment and further breeds inferiority complex and health related issues like depression (Maslach, Jackson and Leiter, 1996) because the person has been relegated to perform a duty below his/her capability. This is important for an industry like construction where women are perceived to be incapable of coping with work demands hence, many women are relegated to the background to carry out clerical activities. Such scenarios reduce the morale and commitment of women which could force them to resign or just cope unenthusiastically. It is the unenthusiastic part that affects job commitment and organizational performance (Grover & Crooker, 1995). Hence, construction organizations must treat women on their merit and give them a chance to demonstrate the skills and aptitude that they possess in order for them to develop a career and stick with the industry.

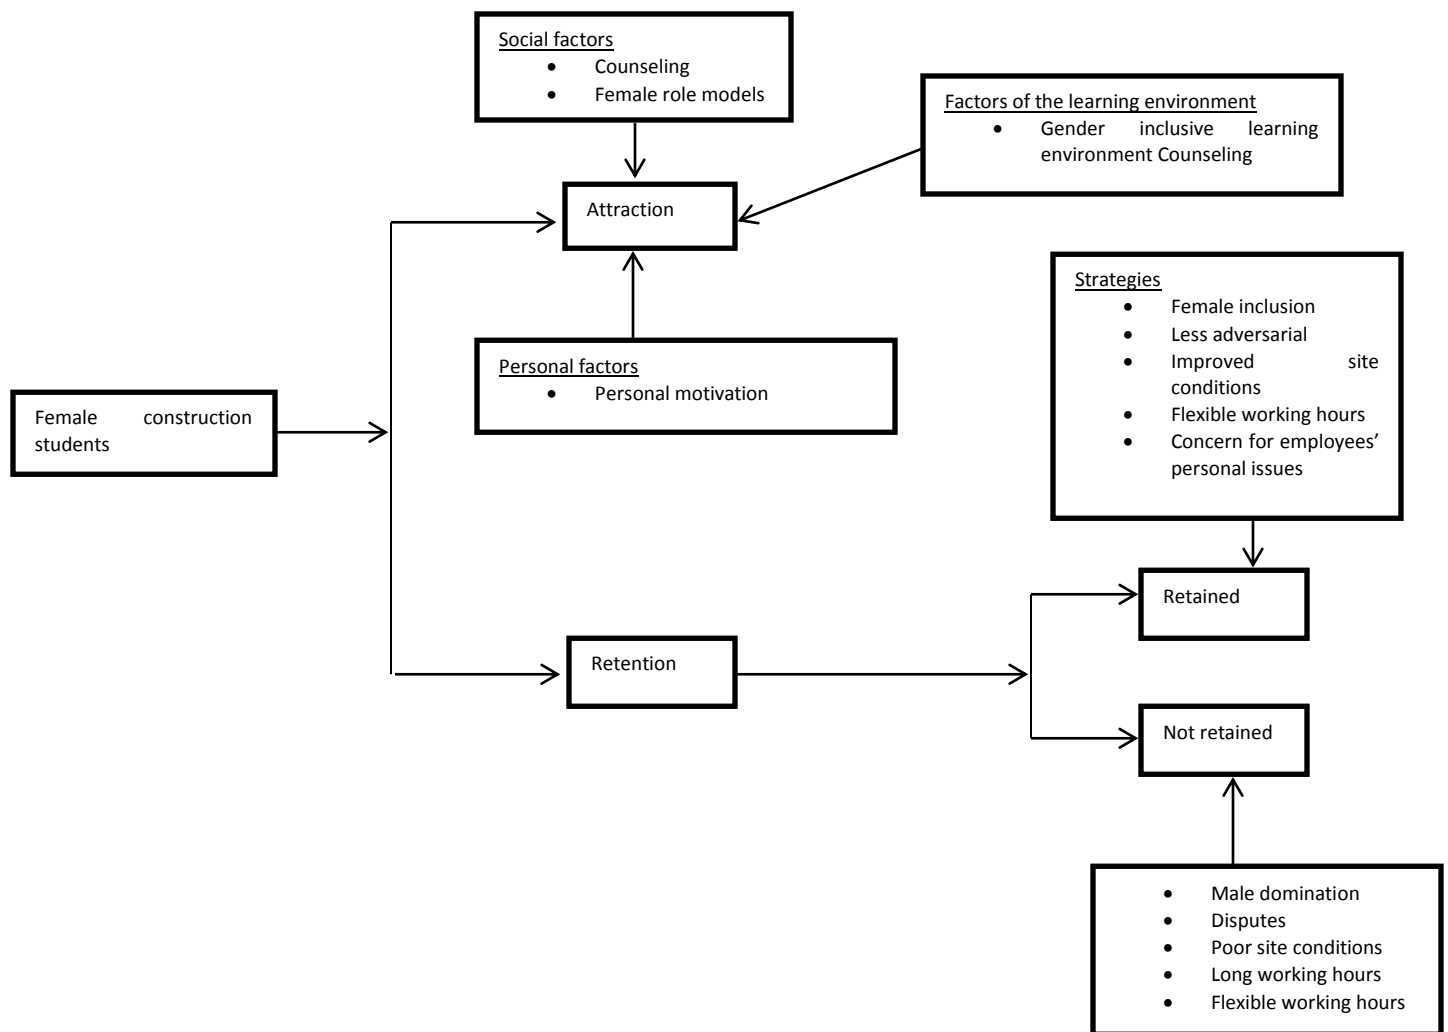

Fig 1: Conceptual framework or attracting and retaining female students in construction related programs Author's concept (2017)

CONCLUSION

Strategies for attracting and retaining females into construction related programmes were reviewed. Attracting female students will require adequate career counseling, a gender inclusive learning environment, exposure to female role models and personal motivation from the student. Retaining females in construction related programmes necessitates that the image of the industry be improved particularly in three areas: one, the male dominated industry

should be changed into one that is inclusive and pluralistic where women are well represented in all sectors of the industry. Two, the litigious nature of the industry needs to be improved upon so that it can become less adversarial thereby creating a peaceful and safe ambiance and finally, the industry should adopt flexible working hours, show more concern for workers personal issues and give females opportunity to demonstrate their skill and aptitude. This research has implications for the construction industry. Given reported cases of skill shortages and the existing aging population, females can bridge the gap. Hence, construction stake holders and indeed educators need to adopt the identified strategies for attracting and retaining females in construction related programmes.

Authentic Assessment Techniques for Content and Language Integrated Learning (Clil) Classroom: A Case Study

Nuchwana LUANGANGGOON

Faculty of Education

Khon Kaen University

Khon Kaen 40002

Thailand

nuchwana@kku.ac.th

ABSTRACT

The major aim of the study was to examine how authentic assessment techniques utilized in Content and Language Integrated Learning (CLIL) classrooms in a Thailand public university. Since CLIL was recognized as a teaching approach that met the demands of Thailand Ministry of Education due to the exposure of using English communication thus improved their confidence in using English. In addition, this public university was called to provide CLIL professional development training. A total of 25 participants of this training and their course syllabuses were screened using content analysis. Pharmaceutical Practice II course was chosen. A total of 38 undergraduate students who attended this course were the samples. Data was collected through classroom observation. Results of this study indicated that the lecturer not only focused on the content learning but also language learning. Lecturer found to use multiple forms of assessment that reflecting student learning achievement, motivation, and attitudes on instructional relevant activities. The authentic assessment was designed to blend as part of learners' learning. The interactions between lecturer and learners, learners and judge, and among learners were found to be very good. In conclusion, lecturer should blend the classroom activities and assessment in CLIL classroom.

Keywords: Authentic assessment; classroom activities; Content and Language Integrated Learning (CLIL)

INTRODUCTION

Popham (2008) defined authentic assessment as a process used by lecturers and learners during instruction that provides feedback to adjust ongoing teaching and learning to improve learners' achievement of intended instructional outcomes. Popham further explained authentic assessment is a planned process in which assessment-elicited evidence of learners' status is used by lecturers to adjust their ongoing instructional procedures or by learners to adjust their current learning tactics. Performance assessment is an approach to measuring a learner's status based on the way the learner complete a specified task. In other words, a performance assessment is one which the lecturer observes and makes a judgment about the learner's demonstration of a skill or competency in creating a product, constructing a response or making a presentation. There are two parts of a performance assessment namely task and systematic procedure for evaluation such as using scoring criteria and rubrics. Therefore, the term performance is shorthand for performance-based or performance-and-product (Popham, 2014).

Authentic assessment aims to evaluate learners' abilities in 'real world' environments. In other words, learners learn how to apply their skills to authentic tasks and projects. Authentic assessment does not embolden rote learning and passive test-taking. Instead, it emphasizes on learners' analytical skills, ability to integrate what they learn, creativity, ability to work collaboratively, and written and oral expression skills. It values the learning process as much as the finished product (McMillan, 2011). Chan and Sidhu (2013) defined authentic assessment as an assessment conducted at regular intervals of a learner's progress with accompanying feedback in order to help to improve the learner's performance. However, Boud (2000) reprimanded that current assessment in higher education is insufficient to the task of preparing learners for lifelong learning.

McMillan (2011) proposed a total of nine characteristics to determine performance assessment as follow: i) Learners perform, create, construct, produce, or do something; ii) Deep understanding and/or reasoning skills are

needed and assessed; iii) Involves sustained work, often days and weeks; iv) Call on learners to explain, justify, and defend; v) Involves on engaging ideas of importance and substance; vi) Relies on trained assessor's judgments for scoring; vii) Multiple criteria and standards are pre-specified and public; viii) There is usually no single 'correct' answer, and ix) if authentic, the performance is grounded in real-world contexts and constraints.

Content and Language Integrated Learning (CLIL) has previously known as 'content-based learning'. The basis of CLIL is that content subjects are taught and learnt in a language which is not the mother tongue of the learners. CLIL assumes that subject teachers are able to exploit opportunities for language learning (Pérez-Vidal & Roquet, 2015). Boud and Falchikov (2005) suggested that we have to move from summative assessment that concentrates on specifics, standards and immediate outcomes to more sustainable assessment that can support learners to become active learners not only in managing their own learning but also assessing themselves to life beyond the end of the course. To date, there is sufficient evidence in research proved by the past researchers like Nicol and Owen (2008), Nishigaki (2008), Merrill (2008), and Manbeck (2008) that authentic assessment can contribute significantly to the learning experiences of university learners and is a significant driver for transformative learning in higher education (Chan & Sidhu, 2015).

Graduates' English competence has become a major concern of higher education institutions in Thailand. Prapthal's study (2001) revealed that the English ability of Thai graduates is ranked eighth among ASEAN member countries, according to the Chulalongkorn University Test of English Proficiency (CU-TEP). One of the several factors leading to this problem is English teaching system in Thailand (Kongkerd, 2013). When the ASEAN Economic Community was officially formed in 2015, Thai people have to work and interact more with a considerable number of people from the ASEAN member countries and its counterparts. Therefore, to achieve effective communication in English as a lingua franca context, Thailand Ministry of Education launched the policy of using English language in higher education classroom.

The CLIL approach was first applied in English classes in Thailand in 2006, through the cooperation between the Thailand Ministry of Education and the British Council in efforts to improve Thai educational outcomes (MacKenzie, 2008). CLIL seems to be a teaching approach that meets the demands of Thailand situations because it provides opportunities for the learners to be exposed to English communication in the classroom that increases their confidence in using English. Thai higher education institution teachers in particular must find a teaching approach well-suited so that learners have high levels of English proficiency, are knowledgeable in subject matter, can apply all steps of thinking in cognitive processes, have the ability to communicate with others, and can present their own cultures and learn about other cultures as well as encourage the use of English as a medium of communication (Suwannoppharat & Chinokul, 2015).

The Qualification Framework for Thailand's higher education system (TQF: HEd) is planned to support implementation of the educational guidelines set out in the National Education Act, to guarantee consistency in both standards and award titles for higher education qualifications, and to make clear the correspondence of academic awards with those approved by higher education institutions in other parts of the world. The framework will assist to deliver appropriate ideas of comparison in academic standards for institutions in their planning and internal quality assurance processes, for evaluators involved in external reviews, and for employers, in understanding the skills and competences of graduates they may employ (Thailand Ministry of Education, November 2006). As a result, higher education students' learning are categorized into five domains namely ethical and moral development, knowledge, cognitive skills, interpersonal skills and responsibility, and analytical and communicative skills.

CLIL MODEL

CLIL is a dual-focused educational approach in which an additional language is used for the teaching and learning of both content and language. That is, in the teaching and learning process, there is a focus not only on content but also on language. CLIL is an innovative fusion of both language and subject education. In this case, a language different from the domestic language that is Thai language is used as the medium of instruction for curricular subjects. According to Hood (2005), an analysis of case studies indicates that there are four potential models emerging in the United Kingdom.

Surface cross-curricular linking (MFL Approach: Modern Foreign Languages)

Both language and subject teachers are involved in planning together the cross curricular project. An example might be a study on different aspects of eco-citizenship or global village, fair trade or war and peace.

Integrating language and recycling/deepening content

Subject topic or syllabus are adapted in teaching the targeted language in order to explore the subject from different perspective and the same time improving the foreign language skills as well. For example Human Geography subject teaching using the French language as the medium of instruction.

Integrating language and new content

It is possible to re-conceptualize curriculum in an integrated way whereby using CLIL model consists of the study of ‘water’ in a foreign language which is investigated from the different perspectives such as scientific, geographical, historical, current catastrophes, water shortages, water for leisure, poetry, art, drama and music whenever possible language to space and place. A global project such as those organized by *Science across the World*, whereby the identical topics are studied by learners from various countries using different languages then the results are compared among the countries.

Immersion (Content Approach)

Language teachers develop a more content type approach to a theme. This may include taking a typical topic such as house and home and carrying out a comparative study between house and home in an African country and in an English-speaking western culture.

Therefore researcher would like to analyze the application of CLIL model in university courses which using English as a medium of instruction in one of the public universities, at Khon Kaen province, Thailand. There is no suspicion that learning a language and learning through a language are coexisting processes, but implementing CLIL requires a reconsideration of the traditional concepts of the language classroom and the language teacher. To conclude the above concepts in CLIL settings, it is necessary for learners to progress systematically in both their content learning and their language learning and usage, as argued previously. Therefore using language to learn is as important as learning to use language, both are requirements as indicated in the following as language of learning, language for learning, and language through learning.

Language of learning is defined as an analysis of language needed for learners to access basic concept and skills relating to the subject theme or topic. For example, new knowledge such as key words or phrases will be given to learners to deal with the content. However, in what way the learners will need to use them to learn should be considered simultaneously. Language for learning focuses on the kind of language needed to operate in a foreign language environment. Learning to use the language is challenging for both teacher and learners as each party has a role to play. Learners need the strategies to enable them to use the foreign language effectively. For example, they need language to assist them to write the research project report and present the findings of the research project successfully. Language through learning refers to the principle that effective learning cannot take place without active involvement of language and thinking. When learners are encouraged to articulate their understanding, a deeper level of learning is expected to take place. The challenge for teachers is how to capitalize on, recycle, and extend new language, or language progression. For example, learners need language to express their new ideas or data during their group discussion. Nevertheless learners need dictionary skills to read some academic articles and review the literature of past research while they are doing research. Additionally, Coyle, Hood, & Marsh (2010: 35-37) revealed that the CLIL classroom demands a level talk of interaction and dialogue activity which is different to that of the traditional language or content classroom.

LITERATURE REVIEWS

Pérez-Vidal and Roquet (2015) seek to contribute new evidence regarding the linguistic progress achieved over one academic year by CLIL secondary education learners, enrolled in an English-medium Science course. Their study found that learners gauge the relative linguistic gains resulting from the CLIL program in contrast with a formal instruction program in the same school. Participants were followed longitudinally with a pre-test vs post-test design. Test used to produce data were modelled on the type of tasks used both in formal instruction and CLIL classrooms. They appointed into the productive and receptive skills of the learners. The sample

included two groups of bilingual Catalan/Spanish participants, English being their third language. The total number of each group is 50. The experimental group had formal instruction plus CLIL in the Science course while the control group only had formal instruction. Results obtained confirm that larger relative gains are obtained by the experimental group, however not in all domains and to the same degree; relative higher gains accrue in reading, as expected by researchers but not listening. Similarly, their writing ability, and particularly so their accuracy, shows higher relative gains, and so do their lexico-grammatical abilities. In sum, in the CLIL program analyzed, reading and grammar seem to be the most benefit.

Suwannapharat and Chinokul (2015) studied on the application of CLIL in an EFL (English as a foreign language) context, a case study in Thailand. Their study emphasized on explanation of CLIL framework and principles and how these are implemented in Thailand as guidelines for developing EFL courses or curriculum. They further examined both advantages and disadvantages of applying CLIL and the difficulties of applying CLIL in the classroom to help EFL teachers to plan their courses more effectively. Their findings revealed that successful CLIL classes not only depend on active learners but also on enthusiastic teachers to facilitate in providing scaffolding for their students. In addition, they found that if CLIL application has been well-planned and prepared for, the CLIL approach enable to produce life-long learners who learn about the real world, are motivated toward learning and have self-confidence as strong communicators and collaborators in the real world. Kewara (2016) explored the CLIL type classroom in Thailand among Thai content teacher. The aim of Kewara's case study was to identify the situation of teaching content through English in Thailand and to concrete CLIL teacher training program. Kewara's qualitative findings from the analysis of CLIL classroom observations revealed that the effectiveness of CLIL teacher development program is able to produce a further model of in-service training program. Moreover, Kewara found that a holistic understanding of content teachers on CLIL approach is important for them to manage their classrooms. In order to conduct a successful CLIL classroom, teachers ought to fulfil linguistic needs, teaching materials, and other supports. Finally, Kewara suggested that it could be useful to enhance specific aspects for successful CLIL type classroom into training and to sustainably promote English as a medium of instruction in Thailand.

Smala (2013) investigated on CLIL pedagogies in Queensland. The CLIL programs use a second language as the medium of instruction to deliver mainstream subjects, such as Science, Mathematics or History were examined. An analysis of pedagogical considerations and domains, elicited from interviews with CLIL program directors at different Queensland schools was carried out. Three concepts including fields of visibility, technical aspects of program enactment and forms of knowledge were used to guide a synthesis of CLIL pedagogies and theories of bilingual education as well as a research framework in Smala's study. Smala concluded that CLIL is a favorable teaching design model as a reaction to rehabilitated calls for languages learning in Australia. However, the demands of CLIL programs require CLIL program directors and teachers to apply a multitude of pedagogical consideration; subject-specific concepts; available teaching resources in the second language; translation and simplification of materials; students' access to learning through modified language. Therefore, CLIL programs need to be supported through resources and focused on professional development opportunities.

RESEARCH AIM

The main aim was to examine how authentic assessment could be utilized in CLIL classrooms.

METHOD

This is a subsequent study after the first phase of the project has been carried out. In the first phase, a total of 25 lecturers who attended the professional development program on CLIL techniques during 2015 to 2016 were required to submit their course syllabus. A rubric based on 4Cs framework (Coyle et al., 2010) was used to assess the Content (subject matter), Communication (language learning and usage), Cognition (learning and thinking processes), and Culture (developing intercultural understand and global citizenship) of the submitted course syllabus. Content analysis technique was used to identify the courses that suitable to proceed for the Phase 2. After the screening process, researcher selected Pharmaceutical Practice II for further investigation.

A total of 38 undergraduate learners from the Faculty of Pharmaceutical Sciences were purposively selected. Classroom observation was employed to collect qualitative data. The classroom activities composed of two parts namely lecturing and game-based activities. A teaching team comprised of a professor and three mentors were involved. Research instrument used was an observation form composed of three sections: Language of learning, Language for learning, and Language through learning. Each section was followed by six key issues to examine

namely i) classroom activities; ii) role of lecturer/learners; iii) task; iv) assessment; v) language used, and vi) notice of the observer. Data was analyzed using content analysis technique. The authentic activities and assessment data were categorized into three major themes: i) Language of learning; ii) Language for learning, and iii) Language through learning.

FINDINGS

The initial findings are presented based on classroom observation. Observation data was collected by May 4, 2016, 2.00 to 3.30 p.m. at Room 2323, Faculty of Pharmaceutical Sciences, a public university located in Khon Kaen province, Thailand. The teaching topic was ‘Anxiety disorders and insomnia’, followed by the game-based activities. The following findings are presented according to the three major themes of authentic activities and assessment namely language of learning, language for learning, and language through learning. Other than examining the authentic learning and authentic assessment, researcher also looks into the different level of authenticity, ranged from relatively unauthentic, somewhat authentic, and authentic that related to learning objectives

Language of learning

Language of learning theme encompasses ‘key vocabulary/phrase’ and ‘language of describing or defining’. Findings of the study indicate that authentic learning and assessment in key vocabulary/phrase as such:

- a) The lecturer used power point presentation as a media of instruction.
- b) The lecturer explained the definition of each word and gave the related examples.
- c) The lecturer highlighted key words then used questions and answers to check the learners’ understanding.
- d) The lecturer used word comparison in order to clarify the meaning of the word.
- e) The lecturer used Diagram or Table to check the learners’ understanding.

For example:

The lecturer explained about five types of anxiety

- a) GAD (General Anxiety Disorder)
- b) PD (Panic Disorder)
- c) *The lecturer explained the meaning of panic, “Panic is the feeling of fear of something.”*
- d) SAD (Social Anxiety Disorder)
- e) OCD (Obsessive Compulsive Disorder)
- f) *OCD is “something do something again and again like locking the door.”*
- g) PTSD (Post Traumatic Stress Disorder)

Traumatic means mind, physical.

PTSD means cannot separate the real lives from the experience, like the soldiers who were back from the war.

Findings reveal that authentic learning and assessment in language of describing or defining as follow:

- a) The lecturer marked the circle round the important vocabulary on the slide and explained.
- b) The lecturer used Diagram to explain the process of...something...
- c) *Longterm Tx of GAD*
- d) *Lecturer: You’ve learned from lecturer Supinya. How many weeks you have to wait for...?*
- e) *Learners: 2 to 4 weeks*
- f) The lecturer gave the information in the Table as the situation then the students had to make the decision under that situation.

“The research findings showed that the effect of using sleeping pill may cause attempted suicide in patients.”

Language for learning

Language for learning theme composed of ‘asking and answering question evidence’. Findings of the study indicate that authentic learning and assessment in asking and answering question evidence as below:

- a) The lecturer posed questions then encouraged the learners to answer orally.
- b) The lecturer designed the assignment that students needed to fill in the form.

What’s the differences between

‘Advice means give advice’

'Counselling means try to find individual problem and you fix it'

Buspirone Therapy

BZP discontinuation

What's the difference between rebound and recurrent

Rebound means the patient has the symptom more than last time

Recurrent means the patient has the symptom many times

Language through learning

Language through learning theme covers 'using feedback', 'dictionary skills', 'extending presentation skills', 'presenting evidence' or 'recycling discussion'. The lecturer used almost every element through game-based activities. Findings of the study indicate that authentic learning and assessment in using game-based activities as follow:

The game-based activities were:

- a) Learners were divided into 4 to 5 learners per group. As it was a computer-based, each group had to go to Socrative.com Room pcothers2. Each group had to fill their responses into the computer program. Then presenting their responses to the class. (*Dictionary skills, extending presentation skills, presenting evidence*).
- b) The lecturer invited another three more mentors to give the score (*Using feedback*).
- c) The lecturer provided the Situational Analysis Task so that the learners had to use their critical thinking skills during their group discussion (*Recycling discussion*).
- d) The lecturer explained the Scoring Criteria and how to fill the response in the computer (amount of ml. per dose, number of times per day, number of days per week).
- e) There was a time keeper bell.

The given situation:

There is a patient with Insomnia come to see the pharmacist.

As the pharmacist, how could you diagnose and make a decision.

- *Photo of drugs*
- *Sleep cycle*
- *Types of Insomnia: Onset insomnia, maintenance insomnia, terminal maintenance insomnia, and non-restorative.*
- *Calculate by divide 7 days per week, divide 3 meals per day.*

When researcher compares the Characteristics of Performance Assessments introduced by McMillan (2011) below, the overall findings prove that this game-based activities response to every characteristic. Moreover, the authentic learning activities were well designed that would lead to effective authentic assessment.

Characteristics of Performance Assessments (McMillan, 2011):

- Learners perform, create, construct, produce, or do something.
- Deep understanding and/or reasoning skills are needed and assessed.
- Involves sustained work, often days and weeks.
- Call on students to explain, justify, and defend.
- Involves on engaging ideas of importance and substance.
- Relies on trained assessor's judgments for scoring.
- Multiple criteria and standards are pre-specified and public.
- There is usually no single 'correct' answer.
- If authentic, the performance is grounded in real-world contexts and constraints.

Findings of authenticity based on learning objectives

Other than considering authentic learning and assessment, the level of performance products and skills varying in authenticity that related to learning objectives would be investigated according to the three types of language learning in CLIL classroom.

Learning objectives: At the end of this unit, learners are able to:

- a) Explain the meaning of Anxiety disorder...
- b) Explain the treat of...
- c) Plan for tapering of Benzodiazepine...
- d) Explain about sleep hygiene...
- e) Comparison of anti-anxiety and hypotics...

Language of learning (key vocabulary/phrase, language of describing or defining) was identified '*to explain*' as response learning. Besides, the authenticity was found at relatively unauthentic.

Language for learning (asking and answering question evidence) was identified '*to explain*' or '*to compare*' as response learning and the authenticity was indicated at somewhat authentic.

Language through learning (using feedback, dictionary skills, extending presentation skills, presenting evidence, or recycling discussion) was identified '*to plan*' as response learning and the authenticity was found at authentic level.

When researcher compared the classroom activities with the characteristics of performance assessment (McMillan, 2011), it was proved that the game-based activities response at authentic level. This is followed by considering the learning objectives to Taxonomy of Cognitive Domain, the higher order thinking learning objectives would lead to authentic assessment. Otherwise, the well-designed authentic learning activities would lead to effective authentic assessment.

DISCUSSION

In higher education contexts, lecturers must understand their learners' learning and take into account of learners' construction of meaning and reality. Reality as experienced by the learner has an important additional value. This assumption offers rich insights into the quality of the language used by lecturers and learners in CLIL classrooms, particularly during lecturer-learner and learner-learner interactions, both of which take up the largest part of instructional time. This focus can be interpreted as a process-oriented evaluation of the affordances for language-and-content learning typically emerging in CLIL environments.

Results of this study showed that the CLIL model implementation was useful for language learning in Thailand public university context. The English skills of learners were improved and had positive attitudes towards learning language. However, the CLIL practices can be shown to work effectively with the condition of lecturers' roles in the classroom as facilitator who help to encourage learners' learning not only content knowledge but also language learning. Learners are expected to acquire knowledge, power of perception, communication, and reasoning (Dalton-Puffer, 2011).

Furthermore, CLIL pedagogy simultaneously enables to develop concrete communication skills in English language as well as working through the main requirements for curriculum content knowledge. It therefore offers learners to a focus on both the language of academic cognition and language of communication. Result indicated that language of communication seems to be neglected by the lecturers. This CLIL model practice is only possible by adapting teaching strategies that interactively segment and build up both learners' linguistic skills and conceptual understanding in course-specific area. As a consequence, CLIL lecturers have to face various layers of consideration in their pedagogical planning including the concepts used, available resources and materials, and assessments.

Moreover, learners' active participation and learning engagement in classroom activities were also activated by the CLIL model. As a consequence, this CLIL model may be effective in enhancing the learners' motivation and confidence in speaking well. In addition to this, exposing learners to speak with people from ASEAN member countries is important in particular at current situation.

In conclusion, results of this study were made very clear that CLIL model is not one method but a variety of approaches to teaching a curriculum course through the medium of English. Since CLIL model is not an easy option for Thailand Ministry of Education to introduce wholesale teaching of a course through English even in higher education institution, it must equip lecturers with the language ability and teaching skills then only to be able to do so. It is suggested that CLIL seminar or workshops for lecturers should be conducted from time to time so that they are able to implement the CLIL model in their classroom.

ABSTRACT

The character profile is the first document that one prepares when one wants to write a screenplay for a film. This is based on the principle that it is characters that drive the story and not vice versa. A strongly developed character can shape an impactful story. In teaching, this parallels a teacher in his or her teaching environment. It is the teacher (and the teacher's identity) that drives the way in which students learn and how they are supported in their learning. The teacher's identity governs the way the teacher thinks, behaves in the teaching and learning environment and how the teacher perceives / treats the students. This paper describes how teachers can explore and reflect on their identity, using the character profiling tool. It reports on a small group of HE teachers' attempt to reflect on themselves and write their own character profiles during a two-day professional development programme. The perceived value of the character profile in relation to understanding teacher identity and the challenges they faced in adopting the character profile as a reflective tool will also be discussed.

Keywords: continuous professional development, higher education, teacher identity, reflective teaching

INTRODUCTION

Screenwriting is the discipline of writing screenplays, that is, film scripts. Screenplays contain not just dialogues, but also the time, location and description of a scene, characters and their age, as well as action descriptions. They become the blueprint for the film director, actors and the whole production team on how the film should be executed. In essence, and most importantly, the screenplay delivers story, that is, the narrative of the film. Before a screenplay can be written, the writer needs to firstly create and develop its characters, especially the protagonist. A writer might have an idea for a story, but he cannot chart the storyline if his characters are not well-developed. This is done through a document called the *character profile*. Although only a small component in the whole writing process, it is, nevertheless, a very important document. This is because in a mainstream story, it is characters that drive the plot, not vice versa (Thomson-Jones, 2008).

Character Profile in Screenwriting

Screenwriting scholars agree that there are many different approaches to writing a character profile (Mehring, 1990). A character profile is drawn from answering all the questions that help describe a character from infancy to the first pages of a screenplay (Mehring, 1990). In relation to that, Parker (1999, p. 89) explains that the character profile is used as means to come to terms with who the character is and what makes them who they are; they are created by answering the questions based on their outer and inner presence, and context. Field (2005), who calls it as "character biography", summarises character profiling as an exercise that reveals the interior life of the character, the emotional forces working on them since birth. Regardless of the slightly differing definitions and approaches to character profiling, the role of the character profile is the same: to provide an adequate description of the characters so that they will become believable on screen, in the make-believe world of cinema. In addition, the aim is always to create an exciting, multifaceted and three-dimensional character, rather than a flat, boring and a single-dimensional one.

Evidence on the Screen

In film, a well-crafted character profile will result in a strongly developed character. A strong character is recognised, most importantly, from having a clear goal on what he wants in the story. A strong character will also move heaven and earth to achieve his goal, despite all the overwhelming obstacles that come his way. This is noticeable, for instance, in the character of John Keating (Robbin Williams) in the film *Dead Poets Society* (Haft, Witt & Thomas, 1989), which won the Best Original Screenplay at the 62nd Academy Awards.

Keating wants to inspire his students at the elite all-boys preparatory school, Welton Academy. He wants them to be extraordinary and seek for what they truly believe in and achieve it - to seize the day or *carpe diem*. That

becomes his goal. Why he wants it is because he believes that every person has the potential of realising their dreams and that they should make their lives meaningful. Why he is pursuing this goal now (in the film) is because he has just been transferred to that school as their new English teacher. His unorthodox ways of teaching poetry cause a conflict with the institution which has its own conservative and tradition-based high standards. It is Keating's relentless pursuit of his goal, despite oppositions from some teachers and students, which creates the essence of drama in that story – the conflict between the character's goal and his stakes. Keating exemplifies a strongly developed character, from a well-crafted profile, who remains consistent in his pursuit from the beginning until the end of the story.

In another box-office hit and critically acclaimed film series, the same pattern of character development is apparent. The character Frodo Baggins (Elijah Wood) in *The Lord of the Rings* trilogy (Jackson et. al, 2003, 2002, 2001), which won the Best Adapted Screenplay in the 76th Academy Awards with its third and final instalment *The Return of the King* (Jackson, Osborne & Walsh, 2003), also had a strong protagonist with a clear goal. All that Baggins wants is for the one ring to be destroyed so that his beloved village The Shire will be safe from all evil and tyranny. That becomes his goal. He wants it now (in the film) because he has been made the official ring bearer by the wizard Gandalf. Baggins' naivety, lack of knowledge and experience, and his small size makes him an unlikely person to undertake the journey to destroy the ring at Mount Doom and face his antagonist, Lord Sauron along the way. Baggins' continued persistence makes him successful in the end. Again, the conflict between a protagonist's goal and his high stakes becomes the perfect ingredient for drama, for what is story without drama.

Parallelism between Character Profiling in Screenwriting and Teacher Development in HE Teaching

An important aspect of teaching development in HE is teachers' ability to reflect on their teaching and make positive changes to their practise. Early work on reflective teaching can be traced to Dewey (1973), Schon (1983) and later Brookfield (2002, 2077). Schon argues for the importance of teachers to "reflect in action", that is, while they are teaching and then "reflect on action", i.e. a reflection after the teaching session. Brookfield's framework for reflective teaching appears to embrace Schon's idea but puts forward reflective action in a different way. Brookfield (2002) identifies the importance of using critical incidents in teaching as a trajectory for teacher reflection. However, in analysing critical incidents or issues in teaching and learning, an effective/complete reflection cannot rely only on one or two perspectives. Brookfield (2002) proposes 4 lenses that teachers should use to reflect on their teaching. These lenses are (1) the teachers' own experience as a learner and as a teacher; (2) the students' perspective; (3) colleague's perspectives; and (4) theory / literature.

