ABSTRACT

The authors of the study describe a relatively new service in the Czech Republic – children's daycare in children's groups. They describe the legislation connected to this service and its main features, they discuss its strongest and its weakest links. The authors present results that emerged from the pilot research, carried out in a particular region of the Czech Republic in three selected children's groups, all of them situated in the city of Zlín.

Data was gathered from controlled interviews with providers of children's daycare in children's groups, and from the analysis of publicly available information about children's groups. The questions aim at obtaining information about both visions of particular providers and practical information about such service, its functioning and known limitations from the perspective of children's groups' establishments.

Key words: kindergarten in the Czech Republic, children's group, preschool education, the Zlín region

INTRODUCTION

The pressure of society and emancipation of women bring demands for placing two-year-old children and even younger children in some kind of preschool institution. Many countries make preschool education more available for children by making it free-of-charge, however, in some regions the demand is much higher than the offer when it comes to the youngest children. On European scale, Early Childhood Education and Care is characterized by a variety and complexity that depend on circumstances, conditions and possibilities, or historical context of given countries. Quality markers include level of personnel qualification, differences in the content of educational curriculum and the existence of a divided system of education and care. Countries with a combined approach are for example Sweden, Denmark and Finland. Some states of the southern Europe prefer divided system of care, for example Greece or Portugal. A country that can serve as an example is for example Finland, where the main emphasis is on quality of preschool teachers' training and the evaluation of preschool education and care. Portugal, where ECEC is included in the educational system, has divided system for children up to three years of age, but there the education of such young children is perceived as a natural thing to do, considering the specific development of human brain, whose most important parts develop in the first years of life.

The Czech Republic belongs among the countries with the longest paid parental leave and where traditional woman's role as a caregiver and man's role as a breadwinner worsens women's position on job market, especially due to a very long time, during which they care for their child on a daily basis. Compared to other countries, in the Czech Republic it is typical that after parental leave a woman returns to a full-time position. The offer of preschool institutions and their opening hours reflect this fact.

PRESCHOOL INSTITUTIONS IN THE CZECH REPUBLIC

In the Czech Republic there are kindergartens that normally accept children between the age of three and six. Presently, there is a livid discussion about accepting children younger than three in public preschool institutions. In the Czech Republic opposing opinions are emerging regarding this issue, even though it is a known fact (from the foreign studies, such as Lenroot, Giedd, 2011, Zeng, 2016 or Gregoridiase, 2015) that in foreign countries this is a regular practice in educational strategies of particular states.

In the following chart we present an overview of accepting children younger than three in preschool institutions in three selected countries – Finland, Greece and Portugal. From the chart it is clear that in these countries it is possible for a child younger than three to attend so-called care centers, which are a part of preschool institutions.

Chart 1: Situation in the selected European countries

Country	Type of institution	Children's age	Auspice	Problem	Advantage
Finland	Kindergarten Care Centers	6 years 0-6 year	Finnish National Agency for Education. Early Childhood Education and Care Policy. National Core Curriculum for Pre-primary Education.		Emphasis on quality of education for future preschool teachers Work with the whole professional path of a child from the very beginning Every preschool teacher has a master's degree Precise inspection and evaluation of preschool education Questionnaires ascertaining parental satisfaction Emphasis on children's play
Portugal		3- start of school attendance 0-3 years	Ministry of Education Ministry of Labour, Solidarity and Social Security		Support of group education for children from an early age, based on the knowledge from cognitive psychology
Greece	Kindergarten Care center	4-6 years 2.5-5 years		Lack of financial backing	Obligatory bachelor's degree A possibility to use Greek nature in lessons

Even in the state documents there is some space for meeting kindergarten educational objectives with children younger than three, also from the perspective of future preschool teachers' training (Gavora, Wiegrová, 2017). Kindergartens in the Czech Republic oppose accepting children younger than three. That was a partial reason why new institutions emerged, and were later named children's groups. The main reason for their existence, according to data from the Czech Statistical Office, is that there was an increase in the number of children born. Consequently, kindergartens could not manage the demand, as there were more children than their capacity could accept, and they were forced to reject even three-year-old children. We will mention the status of children's groups in the Czech educational system further.

A novelty in Czech preschool education since 2017 is obligatory education for five-year old children. So far, obligatory school attendance was initiated with the first year of elementary school, as a rule when the child is six. Presently, even the final year of kindergarten is obligatory for children. However, every parent can ask for a so-called home-schooling for their child, which means that the child is registered in the school nearest to his/her home, or any other school, and every quarter of a year the child is tested on the aspects of his/her maturity. Introducing obligatory final year of kindergarten is one of the objectives of a long-term strategy of education and development in Czech educational system for years 2015-2020. One of the objectives is to decrease the inequality in education and to have the possibility to educate children in kindergarten is supposed to help with it. The plan is to reach given objectives by creating space which supports, stimulates, includes and motivates children to learn their whole life – so-called life-long learning. The strategy includes steps to improve the quality of preschool education and improving teachers' pedagogical skills. The importance of kindergarten is emphasized, as are its educational functions, especially for children from socially disadvantaged environment,

where successful preschool education helps to eliminate the shortcomings in the family. According to Hejlová and co. (2013), preschool education includes the aspects of education and upbringing and its theoretical basis is General Educational Program for Preschool Education (2004), which respects child's needs and is based on objectives of upbringing and individually oriented model of educational activity and of upbringing. Aspects that play the role in parents' choice of preschool institutions are – availability of daily meals, closeness to home, number of persons who care for children and the qualification of the caregiver. Then the fee and other activities that kindergarten offers, pedagogical activities, among which belong also educational program and preparation for elementary school.

Children's group is a service that offers daycare for children from one year of age till the age when the child must go to school. It emerged as an educational alternative in kindergartens in 2014, when the problem with kindergarten's capacity peaked. Every children's group must be registered in the register of providers of daycare in children's group, whose establisher is Ministry of Labour and Social Affairs. Obligatory document, which every children's group must have, is educational plan and a plan for children's daycare in children's group, which is attached to the contract of children's care. The aim of children's group is improving parents' conditions on job market and satisfying the demand for placing children younger than three in preschool institutions.

Children's group offers parents, and especially mothers, a possibility for earlier return to work and thus improves their status on job market. With regard to priorities of European Union, defined in Strategy Europe 2020, establishers of children's groups have the possibility to obtain grant support via operational programmes.

Children's group can be a new opportunity for all people interested, be it children, parents or teachers and it can enrich the community, in which it represents another modern service that can accompany children in their childhood and the proces of learning about the environment to which they were born. Children's group represents another option in the wide offer of preschool institutions (various alternative approaches that are used in children's groups) and also offers parents, especially mothers of children younger than three, the possibility to place a child in the institution and return to work either as a full-time or part-time worker. This enables women to find the balance between family life and professional life.

In our research we focused mostly on educational priorities in children's groups and their strong and weak links.

FINDINGS

The Zlín region is one of the Czech regions, situated in Moravia county. Presently, ten children's groups have been established in the Zlín region, and new ones are still emerging. We decided to carry out our research in three of these instututions that are situated directly in Zlín, county town.

Chart 2: Overview of selected children's groups

		The Zlín region – children's groups			
Place	The name of the children's group	Number of groups	Capacity	Started in	Establisher
Zlín	Kamarád Nenuda	1	12	2016	Kamarád - Nenuda z.s.
	Šťastné dítě	1	12	2017	Centrum Šťastné Dítě, z.s.
	Aktiváček	1	12	2016	Aktivně životem o.p.s.

The aim of the research was to understand and describe the existence and functioning of these selected instututions (children's groups) in Zlín.

RESEARCH METHODS AND DATA COLLECTION

We contacted every children's group by telephone and arranged a meeting in order to carry out an in-depth interview. Then we set the date. The criteria for our selection of children's groups were: they must be situated in the Zlín region, they must be willing to participate in our research and share their knowledge and experience, and they must agree with data processing for the purposes of this study. Three groups met with these criteria.

For our research we chose qualitative research design and decided to use the interview and content analysis of promotion materials from each institution.

Interviews were always recorded on voice recorder and consequently transcribed.

Interviews were always carried out with establishers of children's groups and parents. Another source of information that enabled us to create a children's group profile were web pages of particular children's groups. All three chosen groups are financed from operational programme employment.

PILOT RESULTS OF RESEARCH

The main problematic (or potentially problematic) areas regarding children's groups are:

- a.) qualification of the carer
- b.) status of children's group in the system of preschool education
- c.) insufficient legislation regarding children's group

Even in professional psychological debates there is a vivid discussion on the age of children in children's groups. According to Mertin (2014), from the psychological perspective, there is not much to object to regarding children's groups, especially because many young children at that age are already in the care of grandmothers, nannies, aunts and other helpers the families use if they need them. It is untrue that only family members care for children, even though it is expected that until the age of six, the child will be predominantly in the care of family, and not other forms of daycare. Mertin sees in children's groups an alternative form of daycare that can supplement kindergarten, but he suggests that it is inappropriate to compare these two forms of daycare. Instead of increasing the capacity of collective daycare institutions for youngest children he suggests that the support from parents' employers would be a better solution – employers should offer part-time jobs for parents. He would support children's groups as a temporary solution and in the long run he considers financial support of kindergartens by the state, professional growth, investment in teachers and improving the prestige of their jobs as a sustainable solution.

Obligatory attendance, provided by the establisher of children's groups, is required by the law and it should be at least six hours a day. In reality it does not mean that parents have to use the whole six hours. Most institutions offer two or three varieties of the attendance, usually morning, afternoon or whole-day shift. This is reflected also in the price. As we can in the chart, opening hours are different for each children's group, probably because of different parents' needs and the type of establisher. In case when the service is financed from a grant and it is, therefore, a public service, the establisher is obliged to keep the attendance record for each child in an electronic form. Attendance sheet needs to be signed at the end of each month by child's parents. Child's attendance is one of the significant project indicators. Typical opening hours of a kindergarten, established by the town council, is from 6:30 – 16:30.

There are huge differences between children's groups, when it comes to promotion of children's group's activity. It is necessary to mention that the transformation process of the institution is not simple. Understandably, promotion on the internet and via media commercials is marginal. Parents learn about the institutions mostly from:

- a.) webpages
- b.) leaflets, promotional materials with pictures
- c.) facebook

Children's groups in Zlín have educational background. Parents want to know what children's group is, they are generally interested in alternative daycare services. They make their choice based on many criteria. From what we know so far, we perceive the future of children's groups in the Zlín region as promising. New institutions are constantly emerging and the capacity of the already existing ones is fully used and parents have to either wait for a place for their child, or to seek another institution.

MAIN ADVANTAGES OF CHILDREN'S GROUPS AS A DAYCARE INSTITUTION FROM THE PERSPECTIVE OF THEIR ESTABLISHERS

Research of the establisher's opinions on the advantages of children's groups brought many interesting points. Advantages are presented in two central categories.

Main Advantages of Children's Groups from the Perspective of the *Establishers*:

- possibility to create trustworthy family atmosphere
- friendly environment that enables easy adaptation of newly admitted children
- smaller number of children per carer
- possibility to use individual capital of a carer

- small work team
- formation of a professional portfolio of a carer
- variety of carers that ensures variety of influences on children
- possibility to include aspects of alternative preschool pedagogy
- freedom regarding interest-based learning in children's group (canistherapy, hippoterapy, English lessons, yoga for children, speech-therapy games)
- possibility of individual treatment of children
- possibility to adjust the equipment according to children's needs
- easier diagnostics of a child in smaller group
- closer and more intimate relationship between the carer and the child
- smaller number of children in the group
- individual treatment
- open communication with parents
- parents can participate in children's group activity
- openness towards parents and cooperation with them
- parents can combine children's group with attendance to other institutions, for example so-called forest kindergartens
- they are financially convenient and enable time flexibility
- parents can choose from a variety of preschool care
- flexible opening hours that meet parents' needs half way

Main Advantages of Children's Groups from *Parents' Perspective*:

- they are a natural environment for adaptation to groups of children
- parents participate in the process of child's adaptation
- children look forward to going to children's group
- there are no meltdowns in the morning because child does not want to go kindergarten
- stress-free environment
- family atmosphere
- peaceful environment for child's sleep (smaller group, reading stories)
- better balance between professional and family life
- possibility to go to work when the new employer needs it
- possibility to place a child in children's group even in the middle of the school year, therefore immediately after parents start working
- when the child is happy, other relationships in the family improve as well
- mother can dedicate more time to a younger sibling, herself of other members of family
- child is happy in the group
- cooperation that aims to improve progress of autistic children
- understanding of children with autism spectrum disorders (ASD)
- child with specific needs is in a smaller group and is capable of greater progress

Each of researched institutions is specific and has a certain advantage that the other one does not have. Nenuda, for example, is situated in the city centre and its principal is very flexible. She enables attendance of two-year old children and older. Children's group Aktiváček has a principal who is very open to innovation, is enthusiastic about the daycare system in children's group, moreover, it is situated close to the city centre and welcomes children as young as 18 months. Štastné dítě has the advantage of an inclination towards aesthetic alternative activities, musical therapy, artherapeutical activities combined with yoga for children. It seems that the activities are adjusted to specific interests of carers who work there and parents choose the institution because of that. The existing users of the daycare service, therefore parents, are greatly satisfied, which is proved by the fact that there are no free places in children's groups at the moment. When one institution does not have a place for yet another child, they inform parents about the other children's groups. A logical outcome of this communication is emergence of Association of Children's Groups in the Zlín region. This association would facilitate providing the service to parents in the Zlín region, simplify the process of accepting children to children's groups based on actual and individual needs of parents and improve the quality of care in children's groups.

CONCLUSIONS

In the Czech Republic, according to statistics of the Ministry of Labour and Social Affairs, in April 2017 289 children's groups were registered and they provide places for 3,822 children. At the beginning of 2017 a new appeal to support children's groups was issued by European Union. However, an increasing number of children is not expected and moreover, even kindergartens are more open to possibility of accepting two-year-old children now. Czech Statistical Office expects decreasing tendency in years 2016-2022 among 3-5 year-olds by 12.5% (City of Zlín). It is not expected that the problem with capacity of preschool institutions and impossibility to place a child there would recur any time soon. Measures have been taken in order to improve the situation. However, the opposite extreme can be expected – new institutions would be established, but there will not be enough children to fill their capacity. Since 2014, several commercial institutions in the Zlín region closed down, because so-called babyboom is over now. The number of children born will decrease more and more and we can expect that the interest in 'alternative pedagogy', be it a private kindergarten or public children's group (public as long as it is financed from a grant) will decrease as well. Many children attend these institutions either because they are too young, or because the city kindergartens were full and could not accept them. Time will show what the actual situation with children's groups in the Czech Republic will be like. We will see if the reason for their existence has already passed or not.

ABSTRACT

Background: Communication between health professionals, the health team, patients and families, benefits the adherence and success of the treatment, the reduction of anxiety and the satisfaction with the received care. Therapeutic communication is a challenge for nursing students, being an integral part of the nursing curricula since the initial training. Objective: This study is aimed to adapt the Clinical Communication Skills Scale (CCSS) by Ferreira, Silva and Duarte (2016), gathering evidence of their factorial validity and internal consistency, as well as the factorial invariance of this measure for nursing students. Methods: This is a descriptive, cross-sectional and correlational study performed in a non-probabilistic sample by convenience, consisting of 374 nursing students from two health schools of the central part of the country, aged between 18 and 21 years old (68.2%), mostly female (82.4%) and attending the 5th semester of the course (24.9%). The collection instrument consists of 30 items organized in a Likert's scale from 1 "I do not agree" to 5 "I totally agree", and the higher the quotation the better the communication skills. Results: The results of the confirmatory factorial analysis provided evidence for the validity of the scale, presenting very adequate values for ($\chi^2 / df = 3,198$ RMSEA = 0.077; RMR = 0.023; SRMR = 0.053 and satisfactory for CFI = 0.834 and GFI = 0.870) when applied to students. In the internal consistency study of Cronbach's alpha, the values are very good oscillating between $\alpha = 0.943$ and $\alpha = 0.946$, being the overall alpha of ($\alpha = 0.946$). Conclusion: The results of the present study support the psychometric adequacy of the clinical communication skills scale, indicating that it can be used in future trials in order to understand the communication skills of nursing students.

INTRODUCTION

Communication skills are the basis of nursing care and a differentiating care of excellence (Alves, 2011). The development of these skills is an evolutionary process established in five stages: beginner, advanced beginner, competent, proficient and expert. The impression of necessary skills becomes more evident at each level. For the author, the more advanced levels of qualification could only be achieved by experience in practical work situations (Andrade, 2014), the professional development of communication skills depends on the people and their knowledge needs, as well as on learning situations.

Communication skills integrate three major types of essential skills in the nurse-patient interaction: *content*-related competencies that translate what health professionals communicate (for instance, the information they collect, treatment they suggest, etc.); *process*-related competencies, that is, how they communicate (for example, how they establish the relationship with the patient, how they organize information) and *perceptual* competencies, referring to what health professionals think and feel (for instance, decision-making process, attitudes, perception of the patient's feelings and thoughts) (Grilo, 2012). Nurses who are effective communicators make patients verbalize expectations and emotions and reveal their information needs. As a result, patients have higher rates of satisfaction and compliance, and lower levels of anxiety (Grilo, 2012).

It is concluded that the quality of nursing care will be predominantly marked by the attitudes and behaviours of the caregivers, that is, the nurse, and that competent professional performance requires a know how to mobilize, integrate and transmit the acquired knowledge in the scope of training. In nursing, *know-how* integrates relational *know-how*. Care takes place in a context of interpersonal relationship, which requires nurses to have complex skills centred on humanistic principles (oneness, a tendency of updating, autonomy, evolution) and a helping relationship (acceptance, authenticity, empathy, warm respect, congruence, active listening) (Lopes, Azevedo & Rodrigues, 2012).

In a health organization, communication between health professionals and users of health care is essential to promote their health and safety as well as satisfaction with the care provided. Therefore, it is necessary for health professionals to have communication skills so that they can effectively develop care for users (Alves, 2011). There is evidence that a high level of emotional competence brings benefits to the health of the users to the extent to which there is an increase in adherence to the therapeutic regimen, higher patient satisfaction and better health outcomes (Schoenthaler, Chaplin, Allegrante et al., 2009).

In this context, a number of representatives of professional organizations and education of health professionals met in 1999 in Kalamazoo, United States of America, within the scope of the "BayerFetzer Conference on Physician-Patient Communication in Medical Education". They outlined a set of essential guidelines for professional health/patient communication. The therapeutic relationship as a fundamental instrument of professional health/patient communication is also evidenced here (Peixoto, Simões, Teles et al., 2012), which should contemplate several phases - a) Open the discussion b) Obtain information c) Understand the patient's perspective d) Share information e) Reach an agreement on the problems and plans f) Finish the interview. These stages should be adapted to the different specialties, scenarios and health problems, becoming an effective tool for the acquisition of clinical communication skills for nursing students. Given this problem and after the validation of an instrument capable of evaluating **clinical communication skills for nurses, we propose to adapt the scale of Clinical Communication Skills (CCS) by Ferreira, Silva and Duarte (2016)**, gathering evidence of their factorial validity and internal consistency, as well as the factorial invariance of this measure for nursing students.

Methods: This is a descriptive, cross-sectional and correlational study performed in a non-probabilistic sample by convenience, consisting of 374 nursing students from two health schools of the central part of the country, aged between 18 and 21 years old (68.2%). They are mostly female (82.4%) and attending the 5th semester of the course (24.9%). The collection instrument consists of 30 items organized in a Likert's scale from 1 "I do not agree" to 5 "I totally agree" and the higher the quotation the better are the communication skills.

RESULTS

Psychometric study of the Clinical Communication Skills Scale

Scales and all measuring instruments should be valid and reliable. Validity refers to the ability of the instrument to measure the construct it wishes to quantify, and the trust or reliability relates to the property of demonstrating analogous, error-free results in repeated measurements. In this work, the reliability and validity study for the scale under way was carried out.

Reliability makes it possible to evaluate the temporal stability and the internal consistency or homogeneity of the items by determining Cronbach's alpha coefficient and the Split-Half coefficient or halves method, which is a way to verify if one of the halves of the scale is as consistent in measuring the construct as the other half. The values of the Cronbach coefficient can range from 0 to 1, in which the higher the value the better. A good internal consistency should exceed an alpha of .80 (Marôco, 2014). The same author and Pestana and Gageiro (2014) allude as reference values: higher than 0.90 very good; between .80 - 0.90 good; between 0.70 - 0.80 average; between 0.60 - 0.70 reasonable; between 0.50 - 0.60 mediocre; and less than 0.50 unacceptable.

Reliability is a necessary condition, but it is not enough to guarantee the validity of the instrument (Marôco, 2014).

As for reliability studies, the results in Table 1 show the statistics (means and standard deviations) and the correlations obtained between each item and the overall scale. The correlation coefficients of the item-total correlation vary between 0.422 (item 4) and 0.708 (item 23), being the correlations above 0.20 (reference value). Regarding the mean values and respective standard deviations of the different items, they indicate that, overall, they are well centred and above the expected average index, registering the lowest mean value (M=3.34) in item 28: "Give bad news" and the highest mean value (M=4.49) in items 17: "Use of plain language with the patient" and 18: "Check if the patient understood what I wanted to say." As far as Cronbach's alpha values are concerned, they range from $\alpha=0.943$ to $\alpha=0.946$, with alpha ($\alpha=0.946$) being classified as very good for the whole scale.

Table 1. Internal consistency of the items of the Clinical Communication Skills Scale and interpersonal relationship

Item No.	Items	Mean	Sd	r/item total	α sem item
1	Establish rapport with patient Encourage	4,25	,553	,563	,945
2	a partnership with the patient	4,23	,542	,564	,945
3	Accept active patient participation in decision making	4,35	,561	,493	,945
4	Open a discussion in a clinical interview	3,68	,731	,422	,946
5	Allow the patient to complete his/her reasoning	4,39	,556	,494	,945
6	Encourage the patient to talk about his/her concerns	4,52	,598	,563	,945
7	Establish or maintain the clinical relation	4,33	,582	,667	,944
8	Collect the necessary information about the patient	4,33	,635	,653	,944
9	Properly post open and closed questions	4,07	,686	,641	,944
10	Integrate, clarify and structure information provided by the patient	4,16	,585	,661	,944
11	Perform active listening using non-verbal techniques (e.g., eye contact, body position) and verbal techniques (e.g., words of encouragement)	4,43	,575	,594	,944
12	Understanding patients and perspective on the disease and problems	4,30	,586	,690	,943
13	Explore contextual factors in the patient's life (e.g., family, culture, gender, age, disease perspective, socioeconomic level, spirituality)	4,11	,667	,582	,944
14	Explore beliefs, concerns, and expectations about health and disease 15	4,07	,649	,641	,944
	Consider the patient's ideas, feelings and values and respond to them 16	4,23	,647	,645	,944
	Share information with the patient	4,09	,650	,439	,946
17	Use of plain language with the patient	4,49	,547	,631	,944

CONFIRMATORY FACTOR ANALYSIS

Following the study carried out for communication in nursing, we sought to know if the factor structure remained invariant for communication in nursing students. In this sense, we subjected the penta-factorial solution resulting from the first study to confirmatory factorial analysis (CFA), using the software AMOS 23 (Analysis of Moment Structures). We considered the covariance matrix and also adopted the maximum likelihood estimation (MLE) algorithm for parameter estimation. The normality of the items was evaluated by *asymmetry (Sk)* and *flatness (Ku)* assuming as reference values of asymmetry ≤ 3 and flatness ≤ 7 respectively, and the validity of the construct evaluated by the factorial, convergent and discriminant validity values.

As indicators of overall adjustment quality, we used the ratio of $\chi^2/df < 5.0$ the **CFI** (Comparative Fit Indice) > 0.90 , the **GFI** (Goodness of Fit Indice) > 0.90 , the **RMSEA** (Root Mean Square Error of Approximation) < 0.08 , the **RMR** (root mean square residual) < 0.08 and the **SRMR** (Standardized root mean square residual) < 0.08 .

In the quality of the local adjustment of the model, the composite validity obtained through the individual fidelity item (λ) was also considered, being the reference factor weight greater than 0.50, the individual reliability of the items (δ) with coefficients equal to or greater than 0.25. In exploratory studies, factorial weights of 0.40 are acceptable.

For composite fidelity (CF) that estimates the internal consistency of the items relative to the factor, reference values are above 0.70 (Marôco, 2014) and the convergent validity is evaluated by the average variance extracted (AVE). This allows us to verify the way the items belonging to a factor, saturate in this factor, have reference values of 0.50 (Marôco, 2014).

Discriminant validity (DV), which is considered when the AVE value for each construct is greater than the square of the multiple correlations between this construct and another, was analysed.

The first step was to evaluate the normality of the items through the values of asymmetry and kurtosis, and it was verified that all items present skew indices ranging from 0.003 to 0.890 and kurtosis between 0.043 and 1.808, which is a normal distribution.

Table 2. Asymmetry and kurtosis values

Table 4 presents the critical ratios of the trajectories between the manifest and latent variables denoted by the values of p that are statistically significant, which evidences the maintenance of all items. The same table notes that the factor loads (λ) are greater than 0.50 except for items cr4, cr16 and cr24, which in a more conservative analysis should be withdrawn.

Table 4. Critical ratios and lambda coefficient

Figure 1 shows the item saturations and the individual reliability that we may consider suitable for subscales f1, f2, f3 and f4, but as previously mentioned only items cr1 and cr8 have saturations greater than 0.50. The overall adjustment indices in this initial model presented a satisfactory adjustment in relation to the indices CFI=0.814, GFI=0.789 and RMSEA=0.084, but adequate with respect to $\chi^2/g.l. = 3.610$; RMR=0.026 and SRMR=0.059.

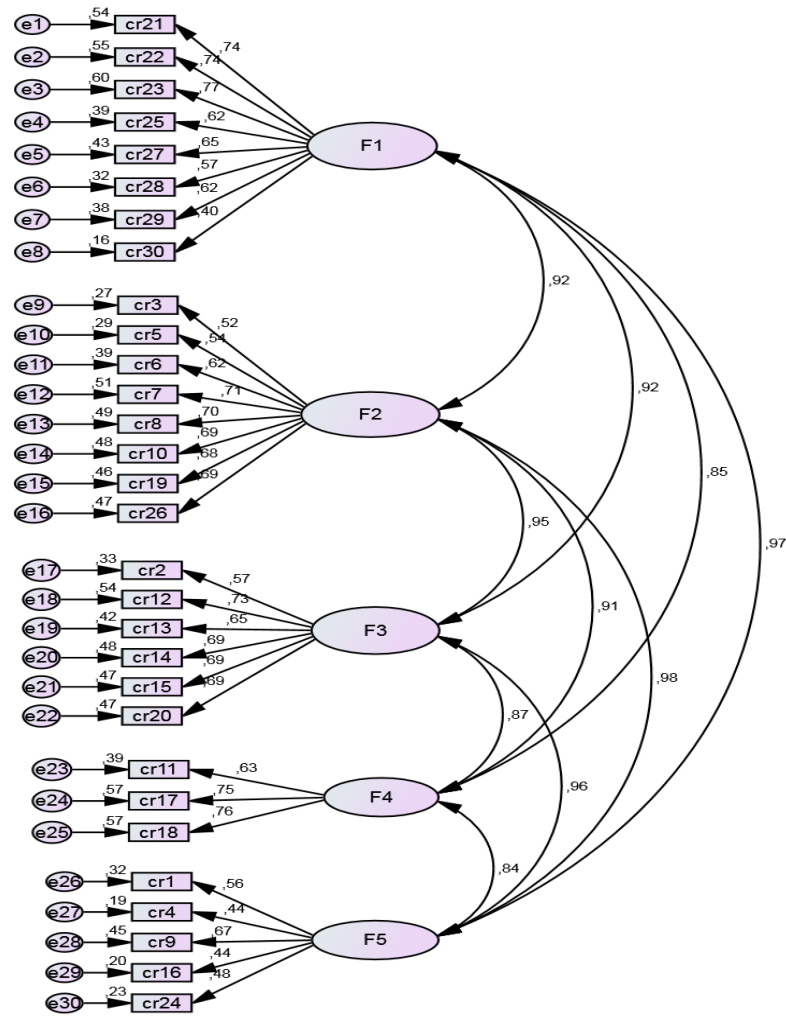

Figure 1. Initial model with all items and factor loads

The model was adjusted using the modification indices proposed by the programme and some errors were correlated (see Figure 2). It was verified that the error 2 belonging to item cr22 of factor 1 correlated simultaneously with errors 1 and 3 of the same factor. Similarly, error 10 of item cr5 is related to errors 9 of item cr3 and item 11 of item cr6 recorded in factor 2. After recording all modification indices, the model obtained improved slightly for the ratio of $\chi^2/g.l.=2.972$; RMSEA=0.073; RMR=0.022; SRMR=0.052, although it continues to maintain unviable indices for GFI=0.832 and CFI=0.871.

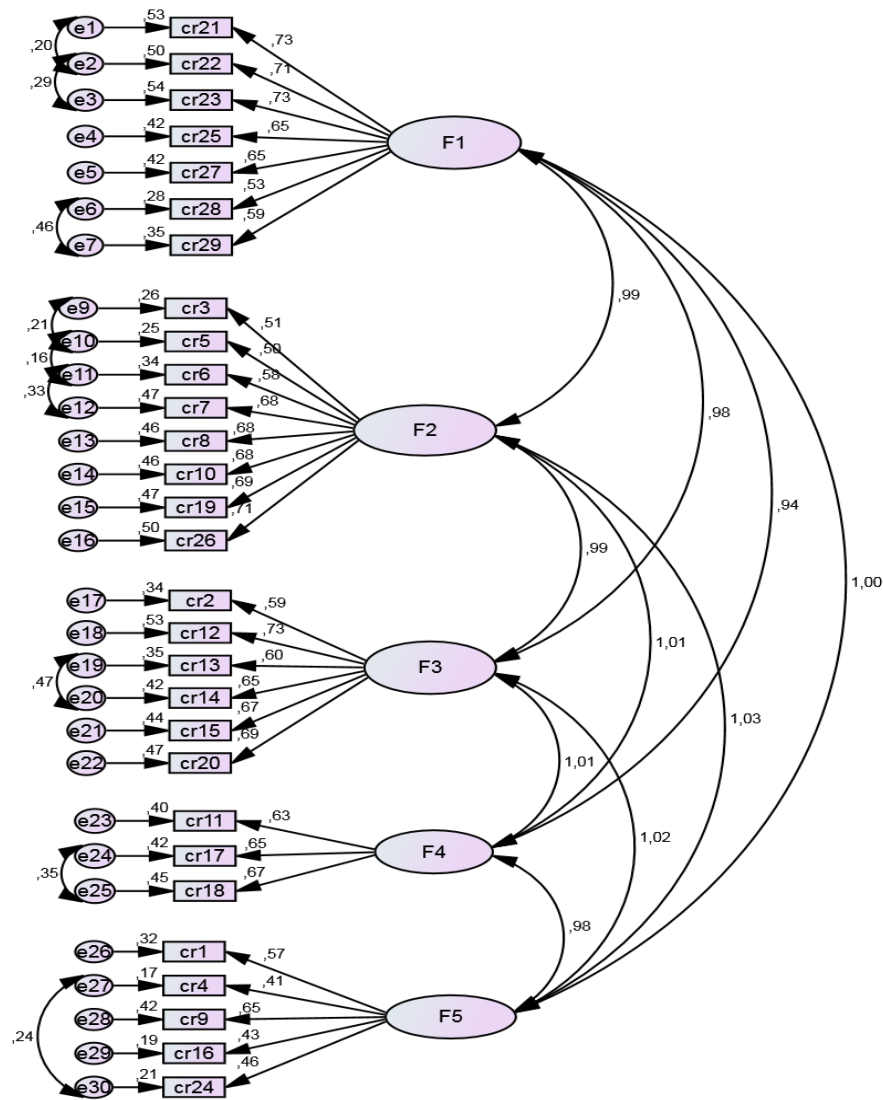

Figure 2. Model with modification indices

To avoid multicollinearity problems resulting from the association of some errors, we eliminate items cr22 of factor 1, and cr5 of factor 2. Because item cr4 has a saturation lower than 0.40, we also eliminated it. The overall adjustment quality indices maintain the GFI (0.834) and CFI (0.870) as suffering. Only items cr16 and cr24 do not present regression weights greater than 0.50, but are statistically significant ($p < 0.001$), which demonstrates the relevance of the factor to predict the items (see Figure 3). The individual reliability of the indicators (δ) presents coefficients ranging from 0.18 in item cr6 to 0.74 in item cr23.