Reflective teaching is a continuous process that goes beyond making isolated improvements to teaching practices. It centres on teachers examining their own sets of assumptions which influence their teaching practice (Samaras, 2002, as cited by Izadinia, 2014). It helps teachers to consistently clarify the assumptions that they may have about how students learn and how best to support students in their learning process (Brookfield, 2002). This, in turn, will help teachers to improve on their teaching decisions and action. If Brookfield's four lenses were to be adopted for the reflection process, the key figure in the reflection process is still the teachers themselves. They decide what elements uncovered from the four lenses that they will consider important and what elements are less important. Their perception of themselves as teachers influences the decision they make, even in the reflective process. This is one of the reasons why teachers need to have a clear understanding of their teacher identities because it is their teacher identities that govern their thinking, decision-making and their teaching and learning approaches. As such, teachers' understanding of their own teacher identity helps them make sense of themselves (Coldron & Smith, 1999). Without that understanding, reflection may be fragmented and inaccurate.

What is teacher identity?

Findings from research on teacher identity point to challenges in defining the concept and the nature of its influences to teachers' learning and work (Beauchamp and Thomas, 2009, cited in Akkerman & Meijer, 2011). Mayer (1999) defines teacher identity as a fundamental belief that teachers have about being a teacher and about teaching itself. This includes how they see themselves and how they feel about being a teacher and about teaching. Teacher identity is a composite of a number of sub-identities based on the teachers' knowledge of the subject matter, their knowledge of teaching and their skills in teaching (Beijaard, Meijer & Verloop, 2004). Teacher identity, which forms through social interaction, can be multiple in nature and can discontinue or change over time (Akkerman & Meijer, 2011, p. 308).

There is a similarity in the way that new teachers and more experienced teachers develop their teacher identity (Archer, 2008). It takes intellectual effort, criticality and professionalism to develop that identity (Archer, 2008). It is also associated with values and morality as the development of teacher identity reflects commitment and

responsibilities, and what can positively or negatively impact the teachers and the stakeholders in their teaching environment (Fitzmaurice, 2013). The evolution of teacher identity often involves internal conflicts and emotional struggles as teachers go through the process of constructing, accepting and maintaining their teacher identities (MacLure, 1993). These internal conflicts are frequently centred on the teachers themselves, i.e. the teacher they perceive themselves to be and the extent to which their situational contexts empower them to do so (Dubar, 1997, cited in Lopes et. al., 2014).

Teachers are often the first ones significantly affected by the institution's processes and values (Winter, 2009) and who face the practical implications of the contextual change (Mcnaughton & Billot, 2016). In the case institution where the action research was undertaken, there was a changing nature of the institution as it aimed for higher research outputs, increase in student number and programmes offered, stronger social impact and market presence, and higher QS and SETARA ranking (a Malaysian rating instrument for higher education institutions focused on quality teaching and learning). These increased demands added to the already heavy teaching responsibilities that academics had. The changing nature of the higher institution thus contributed to the changing nature of the teacher identity. It pointed to the necessity for the teachers to be negotiate between their past, present and future identities (Mcnaughton, & Billot, 2016, p. 656) through a holistic exploration (Hall, 2013). Teachers within the institution – although this was not necessarily unique to them – needed to deconstruct and reconstruct their teacher identities in order to find out how they fitted with the institution and how the institution fitted them (Fitzmaurice, 2013).

There was a need to provide a professional development platform that enabled teachers to reconnect with their existing teacher identity. Chee, Mehotra and Ong (2015, p. 425), in citing Walkington (2005) argue that it is insufficient for institutions to offer professional development programmes for teachers which only focus on content knowledge and the skills for teaching content knowledge. There should also be opportunities for teachers to reflect and develop their “professional ways of being” (Chee, Mehotra & Ong, 2015, p.426). A review of literature reveals that various strategies have been adopted to engage teachers to explore their teacher identities. These include journal-keeping (Joseph & Headig, 2010), teacher-narrative studies (Craig, 2013), teacher-annotated self-portraits (Woods, Barksdale, Triplett, & Potts, 2014) and teaching metaphors (Erickson & Pinnergar, 2016). Other known strategies that have been applied over a longer period include mentoring (Walkington, 2005). To the authors' knowledge, character profiling has not been used as a tool for teachers to explore their teacher identities.

RESEARCH QUESTIONS

In undertaking this action research, the authors sought to answer the following questions:

- (i) What is the nature of teacher identities that can emerge from the character profiling exercise?
- (ii) How do teachers perceive the value of character profiling as a tool to explore their teacher identities?
- (iii) What improvements should be made in adopting character profiling as a tool to explore teacher identities?

THE ADOPTION OF CHARACTER PROFILING AS A TOOL IN EXPLORING HE TEACHERS' IDENTITY

The authors co-facilitated a two-day workshop on reflective teaching, focused on exploring the participants' teacher identity, using character profiling as a tool. The workshop was open to all teaching staff in the institution. Participation was voluntary in nature but the number was kept at 15. Of the 15 participants, 3 were teaching in the field of arts and humanities, 9 in language studies, 1 in law and 1 in social science. Another participant was an internal facilitator for professional development programmes for HE teachers.

Workshop Structure

The workshop adopted the Goldsmiths' method of character profiling. It was based on the method of character profiling applied in the highly successful and industry accredited MA in Scriptwriting programme at Goldsmiths, University of London (where the first author undertook his postgraduate studies). The Goldsmiths' method was chosen as the reflection tool as it focused only on the most essential elements that build towards a strongly developed character. Through the programme advertisement and at the beginning of the workshop, participants were informed that the reflective teaching workshop would adopt this approach. At the beginning of the workshop, participants were informed that the outcome of the two-day workshop was the production of each participant's character profile as a teacher, using screenwriting's character profile format, as adopted by the film-making industry. Ultimately, by the end of the workshop, each participant should have produced his/her own character profile in the form of a one-page document, typed in a single-spaced, Courier type font, size 12. As an introduction to the workshop as well as a modelling/scaffolding activity, Act 1 from *Dead Poet's Society* (Haft,

Witt & Thomas, 1989) was screened. Participants were asked to analyse the *want*, *need* and *stakes* of John Keating, the main character. This activity was later used to illustrate that the foundation of a character profile was built upon these three important criteria.

Participants then engaged in exploring their own teacher identity using the character profile format. They were asked to answer specific questions that were categorised into: (1) want; (2) need; (3) stakes; (4) strengths and weaknesses; (5) likes and dislikes; and (6) important biographic factors. Questions for each category, except the last, were quite similar. For example, for “want”, participants had to apply the following questions to themselves: “What does the character (the teacher) want?”, “Why does he/she want it?”, “Why does he/she want it now?” After answering the questions for each category, they were asked to support their answers for that category with a brief description of an event in the past. Each question had to be answered truthfully in order for the teacher identity that emerged to be what it was at that point. At the completion of each category or paragraph, participants were asked to post their paragraph to Padlet, a free online virtual “bulletin” board. A discussion was then held for constructive feedback so that the paragraph could be improved further. The activities for the two days followed this cycle, with a complete character profile produced at the end of the workshop.

Participant Consent, Data Collection and Analysis

Participants were informed of the authors’ intention to conduct an action research based on the workshop and the data collection methods. They were informed of their rights not to be included in the research data collection and assured that personal information would not be revealed if they chose to participate. Participants were also informed that they could choose to maintain anonymity by using a pseudonym when uploading what they had written onto Padlet. All 15 workshop participants gave their consent to participate in the action research. There was an attrition rate of 26.7% on the 2nd day of the workshop attributed to a medical procedure, marking of final exam scripts, conflicting work commitment and an unexplained absence. Data was derived from the researchers’ observation notes, the 9 character profiles and 11 formal workshop evaluation and feedback form completed by participants. A thematic analysis that focused on what was spoken and written by the participants (Riessman, 2008) was applied to the data to draw out emerging themes.

FINDINGS AND DISCUSSION

1. Teacher identities that emerged from character profiles

Each character profile was labelled from A to I. Each profile was analysed and emerging themes from the profiles were categorised into the following: “goals and wants”, “influencing factors” and “teacher conflicts”. The table below summarises the teacher identities that emerged from the profiles. Further discussion follows.

Table 1: Teachers’ goals and wants, influencing factors and conflicts

	Goals and Wants	Influencing Factors	Teacher Conflicts
A	To inspire students so that they are aware that education is more than passing exams and getting good grades, and, they can function well and contribute to society	Past experience - as a student and as a beginner teacher – focus on grades caused underdeveloped soft skills which affected job applications	Exam oriented culture <i>vs</i> inspiring students
B	For students to break out of comfort zones, be flexible, adaptable and resilient	Past experience – Unable to adapt to new colleagues, new company and its culture, knowledge of a friend who remained jobless 3 years after graduation due to lack of exposure and inadaptability	Exam oriented culture and restricted contact hours <i>vs</i> achieving <i>goals and wants</i>
C	To share with and educate others, and to have a meaningful impact on students	Past and current experience – there were friends in class who were forced to take subjects by their parents and saw the same situation with his students.	Having students who were trapped in the subject/programme of study <i>vs</i> having a meaningful impact
D	To challenge students to become autonomous and self-directed learners who are responsive and engaged in learning	Past experience as a student suppressed by institution and teachers and as a beginning teacher who was “a stickler for rules”	The need to complete the syllabus and adhere to “conventional practices” <i>vs</i> <i>goals and wants</i>
E	For students to balance the pursuit of academic goals with non-academic development	Past experience as a student too focused on studies which caused underdeveloped interpersonal skills upon graduation	Completing the syllabus and preparing students for exam <i>vs</i> carrying out activities that could help students develop themselves
F	To facilitate independent learners in their learning, not spoon-feed students what they needed to know	Current experience as someone who approaches life* situations with the ability to think and view issues from multiple perspectives	Students’ over-dependency, the need to complete the syllabus and prepare students for examinations <i>vs</i> hands-on learning
G	For students to understand that learning is a lifelong process and that marks are not the ultimate goal; they should be able to use what they learned and contribute to “life”.	Personality as a person who tended to “overthink” things and place too much importance on others’ opinion of her teaching strategies	Students’ exam-orientation, the need to the syllabus within a time frame and prepare students for exams <i>vs</i> developing deep learners
	To provide opportunities for students to grow and get inspired so that they are	Current experience – time constraint in	Completing fixed syllabus, preparing students for exam,

	Goals and Wants	Influencing Factors	Teacher Conflicts
H	adaptable to life's stages and challenges and make positive contributions to the world	preparing good teaching that helped students develop mastery	needing to fail "students who needed to be failed" vs <i>goals and wants</i>
I	For students to be bold, confident, speak their minds and not be afraid of the surroundings; and for them to be adaptable to different environments and survive challenges at later stage in life	Past experience as a quiet and reserved student who witnessed a close friend being unable to get a job despite having excelled in examinations Current experience: inexperience caused frequent self-doubt when making teaching choices	Covering the syllabus vs. learning activities that actively engaged the students

1.1 "Goals and Wants"

Eight character profiles (Teacher A, B, D, E, F, G, H and I) identified the teachers' "goals and wants" to be focused on their students and the students' achievements, not on themselves or their career development. In addition, all eight teachers perceived student achievement to be focused on character development, becoming independent individuals who were able to adapt to life after graduation and overcome the challenges that they would meet along the way. "Flexibility", "adaptability", "contribute to society" were each mentioned by 3 profiles; developing "autonomy", "independence" and "interpersonal skills" were mentioned in 3 profiles as well. Only two mentioned examinations as being important but also emphasised that education was more than achieving good grades in examinations. One mentioned that students needed to achieve a mastery of skills:

I want my students to be able to break out of their comfort zones and learn to adapt. They need to be able to adapt because they will be experiencing different phases in life which may present new challenges. (Teacher B)

I want to let my students understand that learning is a life-long process. Although marks are important, they are not the ultimate goal of learning... what's more important is how they can use what they have learnt and contribute.... (Teacher G)

Getting good grades is not everything... being able to function in society is crucial – to pay debts [to society]. (Teacher A).

As the teachers' "goals and wants" were focused on holistic student development, the roles that these teachers perceived for themselves also emerged from the character profiles. These teachers felt that they needed to "inspire" their students and "challenge them to take learning beyond the classroom". To do this, it was important that they assumed the role of "facilitator" of their students' learning and ensured that students were responsive, continuously engaged and wanted to do more. As one teacher stated:

I like it when students are responsive, excitedly asking if the tasks they have chosen are relevant and meet the lesson objectives. My sense of satisfaction is further heightened when they continue to be engaged with the lessons and want to do more. But doubt creeps in when some do not respond as positively... and I question my strategies. I dislike feeling like a failure. (Teacher D)

A slight difference was found in the profile of Teacher C. Teacher C's "goal and wants" were focused on the teacher but it was still linked to students. Teacher C wanted to share his knowledge and educate others and have a meaningful impact on his students.

Based on the 9 character profiles that were submitted, it could be deduced that the teachers' "goals and wants" were defined in two ways. For one, they were defined through their students' achievement. For another, they were defined through their perceived roles and responsibilities in facilitating that achievement; that is, in enabling students to become well-developed individuals who later graduate with a mastery of skills, independence, ability to adapt to change, ability to overcome challenges and be able to contribute to society.

1.2 "Influencing Factors"

From the character profiles, factors which influenced the shaping of the teachers' identities were "past experience", "current experience" and "personality". Three teachers singled out past experience as factors which influenced who they were (Teacher A, B and E) while two others singled out their current experience (Teacher F and H). Two more teachers identified the combination of past and current experience (Teacher C) and past and current lack of experience (Teacher I) as their influencing factors. One participant identified his/her personality as the influencing factor (Teacher G).

“Past experience” that was identified by teachers as the factor influencing or co-influencing their teacher identities could be divided into the following: experience as a student, experience in trying to gain employment and experience as a beginner teacher. Three teachers mentioned that they did not want students to be like they were as students or to graduate with shortcomings similar to their own:

I was once a university student who focused too much on marks and did not participate in any co-curricular activities which could have helped me build essential skills. (Teacher E)

I was once a student like them, quiet, reserved... so I don't want them to be like me... I want my students to be bold, confident, speak their mind and not be afraid of their surroundings. (Teacher I)

When I was working in my previous company, I could not work well with my colleagues, failed to adapt to the new competitive company culture and eventually had a nervous breakdown. I don't want my students to experience the same thing. (Teacher B)

One teacher mentioned that her previous learning experience as a student influenced her to want to be a different teacher. Teacher D felt that she was “suppressed” because of a rule-governed university and being taught by “control freak educators”. It was this learning experience that caused her to want to encourage her students to be “autonomous” learners who could determine their own direction in learning. Interestingly enough, despite wanting to be a different teacher, she admitted to being “a rigid stickler to rules” at the beginning of her teaching career but that she had learned to be “a more flexible educator” over the years.

“Current experience” that was cited as an influencing factor was described as either the work experience of teaching in the current higher learning institution (Teacher H) or the perceived lack of teaching experience prior to joining the current institution, and hence, feeling handicapped by that lack of experience (Teacher I). Teacher H stated that being in an institution with its rules and regulations on completing the syllabus and preparing students for examinations, he felt he was spending more time on marking and grading papers, instead of analysing available data to learn how to get his students to master the skills they needed to master. He wanted his students to be adaptable to different phases of life and the changes and challenges that came with it because it was a situation that he faced in his current institution. As Teacher H stated, “I am overwhelmed by the number of hats that I must wear – teacher, parent and social worker.” Teacher I, on the other hand, felt that despite what she wanted her students to achieve (quoted in an earlier paragraph), she lacked confidence and often doubted her own capabilities to the point that she would “occasionally” come up with excuses instead of doing what she knew needed to be done.

“Personality” was cited as an influencing factor in shaping and reshaping the identity of Teacher G. For Teacher G, her tendency to “overthink” things, even “the smallest matter”, combined with caring “a bit too much” about what others thought of her, caused her to be affected when she was deemed not to have done as well as expected in her teaching. As such, despite having a clear conviction of what she wanted her students to achieve and what she needed to do to help the students, she became emotionally affected when she received contradictory feedback.

It could be deduced that the interaction between the teachers’ past experiences as students and as teachers, their current experience and the teachers’ own personality, shaped how they viewed their own “goals and wants” as teachers and the roles that they needed to undertake in order to achieve these “goals and wants”.

1.3 “Teacher Conflict”

Eight of the 9 teachers identified exam-oriented culture, the need to complete the syllabus and teach the topics within a specific time-frame as sources of conflict which prevented or reduced their ability to do what they felt needed doing. All of them felt that doing what they should do in order to achieve their “goals and wants” could mean that they were seen as “non-conformist”, “deviant” and moving out of “conventional practices”. These might not be well-received by the students, parents and their institution. They were concerned that this might ultimately result in students and parents complaining about their teaching and subsequently put their job at risk.

The 8 teachers whose profiles were referred to above felt that pursuing the fulfilment of their “goals and wants” put themselves and their careers at risk. There were several outcomes which the teachers anticipated in pursuing

their “goals and wants”: inability to complete the syllabus and receiving complaints from students and parents (Teacher B, E, F, G, H, I), a damage to reputation (Teacher B, E, F, H and I), being blamed for students’ poor performance and receiving poor student evaluation of teaching (Teacher D), risking the job (Teacher A, B, E, F, G and H) and losing interest in teaching (Teacher G).

One teacher identified an existing conflict which differed from what was identified by other teachers. Teacher C identified a shared feeling of “helplessness” with his students caused by being forced to take the subject or programme by their parents. As Teacher C stated, “I know most of my students are being dictate[d] by their parents...on their future prospect without [the parents] knowing if their children are interested or have the passion [for it].” Teacher C felt that this was a significant conflict because his students struggled in the subject, causing “negativity” and “hatred” toward the subject “and probably their parents” for putting them through that experience. For himself, Teacher C worried about not making an impact on his students but his concern was more for his students:

I listen to my students’ plight and sadness as they share their passion and interest [which] has been denied by their parents... At night while I sit on my bed reading my book,... [I] try... to figure out how I could help students in their time of need and desperation... If I were to meet their parents and explain to them about their children’s plight... parents’ decision has been made.

With the exception of Teacher C (whose concerns were different), there appeared to be a fundamental belief among the teachers that they were limited in their ability to help students develop into well-balanced individuals who were independent, adaptable, resilient and capable of contributing to society – because they had to complete teaching the syllabus within a specific time frame. There are several possible implications that need to be explored further: (i) that teaching the syllabus is at the expense of students’ holistic development, rather than both being mutually inclusive; (ii) that teachers need to cover the prescribed syllabus during the face-to-face teaching time; and, (iii) that learning is teacher-led.

2. Perceived value of character profiling as a tool

Based on the evaluation form and feedback completed by participants, 63.4% (7) found character profiling to be useful and would recommend the workshop to other teachers while 18.2% (2) did not find it useful. No answer was recorded for another 18.2% (2). Those who found that character profiling technique was useful in exploring who they were as teachers reported that they were satisfied with the character profile that they had produced and that the profile was a reflection of who they perceived themselves to be at that point. A total of 36.4% participants found the use of the tool interesting because it provided them with a new perspective or a new way of reflecting on themselves, 36.4% found that it helped them to reflect on their values as teachers and to synthesis their purpose, while 18.2% stated that the tool taught them to be specific, with the cycle of writing, thinking and writing useful for their reflection. Below are some responses:

“I’ve learnt that I need to look deeper within myself to understand who I am.”
“...have a better understanding of myself as a lecturer. I have learned that how you see yourself/experiences can influence your teaching style.”
“... reflect upon teaching / persona as a teacher.... Reflect on daily lessons / achievements so far... reflect on how lessons progress throughout the semester.”
“A valuable framework for analysis” which provides “clarification a round career direction.”

From the 18.2% of participants who found the tool to be less useful, one reason was cited by one participant. The reason cited was an incompatibility between the tool or how the tool was applied with the teachers’ own identity. As stated by one teacher:

Maybe it’s just me, but I am someone who is boring, drama-free, forgive everyone before going to sleep, let go easily so I really couldn’t dig deep into myself and relate to all of this. Plus, I can’t write that well yet. Ha ha.

This participant’s response could be linked to the requirement that each of them identified a critical, most impactful event for each element of the character profile. A further analysis on this can be found in the next section.

3. Perceived challenges in using character profile as a tool in a workshop for reflective teaching

In reflecting their experience in adopting the character profile technique, most participants reported that it was challenging at varying degrees, although they also found it interesting. At the first stage of the character profiling, participants appeared to struggle with answering questions on their *wants* – what they wanted as a teacher, why and why at that particular point in their career. Providing a brief description of a past event to support their answer appeared to be difficult as well. The challenge identified at this stage was the lack of time to address the deep, self-exploratory nature of the question, which one participant considered as “philosophical”. Given that there was a time allocation for each element of the character profile, the time limit could have inhibited their thinking and reflection process.

Two other reasons were provided by participants to explain their apparent challenges. One reason was that they viewed application of the tool to themselves required not just writing skills but specifically, “creative writing skills” which they were either not good at or needed help in developing. The perception that character profiling was still a creative writing exercise – despite being focused on the participants, their own needs and wants, their past and current experiences – was unexpected but not surprising, given that the tool was borrowed from the creative writing field and the examples that were used to explain each step of the application process were also examples from films and film scripts. As one participant stated, the application of the tool could have been better achieved in the workshop if it had been “directed more to teaching rather than a dramatic fictional character.”

The third reason was the perceived inflexibility in the adoption of a screenwriting method to teachers’ exploration of themselves. One participant stated that there needed to be “more flexibility” in “moving from strict screenwriting to the present subject matter.” This view was linked to the requirement that for each element of the character profile, participants had to identify a critical incident in the past that became the turning point for the teacher. This perception was shared by a number of participants, with three participants being resistant to this step:

“But we don’t make decisions or change just based on one incident.”

“You cannot pick one. One is not enough to decide, even if it is very good or very bad.”

“This is not who I am. If I pick one incident that was bad, does that mean I am blaming whoever... the students? The...whoever...”

Identifying one critical incident seemed to contradict with their belief that responsible teachers should not ethically make decisions based on one incident.

The use of critical incidents in reflections on teachers and teaching is not new. For example, it can be found in Brookfields’ four lenses of reflective teaching and his use of critical incident to explore learners’ assumptions (2002). It can also be found in a study by Clavert, Bjorkland and Nevgi (2014) where participants were asked to draw their lifeline and identify critical incidents, what they describe as “meaningful events, experiences or achievements” within that lifeline. Other studies have explored the use of teacher narratives, and deriving from the narratives, a frame for tracing teacher development and professional way of “being” (Yam, Mehotra & Jing, 2015, p.426).

So why did the use of critical incident in this particular setting seemed less acceptable by the academics? There were two possible answers. Firstly, critical incident as a source of reflection and learning for teachers should not be limited to one incident. Rather, teachers should be engaging in continuous reflection based on analysis of critical incidents that occur throughout their teaching career. Secondly, critical incidents, as they have been used in reflective teaching, do not have to be a dramatic event. Instead, the incidents are deemed critical due to their significance to the students, the teacher or the teaching. For example, they could be related to a teaching strategy that worked really well or a minor conflict that led to an impactful learning for the teacher which could influence how he/she would approach a particular topic area in future. As such, how teachers would normally expect to choose critical incidents for reflective purposes contradicted with how they were asked to choose their critical incident during the workshop. Participants were asked to choose only one critical incident which had the most dramatic effect – because there is a limit to screen time and because on screen, it is the drama that captures the audience’s attention. When analysed from this perspective, some of the participants’ resistance to having to choose one dramatic critical incident could be well-understood.

CONCLUSIONS AND RECOMMENDATIONS

Screenwriting's character profiling appears to be useful as a framework to explore the identity of a selected group of teachers teaching in a higher learning institution. Several things are evident from the analysis of the teacher identities which emerged: (1) These teachers had very specific goals and wants as teachers but that their goals and wants were viewed from the perspective of their students' holistic development, their ability to be part of and contribute to the society. (2) The teacher identities uncovered through the use of the tool concurred with research findings that they are influenced by the teachers' past and present experience and teaching context. Personality was also found to be an influencing factor in the shaping of teacher identities. (3) There appeared to be a dissonance between the teachers' perceived identity and the extent to which teachers' choices in teaching and supporting students' learning could be correlated with their identities. Teachers appeared to view themselves as being unable to or limited in their capacity to achieve their goals and wants due to perceived contextual constraints imposed by their institution and situation.

If teachers chose to focus on completing the syllabus within a specific time-frame, believing at the same time that doing so was at the expense of the necessary student development, it was likely that there were misalignments between how students needed to be supported and the teachers' adopted teaching strategies. This points to further professional development needs. Future professional development activities for these group of teachers should include a further exploration on the teachers' own perceptions about effective teaching and their conceptions of learning for students in a higher learning institution. It is worth exploring to find out if the teachers' current view of teaching is related to their levels of thinking about teaching (Biggs, 1999). According to Biggs (1999, p.2), teacher competence appears to follow three levels of focus which are *what the student is* (Level 1), *what the teacher does* (Level 2) and *what the student does* (Level 3). Available information seemed to indicate that at least some of these teachers may be operating at Level 1 or Level 2 where the emphasis is on what the student is and what the student does. This meant that teaching is based on a deficit model which either attributes student achievement or lack thereof to their differences or to the teacher input which is seen as requisite to learning.

Further professional development activities also need to include teacher reflection on their conception of teaching and learning and how to move towards level 3, where the focus is on what the student needs to do in order to learn and therefore what kinds of teaching and learning activities would support their learning process. At level 3, the teachers' role changes to be more of a facilitator. Some of the teachers involved in this study already seemed to recognise the need for adopting the facilitator role at some stage. It is most likely that they would benefit from engaging in activities that enable them to explore how to be effective at facilitating students' learning.

Finally, whether at subject, department or faculty level, it may be beneficial for academic staff to engage in interaction or development activities where they can explore and come to an understanding of the value of the syllabus, the variety of ways in which students can be guided to learn the syllabus and if indeed there was on over-prescription of syllabus, the mechanism needed to rectify this.

Brief as a Prerequisite For a Successful Solution to a Creative Project

Radomila SOUKALOVÁ

soukalova@utb.cz

ABSTRACT

The presented study discusses the importance of managing creative innovation processes, their understanding, effectiveness and subsequent transfer to real life. The development of concrete creative innovation processes has been observed by high-school students who actively participate in the realization of creative innovations. The aim of the study is to find and identify critical factors within the entire creative process, i.e. from assignment - brief, through individual creative artistic process to individual outputs. Goal setting is based on the assumption that the structure, quality and content of the brief is a prerequisite for a successful solution. Comparing inputs and outputs of these projects and finding answers to identified research questions, which areas of project solution are problematic (e.g. whether wording or student approach or other aspect) is also an integral part of this study.

A qualitative questionnaire survey with narrative elements was used to examine the progress of sub-creative projects, the evaluation of which is done through thematic and content analysis. Conclusions resulting from qualitative research are confronted with general project management rules, and findings will be the basis for identifying critical locations in designing creative projects. The ambition of the author is to confront the conclusions with system archetypes in relation to project management.

Keywords: Creative innovation processes, transfer to practice, meaning of brief, qualitative questioning, project management rules, critical places, archetype in project management.

INTRODUCTION

The importance of expert article's topic can be seen in many sectors of the entire state economy. Currently, there is a lot of discussion on Cultural and Creative Industries including activities related to human creativity, skills and talent (Kreativní Česko, 2016). The cultural and creative industries dispose of great potential to create wealth and jobs opportunities.

The results of these sectors provide added value to other economic sectors and likewise often offers different innovation types, both in technological and non-technological fields. In addition, these results are reflected in the society development as well as in the intellect of individuals. Cultural and creative sectors include areas that are often part of the industrial and technological processes, as well as cultural, artistic, non-profit activities. These sectors include architecture, design, advertising, film and audiovisual art, music, books and press, game industry, software, new media and related IT services, radio and television broadcasts, scenic and fine arts, art handicraft, gastronomy and cultural heritage. Obviously, the effort to prepare students/graduates for successful careers in various areas of cultural and creative industries forms the main interest (apart from educational activities) of the art faculty. That is the reason why we started asking the question of cultural and creative industries at the Faculty of Multimedia Communications seven years ago (Kreativní Česko, 2016). The main impulse of this step was the need to find employment for graduates and minimize their outflow to large cities which led to creation of a platform for communication between educational, political and business sector.

An important prerequisite for employment in the creative industries is to gain knowledge and experience when dealing with specific creative projects under the tutelage of experienced teachers. These activities are maximally supported at the FMC by individual commercial projects as well as whole-faculty projects. Successfully realized projects bring financial benefits to faculties and increase the faculty prestige. Unsuccessful projects or projects which were difficult to carry out have led us to following questions: Why has this situation occurred? What are the critical parts of the project? Who or what caused the failure etc.

We researched analyzes of some individual creative projects in the past whose results were published in Design Stories (2017) or IBIMA 2016, INTE 2016.

Other researches were focused on design thinking analysis of the Art Faculty students in the project "Water for All", which had been announced as a single assignment for all faculty studios.

THEORETICAL BASIS

Creative project management and creative projects

Content and individual topics of this study deal with the process and realization of creative project and they are related to terms of creative project management and creative project. *Creative project management is a way how to create new value based on the unique talented personality of its creator aiming to create a quality product within specified limits* (Šviráková, 2014).

Creative project, according to Šviráková (2014), *is a temporary organization created to provide original and formally perfect products containing intellectual property delivered in accordance with a pre-agreed goal and within specified limits.*

Individual creative projects elaborated on a single subject were selected for the analysis. The project team was formed primarily by designer or pedagogue holding the position of mentor. It was not a classic project with project team and a classic project plan. Analyzed projects could be included in creative design ideas because a significant part of FMC specializations are focused on design work (graphic design, industrial design, glass design, footwear and fashion). Creative projects need to be treated as an individual solution, in which the talent and creativity of the author's solution are maximized, with certain limitations being the focus of project itself.

Archetypes in project management

In project management theory, the system archetypes were defined in relation to project management (Senge, 2007). Archetypes are constantly repeating patterns of behavior in certain situations. They were named, for example, for behavior in nature, in marketing communications, etc. P. Senge (2007) described, for management purposes, fourteen unique archetypes. One of the research objectives of creative projects is to find similarities with archetypes for project management and, as the case may be, to complete their characteristics for creative projects. In order to generalize the research results it is necessary to carry out research surveys in several projects with a maximum number of students.

Examples of use of archetypes in project management are described in specialized literature (Senge, 2007, Sherrer 2010, Bureš 2011, Šviráková, 2014). As part of the design process analysis, see below, the individual defined behavioral patterns will be compared with the analysis results to find a typical archetype for solving the "Water for All" creative project, and subsequently generalize the results of similar analyzes for creative projects.

Design thinking

Design is a gradual process by which the author goes through when dealing with a specific assignment. This process is usually developed in several phases which are sometimes quite individual and sometimes typical of a particular type of assignment. It is necessary to "think designedly" at each stage of creative process from the assignment to the finished work (Ambrose, Harris, 2011).

Design thinking is associated with a great deal of creativity, but this does not mean that this process does not have its rules and certain order. Design process should be perceived as a process directed in a similar way to creative project. Creativity is just as important in design as the economic, time and organizational side. That is a reason why it is necessary to perceive design process and thinking as coordinated process leading to creative, innovative and alternatively unconventional solution. In a particular design process (project), the author considers more ways of solutions and can use different methods and mechanisms contributing towards creative solutions.

Design thinking stages

Ambrose and Harris (2011, p. 12) divided the design process into seven steps:

- a) **Specification area/brief** – in this stage it is necessary to define the design problem and its target audience. The emphasis is put on correct understanding of the design problem and its limitations. Only then we can achieve the solution complying with client's ideas.
- b) **Research area** – concerning activities related to searching for information about existing methods of similar solutions or their history, information about target group and identification of possible obstacles.
- c) **Imagination area** - is the stage of identifying interest and needs of end-user and generating ideas to satisfy them, e.g. forms of brainstorming, brain-writing, etc.
- d) **Prototyping area** – it means to materialize the ideas, present them to users, contractors and designers in order to get their view and evaluation.
- e) **Selection** - comparison of existing solutions with objectives of the assignment and selection of the most suitable ones. Some solutions may be practical but may not be the most appropriate.
- f) **Implementation** (sometimes we talk about transfer to practice) presents the realization of solution and its delivery to contracting authority.

g) **Learning area** helps the designer to develop his design thinking. Feedback from contracting authority and users provides information about satisfaction and fulfillment of the assignment goals. For designer this information is an inspiration or warning what's going to happen in the future and what he should avoid or on the contrary which way he should continue.

Specification area and research

As mentioned above, the subject of this study and research is the area of specification and research. Following areas of design process will be successively analyzed within one major research project whose subject is the creative project "Water for All".

- **Specification/brief, or clarify the problem.** This first step in design process expresses client's solution requirements. Its quality or completeness is related to understanding of solution and to the successful design process solution. Anything what will allow designers to comprehend and start the design process may be a part of the assignment.