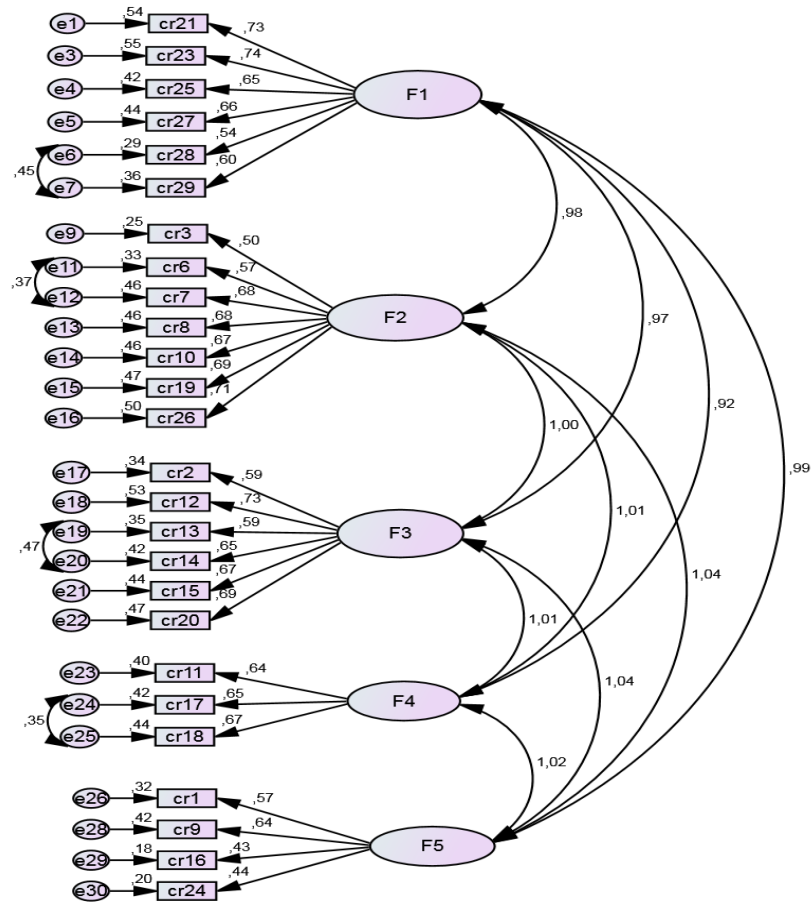

Figure 3. Relevance of the factor to predict the items

We proposed a hierarchical structure with a 2nd order factor that we called **communication in nursing students**, since the correlational values found appear to be quite high. Figure 4 illustrates the model with the 2nd order factor.

Figure 4. Model with the 2nd order factor

In this second-order hierarchical model, the adjustment quality values remain adequate for the $\chi^2/df = 3,198$ RMSEA = 0.077; RMR = 0.023; SRMR = 0.053 and satisfactory for CFI = 0.834 and GFI = 0.870, which demonstrates factorial validity of the communication scale for students. Table 4 summarizes the overall adjustment indices obtained at the different moments of the study.

Table 4 . Quality indices of the adjustment of all models

Model	χ^2/df	GFI	CFI	RMSEA	RMR	SRMR
Model 1 initial	3.610	0.789	0.814	0.084	0.026	0.059
Model 2 with modification indices	2.972	0.832	0.871	0.073	0.022	0.052
Model 3 with modification indices	3.230	0.836	0.870	0.077	0.023	0.053
Model 2 nd order	3.198	0.834	0.870	0.077	0.023	0.053

Regarding the composite reliability (CR), the results reveal adequate indices for factors 1, 2 and 3 because they are above 0.70, but are not enough for factors 4 and 5. The average variance extracted (AVE) presents lower values 0.50 in all factors, registering the lowest in factor 5. In none of the factors discriminant validity is noted.

Table 5. Composite reliability, average variance extracted and discriminant validity

Factors	CR	AVE	Discriminant validity			
			F2	F3	F4	F5
F1 -	0.818	0.432	0.960	0.940	0.846	0.980
F2 -	0.832	0.417	-	1.00	1.020	1.081
F3 -	0.816	0.426	-	-	1.020	1.081
F4 -	0.687	0.422			-	1.040
F5 -	0.601	0.280				--

Table 6 presents the statistics and the internal consistency of the items by subscale. For **Factor 1 - Involve the patient**, the correlation value of the corrected total item varies between 0.506 in item 25 "Ask the patient if he/she has more concerns/complaints" being also this item that expresses less variability (30.4%) and ($r=0.667$) in item 23 "Identify and activate resources and support for the patient" with an explained variance percentage of 47.7%. Cronbach's alpha values can be classified as reasonable and good.

In **Factor 2 - Facilitate the dialogue**, the correlation of the total corrected item has its maximum expression in item 7 "Establish or maintain the clinical relation" ($r=0.669$) with a variability of 50.2% and the minimum in item 3 "Accept active patient participation in decision making" ($r=0.457$), with an explained variance of 22.6% and Cronbach's alpha values classified as good.

Regarding **Factor 3 - Understanding the concerns**, the correlation value of the corrected total item varies between 0.460 in item 2 "Encourage a partnership with the patient" being also this item that expresses less variability (24.3%) and ($r=0.669$) in item 14 "Explore beliefs, concerns and expectations about health and disease" with an explained variance percentage of 53.5%. Cronbach's alpha values can be classified as reasonable and good.

For **Factor 4 - Communicate assertively**, it is of all factors the one which reveals the correlation value of the lowest corrected total item, varying between 0.547 in item 17 "Use of plain language with the patient", and this item also expresses less variability (46.3%) and ($r = 0.575$) in item 11 "Perform active listening using non-verbal (e.g., eye contact, body position) and verbal (e.g., words of encouragement) techniques" with a percentage of variance explained by 46.3%. Cronbach's alpha values can be classified as reasonable.

In relation to **Factor 5 - Conduct the interview**, it can be said that the correlation value of the total item ranges from 0.553 in item 1 "Establish rapport with the patient", which expresses less variability (37.3%) and ($r=0.738$) in item 24 "Finish a clinical interview or a consultation" with an explained variance percentage of 38.2%.

Table 6. Internal consistency of the items by factors of the Clinical Communication Skills Scale

Items	Factor 1 – Involve the patient	Mean	Sd	r/item total	r ²	α sem item
21	Encourage patient participation in decision-making as long as he/she wishes this	4,21	0,645	0,563	0,411	0,806
23	Identify and activate resources and support for the patient	4,07	0,697	0,667	0,477	0,785
25	Ask the patient if he/she has more concerns/complaints	4,39	0,565	0,506	0,304	0,817
27	Discuss and schedule the follow-up	3,89	0,718	0,635	0,418	0,791
28	Give bad news	3,34	0,873	0,590	0,453	0,805
29	Deal with complaints from patients	3,70	0,797	0,648	0,478	0,788
Factor 2 – Facilitate the dialogue						
3	Accept active patient participation in decision making	4,35	0,561	0,457	0,226	0,834
6	Encourage the patient to talk about his/her concerns	4,52	0,598	0,568	0,429	0,818
7	Establish or maintain the clinical relation	4,33	0,582	0,669	0,502	0,803
8	Collect the necessary information about the patient	4,33	0,635	0,645	0,452	0,806
10	Integrate, clarify and structure information provided by the patient	4,16	0,585	0,620	0,412	0,810
19	Encourage patient questions	4,24	0,660	0,589	0,368	0,815
26	Summarize and agree with the patient on the therapeutic plans	4,13	0,701	0,581	0,373	0,817
Factor 3 – Understanding the concerns						
2	Encourage a partnership with the patient	4,23	0,542	0,460	0,243	0,827
12	Understanding patients and perspective on the disease and problems	4,30	0,586	0,635	0,404	0,795
13	Explore contextual factors in the patient's life (e.g., family, culture, gender, age, disease perspective, socioeconomic level, spirituality)	4,11	0,667	0,648	0,507	0,791
14	Explore beliefs, concerns, and expectations about health and disease	4,07	0,649	0,669	0,535	0,786
15	Consider the patient's ideas, feelings and values and respond to them	4,23	0,647	0,604	0,378	0,800
20	Negotiate an agreement with the patient about problems and plans	4,04	0,705	0,584	0,361	0,806
Factor 4 – Communicate assertively						
11	Perform active listening using non-verbal techniques (e.g., eye contact, body position) and verbal techniques (e.g., words of encouragement)	4,43	0,575	0,463	0,217	0,775
17	Use of plain language with the patient	4,49	0,547	0,638	0,441	0,573
18	Check if the patient understood what I wanted to say	4,49	0,561	0,607	0,420	0,607
Factor 5 – Conduct the Interview						
1	Establish rapport with patient	4,25	0,553	0,373	0,142	0,545
9	Properly post open and closed questions	4,07	0,686	0,446	0,199	0,482
16	Share information with the patient	4,09	0,650	0,345	0,124	0,560
24	Finish a clinical interview or a consultation	3,70	0,738	0,382	0,151	0,537

Table 7 summarizes the Cronbach alpha values per subscale obtained in our study. It is emphasised that it is Factor 2 that presents a better internal consistency ($\alpha=0.837$), with an alpha classified as good. In contrast, Factor 5 is what reveals a lower Cronbach alpha, considered reasonable ($\alpha=0.603$).

Table 7. Cronbach's alpha values for subscales of Clinical Communication Skills Scale

Subscales	N° items	Cronbach's alpha
Factor 1 – Involve the patient	6	0.827
Factor 2 – Facilitate the dialogue	7	0.837
Factor 3 – Understanding the concerns	6	0.829

Factor 4 – Communicate assertively	3	0.741
Factor 5 – Conduct the interview	4	0.603

We conclude the study of this scale alluding to the Pearson correlation matrix established with the scale factors. We have verified that the correlations are positive and significant.

Table 8. Pearson Correlation Matrix among the factors of the Clinical Communication Skills Scale

CONCLUSIONS

Reflecting on the skills of clinical communication and interpersonal relationships of nursing students is fundamental for the path as students and for the process of building professional identity. Nursing students, especially in clinical teaching, are in a privileged situation of developing reflection *on* and *about* action. Clinical communication skills are very relevant for the construction of professional knowledge, which implies the development of innovative experiences in this field, in order to improve practices and respond to the challenges that quality health care raises. The Clinical Communication Skills Scale consists of 26 items, which allow to know the **communication skills** of nursing students/nurses in 5 domains or factors: **Involve the patient** with an explained variance of 47.7%, **Facilitate the dialogue** with an explained variance of 22.6%, **Understanding the concerns** with an explained variance of 53.5%, **Communicate assertively** explained variance of 46.3%, and **Conduct the interview** with an explained variance of 38.2%.

After the first study of clinical communication skills in nurses, we sought to know if the factorial structure remained invariant for communication in nursing students. We carried out the penta-factorial solution resulting from the first study, the factorial analysis, the covariance matrix and the maximum likelihood algorithm, and we conclude that after eliminating items 22 and 30 of factor one, item 5 of factor 2 and item 4 of factor 5, the scale has good reliability and validity indices with a dimensional structure close to the initial one. The results of the present study support the psychometric adequacy of the scale indicating that it can be used in future trials in both nursing students and nurses.

ABSTRACT

Performing clinical teaching in an emergency service is a significant step in the student's learning process, which requires adapting to a diverse and complex context of healthcare provision that inevitably generates anxiety and stress. The objective was to verify if the socio-demographic and academic variables interfere in the stress of nursing students in clinical teaching in emergency medicine; to evaluate the stress factors; to verify the relation of sociodemographic, academic and stress factors in clinical teaching with depression, anxiety and stress. A quantitative, descriptive-analytical and cross-sectional study was performed in a non-probabilistic sample for convenience, made up of 74 former nursing students. A self-completion questionnaire was used, consisting of a socio-demographic and academic characterization questionnaire, the Scale of Anxiety, Depression and Stress by Lovibond and Lovibond, adapted by Pais-Ribeiro, Honrado and Leal (2004), the KEZKAK Scale by Zupiria Gorostidi et al. (2003), translated and adapted for the Portuguese population by Barroso et al. (2008). A predominantly female sample (78.4%), with a mean age of around 23.32 (± 3.407 Sd), in which men ($M=24.40 \pm 3.282$ Sd) on average, are slightly older than women ($M=23.02 \pm 3.408$ Sd). The mean stress value was 6.24 (± 3.522 Sd). The highest mean values were the "Impotence and uncertainty" factors 17,39 ($\pm 7,889$ Sd), "Lack of ability" ($M=16.02 \pm 9.076$ Sd) and "Contact with suffering" ($M=13.36 \pm 6.819$ Sd). The women showed more stress especially with regard to the factor close relationship with the student ($p=0.011$). Younger, single students, living in urban environments, living with friends/residence, whose clinical teaching took place in Lamego, revealed higher mean ordering values in the stress factors of clinical teaching, suggesting that they are the ones with higher levels of stress. The results emphasize the need for strategies to reduce the level of stress experienced by students during clinical teaching in emergency medicine, in view of its complexity, especially in the initial training of the Licentiate Degree in Nursing.

Key words: Nursing students; Clinical teaching in emergency medicine; Stress.

INTRODUCTION

Performing clinical teaching in an emergency service is a significant step in the student's learning process, which requires adapting to a diverse and complex context of healthcare provision that inevitably generates anxiety and stress. However, Abreu (2007) points out that clinical teaching is irreplaceable, given its nature of mobilization and knowledge integration. The same author also highlights that the teaching and learning process seeks to develop the areas expected of a nursing professional, fostering solid theoretical training in articulation with practical concrete situations, in order to develop an integrated, critical and reflexive vision of nursing care in students.

In the teaching and learning process, the pedagogical practices that prevail are guided by cognitive processes, knowledge structures, teaching strategies, namely concerning problem solving, information processing and the transfer of learning in new situations (Barroso, 2009). Hence, students, in clinical teaching learning situations, must be able to respond effectively to the different requests and challenges posed to them, mainly in clinical teaching in emergency medicine, where they are interacting with the entire socio-professional environment and must deal with the complexity of various situations.

Being a nursing student in the emergency service is not always easy because it is a service where complex clients, lacking everything and everyone, come in with a polypathology framework that requires nurses to have several possibilities for solving it, a great challenge (Cunha, 2011). Moreover, and as already previously mentioned, the emergency service is characterized by being a service with a high level of complexity due to its structure, functionality and organization. According to the Ministry of Health, emergency services are "multidisciplinary and multiprofessional services that aim to provide healthcare in all situations within the definitions of emergency and medical emergency" (Order No. 11/2002). In the emergency service, the "unpredictability" factor is predominant, which "is quite pronounced and where the transfer of theoretical knowledge to practice must be ready and effective" (Pereira, 2007, p.64). To corroborate, Serra (2008, p.77) states that "complexity and unpredictability in healthcare situations, sometimes based on urgency, and the professional experience that teachers and professionals have, often show the perspective of clinical practices as an anxiogenic experience and the preview of internships as battlefields."

It is considered that clinical teaching, periods of training in real working situation, is made up of privileged moments of the Nursing student's education. Nevertheless, they are not free of problems and difficulties that can be generators of stress (Serra, 2008).

Stress in clinical teaching is conceived as a relation of imbalance between its demands and personal resources, in which the students perceive that certain requirements exhaust or extrapolate the resources that they deem to have in the face of a situation that they consider as threatening to their balance. Therefore, stress in clinical teaching is the result of the existence of a real or perceived misfit between the demands of the situation experienced and the abilities or desires that the student has in facing these demands (Pacheco, 2008). The literature highlights the problems that occur during clinical teaching, which in some way affect students' learning and provision of healthcare. As an example, it refers to the gap between what is taught in theory and the actual practice of care, potentiating moments of anxiety and stress (Rodrigues & Veiga, 2006; Serra, 2008).

In the context of clinical teaching, students, like nurses, are faced with occupational stress situations. The liability for people, in which wrong decisions can worsen injuries or illness and even lead to the death of the person being cared for, worries students and professionals. In fact, in Nursing, due to the specificity of their tasks and having people as their object of care, it is common for students to realize the complexity and uniqueness of the student-patient/client relationship and to confront the limitations of their work and of their scientific knowledge. This is the main reason why many feel deceived and impotent in this stage of training. Early encounters with clients are usually associated with uncertainties, anxieties, expectations and fears (Rodrigues, 2005).

THE STUDY

When a stress response is triggered in the body, there are changes at the biological level, in the functioning of the vegetative, endocrine and immune nervous systems, resulting in a large number of metabolic variations, modifying the basic biological functions and making the organism more vulnerable to infections (May, 2011). According to the author, the situation is worsened the longer and more intense the exposure to stress is. In addition to biological changes, one must take into account the changes that arise at the psychological level and at the level of observable behavior.

Nursing has been referred to as a risk profession with regard to the high challenges and requirements that nurses face on a daily basis. The domain of its intervention and object, the client and the actual nature of caring, and the inherent conditions of the organizational context are assumed as some peculiarities that make the nursing practice susceptible to the development of high levels of occupational stress (Cunha, 2011).

The complexity of the contexts and clinical situations pertaining to the setting of the emergency service are elements that generate great stress for nursing students. The confrontation with illness, suffering or death at all times requires the supervisor to provide the student, in addition to adequate training strategies, an effective emotional support, insofar as the affective changes that may occur during the clinical teaching of emergency medicine need to be managed and overcome positively, which is crucial for the student's personal and professional development. Treating human lives, with the possibility of error underlying the therapeutic decision to be made,

is a factor of stress that students, according to Cunha (2011), frequently report in clinical teaching and what conditions their decision in the intervention, and increases anxiety and stress levels.

RESEARCH QUESTIONS

The empirical study was oriented to answer the following questions: i) Which socio-demographic variables interfere in the stress of the 4th year nursing students in clinical teaching in emergency medicine? ii) Which academic variables influence the stress of the 4th year nursing students in clinical teaching in emergency medicine? iii) What is the relation of sociodemographic, academic and stress factors in clinical teaching with depression, anxiety and stress?

OBJECTIVES OF THE STUDY

To answer the research questions, the following objectives were outlined: i) To identify the sociodemographic variables that interfere in the stress of 4th year nursing students in clinical teaching in emergency medicine; ii) To identify the academic variables that interfere in the stress of 4th year nursing students in clinical teaching in emergency medicine; iii) To verify the relationship between sociodemographic, academic and stress factors in clinical teaching and depression, anxiety and stress.

RESEARCH METHODS

In order to be able to achieve the aforementioned objectives, a quantitative, cross-sectional, descriptive and correlational study was carried out. The quantitative methodology was used since the data provide objective realities with respect to the variables under study. This type of study "aims to analyze the incidence, distribution and relations between variables that are studied as they exist, in a natural context, without manipulation, being almost always classified according to these three basic objectives: describe, explain or even explore" (Coutinho, 2014, p.277).

It is descriptive because it seeks to discover the incidence and distribution of certain traits or attributes of a given population, without the researcher trying to explain them. Accordingly, the present study can be characterized as such, since the distribution of the trait (variable) in a representative sample of former nursing students of a School of Health in the center of the country (sample) is studied (Coutinho, 2014). It is assumed as a cross-sectional study because the data were collected at a single moment in time in a representative sample of former nursing students, either to describe or to detect possible relations between variables (Coutinho, 2014).

For the collection of data, a self-completion questionnaire was used, consisting of a socio-demographic and academic characterization questionnaire, the Scale of Anxiety, Depression and Stress by Lovibond and Lovibond, adapted by Pais-Ribeiro, Honrado and Leal (2004), the KEZKAK Scale by Zupiria Gorostidi et al. (2003), translated and adapted for the Portuguese population by Barroso et al. (2008). The psychometric studies for the present study concerning the two scales used reveal very good values of Cronbach's alphas. Hence, for the KEZKAK scale the alpha values were classified as good, with minimum and maximum values ranging from 0.970 to 0.971, in which alpha ($\alpha=0.971$) was classified as very good for the whole scale, higher than for the first half where a value of $\alpha=0.953$ was obtained and $\alpha=0.945$ for the second one, also classified as very good. For the Anxiety, Depression and Stress Scale (EADS-21), the alpha values were also very good, ranging from 0.918 to 0.927.

For the analysis of the data, we used descriptive statistics and analytical or inferential statistics. All statistical treatment was processed through the SPSS program (Statistical Package for the Social Sciences) version 21.0 (2013) for Windows.

RESULTS

The results obtained allowed the tracing of a sociodemographic and academic profile of the sample of 74 former nursing students, mostly female (78.4%) with a mean age of 23.32 years (± 3.407 years). Men, on average ($M=24.40$ years ± 3.282 years), are older than women ($M=23.02$ years ± 3.408 years). Cunha (2011), in his study, also had a sample of students from the 4th year of the Licentiate Degree in Nursing, mostly female (74.0%) aged between 20 and 45 years old, in which clinical teaching in emergency medicine had already been carried out.

Likewise, Custódio, Pereira and Seco (2009), in their study, found that the majority of their sample was female (81.4%).

Participants without partners (93.2%), those who lived with friends/residence (59.5%) during school time and those living in urban areas (82.4%) are predominant. As for the place where the participants performed clinical teaching in emergency medicine, 47.3% reported that it was in Viseu and 36.5% in Baixo Vouga.

As for data on depression, anxiety and stress, it was found that the mean rates were $3.39 (\pm 3.667 \text{ Sd})$ for depression, with $4.74 (\pm 3.468 \text{ Sd})$ for anxiety and a mean value of stress slightly above 6.0, revealing that the former nursing students went through periods of stress during clinical teaching in emergency medicine. In this context, Serra (2010) concluded in his study that anxiety associated with fears significantly reduces the student's confidence in himself/herself, changing his/her biological rhythm as all this tension increases his/her level of stress, including worrying, decreased hours of sleep and rest, and insomnia. The results obtained in the present study are in agreement with those of Cunha (2011), where it was shown that, at the level of the socio-emotional aspect, nursing students in clinical teaching in emergency medicine showed some emotional inconstancy, especially anxiety (86.00%), nervousness (84.00%) and stress (74.00%). According to the author, these results do not have any significant variation according to the place where the clinical teaching in emergency medicine was carried out. It was also verified, regarding the stress factors of the participants of the present study in clinical practice in emergency medicine, for the total stress, a minimum of 0.00 and a maximum of 172.00, corresponding to a mean of $88.02 (\pm 41.397 \text{ Sd})$, with the highest mean value recorded in the "Impotence and uncertainty" dimension $17.39 (\pm 7.889 \text{ Sd})$, which shows that this was the most relevant stress factor for students at the time of clinical teaching in emergency medicine. In terms of mean, the "Lack of Competence" dimension ($M=16.02 \pm 9.076 \text{ Sd}$) and the "Contact with suffering" dimension ($M=13.36 \pm 6.819 \text{ Sd}$) came next. The factor that caused the least stress in the former students was "Close relationship with the student" ($M=2.20 \pm 1.679 \text{ Sd}$). Some studies confirm that clinical teaching nursing students are confronted with a wide variety of vulnerable situations, experiencing levels of stress and anxiety with greater intensity (Barroso, 2009; Custódio, Pereira & Seco, 2009; Cunha, 2011). This draws negative repercussions on their performance, physical health and emotional well-being, depressive symptoms and stress, associated with the fear of failure, which in many cases results in the feeling of impotence and uncertainty and lack of ability in real-life situations of clinical practice. According to Pocinho and Garcia (2008), occupational stress occurs when people perceive their inability to perform the tasks requested, resulting in suffering, discomfort and a feeling of inability to cope with work situations.

Regarding the first research question, which sought to know which sociodemographic variables interfere in the stress of 4th year nursing students of clinical teaching in emergency medicine, it was verified that women are the ones who show higher means in all stress factors in clinical teaching, highlighting the factor close relationship with the student, where there was a statistically significant difference ($p=0.011$). These results corroborate those found by Custódio, Pereira and Seco (2009), according to which female students express significantly more cognitive-emotional and physical manifestations due to stress, while male students demonstrate significantly more Behavioral stress manifestations. Likewise, Custódio (2010) found that female students showed significantly higher mean levels of perception of stress situations than their male counterparts. It can be inferred that the female sex is more vulnerable to stress during clinical teaching. Barroso (2009) points out that this difference between genders may reflect a greater self-confidence of male students and greater sensitivity on behalf of female students and less self-confidence in their performance. Still from the perspective of the same author, male students can be more realistic and objective whereas female students more perfectionist and subjective.

Another result was the fact that the youngest students were the ones who felt the most stress during clinical teaching, except for the factors impotence and uncertainty, close relationship with the student and work overload, which were more present in older students. Even so, there were no statistically significant differences. These results are not in line with those established by Custódio (2010), inasmuch as the author verified that the students of the 2nd, 3rd and 4th year show a greater perception of situations that induce stress than their 1st-year colleagues.

Regarding the second research question, which sought to verify which academic variables influence the stress of 4th year nursing students of clinical teaching in emergency medicine, the variable that interfered statistically was the place where clinical teaching in emergency medicine took place. It was verified that it was the former students

who had carried out the aforementioned clinical teaching in Lamego who revealed having felt more stress during the same period. The close relationship with the student, getting affected by the relationship with the patient/user and work overload was emphasised. It was also verified that the former students who carried out clinical teaching in emergency medicine in Seia revealed having felt stress during its execution. The participants who reported feeling less stress were the ones that said performed their clinical teaching in Oporto, resulting in statistically significant differences in the factor getting affected by the relationship with the patient/user ($p=0.025$) and work overload ($p=0.047$). Since there are no studies that empirically support these results, it is mentioned that Barroso (2009), in her study, also found that, among the factors that most induce stress in clinical teaching students, it is worth noting the factor getting affected by the relationship with the patient/user and work overload. Nevertheless, the author refers to the progressive learning of the clinical context and the familiarity with the situations of care practices, insecurity decreases, giving rise to a positive development in self-esteem, to which is added the development of coping strategies that allow them to control feelings and deal with situations that may induce stress.

Regarding the third research question, which verified that there is a relationship between sociodemographic variables, academic context, stress factors in clinical teaching and depression, anxiety and stress, it was verified that the relationship with the counsellors and colleagues established a direct relation with anxiety. This suggests that the participants with more impact of the relationship with the counsellors and colleagues reveal more anxiety, being these results in line with those attained by Barroso (2009). These results corroborate those obtained by Rodrigues and Veiga (2006), in a study of clinical teaching nursing students in the hospital context, confirming the existence of anxiety and stress triggers in the supervisory process, interpersonal relationships, adapting to multiprofessional teams, the relationship with counsellors and colleagues, as well as confidence in professional abilities. This leads to the conclusion that these situations, generating anxiety and stress in clinical teaching, may affect the performance of nursing students in healthcare provisions. The same authors concluded that the greater the anxiety and stress felt during clinical teaching, the lower the student's technical skills in providing care to the patient. In this regard, Barroso (2009) refers to the need for a better preparation of the counsellors for the teaching and learning process, because when there is no such preparation, it is translated into a lack of fellowship and support, indifference, passivity and little implication in the learning context of clinical practice. The author points out that the counselling nurses are specified by the students as the most important variable in the success of the training in clinical teaching.

It was also found that getting affected by the patient/user relationship and gender establish an inverse relationship with stress, suggesting that participants who are less aware of being affected by the patient/user relationship, and regardless of gender, reveal more stress.

Taking into account the results obtained, and considering the one recommended by Garrido and Simões (2007), it is important to note that the requirements of the situations experienced in clinical teaching influence the performance of students, as they are faced with new situations, resulting in the development of skills related to their transition from student to nurse. In this context, Abreu (2007) points out that this transition will have to be based on a critical reflection by the student on the work situations experienced. More specifically, on the experience acquired in clinical teaching, aiming to reinforce his/her potential on the environment and to develop the ability to transfer skills acquired from one situation to another. Thus, even from the perspective of Abreu (2007), the lived experiences allow the students to be able to effectively use these skills in different work situations, which will result in a good performance. Otherwise, students may experience stress and consequently see their performance compromised.

CONCLUSION

It was concluded that, in a sample of 74 former nursing students, the majority is female (78.4%) with a mean age of 23.32 years (± 3.407 years), without a partner (93.2%), living with friends/residence (59.5%) during school time and living in urban areas (82.4%). It was found that the main locations where the clinical teaching in emergency medicine was carried out was in Viseu (47.3%) and in Baixo Vouga (36.5%).

The mean values were 3.39 (± 3.667 Sd) for depression, 4.74 (± 3.468 Sd) for anxiety and a mean value of stress slightly above 6.0, suggesting that the former nursing students went through phases of stress during their clinical teaching in emergency medicine.

Regarding the stress factors of the students involved in the present study in the emergency clinical practice, a higher mean value was found in the dimension "Impotence and uncertainty" ($M=17.39 \pm 7.889$ Sd), followed by lack of ability ($M=16.02 \pm 9.076$ Sd) and contact with suffering ($M=13.36 \pm 6.819$ Sd).

Concerning the sociodemographic variables that interfered with the students' stress, it was found that women showed higher means in all of the stress factors in clinical teaching, highlighting the factor close relationship with the student, where there was a statistically significant difference ($p=0.011$). Younger students felt more stress during clinical teaching, except for the impotence and uncertainty factors, close relationship with the student and work overload. These factors were more present in the older students, but without any statistically significant differences.

With reference to the second research question, the variable that interfered statistically was the place where the clinical teaching in emergency medicine took place. Also, the students who carried out the aforementioned clinical teaching in Lamego were the ones who felt more stress, emphasising as most stressful factor the close relationship with the student, being affected by the relationship with the patient/user and work overload. It was also verified that the students who carried out the clinical teaching in emergency medicine in Seia evidenced to have felt stress during this period of time. The participants who reported feeling less stress were those who performed clinical teaching in emergency medicine in Porto, resulting in statistically significant differences in the factor being affected by the relationship with the patient/user ($p=0.025$) and in work overload ($p=0.047$).

It was found that the relationship with the counsellors and colleagues established a direct relation with anxiety, suggesting that the participants with more impact of the relationship with the counsellors and colleagues reveal more anxiety. It was also noted that being affected in the patient/user relationship and gender establishes an inverse relationship with depression, suggesting that participants with less impact of being affected in the patient/user relationship, and regardless of gender, reveal more depressive symptoms. Finally, it was concluded that being affected by the relationship with the patient/user and gender establish an inverse relationship with stress, indicating that students with a lower perception of being affected by the relationship with the patient/user, and regardless of gender, reveal more stress.

In light of the results obtained and considering a reflection on the theoretical framework, it can be said that, for nurses, the provision of healthcare in an emergency service is characterized mainly by its complexity and specificity. In consequence, students, compared to nursing professionals, have a lower degree of experience and dexterity, which results in greater difficulties, and thus leading to higher levels of stress. Accordingly, it is suggested the creation of spaces of sharing between students and their peers and counsellors/teachers, where they can express what is less well and share experiences. This will serve as a starting point for the nursing student in order to gain skills and autonomy, which implies the strengthening of communication channels, creation of group dynamics giving rise to Team Building activities, that is, through which nursing students in clinical teaching, in partnership with counsellors/teachers, can be proactive. In this sense, an offering of proposals to build a professional accomplishment capable of promoting quality health care.

It is also suggested that support networks be reinforced within the school itself in order to positively reassess the sources of stress of clinical teaching nursing students, so as to fight against the negative impact of stress factors. This may also involve reinforcing learning and clinical simulation training so that they are able to cope with stressful situations in a positive way and are able to cope with clinical teachings with physical and emotional well-being.

In this perspective, a more simulation-based teaching is suggested. This may contribute to an increase in the knowledge and performance of nursing students, because simulated practices allow for controlled environments, helping students to combine knowledge and skills through an interactive construction with the case. It is considered

that, through the simulation training strategy, more skills gains can be achieved, becoming more critical, active and reflexive students. This is an active teaching strategy for training in hospital settings. The implementation of the practice based on scientific evidence on the basis of simulated teaching may allow an improvement in the teaching and learning process of nursing students, while providing an optimization of the quality of healthcare given to patients, considering that students begin to develop their psychomotor skills of decision, dexterity, knowledge, leadership, clinical judgment and attitude toward nursing and being a nurse. It also assumes as relevant the planning and development of strategies for the various clinical teachings, in particular for clinical teaching in emergency medicine, making it possible to continue the teaching and learning process in close articulation with work contexts.

ABSTRACT

This research aims to describe the collaboration of Islamics' school students in solving the jumping task during the collaborative learning in a mathematics classroom. Collaboration referred to indicators of social ability and emotional development of students that were learn from, care for, and respect one another. The research result indicated that students tended to have attitude of learn from and care of each other with maximal answer truth while care for ability had not yet appeared in students. Students tended to (1) be able to learn from the use of IT-based learning media or visual aids as well as from students' books that had been provided by teachers in solving mathematical problems, (2) able to express their opinions when there were friends who asked about math concept, and (3) able to discuss well between boys and girls.