- **Research/collection of information about the given problem.** We perceive the term research as a quantitative, qualitative, secondary or primary and user research. The research aim is to get the most information about current issue, target groups of users, their behavior, habits, etc. The idea is to work out, based on obtained information, model of a typical potential user (how old he/she is, what is his/her education, interests, relations to branding and innovation, etc.)

Problems of implementation/transfer of innovations and new ideas into practice

Transfer or implementation in the design field is process of introducing new solutions into practice, which means into production. Transfer in design is usually a part of new products development. And often, product design change is considered to be a significant innovation. Successful transfer is completed by selling license or rights for production and subsequent sale to the entity (the company). Experience shows that transfer process is a very complicated long-term process and it is necessary to identify critical points causing complications of the process and eliminate their impact. Research process of finding critical locations must be successively realized in all areas of design process. This systematic approach analyzing individual areas of design process will provide a partial conclusion for each part of this process. By using partial conclusions, it will be possible to identify transparently critical points of the entire design process.

In the field of design, industrial patterns are usually the most represented. Transfer of design, i.e. industrial patterns, is a very complicated process at academic ground. The significance of design and design process can be paraphrased by statement that product is sold thanks to its design because most of technical solutions have already been invented which is a product added value. Very good feedback can be seen in design awards such as Reddot design award, Design plus award, Good design, Successful design, Design for Asia award, and Plagiarism by FMC students. But these awards will not ensure a successful transfer into practice (Strážnický, 2016)

1. OBJECTIVE AND RESEARCH QUESTIONS

Study aim

Given that TBU is a regional university, it is very important to cooperate with companies, in other words the real world. Our cooperation with corporate sector is primarily focused on creative innovations and these are processed in creative projects.

The aim of the whole research is to find and identify critical factors within entire creative process, i.e. from the assignment - brief, through individual creative art process to particular outputs. This study deals with research of the first and second areas of design process (see paragraph Design thinking), i.e. brief and information survey.

Study object

The object of study and research are partial student creative projects which were processed within a particular assignment for the whole faculty "Water for All". The faculty FMC focuses on industrial design, glass design, footwear, graphic design and 3D design and more. These specializations are very often object of cooperation from companies that is why we were interested in the influence of brief on success or failure of creative project solution.

The main assumption of research

Goal setting is based on assumption that structure, quality and content of brief are basic prerequisites for successful creative project solution, resulting in, as a rule, creative innovations.

2. METHODS AND METHODOLOGY

As it is shown in statistics, the process of successful creative project solution and subsequent transfer into practice is complicated and long-term. In order to identify the process problems when solving creative projects it was necessary to identify problems in particular stages of project solution. The transparency of results was supported by choosing to research a project whose assignment was selected by faculty management as a collective project "Water for All".

Due to certain limitations of qualitative and quantitative inquiries, a combination of these methods has been chosen as a research method. The researchers' intention was to reach as many students involved in the "Water for All" project as possible.

Research process is realized in three phases:

- a) In the first phase, which took place in November 2016, a questionnaire survey was carried out. So-called creative questionnaire with visual elements was presented to students. The questionnaire contained a document which helped them to concentrate on issues and phases of design thinking. Altogether 85 students were approached and we received 65 completed questionnaires.
- b) The second phase of research process will be realized in September and October 2017 in a form of individual interviews with selected students whose project has been completed, implemented and exhibited and who filled in the creative questionnaire with visual elements. Individual interviews will be evaluated in a form of thematic content analysis. We want to let the student tell his story about creative design project; we want to observe his feelings, emotions, negative and positive aspects. These interviews will be analyzed by thematic content analysis with narrative elements.
Questions for the interview are prepared in advance in order to give him opportunity to take his own initiative. Used method is a semi-structured interview with narrative elements: the interviewer adapts himself to type of project and knowledge which is at interviewee's disposal. This way of managing interview gives the interviewer opportunity to engage his own initiative and explore topics that will appear only during the conversation. The conversation must be recorded in agreement with the interviewed person. After recording, the interview is literally registered in written form for purpose of thematic analysis. This record is in the form of a log, the record accuracy is verified by independent person who compares written recording to sound recording (Soukalová, 2016).
- c) In the third phase - October and November 2017, result synthesis will be realized, critical areas in the process of developing design process of the "Water for All" creative project will be identified. The third phase goals of research process are:
 - Identification of critical points in the design process of creative project
 - Identification of typical design process features when dealing with the creative project
 - Results comparison with defined project management archetypes
 - Completion of defined archetypes for creative projects
 - Verification of conclusions and chosen research method on the following creative project "Game" (2017-2018)
 - Results application in the dynamic of the project management system.

3. CREATIVE PROJECT "WATER FOR ALL"

The importance of "Water for All" project is based on a discussion about the effective use of water which has been seen as a global social problem. The project aim was to point out water saving using imaginative solutions with creative elements. This way we wanted to inspire people to use water in a effective way and to take water management issues very responsibly. The aim of this identical assignment for entire faculty was also to inspire students to deal with current issues using creative elements.

Research progress of "Water for All" project:

- a) The project was launched on 21. 9. 2016 in the form of so-called Experts Block, which was intended for all faculty students. It was more like inspirational meeting organized in the form of a conference whose main topic was water. Personalities who deal with water phenomenon in different areas gave lectures about various issues. Artists, architects, publishers and presenters, environmental experts, etc. The objective of Experts panel was to show students possibilities and limitations when dealing with project Water for all. Meetings with experts were considered as a part of project assignment.
- b) From 15 to 28 November 2016 a questionnaire survey was conducted in the form of creative questionnaire with visual elements. We wanted to find out how well are students informed about the topic, whether they understand the assignment, whether they have an idea how they will continue to work on the project.

- c) On 15 December 2016 students presented their partial research solutions. During the presentations some interesting ideas appeared and many had great potential to be completed.
- d) Completion and participation in exhibitions. Selected successively completed projects were exhibited and in the future also will be at national and international exhibitions: April 2017 Zlin Design Week exhibition, autumn 2017 exhibition in Dresden, autumn 2017 Decorex exhibition in London.

4. EVALUATION OF THE RESEARCH PROCESS – PHASE 1

As mentioned above, this study subject is the first phase of our research process. The research goal consists in identification of critical points when dealing with design process in its individual parts, i.e. from assignment to implementation. The main emphasis in this study has been placed on the assignment area. We have focused on question whether the specification/ brief specification quality affects design process when solving a creative project.

Figure No.1 shows creative questionnaire with visual elements and the course of the first research phase. The project was launched by the Expert Block on 21 September 2016. The research was carried out between 15 November and 28 November 2016 in particular studios of the faculty (this period was the present day for students). The deadline for interim result presentation was set on 15 December 2017. Months of January and February in questionnaire provide scope for expressing future plans which we also intended to map and thereafter confront with reality. In order to make the orientation in questionnaire easier for students, all of these so-called milestones were highlighted there.

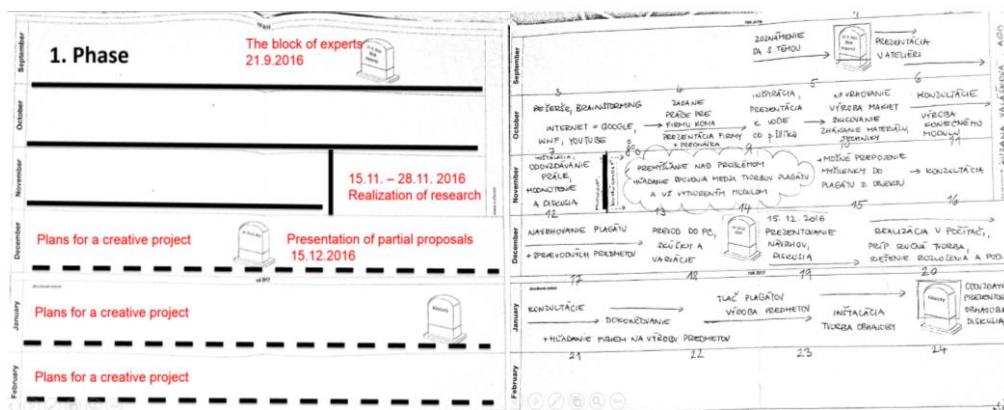

Fig. No.1 Creative questionnaire with visual elements.

Fig. No.2 Example of completed visual questionnaire

Fig. No.2 represents an example of completed questionnaire by a student. The strong vertical line shows the date of questionnaire survey where the student described his realized activities and the period after that date represents planned design process development and its outputs (e.g. attendance at London exhibition).

Students completed their activities monthly. As it was already mentioned, for better orientation in timeline, the so-called milestones, which were the same for all, were marked in questionnaires. These milestones were Expert Block, partial result presentation and end of the semester. From the point of timeline view, we monitored months of September 2016 to February 2017. Together with questionnaire, students were also given a document clarifying questioning objectives and particular phase of design process which they should have dealt with throughout project, see Appendix A.

First part evaluation methodology of the visual questionnaire - Specification/Brief area

In order to evaluate the questionnaire survey we used content thematic analysis according to defined design process areas (Ambrose, Harris, 2011): specification/brief - research - imagination area - prototype production choice - implementation - learning. These areas were marked in the non-filled questionnaire during analysis process. Afterwards, questionnaires were evaluated on the basis of individual specializations in the form of content and thematic analysis where common themes, statements, common words have been searched. Researcher of each studio created a questionnaire monitoring all students' statements describing their design process, see Fig. No.3.

In view of the fact that there was a large number of different information types, we decided to choose the following procedure. Analysis has always been concentrated on one specified problem area; in this case it is the first area, i.e. brief - Expert Block/Specification. This area has been gradually analyzed in all studios. And all problem areas are evaluated in the similar way. Subsequently the first phase result

synthesis of the research/questionnaire survey will be carried out in all design process areas. When processing evaluation of obtained results, researchers' efforts were to find a way that would be usable and appropriate for all design process phases. From the experimental point of view, a thematic analysis method combined with quantitative assessment was used for the first design process area; Specification/Brief. Individual contents were evaluated from -5 to 5, with the - sign representing negative statement and + sign for positive statements. Values from 1 to 5 reflect the topic importance for understanding the assignment (value 1 less important and value 5 very important for understanding the topic), see Fig. No 4. The overall evaluation was determined as the assessment average of all students' statements in given area. In order to maintain objectivity, the particular statements assessment was consulted with a research team member.

Fig. No 3 Common questionnaire of one studio

Evaluation of the area of the specification Brief of the „Water for All“ project

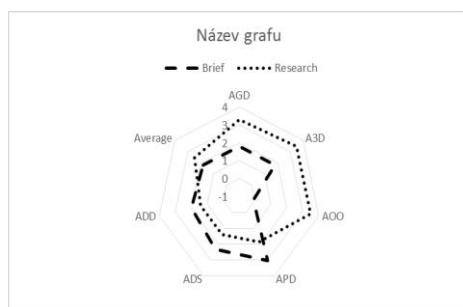

Fig. No. 4 Brief evaluation methodology

Analysis results of visual questionnaires in Specification/Brief design process field

The analysis of creative questionnaires with visual elements was done according to the set methodology described in the previous chapter.

This part of analysis was conducted according to studio specialization; graphic design, product design, clothing and footwear design, industrial design, glass design and digital design. Researcher filled in one single questionnaire for each studio recording all students' statements about design process areas, specification area and research area. Evaluation was carried out according to the set methodology. All students' statements and whole design process area were recorded. Those statements which were not related to evaluated area or those recorded in another area were rated as neutral, i.e. 0, others were rated from 0 to 5 and, depending on the importance and according to the negative or positive was used a - or + sign.

The results of the studios' evaluation in the Brief and Research areas are presented in graphs 1 and 2.

Graph No.1 Brief and Research Areas of design process of "Water for All" project

Graph No.2 Average Brief and Research Evaluation of design process of "Water for All" project

The results showed that Brief area, which included Expert Block, reached the average value of 1.8. Students of Fashion and Footwear Design studios probably did not record the Expert Block at all and did not understand the first phase assignment. They began to deal with the issue only during process of obtaining information and researches. On the other hand, students of Industrial Design studio were familiarized with project immediately, and many of them had already been informed and searched before meeting the Expert Block. Due to this fact, Brief area evaluation was misrepresented in a certain way.

Based on the fact that the filled-in questionnaires were very often connected to Brief and research activities, these two areas were evaluated together. Graph No.2 also presents the average score of both

areas where it is possible to observe diametric difference in evaluation of areas in case of Fashion and Footwear Design Studio. In case of other studios, the assessment situation is fairly balanced. We can summarize that the first two design process areas were best conducted by studios which invited specific companies to deal with the project. These companies presented the particular assignment to students what was appreciated and positively evaluated. Thanks to this fact students got a concrete idea of what to solve right at the project beginning.

CONCLUSION

This paper aim was to find out whether Brief quality influences the creative project success. At the same time, the goal was also to identify critical points of design process when solving creative projects. In the introductory chapters of the article, the design process description was presented as well as the particular creative project Water for All. This project is currently being researched. Together with the research team we are trying to identify development of solution process, its outputs and influence on students. Due to the fact that design process has complex and long-term development, our research was divided into several phases. The results of the first two phases are presented here. In general, we can state that for Water for All project, the first two phases were extensively interconnected and many students perceive specification and research area as one area of design process. This perception was probably caused by a very extensive assignment of Water for All project which was also pointed out by many students in questionnaires. On the other hand, what the students did not comprehend or did not understand within the Expert Block, they had to discover on their own when dealing with research. The research clearly shows that Brief area in design process is crucial for the project research solution. In case of incomplete assignment, the author/designer has to request additional assignment specification. In case of Water for All project, at the beginning many students were not well versed, but under the guidance of pedagogues, some designs were completed and prototypes and models were successfully produced. Selected outputs were exhibited at the Zlin Design Week in Czech Republic and some of them will be exhibited in Dresden and London.

ANNEX NO.A

Water for All - procedure for filling in creative questionnaire

1. Write WHAT you are doing, what you are working on and what your final product should be in studio. Please be specific.
2. Write down all obstacles that will not allow you to work (other tasks in the studio, exam period, preparation for final pieces of work, Christmas, etc.)
3. Write what you will be presenting under milestone 15. 12. How to create ideas 2016.
4. Write down WHAT you have already done, describe September, October and part of November.
5. Between all milestones and activities, outputs, etc., describe HOW you will proceed to be able to present and complete your planned outputs.

Keywords for all studios - design process phases

1. Assignment specification - we evaluate whether:

- It was comprehensible
- We and the contracting authority understand each other
- There were any shortcomings in the assignment
- I am able to accomplish the assignment
- I know who I'm doing it for; who the target group is

2. Information research/collection about the topic, area

- Primary sources (task is to find out what worked /did not work before in similar projects)
- Secondary sources (information concerning issues from all available information sources)
- collecting information about target group what are its wants and needs, etc.

3. Methodology and ideas creation

- Brainstorming in the group/studio
- sketching
- Adaptation to already proven solution
- Know and respect the budget
- I emphasize the originality
- There are doubts in case of the first phase (which, concretely)
- formulate potential problems

4. Model creation/prototype, clarification what and where to exhibit

- Models (prototypes)
- Funding issues concerning the modeling / prototype production

- I do not know exactly what the prototype and model are
- Possible problems: how many models / prototypes to choose
- 5. Solution/decision choice - what and where to be exhibited**
- Consultation with contracting authority
- More expert assessments/expert team
- Possible problems: whether output meets the assignment, corresponds to target group, can be realized in required time and within given budget etc.
- 6. Implementation / delivery (model or prototype)**
- Final project solution delivery to contracting authority (technical documentation, etc.)
- Solution is approved by contracting authority
- Funding is solved
- Is manufacturing, industrial legal protection resolved?
- 7. Output - Exhibition**
- I know the date
- I want to exhibit in...
- I know how many exhibits
- 8. Feedback**
- Evaluation: what succeeded and what did not
- What was the target group feedback?
- was the solution successful?
- What can be improved on the solution?
- How to continue dealing with solution (the effort of serial production, industrial legal protection, etc.)

ABSTRACT

Data generated from research activities are unique and diverse. For that, it takes an application that can analyze and represent data visually. The Indonesian Institute of Sciences (LIPI) creates various types of data in the fields of biological sciences, engineering sciences, earth sciences, and social sciences. LIPI has been provided a repository as tools to manage the data and publication using the Dataverse framework. This framework comes with Two Raven and R. Both are tools for analyzing spreadsheet or tabular data. Data visualization in the form of Bar Chart, Histogram, Gram, etc. resulted from data analysis. But this tools not yet optimally used. This caused by low awareness of the importance of data management. Data management is one of the component of data literacy. This paper will discuss the data literacy in terms of Reading, Working, Analyzing, and Arguing related to the Repository System that LIPI has developed. The literature review and questionnaire were used as a method. This research is expected to be a model to improve understanding of data literacy especially in term of data management.

INTRODUCTION

Research scope that does by LIPI is consist of life science, engineering science, social science, and earth sciences. Because of that, research data that has been resulted from research are varied. LIPI's work unit are located spread over several areas in Indonesia. Many data result from research activity every year. Manage data at the integrated system is still become a challenge. From the result of the questionnaire that we were done, research data are managed by researchers or research group. Data are storage in PC/Notebook, external hard drive, USB drive, CD/DVD ROM, and cloud (Dropbox and Google Drive).

One of the barriers that often faced by the researcher for manage the data is recorded their laboratories data manually at log book. To changes manual record to digital need time and effort. This become one of the barriers when they must store their data in the digital form. A log book is an important and valued asset for researchers. A manual log book is harmful to be stolen because of the low-security system to access the data. One of security used is storage that inside the locker or personal table.

Data become qualified and useful if they are used by others to support research. If research data only stored, that data becomes useless. In order useful, data should be accessed by others. If data are open for public or open access, it will have an impact on researchers and institutions. The researcher will gain recognition in the scientific community through cited data, while the impact on the Institute will be known as a qualified research institution for the results of his research.

To manage the research data, LIPI as an institute that has authority to educate and build Indonesian researchers has been issued regulation that obligate the researchers to store their data in a repository system. The regulation are apply for researcher that used funding from the government. The ownership of the data is also mentioned in the regulation, namely: the copyrighted research data is the relevant Researcher or Research Group, the institution of the workplace, and the funders. While copyright publication is on the publisher.

Beside manage data, giving interpretation for the dataset are important. Two of them are component of data literacy (Prado & Marzal, 2013). The more researchers able to create, control and understand data, they become more powerful (Frank, Walker, Attard, & Tygel, 2016). The aim of some research are giving recommendation for the decision maker. Data literacy education helps in delineating decision domains and defining accountability for decision making (Koltay, 2016). Many paper are discuss about data literacy. Some of them discuss about designing tools for data literacy (Bhargava & Ignazio, 2015) and the others are concerning about curriculum for data literacy (Schneider, 2013). This paper will explore how to build data literacy in the scientific communities.

THE STUDY

This study was conducted to explore and understand about data literacy in the scientific community. We explore about data literacy in LIPI researchers. We conduct analysis based on repository facilities that are provided by institution. Gap analysis about what are the element of data literacy and what skill should researchers have are discussed.

FINDINGS

Every research activity produce data. When data is processed, organized, structured or presented in a given context so as to make it useful, it is called information. Qualified data will produce qualified information. Because of that, caring about data quality for research data is a must. In a company, improving processes could be done by first understanding the basic procedures the companies use and then showing new ways to collect and analyze quantitative data about those procedures (Herzog, Scheiren, & Winkler, 2007).

As other companies do, LIPI develop a repository system to manage the research data. It is a started step to collect a research data from the Indonesian researchers. In order to push the researcher to put their research data (primary and secondary) into the system, LIPI made a regulation. There is no statement about punishment at that regulation. The repository system is integrated with third parties such as Dropbox, Google Drive, iCloud, OneDrive, and other cloud-based storage providers. The goal is that researchers do not reupload research data that has been stored in the storage provider. The system is integrated automatically so that both primary and secondary data can be directly uploaded to the Repository system.

To ensure the data quality, data owner are suggested to input the description of each file. LIPI using Dataverse Framework as a repository system. Different with others, Dataverse Framework not provides metadata of the document, data set, or publication but provide specific metadata of the file. With the detail description of the file, It is expected can guarantee the research data quality. Indirectly, business processes in the Repository System provide education to researchers in maintaining data quality so that it can have a positive impact on the world of research.

Koltay (2016) study about data governance, data literacy, and the management of data quality. At the conclusion, he stated that data literacy is indispensable for managing data quality. Being data literate is not only crucial for researchers but also for information professionals in order to involve in supporting data-intensive research (Schneider, 2013). Data literacy refers to the ability to understand and use data, particularly in the context of the Internet (Frank et al., 2016). Data Carpentry focuses on data literacy in particular, with the objective of teaching skills to researchers to enable them to retrieve, view, manipulate, analyze and store their and other's data in an open and reproducible way in order to extract knowledge from data (Teal et al., 2015). Data literacy is depends on the community context. For this study, we adopt definition of data literacy from Bhargava & Ignazio (2015). Data literacy includes the ability to read, work with, analyze and argue with data.

1. Reading

Reading data involves understanding what data is, and what aspects of the world it represents (Bhargava & Ignazio, 2015). Data obtained from the internet are not necessarily valid and qualified like as we wish. Data is divided into two categories such as quantitative and qualitative. Quantitative data are numeric data which have a continuous variable (height, weight, cholesterol) and Discrete (number of respondents, a number of children, number of library visitors). While the Qualitative Data in the form of non numeric data that has nominal variables (eye color, blood type) and ordinal (cancer stage, grade rank). The ability to read a data is needed when the data is displayed in a visual form such as Formula, Diagram, Graph, Cart, Plot, or Map. Understanding and analysis results of research data depend on the party who has provided the data. Therefore, it is necessary to consider several aspects of managing the data so that quality data are: (1) relevance, (2) accuracy, (3) timeliness, (4) accessibility and clarity of results, (5) comparability, (6) coherence, and (7) completeness. That aspect is the seven most commonly cited properties (Herzog et al., 2007).

The ability to read data for developing research and to interpret whether the data is related to the research being done is the process of data literacy. The researcher must have the ability to read and interpret collected data in the form of graffiti, drawing, numerical, or graphic. The present condition, the researchers already have the ability to read and to interpret data. Literature reading techniques have been taught when the researchers at a candidate researcher position. Training and coaching are done for 3 weeks or equivalent to 120 hours. Several papers have been published in the national or international journal globally indexed. Some of the researchers at the professor level have become a blind reviewer of an international journal. That indicates that the ability to read and to interpret data is not a barrier for researchers.

2. Working

There is the great potential to conduct data-driven research and address questions in all fields when the ability to digitize text and collections, automate data collection, conduct large scale surveys and generate vast genomic, geophysical or another type of data is an increase (Teal et al., 2015).

In the 21st-century, data-centric thinking becoming vital to the way work, communicate and understand. This has led to a proliferation of tools for novices that help them operate on data to clean, process, aggregate, and visualize it (Bhargava & Ignazio, 2015).

The ability in the computational and statistical analysis are required. Both are need to analyze the data appropriately. But, many researchers have limited skill. Beside that, unfamiliar with best practices and tools in the data lifecycle: most of what they know about data management, analysis, and sharing has been learned piecemeal, or not learned at all.(Teal et al., 2015). Working with data involves creating, acquiring, cleaning, and managing it (Bhargava & Ignazio, 2015).

a. Creating

Research data management, i.e. the processing of all types of raw or primary data, that are created along every research process, will not only play a crucial role for many scientists in the next years, but will also have strong implications for library and information science (Schneider, 2013).

In Research Data Life Cycle, the role of researchers is very important when generating research data. Before creating the data, the researcher will search the source of information as supporting data. Data may come from previous research data or use other people's data. Research activity plays an important role in creating a wisdom. Data generating from research can be used to create information; information can be used to create knowledge, and knowledge can be used to create wisdom (Rowley, 2007).

The type of data generated from the research depends on the field of research science. Different field using different kinds of laboratory tools, this caused the type of the data are different. An example of original image data, viewed in the JCB DataViewer. The image shows the following: a 3D stack of a fixed HeLa cell stained with DAPI (blue), anti-INCENP (red), and anti-tubulin (green), recorded using a wide-field microscope; a time-lapse video of a *C. elegans* embryo expressing GFP-tubulin, recorded using a multiphoton microscope; a transmission electron microscope (TEM) image of bacteriophages visualized using negative stain; etc. (Curtis et al., 2010). In the other tools, digital microscopes produce data in the form of images. This primary data is stored in the storage connected to the server. For easy reading by other software, that primary data can be exported in a spreadsheet document in XLS, CSV or XML format. This primary data should be stored in the repository system.

b. Finding

One of the big challenges become data literacy is the ability to identify a data and determine what institution is stored that data. If data posted online, we can find and download easily. But if data are not posting online, we should ask to the institutions. Knowing what institution has relevant data with our research field still becomes a problem. To fulfill that challenges, we must change the mind set about the development of online data. Giving enough understanding about data ownership, copyright, infrastructure, and how to manage them.

In Indonesia, every government research institution has data that manage in online or offline database. Commonly, data is available online in the form of publication. While, raw or primary data is not publish publicly. If need data, we should contact the institution as the owners. This become one of barriers in finding the data. Raw data can be used by other to support their research. With using others raw data can decrease resources, fund, and time. For example, questionnaire data can be used for different research purposes but still in one theme.

To increase research quality, Indonesian government provide a fund to subscribe journal, book, proceeding, research report, theses, dissertation, and other scientific publication that are provided by international scientific article providers (ex: Scopus, ProQuest, SAGE, Science Direct, Cengage Learning, etc.). Besides provided by the government, researchers also must have the ability to search information in open access database or repository that has a good reputation.

Collecting data at the repository system will make o easier to find data. This will make other institution knowing what data we have. Not all the data at the repository is open access. There are some data that must be

closed because of regulation or social reasons. If others want to use it, they must ask formally to institution or the owners.

c. Cleaning

Data cleansing or data cleaning is the process of detecting and correcting (or removing) corrupt or inaccurate records from a record set, table, or database and refers to identifying incomplete, incorrect, inaccurate or irrelevant parts of the data and then replacing, modifying, or deleting the dirty or coarse data (Wu, 2013). Data cleansing was necessary because errors still occurred at the data entry process (Baur et al., 2015). Control the quality of the data is the purposes of data cleansing process.

Mostly doing is manual data cleansing even if very difficult and time-consuming is and vulnerable to errors (Maletic and Marcus, 2001). Machine learning for guided database repair is one of data cleaning strategies (Yakout et al., 2010), inferring and imputing of missing values (Mayfield et al., 2010) and resolving of inconsistencies using functional dependencies (Fan et al., 2008) have been described before (Baur et al., 2015).

Research data divided into many file format, ex: text, worksheet, tabular, statistics, and another format. In order to be qualified, data at worksheet format need techniques to clean it. Data inconsistency is caused by various factors such as input or ambiguous. At the data cleaning process, researchers usually use SPSS or Excel. Microsoft Excel methods to fix and prevent problems with missing leading zeros and hyphens, scientific notation format for numbers, system limitations, file delimitation while downloading, extra spaces, and non-printing characters are shown by Baur et al. (2015). The other data cleaning application like Drake Open Refine, Data Wrangler, Data Cleaner, and Wenpure Data Cleaning are not yet familiar to the researchers. To improve skills in the data cleaning process, training on how to implement that application is required.

3. Analyzing

Data analysis, also known as analysis of data or data analytics, is a process of inspecting, cleansing, transforming, and modeling data with the goal of discovering useful information, suggesting conclusions, and supporting decision-making. The analysis regardless of whether the data is qualitative or quantitative has the skill to describe and summarize the data, identify relationships between variables, compare variables, identify the difference between variables, and forecast outcomes.

Analysis refers to breaking a whole into its separate components for individual examination. Data analysis is a process for obtaining raw data and converting it into information useful for decision-making by users. Data is collected and analyzed to answer questions, test hypotheses or disprove theories (Judd & McClelland, 1989).

Determining what raw data should be analyzed and how the data will be analyzed is data analysis. This is an important aspect of data management for researchers to consider because analyzing the wrong data could lead to false results (Kalichman Michael, 2006). Many people are confused about what type of analysis to use on a set of data and the relevant forms of pictorial presentation or data display. The decision is based on the scale of measurement of the data. These scales are nominal, ordinal and numerical.

LIPI researchers produce several types of data, when they analyze the data they must have knowledge of the data itself. In the LIPI repository system, tools for analyzing data such as R, WorldMap and Two Ravens are available. Each researcher will effectively work with System Repository without opening the analytics software on PC or Notebook.

4. Arguing

Arguing with data involves using data to support a larger narrative intended to communicate some message to a particular audience (Bhargava & Ignazio, 2015). Data visualization is a general term that describes any effort to help people understand the significance of data by placing it in a visual context. Patterns, trends and correlations that might go undetected in text-based data can be exposed and recognized easier with data visualization software (Margaret Rouse, 2012).

One of the most arguments for value of data visualization is expressed from John W Turkey in the book *Exploratory Data Analysis*. The greatest value of a picture is when it forces us to notice what we never expected to see. Data visualization is not easy. Need of many different skills and a great deal of practice or experience.

Above all, it requires a deep and broad knowledge across several traditionally discrete subjects, including

cognitive science, statistics, graphic design, cartography, and computer science. In convey opinion or argumentation, visual data, graph, simulation, map, symbol, infographic, and diagram chart can be used (Andy Kirk, 2012).

Some software can use to data visualization from data scientific to easily understood data for general community. As researcher must can making arguments based on data analysis so the arguing be high quality. Data presentation based dirty data will false argument and can a dangerous reference.

The end of the research activity led to a paper that contains methods, discussion to argumentation to convince the research is acceptable and useful. Associated with data literacy, the researcher must have skill in searching data, filtering, cleaning data, analyzing until data visualization so that others can understand what is researched and what is its benefit.

CONCLUSIONS

Data literacy in scientific community include the the activities of reading, working with, analyzing and arguin with data. For scientific community, especially in Indonesian Institute of Sciences, not all of the activities has done during the research process. There are many data cleaner software tools or data visualization tools. Most researchers use familiar software and simple tools to cleaning and visualizing the data. Because of that, improving the ability to use other software is needed. This is become one of the inhibiting factor in arguing result of research in the visual to society.

To increase data literacy in the scientific community, it needs to do some approaches such as training, workshop, seminar, focuses group discussion, and other activities. These efforts make research activities will produce right goals and objectives, begins from finding, collect, cleaning to data visualization. Fruitfulness in an implementation of data literacy depending on behavior and habits of a researcher in the research data management, even more, implementing the research data lifecycle.

ABSTRACT

The study aimed at assessing the building practice in the new millennium and evaluated the readiness of building education in meeting these challenges. The objectives of this research are to evaluate building education and practices in the new millennium, identify the challenges building practices face in the new millennium and evaluate the readiness of building education in meeting these challenges. Secondary and primary data were obtained. Data was obtained by the administration of questionnaires, and interviews of students studying Building Technology in Covenant University and construction practitioners. A sample size of 150 students comprising of students from the 5 levels of the programme partook of the survey. Purposeful sampling technique was used and the data obtained was analyzed using a 5-point Likert scale. The factors affecting the readiness of building education in meeting the challenges of Building Practice in the New Millennium in varying degrees include Poor Educational Background, Poor curriculum, Poor Relationship Between Educational System and The Construction Industry. Lack of Prospect To Take Risk, Insufficient Building Practice, Corruption, Financial Inadequacy and Economic Recession. It was also observed that that the education sector and public lack awareness of what building millennium entails and do not have the pre requisites building education that can meet up with the rapidly evolving standards of the millennium. The study therefore concluded that the building education is not ready to face the challenges of the new millennium; it recommended that the curriculum should be assessed and restructured to be able to meet up the requirements of the new millennium building construction.

Key words: Building Education, Building Practice, Construction, Curriculum New Millennium:

1.0: INTRODUCTION

Nigeria faces many challenges in the years ahead with recent developments taking place attracting attention of the countries unstable economy which could lead to national conflict management practitioners over the next few years. Building education be described as the introduction to building in new ways of which are beneficial to both the economy and the practitioner. It is done to give enlightening insights of how the construction industry would change from time to time whilst being unique and serving satisfaction to occupants.

The new millennium is an age in which the development of construction practices would be advanced with basic principles of building made easy with the use of modern devices and facilities. New Millennium Building Systems should be encouraged to attain cheap and reliable building components for use primarily in low-rise non-residential buildings – including commercial, industrial, and government construction.

This research was done to evaluate possible challenges the building industry of Nigeria would be facing in the new millennium and proffering solutions of what to do to reduce the negative impacts that might be experienced in the

nearest future. Building education seems to be developing at a fast rate and it is from this perspective that the study examined if the Nigerian building education is prepared for the new millennium of building. The construction industry has historically been linked with the process of industrialization and urbanization, particularly since the advent of the Industrial Revolution. Transport infrastructures facilitated trade and co-operation between countries and also the diffusion of technical innovations from the most advanced to the less advanced areas of the globe. The construction industry played a key role in the reconstruction of the war-ravaged Europe.