Keywords: Collaboration, islamics' school, mathematics classroom, collaborative learning

INTRODUCTION

Collaborative classroom is a model for all teachers respecting and supporting all student activities by creating a safe, happy, and exciting atmosphere (Armstrong, 2011). Therefore in this research, what was meant by collaborative mathematics classroom was a model that all math teachers could use to create a learning atmosphere in a fun math class and give students the opportunity to construct their knowledge. Collaborative learning is a learning model referring to communication theory by John Dewey and development theory by Lev Vygotsky (Sato, 2014)

There are four core principles of succeeding a collaborative classroom: 1) social and academic curricula have to be interdependent and related each other, 2) fostering the caring relationship and developing an inclusive and safe environment, 3) classroom learning experiences have to be built around the knowledge developed by students and engage in their actions, and 4) respecting and building the students' intrinsic motivation leading to their engagement and achievement (Classroom, 2015). The four principles were also applied to this research which focused on mathematics learning. Hence, the implementation plan of mathematics learning designed in this research also focused on these four principles and gave every student the opportunity to learn math maximally. During collaborative learning on mathematics learning, students were expected to have good collaboration skills.

Collaboration into several skills, namely (1) demonstrating the ability to work effectively and respectfully with different groups, (2) training fluency and willingness to assist in making compromise needs to accomplish the main goal, and (3) accepting the sharing of responsibilities for collaborative work and the value of individual contributions made by each member of the group (P21, 2016). Future expectation is one day when every school and every classroom provides a safe and supportive environment where children can take the risks needed to grow themselves both socially and academically, and eventually grow into a principled, critical thinker who learn from, care and respect for each other (Anonymous, 2015). Based on the explanation, the collaboration indicators

in this research referred to the indicators of social ability and emotional development of the students that learn from, care for, and respect one another. Students had the learning collaborative skill from IT-based learning media, mathematics tools, student books, and explanations from friends and teachers. Furthermore, students had a sense of care for each other which were being brave to ask friends if there was understandable material, caring to friends by discussing together, and collaborating with friends in solving the jumping problems given by the teacher. Collaboration activities were done when students solved the jumping problem in group discussions.

Jumping task is a suitable task to develop collaborative skill among students (Sato, 2014). Based on Lev Vygotsky's theory, students cannot learn by themselves to develop their academic skills but students develop more if they learn with their friends (Vygotsky, 1980). Jumping task is a set of problems above the students' Zone of Proximal Development (ZPD). This is because students having the low ability or high ability have not been able to solve problems existing in the jumping task, so it needs the collaboration among students in groups. The ZPD is the distance between a student's ability to perform a task under adult guidance and / or with peer collaboration and the student's ability solving the problem independently (Crawford, 1996). According to Vygotsky, learning occurred in this zone.

Student collaboration at Islamic schools in Jember regency, East Java Indonesia had not developed maximally especially collaboration of male students with women students. The collaboration was in the form of mutual learning communication between male students with women students. In addition, students in Jember Regency had not utilized maximally the use of the internet in searching for some mathematical materials that could help them to solve the problems given by the teachers. In everyday life, students used IT for facebook and online games. Furthermore, students also had not been able to have good caring attitude, for example students having good skills (smart) did not want to teach his friends; otherwise, students having low ability did not have the desire to be brave to ask. The use of blackboards at Islamic schools in Jember occupied by teachers and students was also not optimal in helping the smooth learning in the classroom. This resulted student collaboration with blackboard or student collaboration with teachers was also not maximal. Besides, by using a whiteboard maximally, it could improve the learning quality in the math class and able to improve students' learning ability (Balta & Duran, 2015). The use of learning media either interactive projector or general data projector can also improve students' math learning ability (Liu & Cheng, 2015), so it is necessary to collaborate with learning media in the form of interactive projector and general data projector.

Some problems causing students' high order thinking skill of Islamic school were not maximal. It was in accordance with the results of previous research stated that there were 80% of students in Islamic schools around Jember coffee plantations belonging to the Apprentice category, ie students had not been able to have performance ability, especially the utilizing coffee plantations understanding that can support the process of solving math and science problems (Suratno & Kurniati, 2017). Therefore, it was necessary to trace collaboration among students during classroom learning through giving the jumping task. After knowing the collaboration among students in Islamic schools, it could be known the learning model with suitable learning environment used in Islamic schools, especially in Jember, East Java, Indonesia.

METHOD

This research was a descriptive research using qualitative approach. Research aims to describe the collaboration of Islamic school students in solving the jumping task during the collaborative learning in a mathematics classroom. Observations of the students' collaboration were carried out continuously during the collaborative learning. Focuses of the collaborations' observation were how students do learn from, care for, and respect one another. This research was conducted in the Islamic school in Jember regency, East Java, Indonesia. The research subjects were 36 students.

The stages of this research were (1) giving jumping task to each group consisting of 4 students with 2 male and 2 female, (2) observing the collaboration of the four students in one group during doing the jumping task, (3) the analysis of each student's collaboration was based on the observations either written on the observation sheet or video recording during doing the the jumping task, (4) interviewing to some students who were considered observers had not been seen clearly the collaboration process, and (5) determining the collaboration tendency of

all students in finishing the jumping task on mathematics collaborative learning . The observation sheet in this research referred to an open observation sheet and can be seen in Figure 1. The given problem was an essay question, and there were 4 questions relating to the sub-subject of two-dimensional figure. Giving the jumping task was done continuously for four meetings for two-dimensional figure material. The seat position was designed by using cross-linked between male students and female students. It can be seen in Figure 2

Observations' Sheet

RESULT AND DISCUSSION

The research test was conducted on two Islamic schools in Jember regency namely MTsN 2 Jember and MTsN Arjasa 1 Jember with the research participants of 36 students. The research participants were divided into 9 groups. Each group consisted of 4 students (2 males and 2 females). The seat position was designed by using cross-linked between male students and female students.

The seats in the classroom were set in U position. It was expected that there were collaborations between students and teachers and students with different groups. Each group was given the opportunity to share with other groups (but it was emphasized not to cheat the answers of other groups). Observation was focused on student collaboration activities with students, teachers, instructional media, student books, and student work sheet during collaborative-based mathematics learning. Collaboration indicators in this research were learn from, care for, and respect one another.

Groups 1, 2, and 3 were able to solve all the problems given on the jumping task correctly. Female students in group 1 were able to work with male and female students; as well as, male students were able to work with female and male students; so that, male and female students in groups 1, 2, and 3 were able to work well despite the U-seat seating position. When completing the question no 1, the students jointly designed a mathematical model by drawing a house design consisting of two-demintional figure of triangular, rectangles, parallelogram, and square. Furthermore, in solving the problem no 2, students groups 1, 2, and 3 were able to utilize Microsoft Excel program to determine the estimated value of the area of two-dimentional figure in the form of a garden

with an approach of number 5 integration. In the problem no 3 and 4, students utilize books in the library and props provided by the teacher correctly in helping them solve the problem about the design of a house completed by a garden in order to make the house look beautiful with minimal expenses. During the process of solving the problem in jumping task, male or female students in groups 1, 2, and 3 were able to collaborate well, for example one female student having high math ability had concern for three friends having low math ability. Furthermore, the other three students were also brave to ask the smart friend when having difficulty in solving the problem.

Groups 4 and 5 had the same tendency in solving problems on jumping tasks. There were 3 questions from 4 questions answered correctly by groups 4 and 5. Students had the ability to draw a house design consisting of two-dimensional figure of triangular, rectangular, parallelogram, and square to solve the problem number 1. Furthermore, students were also able to utilize the book in the library and props provided by the teacher correctly in helping them solve the problem about the design of a house completed by a garden in order to make the house look beautiful with minimal expenses. However, students had not been able to utilize Microsoft Excel program in solving the problem number 2. In addition, female students of groups 4 and 5 had the same tendency that was able to collaborate with male and female students while male students were unable to collaborate with female students although they were in one group. Male students felt awkward in communicating with female friends. However, all students in groups 2 and 3 were brave to ask the teacher if they had difficulty in solving all the problems.

Groups 6 and 7 had similar collaboration tendency among their students. However groups 6 and 7 were able to complete 3 true questions from 4 given questions. Problem that could not be done was the problem no 1 about utilizing the media in the process of solving the problem. Students in groups 6 and 7 were able to utilize Microsoft excel programs, props, and books in the library in solving the problems 2, 3, and 4. The tendency owned by students in groups 6 and 7 was similar to the tendency of student collaboration in groups 4 and 5, ie female students were able to collaborate with men and women students while male students were only able to collaborate with male friends. In addition, all students in groups 5 and 6 were also brave to ask if they had difficulty in solving the problems to the teacher, and had a concern to friends having difficulty.

Students in groups 8 and 9 were only able to do 2 questions from 4 questions given. This was because students had not been able to utilize the props and books provided in solving the problems. In addition, students also had a tendency to communicate only to friends who had same sex and to teachers. The care of students to ask when they experienced difficulty developed well, but the care of helping each other in solving problems in jumping task was not maximal yet.

Based on the results of collaborative analysis of each group, the tendency of male students' collaboration occurred only with male students. It was different from female students who were able to cooperate with male and female students. Male and female students had similar tendency when they collaborated with II-based learning media, props, and student books. Students were able to utilize the media and books to help them solve the problems provided by the teacher. Furthermore, male students did not have a caring attitude towards friends who were unable to solve the problems, but they had the ability to ask a friend in his group if there was something they did not understand. It was different from female students having a caring attitude towards friends having difficulty. They conveyed their opinions related to the knowledge they had to help friends; as well as, some female students were brave to ask if they did not understand the material in the questions.

Referring to the results of each group's collaboration tendency, it could be seen that a group with good collaboration skills would impact on the result of the jumping task. Students were able to solve all problems correctly if all three collaboration indicators were met. It was in accordance with the results of other researches suggesting that collaboration among students can have a positive impact on students when they solve the problems (Zumbach, Reimann, & Koch, 2006). Therefore, learning of mathematics must be done continuously and it had to focus on collaboration among students and utilize the jumping task; so that, students' math skills would increase.

CONCLUSIONS

The research result indicated that students tended to have attitude of learn from and care of each other with maximal answer truth while care for ability had not yet appeared in students. Students tended to:

1. be able to learn from the use of IT-based learning media or visual aids as well as from students' books that had been provided by teachers in solving mathematical problems,
2. be able to express their opinions when there were friends who asked about math concept,
3. be able to discuss well between boys and girls.

SUGGESTION

Mathematics learning activities especially in Islamic school is done by focusing on collaboration among students, especially caring for among students, for example students having good ability have to care to other friends whose ability are low by teaching and discussing each other. Furthermore, students having low ability have to be brave to ask friends who have better ability than his ability or to the teacher, so the ability of math increases. Collaborative activities have to be a culture in school learning either in math or other subjects. The quality of learning will increase if students' collaboration and student-teacher collaboration maximally implement. The research results can be used by Islamic schools to determine the learning model and what kind of learning environment is suitable to be used in improving the learning quality.

ACKNOWLEDGMENT

ABSTRACT

Service learning is a pedagogical model for educating students at schools or universities in different dimensions: cognitive, ethical, civic, democratic. This model, very common in the USA, is not well known in Europe.

At Verona University (Mortari, 2017), in Italy, the Center of educational and didactic research proposed the Service Learning model to pre-service teachers education. To avoid using a training model where students simply “apply” academic learning within the class and where schools are considered only as passive locations, students are engaged as service teacher collaborators and educational researchers.

This Community Service Learning project offered pre-service teachers multiple educational directions, not simply theoretical and instrumental learning, and provided them opportunities to: face the complexity of school-life; be the apprentice of in-service teachers; orient teacher education toward an ethical approach; and educate teachers as researchers.

All these directions are core competence requirements as indicated by the European Commission (2013, 2014).

Following this vision, our department chose to pay attention to schools where the complexity of social and educational contexts was growing.

This paper will present this educational path, starting from the theoretical framework nurtured by an ethical and political vision of education, and moving toward its practical and organizational aspects.

Keywords: initial teacher education; Community Service Learning; teacher-researcher; ethical competence.

1. INTRODUCTION

Pedagogy is a practical wisdom, and it needs to be rooted in a theoretical vision able to nurture its practice and orient its choices. Moreover, pedagogy has a special responsibility toward the community because it deals with the education of people as individuals and as citizens; it deals with the future of the whole society. Pedagogy should thus be framed within an ethical and political theory and rooted in them. Rethinking education as an ethical and political act requires one to imagine and design new educational paths that are able to enforce these two dimensions that are essential for every human being and for every human community.

The necessity to frame educative path within an ethical and political theory is particularly urgent for teacher education; in fact, teacher educators are not only responsible for the education of these adults but also for the children whom the teachers will deal with. There is a double responsibility that requires deeper attention, i.e., a path that is educational not only in its “content” (*what* you teach) but also in its “form” (*how* you teach). Moreover, education should be rooted in reality, in real people’s life; in particular, teachers should be intuitive and pay attention to every child they meet, and they should know how to face the complexities of everyday class life (within specific social contexts: with different social, multicultural, and multilingual backgrounds).

The Community Service Learning (CSL) model responds to this deep vision of pedagogy, and in particular, of teacher education. It has been 50 years since the term “service learning” entered the scientific literature (Stanton, Giles, & Cruz, 1999; see the systematic review in Ubbiali, 2017) as a pedagogical model for educating students

at schools or universities in different dimensions: cognitive, ethical, civic, democratic. This model, very common in the USA, is not well known nor has it been adopted in Europe.

At Verona University (Mortari, 2017), the Center of educational and didactic research proposed the Community Service Learning model to pre-service teachers whose academic education requires long periods of scholastic training. This proposal not only educates teachers with a wider vision but also acts “politically,” i.e. paying attention to the common good. In fact, this CSL model answers to the calls from our society and from the schools that must deal with new challenges, very often with few sources to confront them. Moreover, this CSL model has a political vision of the university, engaging it in research that responds to the real needs of the community.

In this paper, are presented in detail the theoretical background and a review of the main themes referred to in community service learning and teacher education, as well as the Verona proposal contained in the Master's Degree in Primary Teacher Education.

2. AN ETHICAL APPROACH TO EDUCATIONAL POLICY

According to Aristotle, every being tends toward the good (*Nichomachean Ethics*); human beings look for a good life and for what makes life worth living: the research of the good is the direction orienting our soul to life (Plato, *Republic*, VI, 505e), and it is what allows us to reach wisdom.

Ethics is the discipline that has good as the systematic object of its research. Human beings need ethics as a guide for their tension “aiming at a good life lived with and for others in just institutions” (Ricoeur, 1992, p. 172). Ricoeur himself, to give voice to this necessity, connects ethics to the experience of care, and to avoid a too-generic meaning of the term “aiming” or “wish” (in the original: *souhait*), he suggests substituting “aiming” with the term “care.” As a consequence, he establishes ethics as a discourse about care for oneself, care for the others, and care for institutions (1990). As Ricoeur is a philosopher external to the debate about care, his proposal is interesting because it suggests that the ethics of care could be extended even to the institutional dimension of social life. In this way, care spills over its boundaries into private life and becomes a fundament for public and political life (traditionally founded on the ethics of justice).

In contemporary life, we find the important presence of care in many places: schools, social services, hospitals, voluntary organizations, public organizations, etc. However, social life is also moved by other rationales, often contrary to the ethics of care. In fact, according to a shared sociological analysis of our context, we can affirm we are in a liberistic society, based on competition, where a “good life” is intended as the affirmation of oneself. This individualistic way of living is one of the main risks for a democracy. In fact, if communitarian feelings become weak, democratic culture, i.e., a vision of public life founded on responsibility, solidarity, and engagement in the community, is at risk. These dimensions are strictly connected, and it is very important to consider them in a circular and mutual relationship in order to avoid believing that because these are very recurrent words in our political and medial language, they are also real characteristics of our society. In fact, when the call for responsibility is only empty, rhetorical speech, the excess of solidarity becomes an excess of charity and piety (Bauman, 1999). That which makes the difference are the “structural” responsibilities and solidarity, which become a sort of “grammar” for civic action.

The characteristic of a community is the principle of solidarity (Stein, 2000) that makes society a place where every member is recognized in his/her originality as a subject able to give his/her own contribution to the community project, whose sharing is the basis of the community itself.