The heavy program of construction improvement of housing and social infrastructure, beside its contribution to the national output, was also a reflex of a better re-distributive economic policy in Europe post World War II. The importance of the construction industry has also been recognized in the context of countries affected by natural hazards (Ruddock et al, 2010; Amaratunga and Haigh, 2010). Besides its multiplier effect on other sectors of the economy, a well-devised reconstruction program of building and community service infrastructure can contribute to sustainable development and protect the natural and built environments.

With regard to the relationship between construction and economic development, Turin (1973), using cross-country comparisons, found an association between construction investment and economic growth. That finding was consistent with the classical approach in growth theory in which physical capital formation is the main engine of economic growth and development. Turin's argument about the pattern of the construction industry contrasts with the argument advanced by Bon (1992; 2000).

Nigeria faces a lot of developing crisis such as economical degradation, rise and fall of currency, recession and the corruption rate we have in our economy. The construction industry is presently experiencing a huge record of construction failure, building collapse and most of the time leads to poor foundation design and construction therefore it will be of utmost interest to initiate ways of facing such challenges and proffering solutions especially in our economy which has forced the building industry to adapt to new changes triggered by an ever sophisticated society characterized by an increasing demand for customized modern buildings. The major problem facing the growth of the building industry in a depressed economy like Nigeria is poverty, unemployment, poor economy, and corruption which would eventually lead to non-compliance of the building codes as well as building laws.

The aim of this research is to design, critically identify, examine and investigate if the building education is ready to meet the challenges in the new millennium. The objectives are given below:

- To evaluate building education and practices in the new millennium
- To identify the challenges building practices faces in the new millennium.
- To evaluate the readiness of building education in meeting these challenges

This research covers the building practices in the new millennium; it also covers an investigation if the building education is ready to meet the challenges of how the new millennium works. The limitation of the study is Nigeria. The findings of this study will be beneficial to Ministry of Housing and Urban Development, lecturers, teachers, and students, Nigeria Research Council, Nigeria Institute of Building (NIOB), Council of Register Builders of Nigeria (CORBON), construction consultants, contractors and real estate surveyors/value. It will also help the building construction companies and high institution on recruiting, training and retraining of staff in the new millennium, as the information generated would serve as a database for them. The result findings would help building clients, the governments, builders, professional bodies and building team of specialists to jointly improve working conditions of building professional members in organizing seminars, workshops and conferences.

2.0: RELATED STUDIES

2.1: What is new millennium?

New millennium can be referred to as an age where building technology or construction has gone into the jet age where laborers are no longer needed and technicians are essentially welcome on site with the introduction of new machines and equipment which would make jobs or construction a lot easier to accomplish. Modern marvels would arise in the construction industry in a millennium from now that would lead to better efficiency and sophisticated complex programs giving rise to structures that can only lead to structures that have only been fantasized on. The future of the construction industry seems brighter than ever. Aside from providing various jobs to those seeking

careers in this field, evolving techniques have enabled different living options for people to better suit their styles and preferences.

Condos in key cities, for example, have provided people with an alternative way of living, aside from the standard residences that people are more accustomed to. As more and more buildings and condominiums in major cities are being built, the industry is also keeping in track with the latest technologies to better improve the quality of said buildings, geared towards the future of man's day-to-day living through sustainable construction practices. So what are the different technologies available to the construction market to advance the industry beyond conventional builds into ones that represent the standards of the future? What are the innovations and materials that will build the high-rise buildings of tomorrow in the world's largest cities?

2.2 Future construction technology

When it comes to construction technologies, the possibilities are endless, and the current rapid innovation and technology of construction will shape the appearance of future buildings. In terms of building construction, the construction workers of the future could be robots. The Harvard School of Engineering and Applied Sciences and the Wyss Institute for Biologically Inspired Engineering have designed termite-inspired robots which can already perform construction tasks.

They can build structures without supervision and even without pre-determined roles. Four years have been allotted by the researchers to develop TERMES, the team of small robots that can build 3D structures from foam bricks. They plan to use similar robotic systems such as these for construction projects that may be too risky for humans. Italian robotics engineer Enrico Dini has said: "We might print not only buildings, but entire urban sections." This may well hold true, with architects already producing the first 3D-printed houses. Last January 2013, Universe Architecture had designs of a two-storey house that looks like a Möbius Strip and designer's plan that it will be concretely printed on site. Universe will be collaborating with Dini with his D-shape machine, which is considered the largest 3D printer in the world. In 2010, it built a single-room structure resembling a mountain hut with two windows; an interior that has a workspace, platform bed and a sink.

These kinds of printed buildings might offer a glimpse of the future of building construction, but because of its fragile parts, the buildings must be printed with supporting structures to prevent them from collapsing while under construction. The support can be removed once the concrete filling has been added. At present, the whole process has been estimated to cost around €5 million: rather prohibitive, but constantly falling as the technology is refined. (www.constructionglobal.com/equipment-and-it/future)

2.3 Building materials of the future: Greener, more intelligent

Future building materials will take their cue from current scientific technologies. As reported by BBC News, a self-healing concrete developed by microbiologist Henk Jonkers and Eric Schlangen, a concrete technologist, involves the genus *Bacillus*' mixed bacteria spores. Its nutrients, when activated by water, will feed on calcium lactate to produce a primary component of limestone, which is lactate. This self-healing concrete may be available within the next few years if tests are successful. Once proven, it could eliminate concrete cracks and expensive concrete maintenance. Alongside and influencing these technologies is a greater awareness and need to build greener, with sustainable materials used at the construction phase. Malama Composites has started manufacturing foam material from plant materials like hemp, kelp, and bamboo that will be used in turbine blades, insulation, and furniture. The foam can provide high moisture and high resistance to heat, and when used can also give protection against molds and pets. It even improves the quality of living, thanks to its better insulating properties and higher thermal resistance. Plus, it can also give your living spaces the right kind of acoustics.

2.4 Re-defining future design

While it may be easier to stick to familiar construction methods, the industry is changing and the new, innovative greener techniques, while challenging to develop to the point that they become standard, can be highly beneficial to the quality of the urban environment, and often ingenious.

In Indonesia, Skidmore, Owings & Mills has revealed its design for a 99-story PERTAMINA Skyscraper that is shaped like a budding flower's petals. What's interesting to note here is that to harness wind energy, the said

skyscraper will slightly open its peak to allow its wind funnel to convert high speed winds into energy sources. The design team, as part of its green architectural design plan, also took steps to minimize the solar heat, adding solar panels to the façade of the skyscraper to take advantage of the natural daylight coming from the sun, thus decreasing carbon dioxide emissions.

Elsewhere, to decrease construction costs and at the same time reduce waste, VS-A and Chartier-Corbasson unveiled their skyscraper design made from the tenants' trash. Dubbed as "The Organic London Skyscraper", it will be made of durable panels made out of plastic waste and discarded paper. The said building will grow as its initial residents produce more trash for the construction materials. The plastic casting can be completed in a year, and to be able to generate its own electricity, the hollow tubes in the embedded scaffolding will be provided with wind turbines. Recycled materials will be converted to durable panels installed across the building.

2.5 Seeing beyond the tall buildings

Considering the future of construction development can give us a wider perspective and fresh ideas when it comes to designing the living spaces such as condos, skyscrapers, skylines and office spaces being built in major cities around the world. (www.constructionglobal.com/equipment-and-it/future)

Architects and designers have given us exciting ideas that will define the way we live, and the kind of living that the next generation will experience. More importantly, as these buildings are constructed, experts should ensure that every material and every action taken in the construction process will minimise environmental damage, ensuring the world outside these future buildings is as pleasant as it is inside.

2.6 What are the new construction techniques?

Modern methods of construction the Office of the Deputy Prime Minister defines modern methods of construction as a process to produce more, better quality homes in less time. For the purpose of awarding grants, the Office of the Deputy Prime Minister uses a definition in terms of products.

- Panelized units are produced in a factory and assembled on-site to produce a three dimensional structure. Open panels consist of a skeletal structure only, whereas more advanced panels may include lining material, insulation services, windows, doors, internal wall finishes and external claddings.
- Volumetric construction involves the production of three-dimensional modular units in controlled factory conditions prior to transport to site. In Hybrid techniques combine both panelized and volumetric approaches. Typically,

volumetric units (sometimes referred to as pods) are used for the highly serviced and more repeatable areas such as kitchens and bathrooms, with the remainder of the dwelling or building constructed using panels.

- Other modern methods of construction may use floor or roof cassettes, pre-cast concrete foundation assemblies, pre-formed wiring looms, and mechanical engineering composites. They can also include innovative techniques such as tunnel form or thin-joint block work.

Modern methods of construction are about better products and processes. They aim to improve business efficiency, quality, customer satisfaction, environmental performance, sustainability and the predictability of delivery timescales. Modern methods of construction are, therefore, more broadly based than a particular focus on product. They engage people and process to seek improvement in the delivery and performance of construction

2.7 Reasons and challenges why we are not meeting the standards

The global economic crisis would pose challenges to building construction in Nigeria in the following ways; Inadequate or non-availability of building construction engineers

According to Thanni (1998) building construction details which the contribution of a team of specialist such as the engineers, architects, builder, quantity surveyors structural engineers electrical engineer and mechanical engineers whose knowledge and skill are utilized on large building projects.

According to Obiegbu (2004) building construction can no longer be the total responsibility of one person.

According to Nakashima (2010), building Contractors, site workers also are handing their hats on public work.

According to Prock (2010) other challenges was keeping key personnel gainfully employed. He says “while were got a large backlog, many of our projects are starting slow, until we got key people waiting to go to work.

According to Kobatake (2010), a constant challenge is employing experienced project and field personnel and Good Follow Bros (2010) stated that the best employees right now but they have a lot of potential demands especially if members of our families have been laid off. According to Skelton (2010), our challenge is helping them keep focused on safety we don’t want to lose sight of the overall goal, which is to work safe and be able to go back home to our “families” Skelton adds that in thought economies times, ‘people change industries just to survive and they don’t always come back. The industry loses quality people who could take it to the next level’.

According to Anaele (2000) the acquisition of building construction skill in technical colleges and other colleges depends more on the teachers. Building constructing teachers should be professionally qualified and occupationally competent as to impart the required skill to the students.

2.4 What are we taught in building education?

In Covenant University and Nigeria as a whole, building education can be said to not be ready for the new change or innovations in building construction given the fact that we are not adequately exposed to any form of innovative or creative building experiences. We do not want to advance in the construction industry because we still use conventional methods of building and are unwilling to research or input ways into which to develop our building. Moreover, we do not all have free access to the internet or connected people in high places that grant us access to relevant information with which we could improve ourselves in this field.

3.0 RESEARCH METHODOLOGY

Extensive literature review was carried out through the use of relevant textbooks, professional magazines and internet as a secondary data collection sources. The primary sources are interview and the use of questionnaires. The use of questionnaires and interview were the methodology approach use for this research. This research is based on the case study which is Covenant University. Field data was obtained by the administration of questionnaire, and interviews of students studying building technology in Covenant University. The population of Building Technology students from 100 to 5001 studying building technology in Covenant University was a total of 283. A sample size of 150 students comprising of students from the 5 levels of the programme partook of the survey. Purposeful sampling technique was used. The data was analyzed using tables and a 5-point Likert scale.

4. 0: ANALYSIS OF DATA

The survey was carried out on the Building technology students in Covenant University. A total of One hundred and fifty (150) questionnaires were distributed. One hundred and ten (110) was retrieve out of which ten were not properly filled. The males that participated were 102 in number while females were 48. Analysis of data was done using the Likert scale. The scores were obtained by assigning weights to the 5 – point Likert scale, that is, from strongly Agree = 5 points to Strongly Disagree = 1 point, then summing the scores for each item and them dividing by the number of respondents to each item. The mean score was then grouped as follows to arrive at consensus opinion about each item:. Strongly agree= 5.0-4.50, Agree =4.49-3.0, Neutral= 2.99-2.50, Disagree= 2.49-1.5 strongly Agree=1.49-1.0.

Memos and visual demonstrations of ideas provide an insight into how the final grounded theory categories were developed. The discussion on the results of the two phases of data collection and comparison of those findings with the relevant academic literature are provided as follows: The questionnaires were analyzed with the help of a content analytic summary table. The following questions for the questionnaires are as follows:

Table1: Is our Nigeria education system meeting the international standard?

	Frequency	Percentage
Yes	13	13%
No	75	75%
Probably	12	12%

Majority of the students (75%) believe our education system is not meeting the international standards

Table2: Are we restricted to information in building education?

	Frequency	Percentage
Yes	44	44%
No	37	37%
Probably	19	19%

Majority of the students (44%) emphasised that they are restricted to information in building education

Table3: Do you know what millennium building means?

	Frequency	Percentage
Yes	62	62%
No	13	13%
Probably	25	25%

Majority of the students (62%) do know what millennium buildings mean through internet.

Table 4: Are we aware of millennium practice in Nigeria?

	Frequency	Percentage
Yes	25	25%
No	63	63%
Probably	12	12%

Majority of the students (63%) are not aware of millennium practice in Nigeria

Table 5: Do we implement millennium practices in Nigeria?

	Frequency	Percentage
Yes	13	13%
No	56	56%
Probably	31	31%

Majority of the students (56%) are of the opinion that we do not 56% implement millennium practices in Nigeria

Table 6: Are Nigerian professionals involved in millennium practices?

	Frequency	Percentage
Yes	44	44%
No	44	44%
Probably	22	22%

The students are of divided opinion that Nigerian professionals involved in millennium practices

Table 7: Are their knowledge gotten from their education or personal experience?

	Frequency	Percentage
Yes	31	31%
No	69	69%
Probably	0	0

Majority of the students (69%) stated that their knowledge were not gotten from their education or personal experience

Table 8: Is the education system meeting up with the standard of the requirements needed for construction?

	Frequency	Percentage
Yes	14	14%
No	75	75%
Probably	11	11%

Majority of the students (75%) emphasised that the education system is not meeting up with the standard of the requirements needed for construction?

From the various summary tables it can be concluded and supported by the larger percentage of our respondents that the Nigerian building education is not ready to meet the challenges of the building practices in the new millennium.

For further information, the second phrase using oral interview used to ask the respondents to state the challenges that are contributing to the educational system in building. Some of the challenges highlighted are:

- Educational background of institutions

Nigeria has been plagued by frequent political unrest. This political instability has generated negative effects on the education system. Although education had been in crisis for many years, the situation has recently been made worse by frequent strikes staged by students, faculty and teachers. Much of the difficulty lies in the fact that the sector is poorly funded. These results in shortages of material and human resources for education: lack of qualified teachers; a brain drain from the public sector; few instructional inputs, shortage of classrooms, and a host of other problems.

These difficulties have been most pronounced at the foundation levels of education both Primary and secondary school levels have been negatively affected. In 1997 the Federal Minister of Education, following a nationwide tour of the schools, stated that the basic Infrastructure in schools such as classrooms, laboratories, workshops, sporting facilities, Equipment, libraries were in a state of total decay. The physical condition of most schools is reported to be pathetic.

Nigeria as a reconstituted democracy has to address issues of a dual transformation. The country needs to re-examine its past and focus on development plans that will meet the challenges of the future. The need to work out a

new developmental plan puts pressure on the political, social and economic sectors of the country. The new government has declared education as one of its priorities. The goal is to have a reformed system of education that will provide access at all levels of education and to improve the quality and efficiency of the entire education system. While these are lofty goals, the real challenge will lie in the successful implementation of them

The education sector of Nigeria does not fit a vivid representation of building education due to the lack of building practices in the institutions as well as the dire need for individuals with the understanding of the field to share valuable information that would improve the standards of practitioners in the field

- Poor relationship between educational system and construction industry

The revaluation of standard in Nigeria needs to be accomplished by leaving our comfort zones and taking breaks or excursions to more developed areas or zones to determine the differences in economic stand and how we could build up to those standards so that we could attain a good relationship while trying to gain more knowledge.

- Corruption

Corruption takes a great toll in the building industry due to the leadership and high ranking officials which civilians do not trust, brings a complex discussion on how we can eradicate corruption from the economy.

- Poor curriculum

Poor curriculum causes a huge mess in the building sector because of economic recession as well as the industry causing us to put into consideration the integrity of our building codes.

- Financial recession

Financial recession or inadequacy has led to a great toll in the construction industry due to embezzlement in the economy of the nation, fall in the value of currency as well as embezzlement of money on site which creates a brink in the downfall of the economy.

- Insufficient practical practices in institutions

In Nigeria today practical practices have been rapidly declining as more theory works are being taught instead of practical practices especially in courses like engineering and building technology except from the internship programme which is conducted by all institutions and mandated by the government. However, this internship programme is not really controlled as students face a lot of challenges on sites that hinder knowledge but as discussed in class the internship programme should be taken more seriously by the school to curb the challenges on site and increase the knowledge gained by the students.

- Lack of Risk taking

Taking of risk in building technology as a course and innovation has been very difficult in Nigeria because firstly from our research we found out that our building education in Nigeria is not meeting up with educational standard and also our Nigerian professionals have not been taking part in a new millennium projects which suggest that we are not fully innovative in Nigeria and come up with innovative ideas

- Independence

Lack of confidence in ourselves as well as our means of construction because of conventional use of building materials using self instincts on site or being creative is unavoidably too low thus the institution is not able to grow into the new millennium.

5.0: CONCLUSION AND RECOMMENDATION

5.1 Conclusion

It is concluded that the building education is not ready to face the challenges of the new millennium according to the data analysis, literature review carried out on different perspective at which people saw the growth of buildings construction in a new millennium in Nigeria, mainly because it is not so practiced in Nigeria. It was also observed that that the public lack awareness of what building millennium entails and do not feel like that the building education can meet up with the required standard of the millennium.

5.2 Recommendations

Generally, the curriculum should be accessed and restructured to be able to meet up the requirements of the new millennium building construction, what it entails, what is required of new members or recruit entering the construction sector. The leaders in charge or the higher bodies in charge of coordinating works and construction in the industry should either be sanctioned why we not meeting up with the new millennium requirements. Concerning financial adequacy, the industry needs to be more attractive for stakeholders and investors to be interested in for us to be able to solve our financial inadequacy. Nigeria needs to be full of individuals who are ready to take risks to see how far we could go and leave our comfort zone of conventional practices in Nigeria.

ACKNOWLEDGEMENT

We sincerely appreciate the platform and financial support of Covenant University towards the successful execution of this project and publication of the paper in your journal.

ABSTRACT

In the paper we illustrate the problem of the burnout syndrome and describe the incidence of the burnout syndrome within teachers of special primary schools in Slovakia using the Maslach Burnout Inventory questionnaire. The burnout rate has been surveyed within 144 respondents in the area of emotional burnout, depersonalization and personal performance. The results were evaluated by Student t-test. We have found out an increased rate of the syndrome in the studied areas in the cohort of those teachers involved in educating pupils with special educational needs only in few factors.

Keywords: teachers, special pedagogue, special elementary school, burn out syndrome, emotional burn out, depersonalization, personal performance, stress

INTRODUCTION

Being a teacher is on one hand very nice but on the other hand very hard, as well. Heavy workload puts this job into the hard ones. Special pedagogues, including the special elementary school teachers, are often overloaded and have to cope with a lot of various emotional situations. Pursuing a content analysis of three Slovak pedagogical journals, Hamranová (2015) found out that the most attention is paid to educational topic, to various information and reviews, but only negligible number of articles is dedicated to the teacher's mental health care. According to Vernarcová and Vancu (2016) teachers can make a world of difference for students with special educational needs and can help them to succeed by implementing certain adaptations or interventions. Special educators need to be aware and knowledgeable about the nature of the disorders, as well as the strategies effective in reaching and teaching these students. Hand in hand with this profession goes the notion overload, either emotional, mental, or sensoric. Vašek (1995) claims that the special teachers should especially have the following skills – professionalism, strong will, diligence, resolution, and systematicity. Vančová (2005) says that important things in this profession are:

- Reflective skills which are characterised by friendly, nice, and supportive behaviour
- Teacher's personality integration which is reflected by their emotional stability
- Adaptation which presents the ability to reveal changes in the outcome expectations
- Adequate level of dominance and dynamism to lead the students and manage them. Decidedness and responsibility are a part of the teacher's dominance.
- Adequacy of self-perception - teacher should feel sufficient self-confidence, ambition, power and enough energy for solving life situations in connection with the pedagogical situations.
- Adequate classification and assessment of the students

THE STUDY

From what has been said so far, we can see that teaching is a very difficult profession with high demands put on it. Teachers are connected with high mental and physical demandingness. Special elementary school pedagogues are

special pedagogues because they work with students who require special treatment. These teachers are required to have certain skills, such as, active listening and sensitively gain information, problem solving skills, providing emotional protection, feeling of safety, acceptance and confidence, pedagogical tact, enthusiasm, certain level of spontaneousness, ability to cope with stress situations, understanding of non-verbal behaviour, ability to provide feedback and self-reflection, self-control, self-regulation, etc. Helen Sek (2004) describes the burnout syndrome as the result of the adaptation process failure (skills and abilities to cope with a difficult situation). Selk also claims that it is not a result of a long-term process. Kallwass (2007) describes burnout syndrome as a failure which affects mostly the people who are required to cope with higher working and emotional load. He also says that the burnout syndrome of teachers is connected to their certain psychical predispositions and that the burnout is also the result of incorrect self-evaluation and wrong estimate of one's own powers. Christina Maslach and Susan Jackson made a detailed characterisation of the burnout syndrome according to the one year observation of people. They describe it as a syndrome of emotional exhaustion, depersonalisation, and lower personal accomplishment. It takes place where people work with people, e.g. people give care to other people's needs. Maslach and Jackson are also the authors of the Maslach burnout inventory questionnaire. Jekl and Reitmayer (2006) tell about the internal and external risk factors. The external factors are working conditions, family, society, profession. The internal are the personal predispositions.

FINDINGS

The research group consisted of 144 special elementary school pedagogues in Slovakia – 9 men, 135 women.

We used the Maslach Burnout Inventory (MBI) method to measure the level of the burnout syndrome. BMI defines burnout by three components – emotional exhaustion, depersonalisation, and lower personal accomplishment. According to Maslach (1997), the first element to show up in the syndrome is the emotional exhaustion as a result of the environment requirements. The exhaustion then leads to depersonalisation where an individual tries to detach from the others and falls back to loneliness. These two factors merge together and negatively affect accomplishment. This method was developed to measure level of burnout in helping professions.

MBI questionnaire, which was used in our research, consists of 22 questions to examine the three components of burnout – emotional exhaustion, depersonalisation, and personal accomplishment. Questions about personal accomplishment factor are, unlike the questions about depersonalisation and emotional exhaustion, filled in vice versa. This part of our work is focused on the research outcomes evaluation in connection to the research hypotheses which we had formulated. We created four hypotheses:

H1: We assume that in the special elementary schools, there will be higher rate of the burnout syndrome in women in comparison to men.

H2: We assume that burnout syndrome rate will rise with age in teachers/assistants in special elementary schools.

H3: We assume that there will be higher burnout syndrome rate in teachers/assistants in special elementary schools with longer work experience.

H4: We assume that there will be higher burnout syndrome rate in teachers/assistants in elementary schools who teach higher number of students.

Table 1: Hypotheses evaluation criteria.

	Statistic date	Identification/code
AGE	20-35 years	1-low
	36-50 years	2-middle
	51-65 years	3-high
EXPERIENCE	0-8 years	1
	9-15 years	2
	More than 16 years	3
GENDER	Woman	1
	Man	2
NUMBER OF STUDENTS	4- 8 students	1
	More than 8 students	2

Questions about personal accomplishment factor are, unlike the questions about depersonalisation and emotional exhaustion, filled in vice versa. Results of the questionnaire were processed by comparison of arithmetic average. The hypotheses were evaluated by the Student t-test. The results are shown in the table below. (Table 2,3)

Table 2: T-test results

Kategoriya	Compared groups	EE	DP	PA
AGE (H2)	low vs. middle	0,3683	0,4598	0,2593
	low vs. high	0,4344	0,3782	0,7226
	middle vs. high	0,1237	0,8766	0,1800
EXPERIENCE (H3)	low vs. middle	0,7319	0,9084	0,9855
	low vs. high	0,3900	0,0635	0,5930
	middle vs. high	0,3311	0,1964	0,6915
NUMBER OF STUDENTS (H4)	4 - 8 vs. more than 8	0,4743	0,5254	0,3748
GENDER (H1)	men vs. women	0,9129	0,1705	0,6058

Table 3: Results of the answers of the questionnaire according to the EE,DP,PA average; Standard deviation

Category	Group	Average			Standard deviation		
		EE	DP	PA	EE	DP	PA
AGE (H2)	Low	2,65	1,55	5,56	0,9028	0,8449	0,8233
	Middle	2,48	1,43	5,74	1,0084	0,8394	0,8237
	High	2,83	1,41	5,48	1,1681	0,6333	0,9907
EXPERIENCE (H3)	Low	2,68	1,60	5,58	0,9855	0,9741	0,7369
	Middle	2,77	1,58	5,58	1,1677	0,9639	0,8455
	High	2,52	1,31	5,66	1,0056	0,5159	0,9709
NUMBER OF STUDENTS (H4)	less 8	2,66	1,43	5,66	1,0239	0,7325	0,8963
	More than 8	2,53	1,53	5,53	1,0416	0,9100	0,8153
GENDER (H1)	Man	2,65	1,98	5,51	0,9741	1,0929	0,5000
	Woman	2,62	1,42	5,63	1,0345	0,7575	0,8884

The first hypothesis assumes that in the special elementary schools, there will be higher rate of the burnout syndrome in women in comparison to men.

We found out that the burnout rate in the emotional burnout area was almost the same in men as in women. It is important to say that women prevailed in the research group. Our questionnaire was filled in by only 9 men and 135 women. When it comes to depersonalisation, the burnout rate is higher in men than in women, in the emotional exhaustion area, the rate is almost the same. According to the Student t-test results, we can say that our hypothesis was not confirmed as the results are higher than the limit of acceptance which is set as $p < 0,05$.

This hypothesis is not confirmed.

Graph 1. Burnout rate according to the gender

In the second hypothesis we assume that burnout syndrome rate will rise with age in teachers/assistants in special elementary schools.

The research correspondents were divided into three groups according to their age:

Low: 20-35 years

Middle: 36-50 years

High: 51-65 years

We were interested mostly in the low and high age groups.

We found out that the burnout rate is higher in the emotional burnout in high age than in low and middle age. The depersonalisation rate is the highest in the low age and the lowest in the high age. Personal performance rate is evaluated vice versa, therefore, the rate is the highest in high age, followed by low and middle age. We found out that burnout syndrome in the emotional and personal performance area rise with age in teachers/assistants in special elementary schools. The p value was higher in the all compared factors, according to which, we can assume that is higher than the limit of acceptance which is $p < 0,05$.

This hypothesis is not confirmed.

Graph 2. Burnout rate according to age

In the third hypothesis we assume that there will be higher burnout syndrome rate in teachers/assistants in special elementary schools with longer work experience. Comparison of the statistic average of the pair difference in the Student t-test showed us the rate of the burnout syndrome in our respondents. They were divided into three groups according to their work experience. The low group have 8 year experience in special pedagogy, middle group have 9-15 year experience, and high group have more than 16 years of experience in special pedagogy.

From the results, we can say that the burnout rate in the emotional factor is the highest in the middle group, followed by the low and the high group which means that the burnout rate is the lowest in the teachers with the most experience. The depersonalisation burnout rate is the lowest in the teachers with the most experience. The low and middle group are similar. The burnout rate was not confirmed in personal performance where the results say that the lowest burnout rate is in the teachers with the most experience. The p value was higher in the all compared factors, according to which, we can assume that it is higher than the limit of acceptance which is $p < 0,05$.

This hypothesis is not confirmed.

Graph 3. Burnout syndrome factors

In the fourth hypothesis we assume that there will be higher burnout syndrome rate in teachers/assistants in elementary schools who teach higher number of students. The research groups were divided into two parts. The first part consisted of teachers with students less than 8, the second part consisted of teachers with more than 8 students. We found out that the teachers with more than 8 students show lower rate of emotional burnout. The burnout rate in depersonalisation is higher in the teachers with more students in the class. The burnout rate in the personal performance is higher in the teachers with more students in the class. In the all compared factors was p value higher, therefore, we can say that it is higher than the limit of acceptance which is $p < 0,05$.

This hypothesis is not confirmed.

CONCLUSION

We found out that in the teachers/assistants in special elementary schools, who educate students with special educational needs, there is higher burnout syndrome rate only in some factors. The higher rate of the burnout syndrome in women in comparison to men was not confirmed. The results show that workload in teaching students with special educational needs in emotional and personal performance area is almost the same in men and women. There is higher burnout rate in depersonalisation in men than women.

The results of comparison of three categories of our respondents show the highest burnout rate in teachers in the highest age when it comes to the emotional area. Depersonalisation burnout rate is the highest in lower age, and personal performance burnout rate is the highest in higher age. The research of the burnout syndrome in workload in connection with work experience of teachers in special elementary schools showed us that there is no connection between the work experience and higher burnout syndrome rate in none of the researched area. However, we can say

that higher burnout rate is present in emotional area in teachers with middle experience, in depersonalisation area is the highest rate in the teachers with low and middle experience. Personal performance burnout rate was the highest in the teachers with the most experience.

Results of the research of connection between the burnout syndrome rate and the number of students in the class with special pedagogues – teachers/assistants in special elementary schools for students with special educational needs, show that higher burnout syndrome rate is present in teachers with higher number of students in depersonalisation and personal performance area. In the emotional area was the highest burnout rate in teachers with lower number of students.

Ternényová and Vernarcová state (2016) that a right intervention will prevent the accumulation and escalation of negative symptoms of the students' disorder and finally also low quality of school life. This can significantly influence the perception of the difficulties by teachers and can create a positive environment at school.

According to our findings, we can say that, as early, as the special pedagogues choose their studies or job, they are better prepared for the workload connected with work with disabled children. This finding is definitely a challenge for next research.

ABSTRACT

Labor market demands are progressively increasing and, at the same time, the skills and knowledge required by businesses and brought in by new students when they reach tertiary education are very different from those existing decades ago. In this paper, we show the process and results obtained with a methodology based on the adoption of a Business Simulation Game in a subject of Accounting and Management Control included in an SME Management course. We show how this active and game-based strategy can be efficient and effective at this learning level both in terms of learning and motivation. Using the statistical analysis of the data collected through surveys applied to the students at the end of the subject, we evaluate how they identify the contribution of the game to the improvement of their skills and knowledge. Our results show that this methodology works as a stimulus to work and study outside the classroom and that during the simulation process students identify ways of learning and evolution. This research, contributing to the literature of game applications in higher education, concludes that this is an extremely useful tool with enormous potential in the future in particular in the area of management.

INTRODUCTION

Even though there is some effort by teachers in management classes at the higher education level to apply new and innovative pedagogical techniques, in most of the situations classes remain taught with a focus in a traditional way of transmitting knowledge between teacher and student. These traditional pedagogical techniques use mainly a top/down process from the one who has the knowledge (the teacher) to the one who wants to acquire it (the student), based first in transmit theory, then in a deductive way use some examples and usually finishing with the resolution of some exercises, supported by pedagogical materials such as books, manuals or power point presentations is becoming more and more outdated and urgently with need of some update in techniques.

This fact is even more urgent since the actual management environment is changing a lot in the last decade and the skills needed by the one working in this field are becoming more demanding and go further than the theoretical and even strictly technical competence. Applied knowledge, soft-skills such as the ability to work in group and the domain of other languages (English is crucial in Portuguese students) are nowadays of crucial importance. A good example of these changing world is the kind of techniques that companies are using in the internal formation programs, like theater, artworks or other pedagogical tools that can achieve these goals.

In this context some programs are starting to look at Business Simulation Games (BSG) as a good solution to apply innovative techniques since they offer a great educational potential. Beyond allowing the acquisition of conventional knowledge, it also allows students to learn about decision-making, working in group and face the pressure of time, among others. Even though with an increasing trend, the number of schools and teachers adopting or thinking in adopt these tools remain considerable low. This happens mainly for three reasons, first because of the term Game in BSG that transmit the impression of a less serious approach. In second place the aversion to change that every individual has, and teachers are no different, so they have some fear of losing control of his class using this methodology when compared with traditional means, and last the need for more resources not always available, like some financial capacity to acquire paid games or the need to computer equipment.

The pathway of the future will be of a more intense use of SBG. The increasingly competitive global market-place

is no longer a phenomena of private firms but is also a reality in higher education, and universities everywhere are facing increasing pressure to prepare their students to face the labor market.

In the next chapter we will make a succinct literature review on simulating games to help contextualize the framework in which this paper is done. After this we will present the data and methodology applied followed by the chapter dedicated to the results and their analysis. The paper will end with some conclusion and future work ideas.