2.1 Toward a new vision of society and of education

At the hearth of a cultural policy is a culture of education, because without educated minds, there is no possibility of cultivating a society. It is very compelling to rethink educational policy because the institutions devoted to youth education are facing an unprecedented crisis. These institutions, instead of projecting along utopic and atopic lines and imagining a quality of life oriented to the good, enforce the individualistic ethos of the present time. There is an individualistic approach toward knowledge as toward life: a good life is intended as an individualistic affirmation regardless of the others' lives, but a so-intended sense of existence forgets that the essence of the human substance is relational, and every personal development is strictly connected to the others'. The sense of community, of being with the other within a common project involving everybody, must be replaced at the core of the politics, and in particular, of educational policy.

Instead, following the individualistic culture that is the foundation of the liberistic policy, the actual educational practice is poor and minimal, engaged in developing only the skills useful to a society that assesses everything in economic and self-affirmation terms. This model is defined as a “banking model of education” (Marullo & Edwards, 2000, p. 746); competitions and technical skills are the competences emphasized in many educational programs. What is not referred to in this model, for example, the humanities, is considered useless and worthless. Our schools and universities do not cultivate social, ethical, empathic intelligence, thus generating an “illiteracy of civic competences.”

Education is a practice, and it requires a theory to give it form. An effective theory of education should improve the young to “give form” to their life, to make flourish all the existential dimensions of life: that means that education cannot be reduced only to the instructional dimension. Instead, education must cultivate every aspect of life: cognitive, social, emotional, spiritual, ethical, and political.

If education is a practice, we have to design educational paths and experiences able to reach its complex purpose (the flourishing of every human aspect), rooted in reality. According to Dewey (1938), education requires a meaningful way to stay within experience, with a reflective element: an experience aimed at not only learning cognitive or technical skills but also the competences that make a person an engaged citizen (Dewey, 1916). In American literature, there is particular emphasis on the theorization and the design of practices that cultivate the development of every kind of intelligence; for example, many authors talk about “prosocial education” as an educational practice that promotes relational dimensions. Examples of prosocial education are “character education,” “cooperative learning,” “moral development,” “citizenship education,” “service learning,” and “social and emotional learning” (Brown, Corrigan, & D’Alessandro, 2012, p. XIII).

We need to work to realize a new vision of education which provides a meaningful experience, i.e., one able to “give form” to a “good person” and to a “good society.” We need an ethical vision of education (Aristotle, *Nichoamchean Ethics*).

3. THE CHALLENGES IN TEACHER TRAINING AND EDUCATION

Within this social scenery and educational vision, teachers have a very important role; caring about their training (pre-service or in-service) is critical for creating “ethical” children and “ethical” citizens, and as a consequence, an “ethical” society.

In multiple official documents (2013, 2014), the European Commission (EC) indicated some core competences required for actual teacher education (pre-service and in-service).

In particular, the EC underlines the importance of these competences (2014, p. 2-3): “sound knowledge frameworks (e.g., about school curricula, education theories, assessment), supported by effective knowledge management strategies; a deep knowledge of how to teach specific subjects, connected with digital competences and students’ learning; classroom teaching/management skills and strategies; interpersonal, reflective and research skills, for cooperative work in schools as professional communities of practice; critical attitudes toward their own professional actions, based on sources of different kinds—students’ outcomes, theory and professional dialogue—to engage in innovation; positive attitudes to continuous professional development, collaboration, diversity and inclusion; [and] the capability of adapting plans and practices to contexts and students’ needs.”

3.1 New challenges, new competences

In theoretical and empirical research (Mortari 2009; 2010; 2017), we can find that what is required is not only academic learning or technical practices (i.e., the traditional university discipline), but also more complex competences that respect the complexity of the teaching and learning process in the contemporary “knowledge society.”

In this paper, we would like to stress the teacher competences deriving from this research:

- *To learn how to face the complexity of real, everyday school life* (Mortari, 2009; Biesta, 2012). The teaching process is one of the most complex human actions; moreover, the school context and the social and familial background of students nowadays is very complex and multifaceted. Very often, schools (and teachers in particular) must deal with numerous challenges related to the different cultures of education and with new educational needs.
- *To be the apprentice of in-service teachers, whose expertise is rich and too often not valorized* (Schneider, 2008). Pedagogy is a practical knowledge, a form of wisdom of educational activity. This wisdom

can be obtained only because of the transmission of expertise from one practitioner to another. There is a richness of experience that in-service teachers have gained in their work life, one that is very often not enhanced or promoted, and even transmitted to novice. University and teacher training programs must promote the transfer of this expertise.

- *To orient teacher education toward an ethical approach* (Mortari, 2017). Education is a very delicate process that deals with the alterity and individuality of a child, and the adult can wound the child's mind and his/her existence; moreover, the entire process of teaching and learning carries a social and political responsibility, since to educate means to build the future society. Teachers should be trained as ethical actors, teaching with care, acting virtuously, and engaging in civic responsibility.
- *To educate teachers as researchers* (Dewey, 1929; Taber, 2007; Mortari, 2009). The complex world of education does not have ready-to-use solutions to everyday challenges because of the situational and contextual dimensions of education itself. An effective teacher should become a researcher, i.e., a practitioner able to analyze his/her own practices and critically reflect on them.

3.2 The voice of schools

In the schools, the complexity of social and educational contexts is growing. Teachers, who are often alone to deal with new challenges concerning with pupils, families and institutions, need practical help, new theories, proposals, and frameworks that can give them answers.

The university is too often separated and distant from the school real life and its research far from the real needs of the community.

4. THE COMMUNITY SERVICE LEARNING AT VERONA UNIVERSITY

According to these social directions, trying to answer these challenges (cultural, political, academic, and educational), and listening to the school's call for help, the Center of educational and didactic research proposed a Community Service Learning path in the academic courses for pre-service teacher education at the University of Verona (Italy).

Community Service Learning is first of all a form of "experiential learning," an educational experience that engages students in real-life problems (Wurdinger & Carlson, 2010). However, CSL does not consider the relationship between university and context in an instrumental way; the "real world" is not only a laboratory useful for making learning meaningful. There is also the possibility of giving the community something useful, a contribution to improving the environment itself.

In the literature, many authors attest that practices of service learning can be organized at every educational level, from kindergarten to university (Furco & Root, 2010; Kielsmeier, 2010; Hart & King, 2007).

At Verona University (Mortari, 2017), the CSL model is proposed to pre-service teachers whose academic education required long periods of scholastic training. To avoid using a training model where students simply "apply" academic learning within the class and where schools are considered only as passive locations without any earning, students is offered the possibility to spend their training time as service teacher collaborators and educational researchers.

The name of our path is "Laboratory LeCoSe"—Learning Community Service. This name sounds like the Italian phrase *le cose*, or "the things," i.e., the important things that must be learned in order to become a "good" teacher and a "good" person.

4.1 What is service learning?

The term service learning was used for the first time in 1946 and entered into the scientific literature in the 1980s (Stanton, Giles, & Cruz, 1999; see the systematic review in Ubbiali, 2017) as a pedagogical model able to educate the students in all their personal dimensions (cognitive, ethical, civic, and democratic) within a school or a university.

4.1.1 A definition

Service Learning is an educative method that can strengthen both the learning processes and the reflective competences by engaging learners in activities useful to the local community.

A commonly cited definition (Bringle & Hatcher, 1995) argues that:

“service learning [is] a course-based, credit-bearing, educational experience in which students (a) participate in an organized service activity that meet identified community needs and (b) reflect on the service activity in such a way as to gain further understanding of course content, a broader appreciation of the discipline, and an enhanced sense of civic responsibility” (p. 112).

The USA Congress has defined SL in the *National and Community Service Trust Act of 1993* (p. 59):

“The term 'service-learning' means a method--

(A) under which students or participants learn and develop through active participation in thoughtfully organized service that

(i) is conducted in and meets the needs of a community;

(ii) is coordinated with an elementary school, secondary school, institution of higher education, or community service program, and with the community; and

(iii) helps foster civic responsibility; and

(B) that

(i) is integrated into and enhances the academic curriculum of the students, or the educational components of the community service program in which the participants are enrolled; and

(ii) provides structured time for the students or participants to reflect on the service experience.”

Under the rubric of SL, a sort of spectrum of service programs (Furco, 1996; Sigmon, 1994), it is possible to find very different programs that combine service and learning. Along this continuum, there are programs that emphasize the service component and the served (volunteer activities and community service) and, at the opposite end, programs that focus on the learning and the provider of the service (internship or on-field experiences). According to Furco and Sigmon, however, only practices where service and learning are in a mutual relationship without the supremacy of one against the other can be defined as real SL.

4.1.2 An equilibrium between different dimensions

Sigmon (1994) presents SL as a practice in equilibrium between service and learning that is different from other educational methods; in SL there is no preeminence of one of the two dimensions over the other. Furco (1996) underlines that the beneficiaries of the experience are both the recipient (the community partner) and the provider (the student).

Bringle and Hatcher (2009) note that the specificity of SL is a service experience integrated within an educational/academic course. Different from other practice-based or community-based learning experiences, SL is a part of a course aimed at developing civic competences. Also, unlike the community-service programs (usually practiced as an extra-curricular activity), SL is integrated in its contents and methodologies and is considered to be an important part of the curriculum. A so-intended SL not only links the school and the university to the “real world,” but also generates a meaningful learning experience while enhancing the community.

Many authors stress the different dimensions that constitute SL experiences: service (service experience meeting a community need); academics (applying academic knowledge and critical thinking skills); civic responsibility (service experience promoting active citizenship); and reflection (leading to a deeper understanding of course content and civic engagement).

Research suggests that SL also supports the learning of efficient, focused, shared decision-making practices (Buchanan, Baldwin, & Rudisill, 2002; Carrington & Saggars, 2008), and that by serving others, students learn more than in a traditional curriculum, think critically and creatively, appreciate personal and social responsibility, develop empathy, and grow in self-esteem (Conrad & Hedin, 1991).

4.1.3 Different monikers, shared criteria

“The scope of what potentially counts as service learning has thus resulted in the development of multiple monikers—academic service learning, community-based service learning, field-based community service” (Butin, 2003, p. 1676), i.e., different monikers for different emphasis. Even if a unique definition does not exist, there are some criteria shared by most authors for SL to be legitimate, ethical, and useful. They may be described as the “4 Rs:” respect, reciprocity, relevance, and reflection (Campus Compact, 2002; MJCSL, 2001; Sigmon, 1979).

An SL provider should respect the one being served rather than see him as someone poor who needs charity. The service should benefit both the provider and the beneficiary, and the member of the community should be both

the subject of and the cooperator in the service action. The service should also be relevant to the academic content of the course, and finally, the service should be reflected upon, because SL “does not provide transparent experiences” (Butin, 2003, p. 1677), and this reflection is necessary to transform action into meaningful learning.

4.1.4 The community service learning

The community service learning programs (such as the “community-based service learning,” Baldwin et al., 2007) stress the dimension of the community as a necessary active partner in every phase of the project. The community must be involved not only at a political and organizational level but also in the design phase, in the initial period of context analysis, during the service action of the student, and in the evaluation of the results of the student’s action.

4.1.5 Service learning and teacher education

Since the 1990s, SL has gained the attention of teacher educators in the USA; many guides offer examples of teacher education institutions that offer comprehensive programs combining courses and fieldwork in SL (Council of Chief State School Officers, 1995; Erickson & Anderson, 1997; Wade, 1997). Anderson and Erickson (2003) counted more than 300 teacher training programs that integrate SL into the curriculum.

In his synthesis and literature review, Anderson (1988, p. 3) argues that teacher educators cite the following reasons for integrating service learning into their courses:

“(1) to prepare new teachers to use service-learning as a teaching method with their K-12 students; (2) to help socialize teachers in the essential moral and civic obligations of teaching, including teaching with “care,” fostering life-long civic engagement, adapting to the needs of learners with diverse and special needs, and having a commitment to advocate for social justice for children and families; (3) to enhance preservice teachers’ ability to reflect critically on current educational practices and their own teaching; (4) to develop in preservice teachers the dispositions and abilities needed to easily and fully adopt other educational reforms such as authentic assessment, teaching with integrated thematic units, focusing on higher order thinking skills, and making improvements in school schedules and climate; (5) to accelerate the process of learning how to perform a variety of roles needed to meet the needs of students such as counselor, community liaison, advocate, and moral leader; and (6) to develop human service-oriented teachers who can work effectively in schools with integrated services or other social service settings.”

Kirtman (2008) says that there are few researches about service learning and teacher training; the available studies focus on comprehending the challenges of contemporary society and the engagement in community life. If SL is useful for enhancing a transformative vision of the teaching and learning practice, it is also very useful for an inclusive education with special-needs children (Russel, 2007), in multicultural contexts (Baldwin, Buchanan & Rudisill, 2007), in poor areas (Boyle-Baise & Sleeter, 2000), and in building a community of practice involving the university, the school, and the community (Swick, 2001).

Wade (1997, pp. 185-186) affirms that SL is particularly suitable for teacher training, and in fact: (a) it provides student teachers with opportunities to practice reflection so as to engage their pupils to do the same; (b) it fosters a student-centered, caring approach to teaching (as in the service experience, it is beneficiary-centered); (c) it develops a more complex vision of teaching and learning practices, enhances creativity, and searches for local resources to develop educational projects; and (d) it offers pre-service teachers the opportunity to develop autonomy in their teaching.

5. LECOSE: SERVICE LEARNING AT VERONA UNIVERSITY

At the University of Verona, for the Master's Degree in Primary Teacher Education program, the Community Service Learning model was chosen because it speaks to a triple challenge in the contemporary higher-education context:

- the necessity to orient the educational processes of the students, in order to prepare them to meet the complexity of the real school world;
- the distress signal from the school that has to face new educational challenges; and
- the desire to re-think the University role as an actor to be engaged in serving the community.

To face these challenges, it was designed and it has been conducting a laboratory where needs, requests, sources, and competences of every participant interact, benefitting the students, faculty, and school teachers. In this

environment, the students' learning occurs within a service activity due to the reflective mediation of the community of practitioners (school teachers), and the supervision of university (the faculty and the researchers of the Laboratory LeCoSe) who accompany them in this research process that activates a reflective posture toward their service experience.

This project started in the academic year 2015-16 and is currently in its third year.

In summary, the Laboratory LeCoSe project is a Community Service Learning experience where the pre-service teachers are involved in helping the in-service teachers in their everyday educational job, and for the university students, the laboratory is a place to design and improve the basis for their dissertation research.

The SL project at Verona University works on three areas:

- political actions;
- the involvement of school teachers; and
- the involvement of university students.

At a *political level*, the university assumes the project for pre-service, obligatory training in schools; the university signed an agreement with the Office of Education of the Veneto region, and can offer this proposal to the schools.

When schools are in session, the academic team meets the *teachers* and collects their specific needs (or desires) related to the problems or the challenges of their everyday lives at school.

After an analysis of these collected needs, the *students* are involved and paired with the teachers who become their mentors. Together, and with the supervision of academic team, the students perform their service in the schools; they meet and study the context, make a deeper analysis of the teacher's need, design a pedagogical path to provide a solution to that need, and perform research on their actions.

From the point of view of *service*, the students help in-service teachers in their professional lives.

From the point of view of *learning*, the students learn from an "elder" and a more expert teacher, and they learn to become a "practical researcher." In fact, we are convinced that the research competence is fundamental to becoming a professional teacher.

All these dimensions are lived within a *community* context: a community made of pupils, in-service teachers, pre-service teachers, and an academic team.

5.1 The phases of the project

Our project consists of five phases:

1. *Identification of the teacher's need.* Using an open questionnaire, the teachers are asked to identify and describe a need for which they would like to receive help. The identified need is then discussed and shared with the university team so that the problem can be analyzed from different perspectives.
2. *Literature review.* Students look for contribution from the literature about the need they face and the project they must design.
3. *Design of an educational project that answers the identified need.* The project involves the teacher and the student with different functions at different levels, but all activities are coordinated and shared.
4. *Period for class observation and familiarization with the context.* Students pass some days at school to meet children, to become familiar to them and to observe class dynamics.
5. *Service action.* After appropriate preparation and sharing of ideas with the teachers, students work on their project with the teacher.
6. *Realization of a research related to their educational project.* During the period of their class service, the students collect qualitative data which they will process within a methodological framework that they have built together with the academic team. This framework will follow the idea of the educational research (Mortari, 2009) that is useful for teaching practice.
- 7.