LITERATURE REVIEW

Learning is a process by which people acquire new skills or knowledge with the objective of increase their performance. This better performance can create better products and services, reach lower costs, discover greater innovation, improve the productivity of a firm or increased the market share of a brand. But to achieve that, learning must be a continuous process, not merely a series of events, and it exceeds the classroom and the workplace. (Rosenberg, 2001) The utilization of games is the attempt to bring the classroom closer to that continuous process. The use of games for educational purposes is not new. Malone (1981) studied the motivational aspects of this type of game in the early 1980s. But since then, electronic games have faced a great development and debates about their educational potential stimulates much interest among scholars but also many doubts. Games also use simulation of the real world to engage the players. Simulation can be defined as a reproduction of reality, which is intended to display what could emerge if the same conditions would actually occur (Day and Reibstein, 1997) The games are naturally considered motivating (Mitchell and Savill, 2004) that is one of the goals we pretend to achieve with the use of this BSG, to motivate the students to class, knowledge acquaintance and autonomous work. Another important characteristic of games is that they allow players to have some feeling of control, a feeling many times absent in the environment of a school classroom, permitting the players to make choices, an important role for the students (Gunter, Kenny and Vick, 2008).

Games have many others characteristics such as rules and goals, the uncertain of outcome, they provide immediate feedback, they also allow the emergence of feelings like the feeling of victory. To Jenkins (2005) games have more qualities like their boost for exploration and experimentation, very important in a learning context, but in an environment where the risk of failure is reduced and they are designed so that players (students) can progress in difficulty levels progressing with their skills.

Simulating games can be a good approach of reality. Analyzing a BSG called MARKSTRAT, Kinnear and Klammer (1987) found that participants could become dynamically involved and actually experience decision-making in a realistic business environment. Regarding another of the most famous games, the Beer Game, Senge (1990) considers it as a reproduction of a real scenery, showing in this statement how good are becoming this type of games.

In this framework, of improvement and representativeness, several authors have also emphasized the learning principles this methodology can comprehend. To Prensky (2003) games have the capacity of the player to act, to make fast decisions founded on information from different sources, to develop strategies to overcome problems, and to understand complex systems through the experimentation and simulation.

Gee (2003) considers that games would involve students in an active, situational learning that would require then the need to investigate different ways of learning and thinking in a context that makes sense. More specifically, educational games would enable different learning objectives to be achieved.

DATA AND METHODOLOGY

In the 2014/15 academic year the Cursos Técnicos Superiores Profissionais (CTeSP) - Higher Professional Technical Course - were created, a higher education courses with the duration of two academic years (DL nº 43/2014 of March 18) corresponding to 120 ECTS. The CTeSP confers a level 5 professional diploma of the National Qualifications Framework in the areas of training and includes three preparation components: General and Scientific Education (up to 30%); Technical Training (minimum 70%); Training in Work Context (Internship in companies / public and private organizations). Taking the distribution of the three areas of preparation, the type of teaching in these courses is not expected to be a mere replication of what is practiced in the undergraduate three years' degrees (Licenciaturas) with 180 ECTS. The subject in which the BSG was applied is part of the curriculum of one of these new courses.

The students were proposed to play the game Virtonomics (<https://virtonomics.com/>), a free online simulation game that allows students to practice with a business strategy game based on real world economy, business, entrepreneurship and management principles. The game do not differ that much from other business simulation games such as SimBrand or MarkStrat. In the game, the main objective is to create a profitable and competitive business. Each player receives a starting capital, which can be used to develop the virtual company according to their own unique scenario and permit to customize their business goals, strategies and tactics.

Forming teams with three students each, in the first semester of the 2016/17 academic year, during the period of the subject, the students should play the BSG. They should do it in an environment outside of class, while the contents were being taught in the classroom. In order to be able to play the game, they have to meet or use online systems (e.g. Skype) to analyze the evolution of the virtual company, make decisions and adopt them during the game period.

At the end of the semester, students have to submit a report based on the evolution of the game, on the consequences of their decisions and on generating output such as tables, graphs and others. They should explain in an appropriate way the events they present, thus demonstrating they could perceive why certain happenings occurred and relating them to their decisions. This will demonstrate they perceive the cause and effect of the decisions, while at the same time perceive how technical and theoretical concepts could help them achieve better results. The assessment of the reports was not made taking into account the result of the virtual company managed by the team, but rather how students understood and explained how their decisions led to those outcomes (profits or losses).

The research design aimed to capture data from students' use of BSG during the duration of the semester allowing to evaluate if this activity promote students autonomous work and skill and knowledge improvement. The survey was delivered to the students at the end the semester, after their grades were published, and included two sections. One of basic demographic data: gender, age, etc. and other with sentences that should be replied using a Likert scale from "Completely disagree" (1) to "Completely agree" (5).

This paper is based on the case study of the application of a BSG in a single class of a higher education institution in Portugal. This institution is a polytechnic higher education public school (system where the new CTeSP courses can be taught). The students are similar to those in other polytechnics, that is, overwhelmingly composed of Portuguese. The participants in this study were students of the 2nd year (last) of the discipline of Management Control for SME's of the SME Management course.

In Table 1 is possible to see the profile of the student's that represents the typical student of this type of course, slightly different from the undergraduate degrees, namely at age level, that in this groups are slightly higher. From the 18 students who answered the questionnaire (from a universe of 23 students registered in the course and who participated in the BSG) we can verify that they are mostly female students (66.67%), which is characteristic of higher education in Portugal, where, especially in courses not related to engineering, there is a clear majority of women. Another curious fact is the number of students who are working or have already had a work experience exceeding 3 months, that in this course represents two-thirds. It will be interesting to realize the extent to which this type of methodology via simulation can reach individuals who have had real experience.

As mentioned previously, in relation to age, we can verify that the age average of 22.5 years is a little higher than that of the corresponding 2nd year of the traditional undergraduate students, show how this type of education can achieve a somewhat differentiated public. This could also support the idea that there is a need for differentiated techniques of learning and knowledge transmission.

Table 1. Students characteristics

Gender		
Male	6	33,33%
Female	12	66,67%
Work Before		
Yes	12	66,67%
No	6	33,33%

Age (avg)	22,5
Grade Average	12,78

RESULTS AND ANALYSES

In this section we will present the obtained results and carry out an analysis of them taking into account the objectives that were intended to be achieved with the implementation of the BSG in the discipline. The summary of the results obtained in the main questions asked in the questionnaires can be observed in table 2.

From the analysis of the average values presented in the previous table, we can verify that in a global manner students consider the game as having been an extremely positive experience. In fact, considering the scale center value as the expected answer and analyzing the deviations from it, we can see that excluding two particular circumstances, in the remaining the responses have very relevant deviation magnitudes from the scale mean. These positive deviations range from 11.11% to 50%. In the case of the two particular cases where the deviation is negative, as, in the case of some other relevant questions, they will be discussed in a little more detail below.

Table 2. Resume main results

Topic	Average	% from Middle
Better understand class concepts	3,67	22,22%
Participate more attention in class	3,33	11,11%
Face labor market more comfortable	3,39	12,96%
Easy to play	2,72	-9,26%
Enjoy playing	3,83	27,78%
Learn new concepts	3,67	22,22%
Innovative class experience	4,5	50,00%
Good idea	4,11	37,04%
SBG should be demanding in classes	3,61	20,37%
SBG should be optional in classes	3,39	12,96%
Lost to many time not compensated by new learnings	2,22	-25,93%
Counseling other school colleague to play	3,89	29,63%
High level of commitment	3,94	31,48%
Better understand how different subject interact	3,72	24,07%

In Figure 1, we can observe how the students consider that the game was positive both to facilitate understanding of the concepts transmitted during classes and simultaneously allowed them to participate in the classes with more attention. In both cases, the game allowed to contribute so that the knowledge and the motivation of the students evolved in a positive way due to the simulation game.

Figure 1. Better understand class concepts and participate more attention in class

In figure 2 we can verify that in addition to the previous positive points, the use of the game was also identified in a positive way to obtain knowledge of new concepts not addressed in classes (Average 3.67), thus showing how the game allows the acquisition of knowledge, but also be a catalyst for the autonomous work of students. We can also verify that the relationship between the time spent outside the room and the knowledge obtained is positive, since the dedicated effort in BSG is not considered a waste of time (2,22). In this case a negative deviation from the mean value is positive.

Figure 2. Learn new concepts and lost to many time not compensated by new learnings

In figure 3 we can see that the students considered a game as an innovative activity, answering the highest of all questions, reinforcing the idea that the pedagogical techniques used are still quite traditional in the other subjects. The students also show that the game was very motivating for them, since they liked to participate in this pedagogical technique (avg 3.83)

Figure 3. Enjoy playing and innovative class experience

At the level of the promotion autonomous work out of class, figure 4 shows that the game is a useful tool to promote this goal. The average of the students' responses to the out-of-class commitment that the game demanded from them was 4, which represents a value 33.3% above the central one. This commitment was also required since the students considered the game not very easy (2,72). In fact, the game implies a great learning curve, not being easy to start and see results immediately by the time spent. Another fact that led the students to consider the game

difficult was the fact that at the time this simulator was used it was not available in the Portuguese language, forcing students to play in English. In any case, the fact that the game was in English was itself one of the attractions of the game and that allowed to develop one of the crucial skills for the managers of the future.

Figure 4. Easy to play and high level of commitment

In the always interesting analysis at the gender level, the differences in the 8 main questions analyzed in the previous figures can be observed in figure 5. There are not very significant differences between the male and the female students in the way they globally face the game in a positive way. Even though, the two most significant differences are in question 1, if the game has helped to better understand the concepts of the classes, in which women consider a higher impact of the BSG (3.83 vs 3.33), but in both cases the answers are positive, and in question 7, regarding the time lost, where again female students show a better result (2.08 vs. 2.5), but also here, being below the central value, both the responses of female and male are positive regarding the application of the BSG pedagogical method.

Figure 5. Gender differences

In an analysis of the differences between students that are working or have worked for a minimum period of 3 months presented in figure 6, it is curious to find that, as a rule, there are slight differences favorable to those who have experience in the field. In five of the eight issues under review, workers value the game experience more than students who have not yet done any business activity. These data further reinforce the potential of using these pedagogical techniques, since even those who have already contacted reality see their use as a value.

Figure 6. Working experience differences

CONCLUSIONS

From the first application of this type of methodology in a context and in a very specific class, it is however possible, to draw enough conclusions and establish directions for the future. Overall, the use of this methodology gives, undoubtedly, an added value and is extremely positive for helping to achieve the desired objectives. Firstly, it allows consolidating the knowledge transmitted; secondly it allows arousing curiosity on students and promoting their autonomous work and their desire to know more. Finally, allows the development of some extremely relevant skills such as working in a group or the improvement of the English language.

The uses of these new methodologies are still not usually (largely) used in Portuguese and worldwide schools, especially in the area of management, but the potential in this area is tremendous and, in the future, considering that it is intended to continue to evolve with this practice, there is a need to consolidate the application of this game or other similar games.

In the future, the goal is to use this methodology not only in the CTESP's but also in the undergraduate courses, since the potential also exists for this level of education. It is also intended to make a posteriori analysis, but also an a priori one, and to be able to compare the evolution of the student's opinions and competences regarding the use of this methodology. It's also an objective to be able to compare if the potential is equal in different levels of higher education in Portugal. Finally, in future works, we intend to go beyond the descriptive analysis and seek to use more sophisticated statistical analysis models, potentially using econometric models.

ABSTRACT

In this paper, we introduce support vector machines (SVM) which are evaluated for application to a variety of non-separable cardiac datasets with several attributes. We implement the SVM kernel algorithm with a number of parameters associated, for to improve the accuracy of the classification. An analysis of the results of data classification is also presented to verify the effectiveness of the proposed kernel function. The method SVM used gives good classification accuracy in almost all data sets, particularly those of high dimension, and gave a recognition rate of 94%, this rate of classification exceeds the results obtained in the literature.

INTRODUCTION

The heart is the central element of the human body, and despite its power it is vulnerable to dysfunction. Several types of diseases may affect it, such as arrhythmias (Premature Ventricular Contraction, Fibrillations, Tachycardia, etc.). According to the World Health Organization (Who, 2017), cardiovascular disease is one of the leading causes of death in the world. The mechanisms of sudden death are mainly ventricular rhythm disorders with 75% the existence of the Premature Ventricular Contraction (PVC) is noted as a possible predictive factor. For these reasons there is an urgent need for the development of new methods of prevention, detection and treatment of these diseases. Among the most commonly performed tests for the detection of these cardiovascular abnormalities is the Electrocardiogram (ECG), which is an electrophysiological signal whose plot materializes the electrical activity of the heart.

Intelligent diagnostic systems have emerged to make the best use of ECG data in large quantities and whose manual analysis is difficult. These systems improve signal quality (noise filtering), extract information that is not visible through direct visual analysis, and provide a diagnosis that can provide sufficient support for physicians to take the right decisions. However, automating the detection of cardiovascular disease from the ECG signal is not trivial, in particular because it is difficult to extract from the latter all the information used by the doctor to make a good diagnosis. In addition, providing a system with sufficient expert knowledge to automate the diagnosis is an extremely tedious task.

The presented work in this paper proposes classification of PVC beats, and is organized as follows:

In the first section, we introduced the problematic and then examined related works to classify cardiac arrhythmia in Section 2. The third section presents details works specialized in detection of the PVC pathology. The proposed approach is detailed in Section 4.

Our experimental results and a discussion are presented in Section 5. Finally, the conclusion is drawn and future work is suggested in the last section.

RELATED WORKS

Several approaches have been tried for cardiac arrhythmia classification. For early detection of diseases, a multiclass multi-label based fuzzy associative classifier with genetic rule selection was implemented for coronary heart disease risk level prediction in curative of the diseases (Sumathi & al, 2014).

In (Chen, 2017), a carrier vector machine classifier is used to group heartbeats, using the MIT-BIH arrhythmia database with an accuracy of 93.1%. In (Herry & al, 2017), the authors used the MIT-BIH arrhythmia database

and the Association for the Advancement of Medical Instrumentation (AAMI) beat classes, by training a SVM classify. In (Hendel & al, 2016), the SVM networks were used in as a multi class classification of cardiac arrhythmias, by achieving an average accuracy of 99.73%, and showed that the SVM post-treatment outputs can improve the classification decision in terms of probability, this approach was also used to solve the multi-classification ECG problem in (Li, 2017).

ECG SIGNAL

In [Figure 1], we have the different waves of a normal ECG, in our study we are interested in the Ventricular case that can cause sudden death in a patient.

Figure 1. The different wave Electrocardiogram (ECG) signal.

PREMATURE VENTRICULAR CONTRACTION (PVC)

Ventricular fibrillation is a cardiac rhythm disorder which manifests as a complete disorganization of the electrical activity of the ventricles with the immediate consequence of the loss of any effective cardiac contraction. According to (Briand, 2002) Ventricular fibrillation is characterized by the occurrence of very abnormal, widely varying, abnormally large, unequally amplitude ventricular complexes, occurring in a totally irregular and high frequency manner (Talbi, 2011).

The parameters used to try to predict the risk of PVC are relative to the QRS and P waves of the ECG [Figure 2].

Figure 2. ECG of a subject which has premature ventricular contractions (PVC) (Talbi, 2011).

To discriminate between the two types of beats (normal and at risk (PVC)), it is imperative to calculate certain parameters and characteristics that can constitute the input vectors of the classifier. These feature vectors are each composed of 9 elements:

- The temporal parameters, namely the duration and the amplitude of the P wave represent the two first elements of the vector and the duration of the QRS complex.
- The shape of the QRS complex.

METHODOLOGIES

SVMs are a new type of learning algorithms, originally introduced by Vapnik (Vapnik,1998). The success of this method is justified by the solid theoretical foundations.

The SVMs are based on a learning algorithm with a decision function an optimal hyperplane in a large dimension space D [Figure 3]. For to solve some practical limitations related to data that are not linearly separable due to the nature of the generally non-linear systems and the presence of noise in these measured data, SVMs have been generalized through two tools: flexible margin and The kernel functions [Figure 4].

The flexible margin principle (Vapnik & Cortes ,1998) is to allow classification errors, which gives the SVMs the ability to manipulate aberrant values. The optimal separation problem is reformulated as follows: the optimal hyperplane separating the two classes is the one separating the data with the minimum of errors and which satisfies the following two conditions:

- The distance between the well classified vectors and the hyperplane must be maximal.
- The distance between the misclassified vectors and the hyperplane must be minimal.

Figure 3. SVM separation.

The projection in this space is done to compensate for the nonlinearity of separation. From the learning data (x_i, y_i) where $x_i \in \mathbb{R}^n$ and $y_i \in \{-1, +1\}$. The algorithm consists in representing the points x_i in this space D by a nonlinear transformation constructed from a family of functions ϕ_k under certain conditions. The series $\phi_k(x) \cdot \phi_k(y)$ converges to a function K called Core (Kernel) [Figure 4].

Figure 4 . Exemple de projection

The functions of the SVM method are as follows:

$$k(x, y) = \sum_{k \in N} \Phi_k(x) \cdot \Phi_k(y) \quad (1)$$

The decision function is given by the sign of the following discrimination function

$$f(x) = \sum_{i=1}^l y_i \alpha_i k(x, x_i) + b \quad (2)$$

α_i and b are coefficients to be determined, by maximizing the distance, called margin, between the decision boundary $f(x) = 0$ And point cloud in D . [Figure 3] for an illustration of these concepts, the problem becomes

an optimization problem :

$$\min \left\{ 1/2 \|w\|^2 + C \sum_{i=1}^N \xi_i \right\} \quad (3)$$

C is a constant to be determined and ξ_i is the non-negative error.

$$LD = \sum_{i=1}^l \alpha_i - 1/2 \sum_{i,j=1}^l \alpha_i \alpha_j y_i y_j k(x_i, x_j) \quad (4)$$

The [Figure 5] below illustrates the calculation of a decision surface by the kernel method in the case of non-linearly separable data (Laouti, 2012).

Figure 5. Support Vectors and Decision Surface Calculated by the Kernel Method (Laouti, 2012).

EXPERIMENTATION

In this study we focus on the classification of Premature Ventricular Contraction (PVC), the 48 records of "MIT BIH Database" are used for the development and evaluation of classifier performance. Each record of this database is accompanied by an annotation file in which each ECG (cardiac cycle) beat has been identified by experts (cardiologists) (MIT-BIH, 1992). These labels (annotations) [Table 1] are used to learn the classifier and evaluate these performances during the test phase. Since this study aims to identify the PVC beat, some records of the PVC-free database were excluded from the study, leaving 35 records of interest. The cardiac cycles used for the learning of the various pathological cases were chosen randomly from several records. The advantage is of course to build a database including different forms of each cardiac arrhythmia.

Parameters	Signification
1	The moment of detection of the peak R
2	QRS onset
3	QRS offset
4	Last RR interval
5	Beat begin
6	Beat end
7	Iso electric level
8	Amplitude pic to pic
9	ST level

Table 1. Parameters of MIT-BIH data base.

ECG RECORDERS

In [Table 2], we can see the few patients in the database MIT-BIH and who are coded from 106 to 234, each record to normal beats and ventricular beats.

recorder	N	PVC	Others	Total
106	1500	517	0	2017
116	2273	109	0	2382
119	1535	442	0	1977
200	1815	773	0	2588
205	2574	68	0	2642
208	1681	1216	44	1941
214	2013	235	0	2248
219	2083	57	3	2143
221	2022	393	0	2415
234	2733	3	5	2741

Table 2. Number of normal and abnormal beats for each signal.

RESULTS

We extracted the characteristics on the set of signals from the MIT BIH Arrhythmia database. To adjust parameter C , we used the kernel and fixed the constants related to this kernel. First, the matrix from the MIT-BIH data block (input x_i) was used for learning and testing. We then supplemented the test matrix with data arbitrarily taken from the study base. For the learning set used, the vector w normal to the hyperplane is 9 elements such that $w = (0.2338, 0.7159, 0.3558, 5.4760, -0.8455, 0.9819, 2.6966, 4.6257, 0.2382)$ where each axis of the dimension of space is represented by an element of the characteristic vector x_i . The classification rate is estimated at 94%. This recognition rate is remarkable compared to classifiers of the literature.

CONCLUSION AND PERSPECTIVES

In this paper, we examined the application of Support Vector Machines based for the recognition of cardiac arrhythmias. The learning algorithm was implemented under the Matlab environment with a kernel. Tests carried out on a database MIT-BIH database have enabled us to achieve a classification rate close to 94%.

The result is satisfactory because the database is not very rich on the one hand and the fact that some beats are very difficult to classify.

Among the prospects for this work, the expansion of the database, and the introduction of a new core may be more appropriate for our application.

ABSTRACT

The purpose of this study is to understand experiences of local based community for older adults who join silver drama community in Andong city, Korea. It is the exploratory and field-based qualitative research utilizing the social capital within social constructivism. Participant observations in drama practice areas as well as in-depth interviews with 10 participants were collected and analyzed using qualitative content analysis. Four main themes were emerged as follows : 1) aging together rather than aging solo with drama members, 2) being activated with the drama community and confident on their own in living place, 3) working for one's own Andong dialect advertised in each other which is social capital through their performance, 4) having the community transformed since the formal and informal experiencing had been changed together. Based on research findings, the practical implications are suggested for enabling the local elderly to social capital in community.

Keywords: Elderly, localism, drama community, social capital, social construction

INTRODUCTION: EMERGENCE OF AMATEURISM LIVING CULTURE COMMUNITY

Multilateral viewpoint of elderly is being explored, based on conversion from policy and welfare approach focusing on 'dependent being' in need of care into 'independent civilian', assuming that everybody is 'aging' (Kim & Mun, 2015; Kim, 2016). In particular, the bottom-up model of community building that ignore unique 'region-specific characteristics' and recent farming village co-housing project that uses the elderly as a tool has been criticized (Lee, 2017) while empowerment of elderly as the social capital themselves by developing various sources and treating them as a partner has been highlighted in Japan, Australia, etc. (Inaba, 2016; Winterton *et al.*, 2014) and South Korea is at the opening stage.

As of 2015, Korean population at age 65 or older was 6,570,000, as 13.2% of entire population, in which 1/5 households were the aged (householder at age 65 or older) and 32.9% of them were single aged households (Korea National Statistical Office, 2016). Since 2000 when rapid increase in elderly population has become one of the social problems, Korean society has put multilateral effort on establishment of a number of policies and welfare systems for elderly. Despite such effort, social pathological phenomena including increase in suicide, poverty and depression of the aged and elder who lives alone have not decreased (Lee, *et al.*, 2016). In other words, South Korea is remembered as one of the countries inhospitable for elderly. Furthermore, outlook for the aged population at age 65 or older to reach 15.7% (8,000,000 people) of entire population by 2020 (Korea National Statistical Office, 2013) reminds of desperate demand for new viewpoint at elderly. Beyond budget support for one-off policies and noticeable effects, recognizing existence value of elderly as 'co-existing entity' is needed. Academic movements for change in viewpoint are being partially implemented in some countries including Japan, Australia and Sweden and continuity of such movements is attracting public interest (Inaba, 2016; Winterton, *et al.*, 2014). In particular, various elderly communities of interest lead to communion with others and solidarity with local community, implying that the elderly is social capital, worthy of notice (Lee, 2017; Winterton, *et al.*, 2014).

The purpose of this study was to consider playacting of the aged as social capital in the region and analyze them at the viewpoint of social constructivism. Accordingly, the elderly drama community that autonomously performs in the city A was defined as a community of interest, of which identity and relationship were discussed in terms of individual and group.

Taking account of social constructivism that regional social capital formally and informally influences the elderly, major resources existed within the community of interest, elderly drama community, were looked into. And then, major relationships between individuals and within the community were looked into. In addition, the type and dimension of social capital presented from each relationship were analyzed.

SOCIAL CAPITAL AND REGION

Social capital refers to the capital available for individual or group inherent in relationships. At this point, trust, reciprocity norm and network are the core dimensions (Halpern, 2005). Although these three core dimensions are universally recognized, how these are used or implemented differs depending on type of social capital. In other words, social capital as intangible asset is presented as network via participation and formed by mutual reciprocity value based on trust, which might be considered as a multi-dimensional term of close relationship. Social capital can be classified as the types of bonding, bridge-building and connection depending on relationship and function thereof (Eo & Kim, 2016). The bonding type of social capital refers to fellowship or trust within the homogeneous community. The bridge-building type of social capital promotes interchange and cooperation between heterogeneous communities weakly bonded each other. The connection type of social capital means vertical relationship inherent between nation and civil society.

The function of social capital in the region is to exchange opinions and suggest and implement problem solving methods via direct participation of residents. As it influences securing localness as well as citizen autonomy, cooperative governance on local problems can be realized.

Important role of special capital in activating and forming the local community has been already insisted and demonstrated theoretically and empirically. Social capital creates productive interaction for common interest between the members of society and helps easily solving problems in various collective behaviors within the community or society (Choi, 2016; Lee, 2006). This study is close to Coleman (1988) approach that addresses social capital in terms of microscopic and personal dimension. Coleman defines social capital as lost reducing and efficacy maximizing by establishment of confidential relationship and highlighted strong power of solidarity.

Meanwhile, the elderly community itself is expected to well understand their own needs and requirements as the members thereof are related to each other within the same region. The welfare system by region is an alternative paradigm for local residents and community as the main agents to improve welfare capability of the region and the community of interest is based on the core elements of social capital, high reliability and strong networking, as the members thereof have same habit or propensity. Empirical studies (Choi & Kim, 2016) demonstrated the positive effects of social capital at the regional level on elderly problem-solving, but still qualitative study on formation and pathway of regional social capital via social constructivism in the community mediated by volunteering living culture is needed.

METHODS

This study was conducted in the silver drama community currently performing in the small-medium city, A. This drama community called "Watniggyeo" was a non-profit organization playing the story relevant to various tangible and intangible resources in the region including history, traditional tales, etc. by using the local dialect. The term, Watniggyeo, is a local dialect implying various meaning such as hi, hello and welcome. Watniggyeo is a non-profit organization consisting of approximately 20 members at mean age 65, one director, two music players (harmonica and accordion) and actors/actresses. Playacting career of each actors/actresses was different, ranged from several months to 3 years, as the time they first joined the drama community was different. They performed various roles in their home and region as ordinary wife, mother, self-employer, volunteering worker, etc., while having no previous experience in playing before joining the drama community. The drama community was registered in the form of cooperative union, one of social economic form and has performed 4 theatricals 20 times until now 2017.

Data were collected researcher note, photographs, and 10 participant's interviews. Data analyses were conducted using contents analysis, classification and sophisticated analysis focused via the process of review between two peers in the study (Kim, et al, 2015; Novak, 2010).

RESULTS: VALUE OF WATNIGGYEO AS A REGIONAL SOCIAL CAPITAL

Greeting, <Watniggyeo>, the most representative Andong dialect: local dialect as a standard language

The silver drama community "Watniggyeo" in Andong city is an amateur community of interest that was established by the elderly who used to live a life unrelated to playacting to present local history and cultural contents in local dialect language. Via theatricals played by them, youth that starts and ends from countless relations and loves was observed and one's identity was found and new relationship with others was expressed. The members of Watniggyeo played a role of messenger connecting the adolescents to the elderly as well as the past and the future in the 'local dialect and story' they were playing. For example, the themes played by Watniggyeo implies local history and identity.

① 'Walgok Bakery' - Story of joys and sorrows felt by residents moved from the submerged area to Imdong Chaetgeori marketplace. As the Andong dam became submerged, Chuja moved to Imdong Chaetgeori marketplace with her daughter and started running Walgol baking house. As her new house became submerged again when the Imdong dam burst, she was compelled to close the shop and decided to move to Seoul where the

married daughter was living. A the day before her moving to Seoul, story of the residents who moved from the submerged area, their sorrows and dear hometown is presented while having farewell drinks.

②‘Jam Jom Jasideo’ - story telling sorrows of elderly and everyday life of neighbors.

③‘Maddeulyeonga’ - Madangguk (one of traditional Korean performance) based on the tale derived from Maddeul (former name of Yongsang-dong).

④‘Geuriwoon Yeian jangteo’ - story based on recalling of residents in Seobu-ri Dosan-myeon, a musical drama showing the market day of Yeian marketplace in some year before the Andong dam was built in 1970s, with singing and dancing.

The initial play <Wolgok Bakery> is a story of the displaced persons whose home disappeared due to community development. Forgotten memories of people who were born and raised in the town were reenacted in the drama while presenting the stories inherent in the town in the local dialect. Both of <Maddeulyeonga> a play based on the tale derived from the name of region and <Yeian Jangteo> presenting relationship between people at the marketplace are addressing region-specific characteristics and contents that people at age 50 or older might empathize with but youth generation even living in the region might hardly understand in terms of language used in the play. That is what Watniggyeo pursued, usage and spread of the local language, Andong dialect. Introduction presented in the local magazine is provided below as a cue to understand identity of the residents.

The drama company, Watniggyeo, named in Andong dialect is quite familiar. Other than any modifier, the name of the drama company itself implies years of experience and region-specific characteristics at once. Gathering every day is not easy when considering age and job of each member. Although they first meet each other with an introduction of acquaintance, through the grapevine, etc. no one knew they would appear on the stage for playacting. (Andongji, June, 2015).

Social capital of Watniggyeo: relaxed solidarity, vertical relationship and power of maintaining community

As of 2017, South Korea is one of the countries paid attention for community of interest that shows the greatest dynamics during spreading of desire and expression started from 'myself'. Candlelight rallies started from political protests implicitly provide the place of action where daily life of citizens is brought into and produces various media with our community of interest that shares common value. South Korean in the past used to be known as a community with united history and culture where individual experiences are distinguishable from each other depending on physical location of region. However, smart revolution beyond contemporary digital technology has created the concept of global village, the new community of interest transcending time and space. The main agent of creation that used to be perceived as the minor now became to be ordinary citizens.

New audiences now a days have evolved to find out express countless 'myself' in terms of common emotion based on the new innovative code, amateurism. In other words, individual 'myself' with similar interest is combined as 'ourselves' with common interest at a chapter of expression. The new audiences have emotions as 'myself' and 'ourselves' at the same time and feel joy of creation in between those emotions. (Lee, 2015)

Likewise, the new audiences formed by amateurism find out common point of contact between 'my desire' and 'sociality as a community member' and share the place where imagination becomes to be realized. For example, there is living culture communities. The concept of living culture community is a new identity of participants to become producers, which enables anyone to start as an 'artist', 'designer' and 'producer' while pursuing routine culture and art.

Table 1. Classification of Social Capital - silver drama community "Watniggyeo"

Unit of social capital	Self-rating on regional dialect command - 'high'	Self-rating on regional dialect command - 'moderate'
Form and Structure	amateur drama company, official, vertical, open, local elite women, volunteering group, spontaneous association	amateur drama company, unofficial, horizontal, closed, spontaneous association
Intra-community social capital	<ul style="list-style-type: none"> - keeping role, concentrating, revising the script into dialect (Andong dialect) - compliance with regulations, age, playacting career, etc. - responding to issues: advising, giving tips - characteristics of social capital: strong bond, reliability by career, mutual understanding 	<ul style="list-style-type: none"> - revising the script into Andong dialect, additional ad-libbing - order of joining the drama company, age - responding to issues: communicative expression, refusal to do what is being told - characteristics of social capital: teamwork, no personal story
Inter-community social capital	<ul style="list-style-type: none"> - actively participating in individual activities (volunteering, resident community, etc.) - elderly-resident social capital - characteristics of social capital: weak bond, absence of reliability and mutual benefits - results: spread of local residents and dialect (Andong people, Andong dialect), development and re-creation of local history and cultural resources, aged generation model, improving quality of life 	<ul style="list-style-type: none"> - being confident in what I am doing (business) - characteristics of social capital: improved (psychological) confidence as an Andong person - results: spread of Andong history, physical health, active communication, life with joy and learning, playacting to become an elegant elderly

1) Intra-community social capital

The members of silver drama community, Watniggyeo, sublimate discomfort from social recognition of the elderly as passive and in need of help in playacting. In other words, they try to deliver their own message by reflecting "how to treat elderly" stereotype in local community to their playacting lines and concentrating on playing their role while having a command of strong and impressive Andong dialect accent.

I was bit worried about performing in front of people from Bupo-ri town. Because we are playing their story, I wanted to do well. So I practiced alone to be linked to people from the submerged district through feeling of empathy. (omitted) When hearing their real story in person after completion of performance, we were proud of becoming one mind with those people. (Jeong, HJ)

I was ad-lipping a lot. The director did not understand Andong dialect well because he was from Daegu. So, we revised the script to be in Andong dialect. (omitted) At first, the director tilted his head when hearing Andong dialect from us practicing, but now he praises us doing well and instructs us how to express specific emotion. (Jeong, SJ)

Though this process, silver drama community, Watniggyeo, put an importance of elderly role in active expression and activity that are being used as playacting-mediated personal and social resources. In addition, they try to accept new information while giving advice to each other based on trust relationship within playacting communication, or provide new information in addition to external resources in community.

We go anywhere if being called. We are neither playing just for money and nor looking to supporting projects. We think playing is like volunteering work. As we started because we like it, we just pay ten thousand won a month as a membership fee, take what is offered, and pay the director operating expenses and payroll costs. Today, I saw some acquaintances among audiences and got to have another performance unexpectedly. (Kwan, YS)

However, own identities of members that could be infringed due to implicit pecking order and authority inherent in age within community, order of joining the community are maintained by keeping science or refusal when

opinion or information exchange is required.

It has been only 2 years since I first joined the community. I think of myself lacking in ability compared to others and sometimes feel difficulty in joining conversation with others. So, I choose not to ask any private affair and rather listen to others and talk if I have to. Sometimes I am supposed to do what is being told because I am young, but I refuse to do so. Because it is uncomfortable and hard. (Kim, HJ & Jeong, SJ)

2) Inter-community social capital

This study was conducted with a single case of silver drama community, Watniggyeo, which made comparison with other population impossible. However, the members of Watniggyeo recognized that their daily life outside of community is directly and indirectly reflected in playacting in Watniggyeo. Especially recognizing that they attract interest of a number of local residents' interest via their process of performance, they see themselves as an important resource of social capital in local community as a local resident.

I became to use Andong dialect more frequently since I started playing performance. So, when family gathering, my daughter and grandchildren from Seoul sometimes misunderstood me using swear words (laugh). When buying some glossaries in Daegu market, people are friendlier greeting me talking in Andong dialect. It became to be all natural daily habits coming from playacting in Andong dialect. (Kim, HJ)

The part of lines from the play <Walgok Bakery> where Andong dialect is largely used by the silver drama community is summarized below.

Table 2. Use of Andong Dialect in Play <Walgok Bakery>

No. of use	Andong dialect	Meaning
4	Gwakjae	suddenly, unexpectedly
5	Maka	all, entirely
2	Sega bbajige	very much (extremely) strenuously
3	Mmagji geuno	in vain
1	Gaejabda	close, near

Likewise, the members try to use Andong dialect in their play as much as use in daily life for better delivery to and communication with the audience. They think, if the audience is not from Andong or young generation even from Andong they could not understand Andong dialect used in the lines of playing. Therefore, the synopsis of playing is usually ordinary story easily understandable and any Andong dialect that the audience did not understand is explained in after-performance talk concert or via personal inquiry, which all lead to positive self-rating of the members as the messenger of Andong dialect playing various roles.

CONCLUSIONS

Identity of elderly as a person newly designed and explicitly expressed in playacting at the old age was looked into via the case of Watniggyeo. The journey of finding oneself who is playacting, not a mother, wife or parent was reflected in the playing in amusing local words, Andong dialect. In addition, relationship between the members of the drama community showed that importance of community and region specific characteristics the community had created social capital, new life experiences such active playing, making friends, etc. at the old age. It means that trust mediated by local dialect was expressed in the playing, which became to be a positive source for individual role in activating and maintaining the community, silver drama community.

Playing performance has become an imitative for the members of the drama community who used to live a life irrelevant to playacting for about 60 years to look back or state a part of their life as well as a pathway to inform the outside world of elderly drama community activities (practice and performance). Differing from public interest in environmental adjustment and supporting policy for elderly alongside with increasing the aged population, playacting as one of the elderly activities within the local community played a bridgehead role in solidarity with local community, in which what is to prospect microscopically and how in reality of daily life in the elderly. More in-depth coverage of a case of individual elderly life might be needed to find out what social capital is created in the elderly.

ABSTRACT

A society has a system of values and norms that have been accepted and agreed upon as a social unit. The system of values and norms is based on the religious beliefs, customs and culture of a particular society. The Malay-Muslim community has its own system of values that has been agreed upon and practiced in everyday life. In this process, individual virtue should be developed and strengthened so that the system of values, norms and religious beliefs will be morally binding. However, due to challenges caused by world globalization and advancement of social media that broadcast and display other values from all over the world, the Malay-Muslim virtue that has been practiced for generations, is under threat. Hence, this paper discusses the challenges to develop and inculcate virtue in the minds of the present young generation, particularly among Malay-Muslims in Malaysia. It is vital for the present young generation to be educated, shaped and empowered due to frequent misbehavior among them. The many factors which contribute to misbehaviour need to be addressed by the society, particularly by parents, educators and the nation's leaders. By presenting the insights of past and contemporary scholars, this paper focuses on and analyzes literature research on the importance of educating, empowering and shaping the virtue of today's young generation who will be at the helm of society as future leaders. Scholars have, among other things, outlined factors contributing to misconduct which undermine youth's virtue. Among the factors discussed by scholars are the influence of media, process of socialization, rapid changes in modernization, the culture of youth's environment, the nature of adolescents who are not yet matured and stable, and their curiosity to experiment new things in the search for identity. These factors are definite challenges for parents, educators and leaders to developing and inculcating virtue in our younger generation. Therefore, it is imperative to study and analyze ideas, suggestions and views from scholars in the field of spiritual and Islamic education as a guide for society in inculcating virtue in the young generation for the future.

INTRODUCTION

The Malay-Muslim civilization Malaysia is founded on Islamic aspects of culture, religion, language and values. These aspects have been underlying the thought and behaviour of the Malay-Muslim society, enabling the construction of a Malay-Muslim Virtue Model (Jawiah & et al, 2016). This Model covers three domains, namely, thought, values and adherence to religious teachings.

The present young generation, also referred to as Gen Z, is a digital era generation. Their lifestyle largely depends on technology with a lesser degree of face to face social interaction. Their communication is more virtual. The effect is that Gen Z lack interpersonal and physical communication skills as well as pay less attention to family values. (Siti Mahani & Nazlinda, 2016). The lack of direct communication with people around causes Gen Z to lack practising the values of Malay-Muslim virtue such as respect, appreciation, trustworthiness, love for knowledge and adherence to religious tenets (Masliah, 2016). Gen Z are also not good listeners as they use World Wide Web to communicate and interact (Siti Mahani & Nazlinda, 2016). Due to their weak values, they are easily influenced by activity which is opposed to local values due to the influence of social media (Azyyati & Fariza, 2016). Some forms of such activity or behaviour are truancy, snatch theft, stealing, bullying, free sex and unwed pregnancy (Noor Amila & Fariza, 2015). Today's youth is through world social media, more exposed to other cultures and values which may differ with the values of the Malay-Muslim virtue. The effect of this is the gradual erosion of the Malay-Muslim identity based on the model of the Malay-Muslim virtue.

METHODOLOGY

This quantitative research uses document analysis to study the concept of Malay-Muslim virtue and the challenges to educating the young generation in developing and inculcating Malay-Muslim virtue. Generally, the focus of this research is to evaluate and analyse through books and articles which discuss Malay virtue. Among the references in this field are al-Quran and Hadith, Ihya'Ulum al-Din by Imam al-Ghazali (1967), Tahdhib al-Akhlaq written by Ibn Miskawih (1985), and writings of Hashim Musa (2012), Aminuddin Mansor (2012) and Jawiah Dakir (2016).

Malay-Muslim Virtue

The Malay-Muslim virtue is a set of values agreed upon by society to be the basis for individual daily behaviour.. This set of values has been practised for generations and ultimately became social norms which are required to be observed. The Malay-Muslim virtue is derived from Islamic teachings, and Malay tradition and culture (Fariza, 1999).

There are a number of writings on the concept of virtue derived from religious sources. Among these is by Yusuf al-Qardhawi (1996) who explained that al-Quran positions the intellect in a place appropriate to its function and ranking. He also stated that intellect is related to al-Quran which is its source of knowledge by which mankind runs his life.

Al-Quran as the source of knowledge underlies the theory on human intellect as espoused by Mohd Fakhrudin Abdul Mukhti (2000) in his book, *Islam dan Akal* (Islam and Intellect). In his view, al-Quran is a book relating to intellect. Al-Quran is a contributor to human thought. That is the reason, the Islamic religion which is derived from al-Quran as its source, underlies Malay-Muslim virtue.

In addition, tradition and culture are also sources in developing Malay-Muslim virtue. According to Abdullah Hasan (1995) in a study of the Malay intellect and mind, the original and creative Malay mind is within the framework of Malay-Muslim culture. It has to be a creative mind, and lead for the sake of the State and people. The originality and creativity of the Malay mind may be preserved through the use of the mother-tongue, namely, the Malay language.

Through the mother-tongue, the Malay-Muslim virtue may be translated through literature, music, drama, dance and various forms of arts. The elements of traditional culture give rise to lofty emotions and values, both social and aesthetic values (Mohd Taib Osman, 1988).

Meanwhile, Sidek Haji Fadzil (1999) in his research, viewed that the Malay-Muslim must place importance on education which is geared towards producing a quality generation. All parties must be committed to the process of developing a quality generation through the process of education.. This world exposed by new forms of social media, poses a challenge to instilling virtue in the young generation.

Hashim Musa (2012) who studied Malay probity through traditional Malay poetry (*pantun*), idioms and proverbs, found 26 core characteristics of Malay probity/rectitude implemented in action, behaviour, values, norms and thought. These said core characteristics are in Table 1 as follows:

Table 1: Core Characteristics of Malay-Muslim Probity /Rectitude

No.	Core Characteristic of Malay Probity/Rectitude
1.	Living according to Islamic teachings
2	Education to develop knowledgeable, courteous, virtuous, God-conscious and practising human beings
3	Gratitude for Allah's favours
4	Work values(ethics) which give priority to seriousness, competence, diligence and concord for benefit in this world and hereafter
5	Obey, serve and honour parents
6	Loyalty to a just and praiseworthy leader.
7	Refined courtesy and high moral character
8	Constant consensus, mutual helping and giving priority to public welfare and community life
9	Respect and service in socializing and honouring guests.
10	Moderation in speech and behaviour, prudent and careful
11	Concerned about self-respect and dignity
12	To act wisely and appropriately.
13	Safeguard and defend truth and justice.
14	Kind and grateful.
15	Forgiving and generous.
16	Affectionate
17	Live a simple life
18	Faithful and willing to sacrifice.
19	Self –reliant.
20	Respect for others' rights and property
21	Honesty and sincerity
22	Have kind thoughts
23	Openness, not to harbour negative feelings or be underhanded.
24	Trustworthy
25	Spend time wisely
26	Foresighted

Source: Hashim Musa & et al, 2012.

This probity/rectitude formed the Malay-Muslim identity. According to a study by Aminuddin Mansor (2012), the formation of the Malay virtue became an important basis in maintaining the Malay-Muslim identity.

From the concept of Malay probity/rectitude derived from the Islamic religion and Malay tradition and culture, the concept of Malay-Muslim virtue may be outlined. The Malay-Muslim virtue which underlies this concept may be categorized into three domains, namely, values, thought and adherence to religious teachings (Jawiah & et al, 2016). The three domains consist of constructs which show the characteristics of Malay-Muslim virtue. This is illustrated in Diagram 1 below:

Diagram 1: Concept of Malay-Muslim Virtue (Jawiah & et al, 2016)

CHALLENGES

The development of social media influences lifestyle, culture, values and thinking of today's generation. The culture and values adhered to for generations have begun to undergo change because the young generation are exposed to values and cultures external to Malay-Muslim society through social media such as internet, facebook, twitter, instagram, youtube and so on. This situation is happening in all Malay-Muslim societies including in Indonesia. A study by Anang Cahyono (2016), found that the influence of social media causes friction in patterns of social behaviour, in terms of culture, ethics and norms.

As a result of beginning to forsake religion, local values and culture, there occur behaviour or acts which violate the limits of Malay-Muslim virtue based on the Islamic religion. The lifestyle of the young generation begins to change from a religious to a hedonistic lifestyle, based on enjoyment and entertainment, to the extent of exceeding the limits of Malay-Muslim virtue. Referring to a study by Fariza & et al (2015) on the present lifestyle of adolescents, there are three categories of lifestyle practised by them in Malaysia: modernism, hedonism and traditionalism or conservatism. Even though the majority of them still practise a non-hedonistic modern lifestyle, the influence of hedonism has already begun to spread among Malay-Muslim adolescents.

Research findings by Veenhoven (2003) showed that youth is trapped in hedonistic behaviour which hankers for excessive fun and enjoyment. This challenge is the result of the rapid process of development and modernization, which Malaysia is also experiencing. It is also one of the reasons for changes in factors of youth socio-demography and environmental culture. This situation causes significant changes in social development and results in contemporary culture and sub-culture which interfere with the development of Malay-Muslim virtue.

In connection with the study by Veenhoven (2003), Siti Raba'ah Hamzah *et al* (2013) asserted that the formation and development of youth behaviour in Malaysia is increasingly eroding their identity. Hedonistic contemporary culture and behaviour which emphasizes importance on freedom in life is replacing traditional culture. This change is capable of preventing efforts to produce a young generation with positive attitude, lofty principles and noble character consistent with the values Malay-Muslim virtue in Malaysia. Moral education as well as nurturing of moral values in daily life is increasingly, though unintentionally, marginalized or set aside.

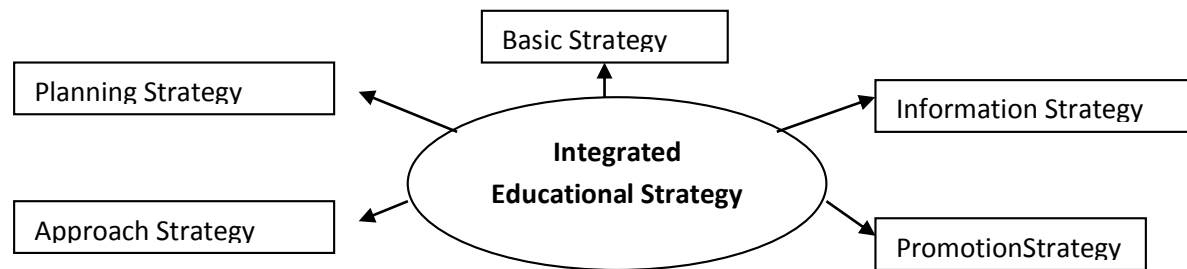

From the perspective of Islamic psychology, self-challenge also plays a role in inculcating Malay-Muslim virtue. Humans who are not instilled with values and religious instruction sometimes do not have a high level of self-esteem to deal with social challenges. Man is created having a psychological dimension (*al-nafs*). A psyche which is untutored and unbridled may tend to give in to his vain desires. Vain human desires are likely to choose matters of fun and enjoyment, even though such may not bring any good, but only harm (Hamka 2009). Thus, man needs to seriously strive and struggle in the process of self-control, but at times his mind or intellect fails to overcome his soul's desires. Hence, Hamka (2009) suggested consistent self-control training.

Strategy to Strengthen Virtue

As a long-term strategy, a systematic effort is required to build strength in youth, mentally, emotionally, spiritually, value-wise and personality-wise as desired by religion and local society. The issue of the young generation's virtue cannot be solved by *ad hoc* steps. It requires a wise, organised and orderly educational strategy because this issue is the effect of influence from an external society, not in line with the values, culture and religion of local society.

Therefore, an integrated educational strategy needs to be devised to deal with this issue. The suggestion submitted in this research involve parents, educational organizations, school authority, leaders of society, policy makers, non-governmental organizations and government agencies. The educational module to be implemented needs to take into account its suitability for the young generation as well as the function and role of organization represented but must be based on the model of integrated educational strategy suggested. The strategy suggested in this research is to focus on the following aspects:

Diagram 1.1: Model of Integrated Educational Strategy

Source: Modified from Fariza & Siti Norlina, 2014

Planning Strategy is to plan, organize and formulate an educational program compatible with current youth's psyche and environment. The strategy approach is to seek, formulate and provide for the approach, *uslub* (language style), method and software of educational program compatible with youth. The promotion strategy is to promote, broadcast and advertise the educational program and exemplary group or idol which may be emulated by the present youth. Information strategy is to transform and shape youth thinking so that they are ready and willing to accept change for a better and positive direction without abandoning or sacrificing virtue.

CONCLUSION

The values of Malay-Muslim virtue, derived from religion and Malay tradition and culture, are beginning to be undermined among the young generation as a result of changes in society. Various challenges are faced by educators, parents and society to preserve the values of Malay Muslim virtue so that the young generation may continue to internalize them. The main challenges are social media, modernization, lifestyle changes and little appreciation for Islamic teachings.

Ongoing strengthening of Malay-Muslim virtue is required so that the young generation develop the moral fibre and ability to lead the country, race and religion. If the present young generation is not properly guided, future young generations will definitely not know about courtesy and cultural values, losing their compass for direction without any religious guidance in their life.

ABSTRACT

This empirical study intends to present core results of the change in environmental literacy of German students by analysing PISA 2006 and 2015 data. The study is carried out within the scope of environmental literacy in science education. The data are based on findings of both PISA 2006 data (N= 4891) and PISA 2015 data (N= 6504) of German students which were published in the official PISA site (<http://www.pisa.oecd.org>). In this study, a valid and a reliable 'environmental literacy' scale is developed. In addition, students' attitudes towards science affecting their environmental literacy are compared between 2006 and 2015. The study is conducted based on the paradigm of a descriptive field study survey. The validity and reliability of the 'environmental literacy' scale is tested in two stages by applying exploratory factor analysis with SPSS and confirmatory factor analysis with AMOS. In addition, parametric tests (ANOVA) and correlation are used to assess the data obtained from the analysis of quantitative data. The findings demonstrate a positive and meaningful relationship between 'environmental literacy' and the sub-factors (Environmental Awareness (EA), Environmental Responsibility (ER), and Development of Environmental Behavior (DEB)) ($r_{EA} = 0.73$, $r_{ER} = 0.43$, $r_{DEB} = 0.37$, $p < .01$). Moreover, there is an increase in the mean of the environmental literacy ($\bar{X}_{2006} = 2.55$; $\bar{X}_{2015} = 2.58$). According to the results, the major of students (63 % and over) indicate that 'they can describe the role of antibiotics in the treatment of disease' and 'they can predict how changes to an environment will affect the survival of certain species' easily on their own in both 2006 and 2015. However, approximately 20 % of German students point out that they cannot recognize the science question that underlies a newspaper report on a health issue' on their own. In addition, the majority of German students (80 %) point out that they have information about the consequences of clearing forests for other land use in 2006 and 2015. On the other hand, more than 60 % of German students think that they do not have sufficient knowledge about the use of GMO in 2006 and 2015. In the light of the results of this study some suggestions related to environmental issues for the development of science curricula are discussed. For instance, one of the suggestions is that the subject of genetically modified organisms and health issue should be more comprehensive in the German science curricula. In addition, critical reflection and decision making about science issues is important to educate an environmental literate citizen.

Keywords: Science Education, Environmental Literacy, PISA

INTRODUCTION

In 2005, UNESCO launched its Decade of Education for Sustainable Development (2005-2014), a project by which educational institutes around the world would focus on educating more qualified individuals for a more sustainable future (Kaya and Elster, 2017). It is critical for the enhancement of the quality of future science education, especially environment education, that researchers bring to light the outcome of this educational project. One of the main purposes of this study is to present the results of the changes in environmental literacy (EL) of German students before and after implementation of this education by analysing PISA 2006 and 2015 data.

Another main purpose is to develop a model for assessing EL directly by using PISA data. It has been reported that PISA will be expanded in the scope of measurement coverage after the PISA 2015 evaluation (TEDMEM, 2017). It is the belief of the researchers that the present study will have a positive effect on this expansion, because, as Kaya and Elster (2017) mentioned, not enough research has been conducted on EL using PISA data, and although scientific literacy tasks in PISA include items related to environmental issues, it does not measure the score of EL directly.

The purpose of this research is to determine the change in the EL of German pupils from 2006 to 2015. Within the scope of this research, the development of environmental issues based on the PISA data is first presented. Next, before defining the research questions, the theoretical framework of literacy, especially science and EL, is introduced in order to reveal the importance of the research.

How is Environmental Education Linked to PISA?

International organizations have reported on the development of environmental education from past to present by organizing conferences or/and meetings on environmental education (The Belgrade Charter, 1972; WCED, 1987; UNESCO-UNEP, 1976, 1978; UNCED, 1992; UNESCO, 1997; United Nation, 2002). Environmental studies and sciences programs were first established in the 1970s and gave rise to the increase of public awareness on environmental studies and issues (Coppola, 1999). In 1972, environmental education gained international acclaim with the Stockholm Declaration (Belgrade Charter, 1975; Wright, 2002). In the report of the Belgrade Charter (1975), it was explained that the six frameworks of environmental education are awareness, knowledge, attitude, skills, evaluation ability and participation. Similarly, the Tbilisi Declaration reported that there are four objectives: awareness, knowledge, attitudes, skills, and participation in environmental education (UNESCO, 1978).

At the beginning of the 1980s, the first environmental education curriculum, named “Procedures for Developing an Environmental Education Curriculum”, was published under the auspices of UNESCO-UNEP, and then revised in the mid-1980s (UNESCO-UNEP, 1994). In 1987, The Brundtland Report, also known as the Common Future, was published by the World Commission on Environment and Development. This report outlines the concept of sustainable development, which is seen as an interrelation of the concepts of environmental protection and economic growth (McCrea, 2006). The transition from the concept of environmental education to the concept of sustainable development began after it was highlighted at the international conference in Thessaloniki on Environment and Society: Education and public awareness for sustainability hosted by UNESCO in 1997 (Pavlova, 2011).

In 1997, the OECD Programme for International Student Assessment (PISA) was created by OECD member countries (OECD, 2013a), and the first PISA survey was launched in 2000 (OECD, 2000), which involves PISA assessing students every three years in three subjects (science, reading and mathematics literacy) (MoNE, 2010). Most of the countries make certain that the PISA assessment tools are internationally accepted and take into consideration the culture and curriculum of the participating countries and their economies (OECD, 2016b). The latest PISA assessment in 2015 was centred on science literacy, an area that has continued to play an increasing role in our economic and social lives (OECD, 2016a). The international organization, UNESCO, has been very active, from past to present, in the development of environmental education and will continue to support this education in the future. The educational outcomes from international assessments, especially the PISA, are important insofar as they serve to maintain the quality of this development.

What is Literacy?

Literacy is a basic element of the right to education, as recognised by the Universal Declaration of Human Rights (UNESCO, 2013a). Despite there being general agreement that literacy is a human right (Keefe and Copeland, 2011), a common definition, accepted by everyone, is still lacking, as discussed in the previous section. Moreover, the idea of literacy has evolved in line with changes in cultural communicative practices and technological developments (Fellowes and Oakley, 2014). As a result, its usage has significantly expanded up to today (McBride, Brewer, Berkowitz, & Borrie, 2013). In recent years, the scope of its definition has grown to include many areas of interest, such as science literacy and EL (Monseley, 2000; Ozturk, Tuzun & Teksoz, 2013).

However, following the start of the Industrial Revolution, the concept of literacy began to be associated with the ability to read and write (Roth, 1992; Coppola, 1999; Monseley, 2000; Daley, 2003; Cambridge Assessment, 2013; McBride, Brewer, Berkowitz, & Borrie, 2013). UNESCO has had a significant role in developing literacy among its member states ever since the middle of the 20th century, and its definition of literacy has evolved substantially over time (Newman and Beverstock, 1990). In 1951, literacy was defined by UNESCO as the capability of a person to read, write, and fully comprehend a brief and uncomplicated expression in daily life (Newman and Beverstock, 1990: 45). Similarly, an alternative definition of literacy is the skill of individuals to get involved in the activities that need literacy to maintain the efficient functions of the society they live in, and to read, write and calculate for both personal and social development (UNESCO, 1978). In this sense, literacy provides a foundation for many other learning opportunities (UNESCO, 2013a), with the reason being that the innovative concept of “literacy” is concerned with the capacity of students to analyse, reason and communicate effectively as they pose, solve and interpret problems in a variety of subject matter areas. (PISA, 2005). It is anticipated that in time to come this innovative concept of literacy will move beyond the skill of reading and writing and be rather described as the ability to transform knowledge into practice.

Framework for Scientific/Science Literacy

Science is very significant for individuals if they are to make sense of their lives (Godek, 2002). Ultimately individuals have the desire to make daily natural events more understandable and useful for them (Agin, 1974).

The needs of individuals are therefore never-ending and continuous (Kalkandelen, 1979). In today's world, education, especially science education (Agin, 1974) is key to transforming individuals into scientifically literate persons. Scientific literacy has thus become a concept common to the basic goals of science education (Gabel, 1976). Moreover, scientific literacy has become the basis on which individuals can fully participate in society (Bybee, 2008). Through science education and the science literacy that results from it, individuals gain the ability to engage with science-related issues and scientific ideas (PISA, 2013b).

In light of the descriptions of literacy, science literacy is defined as the ability to read, comprehend, and discuss scientific matters intelligently (Shamos, 1988). In other words, it describes the ability of a person to understand scientific laws, theories, phenomena and objects and to be equipped with the necessary base of scientific knowledge to make informed decisions for their life (Dragoş and Mih, 2015). Although scientists, educators, and philosophers of science each have their own definitions of what it means to be scientifically literate, it should not be ignored that this concept is constantly evolving (Gabel, 1976). In these respects, Shen (1975 as cited in Liu, 2009) described six components of science literacy: (a) understanding basic science concepts, (b) understanding the nature of science, (c) understanding the ethics guiding scientists' work, (d) understanding interrelationships between science and society, (e) understanding interrelationships between science and humanities, and (f) understanding the relationships and differences between science and technology. In contrast, according to the Board on Science Education (2016), there are three elements of science literacy, namely, an understanding of scientific practices, content knowledge and an understanding of science. These two alternative definitions serve to demonstrate, in short, that, just as is the case for the definition of science literacy, there is no common view on the categories delimiting the concept of science literacy.

In general, it can be said that scientific literacy means to have an appreciation of the basic principles of science and an understanding of what scientific research produces (Smithsonian Institution, 2011). Individuals should have some understanding of or familiarity with the social processes that accompany most environmental issues and how scientific methods work (Schneider, 1997). A scientifically literate citizen must therefore have an understanding of how the scientific and decision-making elements interact (Schneider, 1997). In support of this, Hurd (1998) stated in his study that a literate person uses science knowledge where appropriate in making life and social decisions, forming judgments, resolving problems, and taking action. Although the major advantage of being endowed with science literacy is that it provides a basis, at the school level, of the intentions of science education (Holbrook and Rannikmae, 2009), it entails much more than simply knowing the basic facts established by science (Board on Science Education, 2016). In summary, a definite answer to the question of 'what is science literacy?' should not be sought. Instead, we should seek to find an answer to the question of 'what is the scope of science literacy and how can we meet, within that scope, the expectations of societies in the future?'. In this way, we can train qualified science literate individuals accordingly.

Change in Science Literacy in PISA

The concept of science literacy is constantly being updated by PISA. In 2000, PISA defined scientific literacy as the capability of using scientific information, asking questions and making conclusions based on proof for the purpose of comprehending the natural world, making determinations about it and interacting with it. In 2006 and 2009, PISA redefined science literacy as follows (OECD, 2006: 12; OECD 2009: 128): the holding and use of scientific information to make new questions, draw new pieces of information, make sense of the phenomena related to science, and reach conclusions related to scientific issues based on proof; also the ability to access the core of unique aspects of science by regarding it as a type of human information and investigation, being conscious about the ways that science and advanced technology determine our living situations, in material, intellectual and cultural terms, and being eager to get involved in scientific subjects, as well as having personal opinions about science as a requirement of being a contemplative citizen. In 2015, science literacy was defined by OECD (2013b: 7) as the skill to question and discuss scientific matters and people's opinions related to science, a requirement to being a meditative citizen. These regular updates to the concept of science literacy by PISA are made according to the changing conditions of society.

Framing the Concept of Environmental Literacy (EL)

In 1969, Roth (1968), as cited in Roth (1992), indicated that the concept of EL was first revealed in an academic paper. In the 1990s, however, the field of environmental education underwent a maturation period within the framework of formulating the concept of EL (McBeth and Volk, 2010). Environmental education programs are designed to raise and nurture the development of EL throughout the lifetime of the human (Subbarini, 1998). Moreover, the main aim of environmental education continues to be the development of EL, and ultimately behavioural change in terms of making informed decisions related to natural resource management (Bennett and Roth, 2015). As NAAEE informs us, EL includes dispositions, knowledge, and competencies applied for the purpose of responsible environmental behaviour (Daniš, 2013).

However, as stated earlier, there is no universally accepted definition of literacy (Keefe and Copeland, 2011), especially science literacy (DeBoer, 2000) and EL (Loubser, Swanepoel & Chacko, 2001; Morrone, Mancel & Carr, 2001). Despite the fact that the concept of EL has been in use for many years, coming up with a

comprehensive description of it continues to be challenging due to its complexity. EL is still highly valued in science education, as it has allowed for many solutions related to environmental problems in science to be found. It is because of this that so many researchers have attempted to classify EL.

Researchers have argued that EL has to accord with the five categories of environmental education concepts (awareness, knowledge, attitude, skills, and participation) in order for it to develop into positive environmental behaviours (Wisconsin Department of Public Administration, 1991). In the study by Roth (1992), six major areas of EL were proposed: environmental sensitivity, knowledge, skills, attitudes and values, personal investment and responsibility, and active involvement. Many researchers have sought to provide a working definition of EL, such as the one offered by Subbarini (1998: pp. 245), which states that EL requires individuals to be able to convey and make use of the main ecological concepts and rules, make sense, on ecological grounds, of the effect of human activities on the environment, determine and do research about environment-related matters to come up with different solutions, and assert the values related to the environment that encourage the use of natural resources in a sensible and responsible manner; or the one put out by the DC Environmental Literacy Workgroup (2012), stating “Environmental literacy is the development of knowledge, attitudes, and skills necessary to make informed decisions concerning the relationships among natural and urban systems”.

An examination of the literature showed that there are three levels of EL: nominal, functional and operational (Chacko, 1998). According to Chacko (1998), a person who has nominal EL has the ability to recognize many of the basic terms used in discussing the environment, a person who has functional EL has a broader range of knowledge and understanding about the nature and interaction of human social systems and other natural systems, and a person who has operational EL has progressed beyond functional literacy in both the breadth and depth of understandings and skills.

Literacy, especially EL, is not a process of indoctrination of any one agenda, but rather a building of knowledge and experiences to help persons make informed decisions (TAEE, 2013). Environmentally literate people are equipped with more than just knowledge about ecology; completely literate individuals combine knowledge with values, which leads to action (Morrone, Mancil & Carr, 2001). Moreover, environmentally literate individuals are capable of individually and collectively making informed decisions concerning the environment, are willing to act on these decisions to improve the well-being of other individuals, societies, and the global environment, and are actively engaged in social life (NAAEE, 2011). In short, EL involves the ability to adapt to changes in environmental resources and systems, and their dynamics (Scholz, 2011).

Ultimately, studies have shown that the two general concepts of science and environmental education and science and EL are related to each other; that is, environmental education is a prerequisite for qualified science literacy (O’Hearn, 1972). In viewing this relationship as such, it is possible to see how the problems related to environmental education can be overcome (Longbrake, 1974). The influence of these interrelated and interdependent concepts should be a reflection of the impact of science education on the quality of the education.

RESEARCH QUESTIONS

To be consistent with the PISA definition of scientific literacy, assessment items are required to be designed via the application of scientific knowledge and through the demonstration of the scientific competencies within certain contexts, such as environmental issues. Although PISA was not designed specifically to assess environmental science, by taking the questions used in the PISA science assessment, it was determined that some were related to environmental science (Erbaş, Tuncer Teksöz & Tekkaya, 2012). Furthermore, while PISA assesses reading, science, and mathematics literacy every three years, EL is not directly assessed, although some of the items do fall within an environmental context. As it has been argued that not enough research on EL has been conducted using PISA data (Kaya and Elster, 2017), this study seeks to do research on EL by using PISA data from 2006 to 2015. In conducting this research, the main aim was to determine the change in the EL of German pupils from 2006 to 2015. More specifically, the research questions investigated in this study were:

- What factors influence EL?
- In what way do the EL factors (development of environmental behaviour, environmental awareness and environmental responsibility) change from 2006 and 2015?
- How does the change in the influence of students’ attitudes towards science (such as enjoyment of science, interest in science) impact EL from 2006 to 2015?
- What changes occur from 2006 to 2015 in the influence of teaching methods for lessons on EL?

RESEARCH METHODS AND DESIGN

In this section, we present the ‘type of study’, ‘the sampling and data collection’, and the analysis of data.

Type of study

For this field study, descriptive research methods were employed. The basic aim of descriptive analysis is to provide the reader with the ability to summarize and interpret the findings (Yıldırım and Simsek, 2003). Specifically, a survey format was used in the context of the method of description for this research. Surveys, which are used to determine the current situation, have the advantage of allowing more quantitative data to be

gathered (Cepni, 2007). Questions related to the environmental issues in the PISA 2015 student questionnaire were included in this study. In the context of this study, the questionnaire was used with structural equation modelling to examine the factors affecting German students' development of environmental behaviour (DEB), environmental responsibility (ER) and awareness (EA).

Sampling and data collection

In this study, the sample population was restricted to 15-year-old German students who were attending school in either 2006 or 2015. The PISA sample selection was conducted randomly by applying the two-stage stratified sampling method (Albayrak Sarı, 2015). The study sample included 4891 pupils from 2006 and 6504 pupils from 2015, determined using PISA data from both 2006 and 2015. The data were obtained via the internet from the official PISA website (<http://www.pisa.oecd.org>). In this study, the data obtained with the participation of students from Germany involved PISA data from 2006 and 2015.

Analyses of data

This section consists of two parts, with the first part describing how the scale was developed, and the second part explaining the analysis used in this study. The Environmental Literacy scale was developed in two stages: exploratory and confirmatory factor analysis stages. .