5.2 Different types of service performed by students

Since every class is different and has its own characteristics, and every teacher has his/her own approach, every expressed need is different. Consequently, every educational path is different. In order to provide insight into the complex variability of the projects we have undertaken during these first years, we can categorize the projects into two different groups: 1) projects designed by the teacher (during the phase of expressing their needs, some teachers had already identified a strategy for meeting their need, involving a university student); and 2) projects

designed together with the academic team (some teachers asked for help even while identifying an appropriate educational project to meet their need).

Until now, students have been involved in:

- *operational projects*: Students were asked to help their mentor with a specific project during the class lessons (for example: students helped teachers to assist pupils during work group periods).
- *“indirect” service*: Students were asked to perform a critical analysis of the teacher’s practices through an accurate documentation of his/her job or a research focusing on his/her didactic actions (for example, students documented an innovative science laboratory or analyzed the relational dynamics during the class conversations guided by the teacher).
- *design projects*: In order to face very complex situations, teachers asked students and faculty for help in identifying educational strategies (for example, students created a project to improve the well-being of a very conflictual class).

Students were asked to document the teacher’s educational path starting from the idea of “practicality” (Black & Halliwell, 2000, p. 103; Mortari, 2009, p. 120), i.e., what the teacher does and what he/she is thinking while teaching. This documentation, together with the analysis of the need and of the school context, represents the first part of the dissertation.

5.3 The service research

The service experience is also thought of as a research experience, an empirical, pedagogical research (Mortari, 2003; 2007; 2009). In particular, the research that refers to the SL experience can be defined as a “service research” (Mortari, 2003; 2017), i.e., a research that is useful for educators to improve their competences and their capacity to read (and to try to solve) their classes challenges. The research is designed following four steps:

1. *identification of the research question*: identified as starting from the expressed need and the realized project;
2. *identification of the appropriated instruments for data collection*: instruments, typical of the qualitative methods, must be coherent with the question;
3. *data analysis*: following a naturalistic epistemology and a phenomenological philosophy, through a mix of different methods (Mortari, 2007); and
4. *writing of the research report*: the second part of the dissertation.

5.4 An example of service learning

A teacher in a 4th grade primary school class wanted to organize collaborative, didactical activities in order to improve both active and collaborative learning with her pupils. The class was so large that she needed the presence of a collaborator, and the service-learning university student was asked to act as one. The pre-service teacher helped the in-service teacher by finding the theoretical instruments to plan a collaborative experience, organizing the activities, helping pupils, and producing thorough documentation of the experience.

At the end of the in-field experience, the student who collected the qualitative data from the class performed research that tried to analyze and evaluate the experience. The teacher was interested in understanding how the communication between the children had changed based on the work groups. The research analysis was done following the “discourse analysis” model elaborated by Mortari (2002).

Another teacher, instead, who was very expert and does not have specific issues with her pupils, was interested in assessing her way of teaching. She elaborated a method, she called “circular discussion”, for primary school children that consists in stopping the lesson whenever a pupil asks for a question, sitting round, and debating about it. Questions were usually rooted in something happening during the lesson, and can be referred to different disciplines. The teacher was convinced that this is an effective method to improve children’s competences. But the teacher was not sure that her intentions were really reached, and she wondered if her way of conducting these discussions was really democratic.

She asked the university student for a service research showing her what children really learned from the “circular discussions” and what kind of leadership she was acting in conducting them. The university student entered the class as a “supportive teacher”, having an intense relationship with children and helping the teacher in her normal activity; when a question was asked and a circular discussion started, the university student turned on her audio recorder and started to collect field notes. The data analysis, conducted following the “discourse analysis” and the “content analysis” (Mortari, 2002; 2007) offered the teacher a clear vision of the teaching and

learning experience in her class. The analysis showed that children increased their interdisciplinary competences, their research competence (the capacity to look for answers without expecting them from teachers), the co-constructive dimension of knowledge, the dialogical skills (that also means interpersonal and civic respect for others' idea).

6. CONCLUSIONS

At the beginning of our third year in the laboratory, we can confirm that CSL is a very effective practice that answers the challenges in our contemporary educational context. Students, teachers, principals, and school politicians are enthusiastic about the experience; we collected their opinions unofficially and officially, for example, during dissertations, in seminars, and during a conference we organized in November of 2016.

In summary, the Community Service Learning experience at the University of Verona is a circular practice where service, learning, research, and the creation of the community are brought together. As shown in Figure 1, we can summarize the dimensions of the project as follows:

- service*: the student performs a service as an answer to a real school need;
- learning*: the student learns from his/her expert mentor;
- research*: the student collects and analyses data during the service learning experience;
- learning*: the student learns the research competence; and
- further service*: the school receives the results and the evaluation of the “service research.”

All these dimensions build, step-by-step, a real *community* between the school and the university, providing a political vision of education.

ABSTRACT

The Visegrad group of countries (known as the "V4" countries) is formed by four Central European countries - the Czech Republic, Hungary, Poland and Slovakia. These countries have historically similar political and economic development and also a close cooperation (especially the Czech Republic and Slovakia). Nowadays all these four countries are members of European Union. All these factors (the pre and post-communist situation and EU development) and also the financial crisis in 2008-2009 had an impact and have influence on the situation inside the countries including higher education sector. As higher education institutions (HEIs) across Europe face a threat of critical underfunding and higher dependence on public sources and as we think that the situation might be worse in V4 countries, we decided to compare the situation in these countries. The main studied factors are % of population studied at HEIs, % of GDP spent on education and on the higher education, internal rate of public net financial returns on attending tertiary education or the factors forming the 5th pillar of the Global Competitiveness Index, followed by government subsidies and study fees in V4 countries. For the comparison the multi-criteria evaluation of alternatives methods were used.

INTRODUCTION

Higher education is nowadays an essential part of a productive economy. The way how it is governed and managed has become a major policy issue. The changes inside this sector cover the restructuring of academic programmes to make them more compatible with the needs of the practice, the higher emphasis on research targets and outputs which are measurable and supported by competitively earned funding, the increase the quality standards or the linkage with the industry or services (Hazelkorn, 2015). If the higher education should be the engine of the economy, it is necessary for governments to invest more money into this sector. The dependence on the public sources seems to be a problem and so the discussion about the private sources and tuition fees is more important than before. A possibility to increase the private sources to help the higher education exist but according to Štefánik and Horvát (2015) a declining trend towards private returns in more recent tertiary education is observable especially in the Czech republic, Poland and Slovakia (out of the central European countries). Within the changes of the HEIs the trends of education sustainable development can be seen also in the central Europe but with the reaching of lower transition stages than other western European countries (Dlouhá t. al. (2017).

European higher education institutions (HEIs) can be academically or professionally oriented and usually are separated according to the main funding sources as public and private ones. Academic higher education is traditionally offered by universities whereas professional higher education is offered by non-university institutions - universities of applied sciences, university colleges, polytechnics, institutes of technology etc. Terminology in higher professional education is based on national concepts and is generally a product of historical tradition and background. The problem is that there is no clear and internationally shared definition for the two types of higher education (Camilleri et al., 2013). In some European countries the distinction of the academic/professional higher education was influenced by the Bologna process that started the reform of higher education in the sense of the separation of the system into two cycles, undergraduate (usually three year study bachelor degree) and graduate (Bologna declaration, 1999). According to these changes more non-university institutions practically oriented started to grow. More about the professional higher education in selected European countries was presented in Kuncova, Mulac (2015).

A lot of problems connected mainly with the underfunding from public sources, uneasy ways of private funding or the demographic decrease can be seen not only in the central Europe. As we see that the situation of the higher education in the Czech Republic is getting worse, we decided to compare it with the closest countries belonging to the so-called Visegrad group (to continue with our previous research - Kuncova, Mulac, 2016). This paper describes the situation in each of the Visegrad group of countries from the higher education point of view. The

main aim is to compare the systems, the differences of the institution types, the expenses on education, subsidies and fees, and also the trends in the factors forming the 5th pillar of the Global Competitiveness Index aimed at higher education and training.

THE STUDY

The Visegrad Group, also known as the "Visegrad Four" or simply "V4", is a regional grouping of four Central European countries, including the Czech Republic, Hungary, Poland and Slovakia. V4 was founded in 1991 at a meeting of the presidents of these countries in the Hungarian town of Visegrad. In the then post-communist era, its main objective was to create a democratic environment and lay the foundations for a functioning market economy, including the gradual building of a free trade area. The basic economic objectives of the grouping were in fact fulfilled by the accession of the V4 countries to the European Union in 2004. The importance was therefore moving to strengthening stability in the Central European region and creating conditions for optimal co-operation with all countries. The importance of V4 has increased recently in the context of the migration crisis and introducing mandatory relocation of migrants. The Visegrad Group wishes to contribute towards building the European security architecture based on effective, functionally complementary and mutually reinforcing cooperation and coordination within existing European and transatlantic institutions. In order to preserve and promote cultural cohesion, cooperation within the Visegrad Group will enhance the imparting of values in the field of culture, education, science and exchange of information. (Visegrad Group, 2017)

The states associated to the Visegrad Group have historically, economically and politically passed through stages of co-development and thus raise questions as to how far they have been able to build on earlier cooperation and how their relations evolve in the new conditions of the market economy and EU membership. Especially the higher education systems are changing nowadays so the main aim of this article is to compare the trends in V4 countries. As some other studies consider the Czech Republic and Hungary to be better than Poland and Slovakia (Kuncova, Mulac, 2016; Kosmaczewska, Barczak, 2015) we try to find out if it is valid also in the financing of higher education and in the higher education competitiveness.

Data was taken from the Eurostat (2017) and from the Global Competitiveness Reports (2009-2016). The Global Competitiveness Index is created by these 12 pillars - 1. Institutions, 2. Infrastructure, 3. Macroeconomic stability, 4. Health and Primary Education, 5. Higher education and training, 6. Goods market efficiency, 7. Labour market efficiency, 8. Financial market sophistication, 9. Technological readiness, 10. Market size, 11. Business sophistication, 12. Innovation. The 5th pillar aimed at Higher education and training covers 8 parts:

- 5.01 Secondary education enrollment rate
- 5.02 Tertiary education enrollment rate
- 5.03 Quality of the education system
- 5.04 Quality of math and science education
- 5.05 Quality of management schools
- 5.06 Internet access in schools
- 5.07 Local availability of research and training services
- 5.08 Extent of staff training

Each part is measured on the scale 1-7 (the higher the better) and afterwards the ranking of countries is created.

The description of higher education system and the subsidies and fees in each of the V4 countries is below:

Higher Education in the Czech Republic

Higher education in the Czech Republic is realised at higher education institutions and consists of three cycles: bachelor's, master's and doctoral degree programme. Regarding the system of funding and ownership higher education institutions can be public institutions (legally established), private institutions, existing on the basis of the state approval and state-run institutions (only in the case of military and police academies), legally established under the control of the relevant ministries. In 2017 higher education in the Czech Republic is provided by 26 public higher education institutions, 2 state higher education institutions and 40 private higher education institutions Under the Higher Education Act, they are classified as university type (24 public, 2 state and 3 private) which offer study programmes at all three levels of higher education and non-university type (2 public and 37 private) which offer mainly bachelor's programmes but may also provide Master's programmes. (MSMT, 2017b).

Public and state higher education institutions are established by law and they are funded from the state budget. The main difference between them is the fact that public institutions have the status of a legal entity and they are self-governing organisations with a property passed on them by the state whilst state higher education institutions are governed by the relevant ministries as organisational units of the state. Private higher education institutions could come into existence since 1998 by the 1998 Higher Education Act. The legal entity that establishes a private

education institution is required to have an approval from the Ministry of Education, Youth and Sports. Contrary to the public and state institutions the private ones receive funds from other sources than is the state budget. They can receive a subsidy from the Ministry of Education, Youth and Sports only if they have the status of a public benefit corporation (Eurydice-CR, 2017).

Study programmes are subject to accreditation awarded by the Ministry of Education, Youth and Sports on the basis of the Accreditation Commission standpoint. In April 2016 the amendment to Higher Education Act was approved. New rules for accreditation, including establishment of independent Accreditation Office, and a new system of quality evaluation of higher education institutions were set. In 2017 first accreditation processes started under these new conditions (NAUVS, 2017).

Almost all public higher education institutions with the exception of two are the university type of institutions and both state higher education institutions are universities too. Universities may offer all three types of study programmes and carry out scientific, research, developmental, artistic or other creative activities connected with these. Non-university type of HEIs offer mainly bachelor's degree programmes, only a few of them also master's degree programmes. Their bachelor programmes usually include a period (several weeks – according to the new rules it should be at least 12 weeks) of practical training. They also carry out research, art and other creative activities connected to the programme. All private higher education institutions started as institutions of the non-university type, only three of them became universities lately. (Eurydice-CR, 2017)

The system for financing public universities and non-university type of higher education institutions is the same and also the criteria for evaluation of institutions are common for both segments. The portfolio of the criteria is quite wide, which creates space for some specialization of each institution. The formula of contribution allocation was depended only on quantity of students till 2009 but the demographic decrease and financial situation caused the change of the rules. The new mechanism of performance based funding covers the whole range of activities HEIs could perform. First, the Performance Based Funding was introduced only in certain parts of the budget allocated to Public HEIs and its proportion has been gradually increasing. Second, further expansion of the sector has been capped by limiting the number of new students that would be funded by the state. And third, both measures were linked together – for each HEI the number of students funded by the state would depend on performance indicators attained. The choice of performance indicators is very sensitive as it would significantly affect the behaviour of HEIs and their further development (Koucky, 2012). The Performance Based Funding is based on 10 indicators and their weights. The indicators are divided into four main budget areas. The first area is connected with the performance of the institution – it is based on the number of students in the first year of study, on the financial demandingness of the study programmes (given by the coefficient assigned to each type of study) and for the universities (so in 2017 not for the non-university institutions) also on the research and development activities and the academic staff qualification of the institution (given by the 8 indicators, where for example 30% is connected with the research and development itself followed by the students mobility incoming and outgoing with 20% and employability of graduates with 15% weight). The second budget area is connected with the students support (various scholarships), third area is aimed at the development of the institution and the four area is mainly connected with the international cooperation of the institution. (MSMT, 2017a)

Study fees are related only to admission procedures and need to be paid once per cycle. No tuition fees are paid by 'typical' higher education students who complete their study programme in the regular timeframe. If they exceed a regular length of study by more than one year it is necessary to pay fees (exemptions are made for students on maternity leave). The minimum fee is CZK 9,651/academic year, based on the average cost of a student for the public budget set annually by the Ministry of Education. No maximum is set by law. Also in the situation when students study in second or further degree programmes they have to pay fees (maximum CZK 2,819/academic year). Students of study programmes in a foreign language also have to pay tuition fees which are set by each institution separately and no maximum limit is set by law. (EC, 2016)

Scholarships are granted to students from regions other than the seat of the higher education institution and they are provided in the amount CZK 5,400 per year. Around 47 % of students received this scholarship in 2015/16. Social scholarships are available for students in a difficult economic situation. The amount CZK 24,750 received per year is the same for everyone – but only 0.8 % of students received this support in 2015/16. Family allowances, depending on family economic conditions, may be awarded until the student is 26 years of age as well as the tax benefits for parents provided in the form of tax relief for each student up to 26 years old. The amount is graded according to the birth order – from 2016, CZK 13,404/year for the first child, CZK 17,004 for the second child, and CZK 20,604 for the third and fourth child. In case the child is disabled, the amount is multiplied by two. A child allowance of CZK 700 per month is paid if the family's income is below 2.4 times the subsistence level. (EC, 2016). About 13 % of students receive merit-based scholarships. No public subsidy or market loans are provided

for financing studies in the Czech Republic.