Theoretical framework of scale

In PISA 2006, approximately 33 percent of the context included resources and environments (Bybee, 2008), while in PISA 2015, approximately 11% of the context included environmental issues, and the number of items were found to have decreased compared to 2006-PISA. According to PISA results, the definition of EL includes environmental awareness and environmental responsibility (Kaya and Elster, 2017). When the theoretical framework of EL is examined (Figure 1), EL includes environmental behaviours. According to the scope of EL, as shown in Figure 1, the EL scale was developed using common items related to environmental issues from both 2006 and 2015. Moreover, two of the three sub-factors, namely environmental awareness and environmental responsibility, were included in the PISA data. However, the “Development of Environmental Behaviour (DEB)”, a new factor, was added to the scale of EL. DEB is used to determine whether the students in the school are given responsibilities to improve their skills in demonstrating environmental behaviours.

Scholz (2011) argues that ‘environment’ must be redefined as a co-evolving system coupled to a human system. Thus, in line with this view, he recommends that future research should be designed on the basis of human and environment systems, and he linked trans-disciplinary and disciplined interdisciplinary to the concept of EL. In this respect, the focus points are the interaction of human systems and environmental systems, how individuals learn from feedback and can avoid rebound effects, and what information they react to or ignore. Here, EL is linked to learning, and so the question of how this literacy can be transmitted to future generations receives special attention. For this reason, in this study, the DEM factor, which is related to participations and skills, is included in the EL scale, especially considering that the academic support related to the science education provided to the students is one of the most important factors in securing EL.

According to Tbilisi Declaration for EE (UNESCO, 1977)	Science Literacy (MoNE, 2005)	Environmental Literacy (Roth, 1992)	Frameworks for developing scale
Knowledge	Key Science Concepts Nature of Science	Knowledge	Environmental Awareness*
Attitude	Attitude and Values in Science Scientific Values	Sensitivity, Attitudes and Values, Personal Investment and Responsibility	Environmental Responsibility*
Skills	Scientific and Technical Psychomotor Skills Scientific Process Skills	Skills	Development of Environmental Behavior
Participation	Science- Technology-Society –Environment Interactions	Active involvement	

*The concepts used in the PISA have been preferred so as not to cause confusion.

Figure 1: Theoretical framework of environmental education (EE), Science Literacy (SL), Environmental Literacy (EL), all of which underpin the framework for the developed scale.

Exploratory factor analysis

A scale was developed for this research. The developed scale was applied on 15-year-old students who were attending schools in Germany. The total sample of this study consisted of 9833 students who were selected using PISA 2006 Data. In the first part of developing the scale, exploratory factor analysis, conducted with the SPSS Program, was used to examine the construct validity of the scale. In the second part, confirmatory factor analysis, conducted with the AMOS Program, was used to show the relationships between variables. Prior to performing the exploratory factor analysis, in order to determine whether or not to conduct a factor analysis, the KMO (Kaiser-Meyer- Olkin) Value and Bartlett's Test of Sphericity were calculated. The KMO and Bartlett measurement results are presented in Table 1.

Kaiser-Meyer-Olkin Value	.82
	28905.55
Bartlett's Test Value	105
p	.00

* p<.01

A KMO Value that is over 0.50 (KMO= 0.82, p<0.01) indicates that factor analysis sampling was appropriate. The Bartlett's Test of Sphericity result of 28905.55 (p<.01) was significant in that it showed that the measuring tool could be differentiated into factor structures.

Using item-total correlation for the EL scale analysis, the reliability of test items, the t-test for the reliability of the meaningfulness of the median of the top 27% and bottom 27% groups, and the reliability of Cronbach alpha were determined. The results are shown below in Table 2.

Table 2: Item-Total Correlation

Item	t (Bottom 27%-top 27%) ¹
1	33.64***
2	36.89***
3	39.80***
4	38.34***
5	40.69***
6	34.95***
7	10.76***
8	7.48***
9	7.96***
10	11.11***
11	48.21***
12	47.58***
13	50.88***
14	49.56***
15	45.66***
¹ n ₁ = n ₂ = 2655, alpha= .78, N of Items =20, ***p < .01	

According to the initial data obtained by the exploratory factor analysis, 15 of the items (variables) included in the analysis were gathered under 3 factors and had a value greater than 1. The explanatory variance of these three factors was 47.45%. The commonalities of the 3 factors defined as related to the items should vary between 0.40 and 0.59.

According to the eigenvalue measure, the number of significant factors in the scale was determined to be 3, as clearly seen in Figure 2. While there are 3 factors in the graph with a high ascending curve, the general trend of the graph in the fourth and subsequent factors are horizontal and do not have a significant declining trend. In short, the contributions of the fourth and subsequent factors to the variance are very similar.

Figure 2: Eigenvalue Graph

Analysis of the scale were made on 3 factors and over 15 items (appendix 1). The analysis of converted basic item components is presented in Table 3.

Table 3: Factor Analysis (analysis of converted basic components)

Item	Factor Common Variance	Factor-1 Load Value	Analysis of converted basic components		
			Factor-1	Factor-2	Factor-3
3	.52	.65	.70	.06	.13
4	.47	.65	.67	.03	.13
1	.46	.62	.66	.04	.12
2	.45	.61	.65	.02	.13
6	.47	.61	.65	.00	.22
5	.40	.58	.61	.11	.11
15	.40	.52	.05	.75	.04
12	.51	.51	.05	.71	.06
11	.49	.11	.06	.67	.06
13	.44	.17	.10	.65	.07
14	.56	.22	.04	.63	.02
9	.59	.16	.12	.09	.75
10	.56	.26	.12	.00	.74
8	.43	.53	.21	.01	.62
7	.45	.50	.25	.09	.61
Explained Variance Total 47.45 %, Factor-1: 23.47%, Factor-2: 15.42%, Factor-3: 8.57 %					

Through factor analysis, an attempt was made to bring together variables that measure the same structure with a small number of factors (Buyukozturk, 2009). Item loads larger than 0.61 were chosen and included in the scale. The remaining 15 items were loaded on the 3 factors labelled Environmental Responsibility (ER), Development of Environmental Behavior (DEB), and Environmental Awareness (EA). These factors, along with the number of items attached to them are as follows (see appendix 1):

- Factor-1: Environmental Responsibility (between 1 and 6 items)
- Factor-2: Development of Environmental Behaviour (between 11 and 15 items)
- Factor-3: Environmental Knowledge (between 7 and 10 items)

In summary, although different researchers have preferred to form different EL categories, in this research, three categories (EA, ER, DEB) were established.

Table 4: Correlation of Factors

		EL	ER	DEB	EA
EL	r	1			
	p				
	N	9833			
ER	r	.43**	1		
	p	.00			
	N	9833	9833		
DEB	r	.37**	-.44**	1	
	p	.00	.00		
	N	9833	9833	9833	
EA	r	.73**	.114**	-.02	1
	p	.00	.00	.07	
	N	9833	9833	9833	9833

** p<0.01

As can be seen in Table 1, there is a positive relationship between EL and the sub factors ($p < .01$).

Confirmatory factor analysis

Structural validity was tested by confirmatory factor analysis, as described above. According to the initial results obtained by confirmatory factor analysis, some of the values were not within the acceptable limits. For this reason, covariance was created between the error terms of the items within each latent variable in the model. The findings are listed in Table 5. Each correction should be made on a theoretical basis (Meydan and Sesen, 2015; Karagoz, 2016). The error terms of the items in each factor were therefore identified (Karagoz, 2016) before performing the confirmatory factor analysis for a second time. The corrected confirmatory factor analysis appeared to be a good fit in general. The notions of good fit and acceptable fit are taken at different value ranges. It is possible that a model may fit the data despite having one or more fit measures that are of a bad fit (Schermelleh-Engel & Moosbrugger, 2003).

Table 5: Fit Criteria (Schermelleh-Engel, Moosbrugger & Müller, 2003) and Model Fit Measures

	Good Fit	Acceptable Fit	Model Fit
c2/sd	$0 \leq c^2/sd \leq 2$	$2 \leq c^2/sd \leq 3$	29.49
P	$0.05 \leq p \leq 1$	$0.01 \leq p \leq 0.05$.00
RMSEA	$0 \leq RMSEA \leq 0.05$	$0.05 \leq RMSEA \leq 0.08$.05
NFI	$0.95 \leq NFI \leq 1.00$	$0.90 \leq NFI \leq 0.95$.91
TLI	$0.95 \leq TLI \leq 1.00$	$0.90 \leq TLI \leq 0.95$.88
CFI	$0.97 \leq CFI \leq 1.00$	$0.95 \leq CFI \leq 0.97$.91
RFI	$0.90 < RFI < 1.00$	$0.85 < RFI < 0.90$.87

As shown in Table 5, the significance value was .00. Moreover, the P-values as well as most of the other values indicate that the model had a good fit.

FINDINGS

Factors influencing Environmental Literacy

In this research, parametric tests (t test) were applied in evaluating the data derived from the analysis of quantitative data. ANOVA, T-test and descriptive statistics were used. The change in ER is included in Figure 3. In Figure 3 and appendix 2, it can be seen that among the factors related to the ‘environmental responsibility’ – acid rain, food items and garbage – of the German students, the factor of “acid rain”, with a coefficient of 1.00, had the highest factor value in 2006. However, in 2015 the highest factor was “food items” with a coefficient of 1.04. The factor, “health issue”, had the lowest factor value in 2006, with a coefficient of .76 and in 2015, with a coefficient of .91.

Figure 3: Change in ER based on PISA 2006 data and PISA 2015 data

In Figure 4 and in appendix 2, it can be seen that among the factors related to "development of environmental behaviour" (DEB) in the German students, the factors of "explain ideas" and "practical experiments" had the highest factor value, with a coefficient of 1.33, while the factor of "class debate" had the lowest factor value, with a coefficient of 1.00 in 2006. However, in 2015 the highest factor was "class debate", with a coefficient of 1.00.

Figure 4: Change in EDB based on PISA 2006 and PISA 2015 data

In Figure 5 and in appendix 2, it can be seen that among the factors related to the "environmental awareness" of the German students, the factor of "greenhouse gases" had the highest factor value in 2006, with a coefficient of 1.12, and in 2015, with a coefficient of 1.07. In addition, the "use of genetically modified organisms (GMO)" had the lowest factor value in both 2006 (with a coefficient of .82) and 2015 (with a coefficient of .72).

Figure 5: Change in EA based on PISA 2006 and PISA 2015 data

In the questionnaires, the students' views regarding environmental responsibility (ER) were obtained. The responses are shown in Table 6.

Table 6: Views on Environmental Responsibility (questionnaire results)

Year	Environmental Responsibility	I couldn't do this f (%)	I would struggle to do this on my own f (%)	I could do this with a bit of effort f (%)	I could do this easily f (%)
2006	Health Issue	929 (20.4)	2640 (57.9)	796 (17.5)	193 (4.2)
2015	Health Issue	700 (20.8)	1712 (51.0)	631 (18.8)	316 (9.4)
2006	Antibiotics	375 (8.2)	1246 (27.3)	1894 (41.6)	1041 (22.8)
2015	Antibiotics	285 (8.6)	818 (24.5)	1424 (42.7)	806 (24.2)
2006	Garbage	336 (7.4)	1391 (30.6)	2204 (48.4)	619 (13.6)
2015	Garbage	374 (11.3)	998 (30.2)	1517 (45.9)	419 (12.7)
2006	Certain Species	378 (8.3)	1034 (22.7)	1978 (43.4)	1165 (25.6)
2015	Certain Species	273 (8.2)	745 (22.5)	1505 (45.5)	788 (23.8)
2006	Food Items	421 (9.2)	1335 (29.3)	1897 (41.7)	901 (19.8)
2015	Food Items	398 (12.1)	983 (29.9)	1349 (41.1)	555 (16.9)
2006	Acid Rain	536 (11.8)	1105 (24.2)	1719 (37.7)	1199 (26.3)
2015	Acid Rain	556 (17.0)	894 (27.3)	1201 (36.6)	626 (19.1)

As shown in Table 6, the majority of the students (63% and over) indicated that 'they can describe the role of antibiotics in the treatment of disease' and 'they can predict how changes to an environment will affect the survival of certain species' easily on their own in both 2006 and 2015. However, approximately 20 % of the German students pointed out that they could not recognize on their own the science question underlining a newspaper report on a health issue. Moreover, more than half of the students mentioned that they struggled to understand the health issue. An increase was seen in the percentage of students who stated they could not identify the better of two explanations for the formation of acid rain, from 2006 (11.8%) to 2015 (17%).

In the questionnaires, the students' views regarding academic development support were obtained. The responses are shown in Table 7.

Table 7: Views on Development of Environmental Behaviour (questionnaire results)

Year	Development of Environmental Behaviour	Never or hardly ever f (%)	In some lessons f (%)	In most lessons f (%)	In all lessons f (%)
2006	Explain Ideas	1004 (22.2)	1683 (37.2)	1394 (30.8)	441 (9.8)
2015		1394 (30.3)	1843 (40.0)	1024 (22.2)	345 (7.5)
2006	Practical Experiments	1135 (25.1)	2406 (53.3)	819 (18.1)	157 (3.5)
2015		1254 (27.4)	2333 (50.9)	808 (17.6)	186 (4.1)
2006	Draw Conclusion	378 (8.4)	1212 (27.0)	1933 (43.1)	958 (21.4)
2015		484 (11.0)	1315 (29.8)	1775 (40.2)	842 (19.1)
2006	Design Own Experiments	2776 (62.0)	1106 (24.7)	454 (10.1)	145 (3.2)
2015		2837 (64.0)	1026 (23.1)	402 (9.1)	168 (3.8)
2006	Class Debate	705 (15.6)	2038 (45.1)	1254 (27.7)	526 (11.6)
2015		972 (22.0)	1753 (39.6)	1286 (29.1)	414 (9.4)

As shown in Table 7, in 2006, 62% of the students reported that in science lessons they were never or hardly ever allowed to design their own experiments, and 25 % mentioned that they never or hardly ever spent time in the laboratory doing practical experiments as part of the science lessons. Furthermore, 22 % indicated that they never or hardly ever were given opportunities in the science lessons to explain their ideas. However, in 2015, 64% of the students reported that they never or hardly ever were allowed to design their own experiments in science lesson, 30% reported that they never or hardly ever were given opportunities in the science lessons to explain their ideas, and finally, 27% mentioned that never or hardly ever spent time in the laboratory doing practical experiments as part of the science lessons.

In the questionnaires, the students' views regarding environmental awareness were obtained. The responses are shown in Table 8.

Table 8: Views on Environmental Awareness (questionnaire results)

Year	Environmental Issue	I have never heard f (%)	I have heard about this but I would not be able to explain what it is really about f (%)	I know something about this and could explain the general issue f (%)	I am familiar with this and I would be able to explain this well f (%)
2006	The increase of greenhouse gases	465 (10.2)	1376 (30.1)	1823 (39.9)	901 (19.7)
2015		464 (11.1)	949 (22.8)	1686 (40.5)	1066 (25.6)
2006	The use of GMO	817 (17.9)	2005 (44.0)	1410 (30.9)	329 (7.2)
2015		968 (23.4)	1683 (40.7)	1114 (27.0)	366 (8.9)
2006	Nuclear waste	311 (6.8)	1457 (32.0)	1958 (43.0)	832 (18.3)
2015		317 (7.7)	1111 (27.0)	1804 (43.8)	888 (21.6)
2006	The consequences of clearing forests	248 (5.4)	676 (14.8)	1716 (37.6)	1925 (42.2)
2015		230 (5.6)	620 (15.1)	1753 (42.7)	1501 (36.6)

As shown in Table 8, in 2006 and 2015, the majority of the German students (80%) pointed out that they had information about the consequences of clearing forests for other land use. More than 60% of the German students indicated in 2006 and 2015 that they had knowledge about nuclear waste. On the other hand, in 2006 and 2015, more than 60% of the German students believed that they did not have sufficient knowledge about the use of GMO.

Table 9 presents the mean of the German students' EL (environmental literacy) and sub-factors.

Table 9: Mean of German students' EL and sub-factors

	2006		2015	
	Mean	Participant	Mean	Participant
EL	2.55	4891	2.58	4942
ER	2.20	4891	2.28	4942
EDB	2.72	4891	2.73	4942
EA	2.72	4891	2.73	4942

As shown in Table 9, the means of EL were 2.55 in 2006 and 2.58 in 2015. Therefore, there was an increase in the mean of the EL from 2006 to 2015.

Environmental Literacy and Interest in Science

The results of ANOVA, as related to EL and having fun when learning science, were obtained. The responses are shown in Table 10.

Table 10: The results of ANOVA, as related to EL and having fun when learning science

	View	N	\bar{X}	Source of Variance	Sd	Mean Square	F	p	Sig dif
2006	Strongly agree(a)	1145	1.87	Between groups	3	1.90	24.82	.00	a-b, a-c, a-d
	Agree(b)	1850	2.15	With-in group	4702	.08			
	Disagree(c)	1273	2.41	Total	4705				
	Strongly disagree(d)	438	2.73						
2015	Strongly agree(a)	899	2.57	Between groups	3	.176	1.93	.12	-
	Agree(b)	1499	2.58	With-in group	4058	.091			
	Disagree(c)	1044	2.60	Total	4061				
	Strongly disagree(d)	620	2.57						

The results of the analysis show that there was a meaningful difference in terms of EL averages and having fun when learning science topics in 2006 ($F_{2006}(3, 4702) = 24.82, p < .01$), whereas in 2015 there was no meaningful difference ($F_{2015}(3, 4058) = 1.93, p > .01$). According to the results of the Scheffe test, the EL of the students who strongly disagreed with the fun of learning science (d) ($X = 2.73$) was stronger than that of the other students in 2006. Moreover, while there was a significant increase from 2006 to 2015 in the average of the students who strongly agreed with the fun of learning science ($X = 1.87$) ($X = 2.57$), there was a decrease in the average of the students who strongly disagreed with the fun of learning science ($X_{2006} = 2.73; X_{2015} = 2.57$).

Table 11 shows the results of ANOVA as related to EL and the interest in learning about science.

Table 11: The results of ANOVA as related to EL and the interest in learning about science

	View	N	\bar{X}	Source of Variance	sd	Mean Square	F	P	Sig Dif
2006	Strongly agree(a)	1015	2.51	Between groups	3	2.45	32.03	.00	a-c, a-d
	Agree(b)	1799	2.53	With-in group	4699	.08			
	Disagree(c)	1331	2.57	Total	4702				
	Strongly disagree(d)	558	2.64						
2015	Strongly agree(a)	794	2.56	Between groups	3	.379	4.13	.006	-
	Agree(b)	1492	2.57	With-in group	4023	.092			
	Disagree(c)	1032	2.60	Total	4026				
	Strongly disagree(d)	709	2.60						

The results of the analysis show that there was a meaningful difference in terms of EL averages and interest in learning about science between 2006 and 2015 ($F_{2006} (3.4699) = 32.03$, $F_{2015} (3.4023) = 4.13$, $p < .01$). According to the results of the Scheffe test, the EL of the students who strongly disagreed with interest in learning about science was stronger than that of the other students in 2006 ($X_{2006} = 2.64$) and 2015 ($X_{2015} = 2.60$). However, by 2015, the averages of those who strongly disagreed with the interest in learning science decreased, while the averages of those who strongly agreed with the interest increased.

Environmental Literacy and Reading Science

The results of ANOVA, as related to EL and like reading science, were obtained. The responses are shown in Table 12.

Table 12: The results of ANOVA, as related to EL and like reading science

	View	N	\bar{X}	Source of Variance	sd	Mean Square	F	p	Sig Dif
2006	Strongly agree(a)	1421	2.51	Between groups	3	2.34	30.52	.00	a-b, a-c, a-d
	Agree(b)	585	2.52	With-in group	4704	.08			
	Disagree(c)	1921	2.55	Total	4707				
	Strongly disagree(d)	781	2.62						
2015	Strongly agree(a)	518	2.55	Between groups	3	.787	8.67	.00	d-a, d-b, d-c
	Agree(b)	1128	2.57	With-in group	4031	.09			
	Disagree(c)	1453	2.58	Total	4034				
	Strongly disagree(d)	936	2.62						

The results of the analysis show that there was a meaningful difference in terms of EL averages and like reading science between 2006 and 2015 ($F_{2006} (3.4704) = 30.52$, $F_{2015} (3.4031) = 8.67$, $p < .01$). According to the results of the Scheffe test, the EL of the students who strongly disagreed with like reading science was stronger than the EL of the other students in 2006 ($X_{2006} = 2.62$) and 2015 ($X_{2015} = 2.62$). However, by 2015, the averages of those who strongly disagreed with like reading science stayed at the same value, while the averages of those who strongly agreed with like reading science increased.

Environmental Literacy and Teaching Methods

The results of ANOVA, as related to EL and teacher's explanation about how a school science idea can be applied were obtained. The responses are shown in Table 13.

Table 13: The results of ANOVA, as related to EL and teacher's explanation about how idea can be applied

	View	N	\bar{X}	Source of variance	Sd	Mean Square	F	P	Sig Dif
2006	All lessons (a)	792	2.44	Between groups	3	8.67	116.25	.00	a-b, a-c, a-d
	Most Lessons(b)	1797	2.52	With-in group	4483	.08			
	Some lessons (c)	1463	2.60	Total	4486				
	Hardly ever (d)	435	2.71						
2015	All lessons (a)	749	2.43	Between groups	3	12.73	160.71	.00	a-b, a-c, a-d
	Most Lessons(b)	1720	2.54	With-in group	4387	.08			
	Some lessons (c)	1471	2.65	Total	4390				
	Hardly ever (d)	451	2.74						

The results of the analysis show that there was a meaningful difference in terms of EL averages and teacher's explanation about how idea can be applied between 2006 and 2015 ($F_{2006} (3.4483) = 116.25$, $F_{2015} (3.4387) = 160.71$, $p < .01$). According to the results of the Scheffe test, when students were never or hardly ever informed by the teachers in the science lessons (d) ($X_{2006} = 2.71$; $X_{2015} = 2.74$), the EL average of the students was stronger than that of the other students. From 2006 to 2015, the literacy average increased when the teacher never or hardly ever offered explanations during their science lessons.

The results of ANOVA, as related to EL and teacher's provision of an explanation of the relation of science concepts to our life, were obtained. The responses are shown in Table 13.

Table 13: The results of ANOVA, as related to EL and teacher's provision of an explanation of relation of science concepts to our life

	View	N	\bar{X}	Source of Variance	Sd	Mean Square	F	p	Sig Dif
2006	All lessons (a)	417	2.40	Between groups	3	8.81	118.49	.00	a-b, a-c, a-d
	Most Lessons(b)	1296	2.49	With-in group	4456	.074			
	Some lessons (c)	1972	2.57	Total	4459				
	Hardly ever (d)	775	2.67						
2015	All lessons (a)	457	2.39	Between groups	3	12.10	153.16	.00	a-b, a-c, a-d
	Most Lessons(b)	1175	2.52	With-in group	4380	.08			
	Some lessons (c)	1745	2.61	Total	4383				
	Hardly ever (d)	1007	2.69						

The results of the analysis show that there was a meaningful difference in terms of EL averages and teacher explaining the relation of science concepts to our life between 2006 and 2015, $F_{2006} (3.4456) = 118.49$, $F_{2015} (3.4380) = 153.16$, $p < .01$. According to the results of the Scheffe test, when students are never or hardly ever informed about the relevance of science concepts to our lives by teachers in the science lessons (d) ($X_{2006} = 2.67$; $X_{2015} = 2.69$), the EL average of the students was stronger than that of the other students. The EL average was found to increase when the teacher never or hardly ever provided explanations about the relevance of science concepts to our lives during their science lessons.

DISCUSSION

According to 2006 and 2015 data, the students constituting the study had more knowledge about greenhouse gases than about other items. More than half of the German students had knowledge on the greenhouse gases, the consequences of clearing forests for other land use, and nuclear waste, in 2006 and 2015. In line with this finding, in the research conducted by Yurttas and Sulun (2010), second-grade primary school students specified global warming, ozone layer depletion and acid rain to be the biggest environmental problems in the world. In another study which reported similar results, elementary students were shown to be mostly aware of the environmental problems stemming from environmental contamination, air pollution and waste materials (Demirbas and Pektas, 2011). To continue, in a study by Negev et al. (2010), it was reported that most of the twelfth-grade student participants indicated solid waste, or air pollution, to be major environmental issues. In general, studies have shown that students view air pollution, global warming and greenhouse gases as the most important environmental issues. People tend to have more knowledge about matters that have a concrete impact on their lives. Moreover, social media has helped to draw attention to global problems, including of course those related to environmental issues. The study by Incekara and Tuna (1991) give support to the role that social media plays in spreading environmental knowledge, as they reported that secondary students tended to have sufficient information on issues such as air pollution, desertification and climate change. Similar results have been observed in research conducted on the environmental awareness of teacher candidates. In a study conducted by Artun, Uzunoğlu and Akbaş (2009), teacher candidates pointed to global warming and air pollution as important environmental problems. Diken and Sert Cibik (2007) suggested that teacher candidates have cognitive and sensitive dimensions of environmental consciousness. However, these dimensions are not sufficient in terms of reflecting the environmental knowledge they have onto their behaviours (Diken and Sert Cibik, 2007; Kaya et al., 2009). This could be attributed to their lack of environmental awareness (Güven and Aydoğdu, 2012; Ercengiz, et al., 2014). According to the study by Kahyaoglu et al. (2008) environmental behaviour is influenced environmental knowledge and awareness. Therefore, teacher candidates, especially science teachers, should be provided the necessary support to increase their level of environmental awareness, and they should be encouraged to translate their environmental awareness into environmentally responsible behaviour. For the sake of securing our future, it is crucial that students be taught a high level of environmental awareness. The German students in the present study had the lowest awareness of “use of GMO” in 2006 and 2015. However, interestingly, more students in 2015 seemed to have never heard of this concept. When the opinions of the students were taken to determine their knowledge level on this subject, the German students reported that they did not have sufficient knowledge about GMOs. Similarly, in a separate study, it was found from the opinions taken of students that they had insufficient information and misleading concepts about greenhouse gases (Bahar and Aydın, 2002). These results were in line with those from Darcin et al. (1991), who reported that the levels of knowledge elementary students had on the greenhouse effect were too low. In another study, it was indicated that biology teacher candidates had incorrect ideas about the greenhouse effect (Selvi and Yıldız, 2009). Regarding the subject of GMO, Gurbuzoglu Yalmanci (2016) reported that both high school students and teacher candidates had some misunderstandings about GMO. University students too have been shown to not have enough knowledge about GMO (Temelli and Kurt, 2011). In a study conducted by Cankaya and Filik Iscen (2015), however, it was stated that science teacher candidates had sufficient information about the meaning of the concept of GMO, although, they did have incorrect knowledge about the production of GM crops, the use of GMO in their country, and their effects.

Despite the increase in the health coefficient from 2006 to 2015, it was nonetheless seen that health issues are still not given importance (appendix 2). In support of this finding, approximately 20% of the German students, in both 2006 and 2015, revealed that they were unable to recognize a health problem. Moreover, more than half of the students mentioned that they struggled to understand the health issue. Research shows that overuse of antibiotics poses a threat, not only to human health but also to the environment (Yesil Aski, 2013).

Individuals need to be taught greater awareness about health issues in order to create a healthier public in the future. In addition to the lack of understanding of health issues, it was also found that there was an increase in the percentage of the students who indicated that they were unable to explain acid rain. Therefore, acid rain and health issues should be emphasized in future science curricula.

While in 2006 the students stated that they were not able to express themselves enough in science classes, in 2015, the students mentioned class discussions and their expectations regarding the planning of science lessons so as to allow for the discussion of different opinions. On the other hand, in both 2006 and 2015, approximately 25% of the students reported that they never or hardly ever spent time in the laboratory doing practical experiments as part of their science lessons. Furthermore, more than half of the students noted that they never or hardly ever were allowed to design their own experiments in the science lessons. It can be seen from the students expressed expectations that they would like their science lessons to be more student-centred. In other words, they want to actively participate in the process by taking responsibility in lessons. When the teacher never or hardly ever provides explanations showing the relevance of science concepts to our lives or/and explanations about how a school science idea can be applied during a science lesson, the average rate of EL increases. In fact, it can be

argued that teacher-centred education has a negative effect on EL. Therefore, student-centred lessons should be applied to provide more academic support for the improvement of EL skills. A student-centred approach also provides opportunities for students to increase their interest and attitude towards science. If these are increased, the students will have a chance to improve their literacy. Interest and positive attitude towards science, academic development support and EL are concepts that affect each other.

Last but not least, in this study, there was a positive relationship determined between EL and ER and ADS and EA (Figure 6). Otherwise stated, when EA, ER and DEB are positively supported, this will provide a positive contribution to the students' EL development.

Figure 6: Environmental Literacy (EL) influencing the factors of Environmental Awareness (EA), Environmental Responsibility (ER), and Development of Environmental Behaviour (DEB).

IMPLICATIONS

First, when PISA 2006 and 2015 data were compared, it was initially anticipated that the increase in the average of EL would positively impact environmental education and thereby, in turn, contribute positively to EL between these years.

What are the challenges and solutions for school education?

According to the results gathered in the study, it might be said that the subjects of genetically modified organisms and health issues should be more comprehensively taught as part of the science curricula in Germany. Teachers should allow students to access new information instead of simply sharing information with students. The students' interest and attitudes towards science should be improved, and students should be encouraged to read science books.

Students should be informed about the effect of these on the environment, and in social terms, individuals should have raised awareness of these issues. Furthermore, teachers especially science and biology teachers, should be informed about these issues through in-service training.

In addition, science teachers should design classroom environments in which

- students can express their thoughts,
- students can engage in class discussions, and
- students have access to new knowledge during environmental education.

Ultimately, it is important that teachers are aware of the changing roles of environmental education, that they design student-centred education and/or that they facilitate inquiry-based learning in the classroom environment. Moreover, it is important that improvements be made to secure the professional development and science process skills of the students. Lastly, the importance, scope and competencies of EL should be determined more clearly to ensure a higher quality of science education.

Appendix 1: Items on the Scale

Factor Name	Code	Items
Development of Environmental Behavior	ST098Q01TA	Students are given opportunities to explain their ideas.
	ST098Q02TA	Students spend time in the laboratory doing practical experiments.
	ST098Q05TA	Students are asked to draw conclusions from an experiment they have conducted.
	ST098Q07TA	Students are allowed to design their own experiments.
	ST098Q08NA	There is a class debate about investigations.
Enviromental Awareness	ST092Q01TA	How informed are you about this environmental issue? The increase of greenhouse gases in the atmosphere
	ST092Q02TA	How informed are you about this environmental issue? The use of genetically modified organisms (<GMO>)
	ST092Q04TA	How informed are you about this environmental issue? Nuclear waste
	ST092Q05TA	How informed are you about this environmental issue? The consequences of clearing forests\other land use
Enviromental Responsibility	ST129Q01TA	Recognise the science question that underlies a newspaper report on a health issue.
	ST129Q03TA	Describe the role of antibiotics in the treatment of disease.
	ST129Q04TA	Identify the science question associated with the disposal of garbage.
	ST129Q05TA	Predict how changes to an environment will affect the survival of certain species.
	ST129Q06TA	Interpret the scientific information provided on the labelling of food items.
	ST129Q08TA	Identify the better of two explanations for the formation of acid rain.

Appendix 2: Structural Equation Modeling of Environmental Literacy (Appendix 1)

Changing Hong Kong Students' National Identity: Do Mainland Exchange Programmes Matter?

Annie Y. N. CHENG

The Education University of Hong Kong
ayncheng@eduhk.hk

ABSTRACT

The purpose of this study is to explore the possible impact of short-term Mainland exchange programmes on the Hong Kong youths' national identity. A study using both quantitative and qualitative methods was conducted in 2016/17 to investigate the students' national identity. There were over 600 secondary school students completed a survey and subsequent focus group interviews were conducted to examine whether there was any difference in their national identity after they returned from the Mainland exchange programmes. The results show that students had diverse perceptions of national identity and various dimensions of changes on national identity after participating in Mainland activities. This paper provides insights for schools to enhance meaningful Mainland exchange activities and inform policy makers' ways of formulating effective strategies for promoting such activities.

Keywords: Hong Kong youth, national identity, mainland exchange programme, study tours, ethnic identity

INTRODUCTION

This concept of "national identity" is referred to multiple meanings involving territory and ethnicity (Kearney, 1997). It is complex with little consensus on its theoretical underpinnings (Carey, 2002). It comprises a number of interrelated components including ethnic, cultural, territorial, economic and legal-political (Smith, 1991). The components signify bonds of solidarity among members of communities united by shared memories, myths and traditions. This may or may not find expression in states of their own, but are entirely different from the purely legal and bureaucratic ties of the state. Joireman (2003) argues that national identity develops when an ethnic group adopts a common political identity while their ethnicity is not limited to cultural or social aspects. Studying students' national identity is important because it is an expression of a way of life. It presents what people think, what people feel, how people behave, and the pattern of all social relationships (Burr, 2003). Therefore, national identity has become a vital focus promoted by the government of Hong Kong Special Administrative Region (HKSAR) since the resumption of Chinese sovereignty in 1997.

It is expected that student participation in exchange programmes and study tours provides the possibility of new formulations of national identity. Hence, the HKSAR government has been actively expanding the funding and numbers of Mainland exchange programmes since 2000. Feasibility of these programmes to enhance our youths' understanding of Chineseness was explored to strengthen their national identity (HKSAR, 2008). Both primary and secondary schools have been sponsored or subsidized with the costs of Mainland exchange activities through various grants and channels from government or other sponsors. Hong Kong students who participated in these Mainland exchange programmes have been significantly increased. Despite the programmes and participation, a poll conducted by the University of Hong Kong's (2017) Public Opinion Programme consistently shows that the young people, aged between 18 and 29, have the least and decreasing recognition of their Chinese identity. Considering this contrasting findings, influences of these activities on students' national identity is understudied. This study aims to examine students' perceptions of their national identity and evaluate whether or not the Mainland exchange programmes cum study tours have influences on students' perceptions of national identity.

YOUTHS' NATIONAL IDENTITY IN HONG KONG

Historically, Hong Kong people's sense of Chinese identity is more cultural and ethnic than political (Tse, 2007). Many Hong Kong people distance themselves from the mainland socially and politically, but show a cultural attachment to mainland China (Tse, 2014). Similar to Quebecers, as a 'distinct society' of Canada, dual identities – regional and national, has been emerged within a single nation-state (Guibernau, 2006) and pan-Canadian is promoted in the society (Fletcher, 1998). According to the poll by the University of Hong Kong's (2015) Public Opinion Programme, only an average of 20.4% of Hong Kong people saw themselves as 'Chinese', while 13.6% regarded themselves as "Chinese in Hong Kong" during 2010 to 2015. "National Identity" has become one of the seven key learning goals stressed by the HKSAR government in primary and secondary education since the return of sovereignty to China (Education Bureau, 2015). The HKSAR government has launched many military summer camps and training programmes for secondary students to strengthen the political national identity. Meanwhile, it aims at cultivating a sense of cultural national identity through understanding elements of Chinese history and culture through formal and informal school curriculum (Tse, 2014).

POSSIBLE INFLUENCES OF EXCHANGE PROGRAMMES ON NATIONAL IDENTITY

Past research has evidenced that students' participation in exchange programmes and study tours could lead to outcomes such as personal development, increased global mindedness, cultural understanding and enhanced national identity (Dolby, 2007; Cheng, 2011). These exchange programmes often provide the possibility of new formulations of national identity (Dolby, 2004). Some Hong Kong studies also show that students would readjust their sense of national identity with the change in their frame of reference when studying abroad (Cheng, 2010; Lo & Merryfield, 2008; Wong, 2012). It is also found that Hong Kong students' travel experiences had influences on their attitudes and views of the nation in Fairbrother's (2003) study. Many existing short-term Mainland exchange programmes and activities for secondary students, for example, the "Funding Scheme for Youth Exchange in the Mainland" aims at enhancing Hong Kong youth's awareness and understanding of their home country, fostering exchange with the Mainland people, and strengthening their sense of national identity through sponsoring community organisations to organise exchange tours to the Mainland (Commission on Youth, 2015). Yet, there is relatively little research on the perceptions of national identity and any possible changing after secondary students' participation in these short-term Mainland exchange programmes or study tours. To fill this gap, it specifically aims to address the following research questions.

1. What are the Hong Kong secondary students' perceptions of their national identity?
2. Is there any change in students' national identity after participation of Mainland exchange programmes or study tours?

THE STUDY

Mixed methods approach were adopted to understand secondary students' perceptions of their national identity, evaluate how various types of Mainland exchange programmes and study tours may have influences on their national identity, and identify what factors attribute to their change in national identity. Mixed methods, including questionnaire survey and focus group interviews were employed to collect their first-hand perspectives of the issues. To examine whether there was any difference in their national identity after they returned from the Mainland exchange programmes, there were 7 secondary schools with over 600 students completed the survey and 180 of those students had participated in those subsequent focus group interviews. The interviewed students went to various mainland exchange programme or study tours in different provinces in China with duration from one day to 10 days. These participants were ethnic Chinese studying from Form 1 to Form 6, which is equivalent to Grade 7 to Grade 12 in the American education system. To explore in greater depth the influences of the students' national identity, semi-structured focus group interviews were conducted after the students return from the Mainland exchange programmes or study tours. Each group consist of five to seven students, and each interview lasted about half an hour. The interview questions include: What do you think about your national identity? Is there any difference in your feelings about being "Chinese" after participations of the Mainland exchange programmes? If so, what are the reasons for this change? Thematic analysis of the transcripts was conducted as a tentative set of coding themes (Strauss & Corbin, 1998) to classify students' perceptions of their national identity and to categorize the changes. Then, constant comparisons were conducted (Yin, 2014). In so doing, we could identify the patterns and the second round of analysis led to further examination of the themes of various patterns. To examine the in-depth meanings of the students' responses, this article focuses on reporting the qualitative findings of the study.

FINDINGS

DIVERSE PERCEPTIONS OF NATIONAL IDENTITY

Students' perceptions of national identity are diverse. Some of them declared that they were proud of being Chinese, some regarded that they were not feeling proud of being Chinese, others emphasised that Hong Konger is not Chinese.

PROUD OF BEING CHINESE

On the one hand, some students had very strong Chinese national identity and felt being proud of it naturally, *"I'm a Chinese. That's why I'm very proud of being a Chinese"* (School 1, Gp 3). Among them, some reasoned their Chinese identity as *"Hong Kong belongs to China. Therefore, I'm also a Chinese"* (School 2, Gp 5).

NOT FEELING PROUD OF BEING CHINESE

On the other hand, some students did not feel proud of being Chinese although they did not deny their Chinese identity. One student stated that, *"No matter what, I'm definitely Chinese. This won't change, but I don't feel proud of it."* (School 3, Gp 4). This student seemed to be compelled to be Chinese. Another student stressed that, *"I tend not to mention my Chinese identity because people from other countries always have negative images on China"* (School 1, Gp 2). It indicates that the student admitted as a Chinese, yet he was reluctant to reveal this identity in front of others.

REGARDING HONG KONGER IS NOT CHINESE

Another type of students only admit their Hong Konger's identity, but denied to be Chinese. *"I only know that I'm a Hong Konger, but not a Chinese."* (School 5, Gp 4) This student reasoned her choice as Hong Kongers because of the independent legal system of Hong Kong, *"I am a Hong Konger since Hong Kong is not completely under the rule of law of China yet"* (School 3, Gp 1). Some students identified themselves as Hong Konger accounted for the differences in social values between Hong Kongers and mainland Chinese, *"the values of Hong Kongers and Chinese are very different. I am definitely inclined to be a Hong Konger than to be a Chinese"* (School 2, Gp 2).

VARIOUS DIMENSIONS OF CHANGES ON NATIONAL IDENTITY AFTER PARTICIPATING IN MAINLAND ACTIVITIES

Students' perceptions of national identity changed at various dimensions and levels after participating in Mainland exchange activities or study tours. Their changes included "increased pride of being Chinese", "denial of being Chinese" and "no change on national identity but increased interest in learning more about China".

INCREASED PRIDE OF BEING CHINESE

Many students felt prouder of the long history and culture of China after participating in Mainland activities. A student who went to Guangdong province reflected that, *"I have learnt that China was the first country that made porcelain after visiting the museum. I feel so proud of being Chinese"* (School 4, Gp 1). With the educational activities, some students increased their pride of being Chinese after they reflected what they had discovered during the trip. One group shared their reflected that:

...[B]efore we went to the trip, our teacher said that we, the Chinese, are very smart. We saw a lot of different exhibitions. Those Chinese crafts were not only exquisite, but made with high technology. For example, the dragon boats we saw were constructed by merely fitting pieces of wood together. It was perfectly made without any leak. We have also learnt many excellent Chinese woodworking skills from the exhibitions. I am so proud of our great history after we visited the museums from many provinces and I am convinced that Chinese are very smart. (School 1, Gp 3)

Another group of students revealed were impressed that *"Chinese is tough. I saw how Chinese had pulled through during the Second World War at the 9.18 Historical Museum in Shenyang. I feel particularly proud of this Chinese character"* (School 6, Gp 2).

DENIAL OF BEING CHINESE

Some students had already had negative image of Mainland Chinese before they participated in mainland exchange activities. *"I don't want to be called Chinese since I have seen so many bad images of Chinese people."* (School 3, Gp 3). Another student commented that, *"Chinese are obstreperous."* (School 1, Gp 3). Their mainland exchange experiences merely further confirmed these negative views about being Chinese. *"Mainland Chinese and do not follow the rules. For example, I saw some people smoking in non-smoking areas again during this trip."* (School 5, Gp 2). Students in one schools recalled that *"we had really bad experience during the trip. A lot of people occupied our paid seats by force on the express train. They're not willing to move or leave even we asked them politely. So, we had to stand on the train for the whole time. They eventually left because the teacher urged them to. In China, this is not an unusual occasion"* (School 7).

NO CHANGE ON NATIONAL IDENTITY BUT INCREASED INTEREST IN LEARNING MORE ABOUT CHINA

Although many students had no change on their national identity, the most benefit of the mainland exchange programmes that many students learnt was increasing their interest in learning about China. *"After participating in the exchange programme, I wanted to learn more about Chinese traditional culture, but my national identity was not enhanced"* (School 1, Gp 3). One group of students not only limited their interest in Chinese culture, but also extended their interest in China's economic development: *"we are excited not only learning about different cultures in China, but also the economic development in current China as the economy of China has already become the second largest in the world"* (School 7, Gp 2).

DISCUSSION AND CONCLUSIONS

This study has examined Hong Kong secondary students' perceptions of their national identity and if there is any change in students' national identity after participation of Mainland exchange programmes or study tours. On the one hand, the results show that students had diverse perceptions of national identity including "proud of being Chinese", "not feeling proud of being Chinese" and "regarding Hong Konger is not Chinese". On the other hand, the findings illustrate that students had various dimensions of changes on national identity after participating in

Mainland activities, “some increased pride of being Chinese”, “some denied of Chinese identity”, while some had “no change on national identity but increased interest in learning more about China”. Generally, the students thought that the exchange activities had helped them understand the culture of China and look forward to have more similar exchange activities. One student concluded that, “*I hope there will be more activities like these in future*” (School 5, Gp 2). This part of the findings can enhance our understanding of various aspects of the students’ national identity and their influences on their development. It aims to inform policy makers how to formulate effective strategies for promoting national identity through future Mainland exchange activities. In addition, it can provide significant feedback for secondary schools to organize meaningful Mainland exchange activities or study tours. Ultimately, it may enhance Hong Kong youths’ national identity.

ABSTRACT

MelArete is an educative and research project promoted by the Center of Educational and Didactic Research of the University of Verona in Italy. The project is aimed at educating children to virtue ethics and exploring their ethical thinking. The theoretical background is grounded in the Socratic and Aristotelian ethical visions. Important references are also found in the philosophy of care and in Ricoeur's definition of ethics. The project involves children attending kindergarten (5-6 y.o.) and primary school (9-10 y.o.). The experience is aimed at encouraging children to reflect about the concepts of good and care, about the general idea of virtue and about some specific virtues, such as courage, generosity, respect and justice. The activities designed to reach these educative aims and collect data for the research are the following: Socratic conversations, stories, vignettes, games. Another important activity is the diary of virtues, a journal where children reflect on their ethical experience. The qualitative data analysis is still in progress. However, we can already present some specific examples that show the richness of children's ethical thinking.

INTRODUCTION

Authentic educational research in schools develops new educative experiences and investigates their effectiveness to foster the flourishing of children. On the basis of this presupposition, that concerns the politics of research, the Center of Educational and Didactic Research at the University of Verona, Italy, proposed MelArete, an educative and research project designed to promote and study activities aimed at encouraging the development of children's ethical thinking (Mortari and Mazzoni, 2014). During 2016-2017, the project involved children attending kindergarten (5–6 years old) and primary school (9–10 years old). In this paper, we present MelArete by highlighting the theoretical background and the epistemological framework in which it is rooted. We describe the general structure of the educative path we proposed for the children by clarifying the educative and heuristic valences of the activities we organised and the instruments we used. In order to demonstrate the effectiveness of the MelArete project to promote children's ethical thinking, we present data that show the richness of the children's reflections. Furthermore, we quote some of the teachers we interviewed who highlighted in their opinion the strong points of the project.

THEORETICAL BACKGROUND

In order to present the theoretical background, it is appropriate to start with the title of the project. The word MelArete originates from the union of the Greek terms *meléte* (which means care) and *areté* (which means virtue); the ethics of care and the ethics of virtue are the fundamental theoretical references of the project.

First, it is necessary to highlight that we define MelArete as a project for ethical education because we embrace the definition of ethics given by Ricoeur (1992), who describes it as ‘aiming at a good life lived with and for others in just institutions’ (p. 172). Additionally, we agree with Ricoeur (1990) by maintaining that the concept of aiming is too generic and it should be substituted with the concept of care, so that ethics becomes a discourse that deals with the care for oneself, for others and for institutions. Starting from this vision of ethics, it is therefore legitimate to state that ethics is caring.

Human being is not self-subsistent and, for this reason, he experiences to be vulnerable. Vulnerability of the other contains an appeal to responsibility (Pulcini, 2009), and the necessity to act for the other in a responsible way is the generative root of ethics. A human is a constitutively relational being (Heidegger, 1996), and for this

reason, experiences a need for others: care is the answer to this ontological need. Co-existing with others makes it necessary to take care of them.

According to the ethics of care (Mayeroff, 1990; Noddings, 1984; Held, 2006; Tronto, 1993; Mortari, 2015), to care for others means to search for the good. Since the core of caring is made of virtues (Mortari, 2006a; Mortari & Saiani, 2014), an education in ethics in the light of care is an education in virtue.

MelArete is grounded in the Socratic view of moral development. Indeed, for Socrates, what is particularly important is to reason on virtue because to know the essence of a thing is the condition for the right action. For example, in the *Charmides*, Socrates tells his interlocutor, ‘say what, in your opinion, temperance is’ (159a).

Another important reference is the Aristotelian ethics, according to which virtues are learned by doing them. Indeed, in the *Nicomachean Ethics*, Aristotle specifies, ‘We become just by doing just actions, temperate by doing temperate actions, brave by doing brave actions’ (Book II, 1103b, 1–2).

The philosophy of the MelArete project is in dialogue with the two main approaches of ethical education: *character education* and *moral reasoning*. In order to highlight the major similarities and differences with the philosophical conception at the basis of our project, here we present a simplified vision of character education and moral reasoning even if we know that there are many authors who present a more complex position where the two approaches can dialogue (Mortari & Ubbiali, 2017). Similar to the *character education* position (Lickona, 1978, 1993, 1997; Howard et al., 2004; Watson et al., 1989; Battistich et al., 1991; Solomon et al., 1992), MelArete considers virtue to be a key concept for ethical education; however, we do not confuse ethics with mere socialisation. Aligned with *moral reasoning* (Kohlberg, 1981, 1984; Turiel, 1998, 2002, 2010; Smetana, 1995, 2006; Nucci, 1981; Nucci & Narvaez, 2008; Killen & Smetana, 2010), MelArete gives importance to the development of reasoning and cultivation of analytical, critical and deliberative thinking; however, we are careful to avoid abstractionism and rationalism.

In MelArete, the acquisition of virtues does not follow an adaptive-passivating model, but passes through a radical critical analysis of every aspect of the experience. In its educative valence, the project had two purposes: cultivating in children passion for research of the good and developing in them the capability to examine ethical questions analytically and critically.

EPISTEMOLOGICAL FRAMEWORK

As research, MelArete assumes the epistemological background of ‘naturalistic inquiry’ (Lincoln & Guba, 1985), according to which, the phenomenon under study should be investigated in the context of where it appears. Therefore, this study was conducted in the primary school and kindergarten classes.

Setting the research in a naturalistic context requires the capability to design the research method on the basis of the specific characteristics and necessities of the context that hosts the research. Since the educative context is unpredictable, because each classroom is unique and original, it is useful to avoid a formulistic and aprioristic conception of the method in favour of an emerging and evolutive one. This entails deciding in advance some key epistemological tenets, and then rethinking and redesigning the method by considering what occurs in the field (Mortari, 2006b, 2007, 2009a).

In pedagogy, it is possible to find two typologies of empirical research: the recognitive-constatative one, which aims to increase scientific knowledge by investigating not yet explored aspects of a phenomenon; and the experiential-transformative one, which promotes and investigates new experiences in order to enhance people flourishing and improve the educative contexts (Mortari, 2007, 2009b). MelArete can be described as experiential-transformative research because it aims to design new activities for ethical education and then to investigate their educative effectiveness in schools. Furthermore, the project can also be defined as ‘research *for* children’ (Mortari, 2009b) and not merely as ‘research *with* children’, because it is designed to offer positive and significant experiences to the children involved. This purpose arises from the application of the care ethics to the research: the core principle is the necessity to promote the good of the participants.

Coherent with the characterisation of educative research, MelArete has both educative and heuristic aims by encouraging and exploring children’s ethical thinking. For this reason, instruments are designed to have an educative and a heuristic valence: promoting children’s ethical reflection and collecting data about their ethical ideas. All the data we collected through the different instruments were of a qualitative-type.

THE EDUCATIVE EXPERIENCE

The project was implemented for the first time eight years ago. Since this time, several different classes in Italian primary schools were involved, and the educative path was progressively developed with new activities. In the last year (2016–2017), the project involved six fourth-grade primary school classes (106 nine- to ten-year-old children) and eight kindergarten classes (57 five- to six-year-old children) in two cities in the north and centre of Italy. The educative experience was aimed to encourage children to reflect on the concepts of good and care, about the general idea of virtue and about some specific virtues (in particular courage, generosity, respect and justice). The educative path was designed with a structure of twelve meetings between the researcher and the children. In the kindergartens and primary schools, the project had the same general structure: the activities had

the same educative and heuristic aims, even if they were implemented in different manners on the basis of the age of the children involved. We present below the different typologies of the main activities we promoted in the classes by highlighting their educative and heuristic valences.

Socratic Conversations

Conversations in class were promoted to facilitate the children to reflect on some ethical concepts. This activity started from an eidetic question, which is a question about the essence of a phenomenon. These conversations are defined as Socratic because they find their main reference in the maieutic method exemplified in the Platonic dialogues. Like in the Socratic Circles (Copeland, 2005), this activity stimulates intersubjective thinking. The researcher guided the conversation in a non-directive manner, helping the children to examine in depth their thoughts about phenomena that are relevant from an ethical point of view.

An example of this type of activity is a conversation about good and care that was promoted during the first meeting of the project. In both the kindergartens and primary schools, the conversations were introduced by the presentation of a story concerning the idea of acting with care in order to search for what is good. After the presentation of the story, some questions were proposed to the children; two of these questions were:

- The word 'good' is a beautiful word. What comes to your mind when you hear this word?
- The word 'care' is another beautiful word. What comes to your mind when you hear this word?

These questions functioned as the stimulus to activate Socratic conversations on the concepts of good and care. In the kindergartens, after the conversations, the children were also invited to draw the moment of the story that they liked most and then explain to the researcher what they drew and what the word good meant according to them.

The educative valence of these conversations about good and care is to facilitate the children to reflect on some important ethical concepts that are at the core of the entire educative project. From the heuristic point of view, the activity allows us to collect data about what good and care are according to the children involved.

Stories

Another typology of the activities is the presentation of stories concerning the following virtues: courage, generosity, respect and justice. For each virtue, we invented two stories, focusing on two possible declinations of the same virtue, as represented in the table below.

Virtue	First declination of virtue	Second declination of virtue
Courage	Defending the other	Being able to express one's own thoughts
Generosity	Giving time to the other	Giving something to the other who needs it
Respect	Respecting those who are different	Respecting the nature/respecting the effort and the work of another
Justice	Giving to each one according to his/her own needs	Repairing the damage

We asked the teachers from the classes involved in the project to choose for each virtue, which one of the two stories was more adequate from an educative point of view for their children.

Stories were set in the *Wood of virtues*, a place where animals act and reflect about ethical choices and behaviours. In the kindergartens, the stories were told and presented using puppets, while in the primary schools the stories were illustrated, given to the children and read by the researcher in class.

After the presentation of the stories, the children were asked to answer some questions we highlight in the following table:

Questions in kindergarten	Questions in primary school
<p>- What did [name of the animal who acted virtuously] do?</p> <p>- If you were [name of the animal who received the virtue action], what would you think?</p> <p>- If you were [name of the animal who acted virtuously], what would you do?</p> <p>- Why?</p>	<p>- What is the virtuous action of [name of the animal who acted virtuously]?</p> <p>(In the case of the first story on justice, where two characters make different choices based on their different conceptions of justice, in the first question we asked the children to say which of the two characters they thought was right).</p> <p>- In your opinion, what thought guided the protagonist?</p>

(In the case of the first story on justice, where two characters make different choices based on their different conceptions of justice, at the end of the conversation we asked the children to say which of the two solutions they thought was better).	<p>- What effects did the protagonist's action produce?</p> <p>- What did the protagonist feel inside him/herself after having acted?</p>
---	---

In the kindergartens, the children were asked to answer these questions orally, while in the primary schools, the children were asked to answer these questions in written form.

After answering the questions, the primary school children were also asked to produce a narrative on the basis of the story they had listened to; they carried out this task either individually, in pairs or in a group. They could narrate an episode of their real life or invent a fantasy story.

The educative reason for this activity is to lead the children's attention to a specific virtue (in particular courage, generosity, respect and justice) and to begin constructing the meaning of it. The heuristic reason for the activity is to understand the children's thoughts about that specific virtue.

Vignettes

Another activity was the vignettes. We showed the children three different situations representing three different particular behavioural answers to a same general context or experience that functioned as a starting point for reflection. Then we asked them to describe the three situations, to choose which one in their opinion realised a particular virtue and to explain their choices. The kindergarten children performed this activity in oral form, while the primary school children performed this activity in written form. We designed the vignettes for the virtues of courage, generosity, respect and justice.

Below, we present as examples, the vignettes about generosity (see Figure 1).

In kindergarten	In primary school
<p><i>Start point</i></p> 	<p><i>Start point</i></p> <p>'If the classmate does not have a pen...'</p>
<p><i>Three different situations</i></p>   	<p><i>Three different situations</i></p>   

Figure 1

After the children had completed the activity, they were involved in a conversation about their choices. After the conversation, they were required to draw a situation representing the specific virtue, which was the object of the activity (they could invent a new situation or draw one of the vignettes).

The educative valence of this activity is to offer the children an experience through which they can reflect again on the concept of a specific virtue (courage, generosity, respect and justice), thereby deepening its meaning and having the opportunity to learn other possible interpretations of it. The heuristic valence of the vignettes is represented by the possibility to collect data that allows us to understand:

- the reasoning that children develop to identify and define virtuous situations (in particular situations of courage, generosity, respect and justice);
- the ideas about a specific virtue (courage, generosity, respect and justice) that exist in the children's thinking.

Games

We also organised some games, aimed to encourage the children to reflect on the virtues of courage, generosity, respect and justice. The games were activities that stimulated thought and/or move actions. Their structures and the related educative reasons were different, based on the specific virtue that was the object of the activity.

As examples, we present below the game on courage organised in the kindergartens and the game on courage organised in the primary schools.

The game on courage in kindergarten

The game about courage, organised in the kindergartens (see Figure 2) was titled ‘Courageous cards-actions for the squirrel Theaetetus’. The researcher provided two typologies of cards: the S-cards (in which some problematic situation was represented) and the O-cards (in which some objects were represented). Each child was asked to blind-select an S-card and an O-card, and invent a courageous action that the squirrel, Theaetetus, could carry out in order to solve the problematic situation represented in the S-card by using the object represented in the O-card.

The educative reason for this activity is to stimulate the children’s reflection on courage by engaging them in the construction of micro-stories, while the heuristic reason is to collect data about what type of actions the children considered as courageous.

Figure 2

The game on courage in primary school

The game about courage organised in the primary schools (see Figure 3) was titled ‘The pathway in the wood of courage’. Two concentric circles were represented on a game board: the outer circle contained the locations of the wood and the inner circle the animals. For the first turn, each child was required to throw a die, advance in the outer circle with a pine cone, and write on a leaf the location represented in the box that the pine cone stopped on. For the second turn, each child was required to throw the die again, advance in the inner circle with the pine cone, and write on the leaf, under the location, the animals represented in the box that the pine cone stopped on.

Then, the children were asked to invent a story about courage by setting it in the location and with the animals written on their leaves.

The educative reason for this activity is to stimulate the children to reflect on the virtue of courage, while the heuristic reason is to collect data about what experiences the children considered as courageous.

Figure 3

An Experiential Diary

Another activity was the *diary of virtues* where children narrated virtuous actions (in particular actions of courage, generosity, respect and justice) they carried out or saw carried out by others. In the primary schools, the children were required to write the virtuous actions in a normal notebook, while in the kindergartens, the children were required to draw the virtuous actions in a notebook with leaf-shaped pages (a leaf-diary). In the kindergartens, the teachers were invited to write the explanations given by the children about their drawings.

The children were required to do this activity at least once a week (in the primary schools after the third meeting of the educative path and in the kindergartens after the second meeting).

In the primary schools, whenever the children wrote in their diary of a virtuous action, they were also invited to attach a leaf on the *tree of virtues* (see Figure 4) that was drawn at the beginning of their copybooks. The leaves had different colours based on the different virtues they represented (yellow for courage, red for generosity, blue for respect and purple for justice). Furthermore, whenever the children narrated a virtuous action in their diary and attached the leaf of the relative virtue to the tree in their copybook, they also attached another leaf, identical to the first one, to the *tree of the trees* (see Figure 5) in the classroom.

Figure 4

Figure 5

The theoretical background of this activity was to integrate the Aristotelian theoretical-theory and the Socratic *paideia*: the resulting idea was that virtues are learned both by practicing and examining them. The engagement of keeping a diary finds its educative reason by offering the children a space to reflect on their experience. The heuristic valence of this activity is that it allows us to understand:

- what actions children identify as virtuous;
- what meaning children attribute to these actions and
- if over the course of time the type of the narrated experience changes.

Introduction and Concluding Activities

At the beginning of the educative path (during the second meeting in the kindergartens and during the second and the third meetings in the primary schools) we organised introduction activities, designed to collect data to understand what virtues are according to children and how children define courage, generosity, respect and justice (i.e. the specific virtues on which the entire path focuses). In the primary schools, we also asked them how it is possible to learn virtues in their opinion.

At the end of the project, during the last meeting, we organised concluding activities, through which we proposed the same questions as for the introductory activities, in order to understand if and how the children's thinking had changed.

COLLECTED DATA

From a preliminary analysis, and after a deep dialogue with the teachers involved, we can state that the project helped the children understand the concept of virtue as a framework they assumed in order to reflect on actions and looking for the good. The children were able to recognise the different components of a virtuous action (thoughts, emotions and consequences) and to recognise the ethical call inside dilemmas of everyday life.

The capacity of analysis and reflection was so increased that the children became able not only to name a specific virtue and choose a coherent action in critical situations but also to understand the complexity of some situations and actions, so that they could identify different nuances in the same situation and different virtues in a single action.

The analysis process, with reference to the specific heuristic valence of the different activities, is still ongoing. However, we can already say that the data we collected show the richness of children's ethical thinking. If adequately stimulated through activities aimed to give them a possibility to reflect, children can also surprise adults with their reasoning and statements about ethical concepts and issues. The reading of our data confirms what we had already discovered through precedent research, that is, children are capable of deep reflection on ethical themes.

As examples, we present in the table below some of the children's thoughts we collected through the MelArete project.

Typology of data	Kindergarten	Primary school
Children's thoughts about good	<ul style="list-style-type: none"> - 'Playing in a good way... when nobody hurts himself'. - 'The good is to be friends, giving embraces and kisses each other'. - 'The good is when somebody loves you and embraces you'. - 'The good is when you feel good at the seaside'. 	<ul style="list-style-type: none"> - 'For me, the word "good" means also [that] when someone feels bad or needs help, you help him'. - 'The word "good" means when we all feel good and not only one feels good'. - 'According to me, it means to feel good with others and share our friendship'. - 'According to me, the word "good" is not only love, a kiss, a caress, brotherhood, but it is also feeling good with our heart, with others'.
Children's thoughts about care	<ul style="list-style-type: none"> - 'Giving a kiss on the bump of my pregnant mommy is a gesture of care, even if she is not ill'. - '[The word "care" means] to kiss, to smile at, and to caress [someone]'. - '[The word "care" means] to give happiness'. - 'To care for plants: giving them water...' - 'To help a child'. 	<ul style="list-style-type: none"> - 'According to me, the word "care" means taking care of the city, people, animals and other things'. - 'When someone hurts himself, someone comes to console him'. - 'According to me, "care" means also to take care of people by medical doctors, but it doesn't mean only that. Also mums, teachers, all people take care of us, by giving us food and making us learn new things. To care means many things'. - 'According to me, the word care means also taking care of plants, do not tear off leaves, branches...'
Children's thoughts about courage	<ul style="list-style-type: none"> - 'The [word] courage means that you are not afraid of anything'. - 'If you are on a tree and you are afraid of falling, you must tell to yourself: «it is nothing! You are not a baby!»'. - '[To have] courage means that when you are afraid of something, you wait for a while; after the fear has passed you can start again'. 	<ul style="list-style-type: none"> - 'Not to be afraid of something'. - 'Facing the difficult moments of life'. - '[Courage is] a quality that serves to overcome obstacles, such as: saying something personal; telling a truth'.
Children's thoughts about generosity	<ul style="list-style-type: none"> - '[Generosity is] when you give a caress to somebody'. - '[Generosity is] when a tall person helps somebody that cannot reach something because it is posed in a high position and takes it for him'. 	<ul style="list-style-type: none"> - 'Generosity is, for example, if a child hurts himself I help and embrace him; [generosity is] also to love a mum, a sister, a brother'. - 'When someone has no snack and you share yours with him'. - 'Helping others and lending them the things they need'.
Children's thoughts about respect	<ul style="list-style-type: none"> - '[To have respect for somebody means that] you have to listen to 	<ul style="list-style-type: none"> - 'Caring for someone; also for your own things and for others'

	<p>him’.</p> <ul style="list-style-type: none"> - ‘[To have] respect means that you have to wait for your turn for talking: when the others have finished talking then you can talk’. - ‘[To have] respect means to respect the rules: for example the rules of the games’. - ‘[To have] respect is when I listen to the teacher’. 	<p>things’.</p> <ul style="list-style-type: none"> - ‘Listening to teachers, parents, grandfathers and grandmothers, older brothers’. - ‘Having respect for a person means treating that person well and not excluding her’.
Children’s thoughts about justice	<ul style="list-style-type: none"> - ‘For example, you have to attend your swimming course but you don’t want to: you have to attend it anyway because it is your duty. That’s because duty and justice are the same thing’. - ‘When you are tired and you would like to relax, somebody tells you to do something, you say: «there is no justice!»’. 	<ul style="list-style-type: none"> - ‘Finding a solution to problems in a right way’. - ‘Protecting world, poor people, ourselves, animals...’. - ‘Doing the right thing for the good of everyone’.

THE EFFECTIVENESS OF THE PROJECT IN THE TEACHER’S VOICES

The teachers we interviewed at the end of the project were enthusiastic not only about what had happened during the activities but also in everyday class life. Some of them said that the children had internalised virtue ethics and they had become able and confident to analyse everyday life through the lens of virtue.

The effectiveness of the educative path emerged in the teacher’s reflections. A kindergarten teacher said, ‘it was an interesting experience’ and ‘certainly the children had benefited from this path’. Another teacher demonstrated that she already knew the potentialities of children: ‘The path carried out did nothing but reinforce the certainty that children can do really a lot and always amaze us’, and she added, ‘we must not limit ourselves in offering them new opportunities, above all, when these [opportunities] are tailored for them, respectful of them and strongly formative, exactly like the MelArete project’. The reflections of these teachers confirmed for us that the project design really represented a research *for* (and not merely *with*) children.

In addition, the primary school teachers expressed enthusiasm for the project. One of them said that the path ‘led the children to grow a lot interiorly’ and specified that they had become ‘much more reflective’. Another teacher pointed out that ‘the path was very positive for the children, they had a moment of particular growth’. In particular she specified that ‘it is a project that helps children to have a different vision of themselves, and only when you know yourself in a little bit more depth, you can also relate yourself with others’. Another teacher highlighted that the project helped the children to learn the language of virtue; in this regard, she said MelArete is a path ‘connected to the knowledge of new words for children’.

CONCLUSION

The richness of our data demonstrates the effectiveness of the project to promote children’s ethical thinking. Furthermore, the enthusiastic feedback from the teachers confirmed to us that our project can be authentically perceived as ‘service research’ (Mortari, 2009b), that is, research that can promote something good in the context that hosts it.

Coherent with the inspired approach of the ‘research *for* children’, the activities we promoted were designed to have both educative and heuristic relevance as we have explained and exemplified in this paper.

From an educational point of view, the results we collected through interviews with teachers show that teachers who are interested in promoting ethical education can find effective suggestions in the project activities and its instruments. Furthermore, the data make evident that this project can really contribute to increasing knowledge about children’s ways of reasoning on ethical issues. Indeed, when it is completed, the analysis process will allow us to understand in depth the qualification of children’s ethical thoughts with reference to the different research questions connected to the different activities we organised during the MelArete path project.