Higher education in Hungary

Higher education in Hungary is provided by higher educational institutions. The establishment and operation of higher education institutions are regulated by Act No. 204 of 2011 (National Higher Education Act). Operating within the legal framework of the National Higher Education Act, Hungarian higher education institutions are recognized state (public) or non-state (church or private) institutions. The list of recognized institutions is indicated in Annex 1 of the National Higher Education Act. Regarding their academic profile, there are universities (egyetem), universities of applied sciences and colleges (főiskola -non-university higher education institutions). The main difference lies in capacities. Universities are higher education institutions authorised to provide at least eight bachelor and six master programmes and offer doctoral programmes and award doctoral degree, provided that at least sixty percent of their teaching and research staff employed directly or on a public service employment basis have a doctoral degree, operates students' academic workshops and is able to provide studies in foreign languages in some of its programmes. Universities are authorised to offer programmes in every educational cycle. University of applied sciences is a tertiary institutions with at least four bachelors programmes and two masters programmes, and at least two dual trainings (if its accreditation includes engineering, IT, agriculture, nature science or business studies), having at least 45% of their teaching and research staff employed directly or on a public service employment basis have a doctoral degree, operates an academic student workshop, and is capable of offering foreign language courses at some of its departments. The large former colleges have recently been transformed into universities of applied sciences. Colleges are tertiary institutions having at least one-third of their teaching and research staff employed directly or on a public service employment basis have a doctoral degree. Colleges are entitled to operate students' academic workshops. No differentiation is made by law, but colleges and universities of applied sciences are usually more active in practical education due to historical reasons. (Eurydice-HU, 2017) Their portfolio mainly offers first cycle programmes and shorter programmes and applied research. By contrast, universities usually offer more theoretically oriented degree courses. (Oktatási Hivatal, 2017)

The funding of HEIs in Hungary can be state state financing and income from other sources. According to the database of the Education Authority there have been 25 state funded universities (including universities of applied sciences), 9 non-state maintained universities, 2 state maintained colleges and 28 non-state funded colleges (out of which 21 are operated by a church) operating in Hungary. (Oktatási Hivatal, 2017)

Higher education institutions apply a credit system based on the European Credit Transfer and Accumulation System. Accordingly, one credit stands for an average of 30 hours of student workload. There are two basic types of financial status for students: state-funded students do not pay fees, and self-financed students do. State-funded places, available for both full- and part-time students, are awarded through a centralised admissions procedure primarily based on the secondary school grades and secondary school leaving examination results. There were 64.7% of students state-funded in 2015/16. Higher education institutions set fees for self-financed students for the different levels and fields of study. Fees range from HUF 230,000 to 4.400,000 in the 1st cycle of study. (EC, 2016)

Students can get two types of grants: need-based and merit based grants. Need-based grants (only for the full-time students) are paid for 10 months in year. For students with one living parent and those under legal guardianship until the age of 18, the grant is for HUF 119,000 per academic year. For multiple disadvantaged students, orphans, students supporting dependents or those from a large family, it is HUF 238,000/academic year. Disadvantaged students can also apply for the Bursa Hungarica scholarship jointly financed by municipalities and higher education institutions with an average value of HUF 25,427. Both fee paying and state subsidised students are eligible. In the autumn semester of the 2015/16 academic year, 6.4 % of students received this scholarship. One-off initial and emergency grants are also available. (EC, 2016)

Merit-based grants are available to full-time state-funded students, and a maximum of 50% can receive this support. The minimum amount is HUF 59,500 per academic year. Another merit based 'Scholarship of the Hungarian Republic' is granted to a maximum 0.8 % of state-funded students with a value of HUF 340,000/academic year. In Hungary 34% of state-funded students received merit-based grant and 20% need-based grant in 2015/16. (EC, 2016)

Two government-subsidised loans are available. The first, with a maximum duration of five years (longer for subjects such as medicine), is for both state-funded and fee-paying students, and has a maximum amount of HUF 50 000/month (HUF 60 000 for certain categories of disadvantaged student) for a period of 10 months in year. 9% of students took this loan in 2015/16. The second loan (Loan 2) can only be spent on fees. 18% of eligible students took this loan in 2015/16. Fee-paying students can take out both loans simultaneously. Loan repayment must start

four months after the end of student status, and by the age of 40, with repayment linked to personal income. No tax benefits for parents or family allowances exist. (EC, 2016)

Higher education in Poland

Since the political transformation after the collapse of the communist regime in 1989, the Polish higher education system has undergone profound changes. Currently, according to the the Law on Higher Education, there are these types of higher education institutions (MSHE, 2017):

- university-type HEI – an institution which carries out academic research and where at least one organisational unit is authorised to award a doctoral degree;
- non-university HEI – an institution which provides first-cycle, second-cycle and/or long-cycle programmes, but is not authorised to award doctoral degrees;
- military HEI – supervised by the minister responsible for national defence;
- state service HEI – supervised by the minister responsible for internal affairs;
- HEI of art studies – supervised by the minister responsible for culture and national heritage;
- medical HEIs – supervised by the minister responsible for health;
- HEI of maritime studies – supervised by the minister responsible for maritime affairs.

In the academic year 2014/15 there were 434 HEIs in total in Poland, including 132 public institutions (nearly 70% of HEIs were non-public). Around 70% of public HEIs are university-type institutions which provide first-, second (or long-) cycle and third-cycle (doctoral) programmes, while the remaining ones are non-university HEIs providing only first- and second (or long-) cycle programmes. (Dobia, Hałas-Dej, 2017)

Education in Poland is funded primarily from public sources. The main part of the subsidy is distributed separately for two groups of public HEIs: university-type HEIs (*uczelnia akademicka*) and non-university HEIs (*uczelnia zawodowa*). Teaching activity of public higher education institutions (HEIs) is financed from State budget subsidies. HEIs receive a subsidy for their statutory tasks set by law, such as tasks related to the education of students enrolled in full-time programmes, full-time doctoral students and research staff; the maintenance of HEIs, including renovation of premises (basic grant), tasks related to non-refundable financial support for students and doctoral students, which can also be used for the renovation of student dormitories and canteens, co-financing and financing of investment projects, tasks regarding the provision of appropriate conditions for full participation of disabled students and doctoral students in the learning process. Moreover, a pro-quality subsidy is set aside within the State budget and allocated in the form of grants to the best organisational units of HEIs for quality-related tasks, including top-ups to salaries and scholarships. The amount of the basic subsidy in a given year depends largely on the amount in the previous year, which is intended to ensure stability in HEIs' funding. This is achieved by applying a so-called transfer rate constant (with HEIs receiving in a given year a fixed percentage of their previous-year subsidy), which was as high as 65% in 2016. The remaining 35% is allocated according to the algorithm which is based on 6 criteria (students, human resources, development of education, research, authorisations, exchanges) where the first two form 35% each in the distribution algorithm. For non-university HEIs the rest 30% depends on the development of education, no research and other criteria is included while for the universities the research forms 10% as well as the development of education. (Eurydice-PL, 2017).

Under the Law on Higher Education, there are full-time and part-time study programmes. Full-time studies at public HEIs are free of charge, apart from fees for courses repeated. Part-time studies (evening, weekend and extramural) at public HEIs and programmes at non-public HEIs are subject to tuition fees at levels set by particular HEIs. Full-time students in public higher education institutions pay only administrative fees, they are charged tuition fees only if repeating a study course. Part-time students pay annual tuition fees of, on average, about PLN 4,700 set by higher education institutions. Each institution may provide exemptions and reductions. All students pay a maximum fee of PLN 150 related to enrolment procedures once per study cycle. Students also pay administrative fees which include the issue of student ID cards, student record books and diplomas. (EC, 2016)

Two types of grant are provided to students in Poland: need based and merit-based grants. Need-based grants are available for all full-time and part-time with a low personal/family income, and for students with disabilities. The income threshold to be eligible for need-based grants for students with low family income is decided by HEIs and is between PLN 668.20 and 1,043.90 per person per month. In 2014, 13.28% of all students received a need-based grant based on their socio-economic situation and 1.64 % of all students received the need-based grants for students with disabilities. The average amount was PLN 4,674.28 per year. Merit-based grants are allocated to the best-performing full-time and part-time students. The average amount of the merit-based grant is PLN 4,332.70 per year. 7.43% of all students received such grants in 2014. The total monthly amount of the need- and merit-based grants may not be more than 90% of the lowest basic pay of an assistant (the lowest academic position at higher education institutions) as regulated by legislation. (EC, 2016)

Loans of PLN 6,000 per year may be taken out in any cycle by students whose personal income is below net PLN 2,500 per month (in 2015). The state guarantees the entire loan for students with family income of PLN 600/month per person and 70% for students with a family income of PLN 1,000/month. Students starting their studies before the age of 25 can apply for a loan which is granted for the period of study or maximum six years. Repayment begins two years after graduation. While receiving the loan and for the following two years interest is paid by the state budget, and later on interest rates are capped. The best-performing 5% of graduates may obtain the cancellation of 20% of their loan. A tax relief of PLN 1,112.04 per child per year (2015) for parents/guardians of students up to 25 years of age available provided income did not exceed a specified level, and if the student did not earn a taxable income (including capital gains) exceeding PLN 3 089/year. There is no relief dedicated only to students. Family allowances are based on low income of parents or disability of a student. (EC, 2016)

Higher education in Slovakia

Higher education in the Slovak Republic (SR) is provided by higher educational institutions that have an exclusive right granted by law to provide and organise higher education (accreditation is assessed by the Accreditation Commission and is by the minister of education based on the Accreditation Commission's statement). Regarding the system of funding and ownership, higher education institutions are divided into public, state owned and private ones. In addition, higher education may be also provided by foreign higher education institutions. In 2016/17 higher education in the Slovak Republic is provided by 20 public higher education institutions, 3 state higher education institutions and 13 private higher education institutions. There are also 5 foreign higher education institutions operating here. (MŠVVŠ SR, 2017)

Public HEI is an autonomous institution that establishes and repeals the law. The state-owned higher education institutions are police, military and healthcare higher education institutions. The private higher education institutions are non-profit-making organisations offering generally useful services or limited liable companies which were founded with the purpose of providing education and research. The State consent for operation as a private higher education institution is granted by the Government of the SR. Foreign higher education institutions provide higher education in the Slovak Republic in compliance with the legislature of their home country based on the authorisation granted by the Ministry of Education, Science, Research and Sport of the Slovak Republic. Rights and obligations of a foreign higher education institution's students are not governed by the Act on higher education but by the legislature of the institution's home country. (Eurydice-SR, 2017)

In agreement with the Higher Education Act the professional higher education institutions provide the bachelor's study programmes only while the public institutions provide also master and doctoral programmes. The professional higher education institutions are oriented particularly on the applied research whilst the universities have the primary orientation at basic research and emphasis is laid on doctoral study programmes. (Eurydice-SR, 2017)

The main sources of funding for public and state higher education institutions are subsidies from the state budget, subject to a special regulation. A public higher education institutions use also other sources to cover expenditure necessary for their activity. The ministry provides subsidies to a public higher education institution for the implementation of accredited study programmes, research, development or artistic activities, the development of higher education institutions and for the social support of students. The revenues of a public higher education institution include a subsidy from the state budget, tuition fees, charges associated with the study, revenues from further education, proceeds of the property and of the intellectual property, revenues from gifts from natural persons and legal entities and proceeds of the business activity and other revenues, if permitted by the law. Private higher education institutions secure financing for their educational, research, development, artistic and other creative activities themselves. The ministry provides private higher education institutions with subsidies for social support of students. The private higher education institutions may be also granted a subsidy for its activity from the state budget but actually they receive only the funds for covering statutory claims of the students. (MŠVVŠ SR, 2017)

Students in the Slovak Republic pay certain fees and tuition in the cases defined by law. A public higher education institution may require candidates for study to pay fees for the material provision for the admission procedure. All students pay registration fees, which range from 10 to 100 Euros per academic year. Also the issue of the diploma following the relating examination, the issue of documents on the study and supply of their copies the issue of documents on the education completed, if required in a foreign language, with the exception of the diploma supplement which is explicitly issued free of charge the issue of copies of documents on completion of a study and on recognition of equivalence of study documents may be associated with fees. The amount of fees is determined by the internal regulation of the public higher education institution and is derived from the real cost incurred to the higher education institution by these services. Full-time students of a public higher education institution that have

not exceeded the standard length of study, as prescribed for a study programme, do not pay tuition fees. Students who simultaneously study two or more study programmes at the same level provided by a public higher education institution in one academic year are obliged to pay tuition fees in the second and the other study programme in the respective academic year. Students who exceed the standard length of a public higher education institution study programme have to pay the annual tuition fees for every extra year of their study to the higher educational institution. Tuition can be a maximum of EUR 1,800 per academic year. Part-time higher education students have to pay annual tuition fees for every year of their study, the maximum amount for undergraduate programs is EUR 2,050 in the first cycle and EUR 3,080 in the second cycle. Tuition and other fees at public higher education institutions cannot exceed 50 % of the average costs of full-time education. Tuition fees and fees connected with the study at a private higher education institution are set by the institutions separately. (EC, 2016)

Students are provided financial support in direct and in indirect forms. There is a legal right for a need-based grant/scholarship subject to specified conditions. The amount of this need-based scholarship varies from EUR 10 to EUR 275 per month. Merit-based motivation scholarships are granted by the higher education institutions for excellent results in studies, research and development, artistic or sporting activity. The amount of the motivation scholarship is set by higher education institutions or faculties, usually it is a sum of 1,000 EUR per academic year for 15% of students in the program. The state subsidy for this purpose is calculated at about EUR 450 per student for 10% of students. Statistical data show that 13.71 % of students receive need-based and 8.07 % merit-based grants in 2015. Publicly subsidised loans provided by the Education Support Fund are available for full and part-time students throughout the regular duration of study programmes. Loans range from EUR 500 per year to 2,500 per year and are taken by about 1 % of students. These are loans with subsidized interest rate and deferred repayment. Indirect support implemented outside the education sector is the support in the form of family allowances for students aged up to 25 of age, if they prepare for a future occupation in a full-time study. The amount of monthly allowance in 2015 is uniformly EUR 23.52 per student, it is paid to parents. Tax benefits for parents exist in the form of a lump sum tax deduction of EUR 21.41 per month. There are no tax benefit for working students. (EC, 2016)

FINDINGS

The situation in higher education sector in V4 countries can be viewed and compared according to the various aspects and from different points of view: the future management of education (Dobia, Hałas-Dej, 2017), sustainability transition (Dlouhá et al. 2017), academic attractiveness of the country (Kosmaczewska, Barczak, 2015), estimating private returns to education (Štefánek, Horvát, 2015) or seeing the trends in financing the higher education and number of students involved in (Kuncova, Mulac, 2016). In this article we continue with the previous research based on the comparison of countries using statistical data.

Firstly, we analyzed the total number of HEIs per millions of inhabitants or vice versa, thousands number of inhabitants falling on one institution. From this point of view the widest net of institution can be found in Poland where 434 HEIs per 38 million inhabitants means about 11 HEIs per 1 million inhabitants or 87.5 thousands of inhabitants per 1 HEI. Contrary to these results the situation in the Czech Republic and Hungary is different with nearly half number of HEIs per million inhabitants (Table 1). Only in Slovakia the majority of HEIs is public, in other countries private HEIs outweighs. This is probably the reason of the process of transformation where more private HEIs come into being since the communist era – but the evidence of inverse trend is visible especially in Poland (Kwiek, 2014) where still the highest percentage of private institution exist. In the Czech Republic the tendency of the decrease of the number of HEIs also exist but the changes are very slow (MSMT, 2017b). According to the data in Table 1 and according to the previous research (Kuncova, Mulac, 2016) we cannot say that the number of HEIs in the Czech Republic is extremely high (as it is sometimes said by the Czech authorities).

Table 1: Comparison of number of HEIs in V4. (Source: Eurostat, 2017; Eurydice, 2017; own calculations)

Country	No. of inhabitants (in millions)	No. of HEIs	% of private HEIs	No. of HEIs per million inhabitants	Thousands of inhabit. per 1 HEI
Czech Republic	10.5	68	58.8	6.476	154.4
Hungary	9.8	64	57.8	6.531	153.1
Poland	38	434	69.6	11.421	87.5
Slovakia	5.4	41	43.9	7.593	131.7

Next part of the comparison was aimed at the number of students in tertiary education as a percentage of population, students' distribution between full time and part time forms of study and at the average student-academic staff ratio (number of students per an academician) – Table 2. The main difference among V4 countries was in the ration of full time and part time students where the Czech Republic has more than 95% of

tertiary students in full time form of study. The reason for this fact might lie in the lower number of study programmes offered for part time study. Poland had the highest percentage of population studied at tertiary education (maybe because of the higher number of HEIs per million inhabitants) and nearly one third of them studied at part time form of study. The Czech Republic had also “beat” the others in number of students per academician (which is more negative than positive) – the situation was worse than in 2014 when the ration was nearly 22 students per academician (Kuncova, Mulac 2016). As the EU average ration was about 15.6 in 2015 (Eurostat, 2017), the situation in the Czech Republic was not optimal (the reason might lie in the higher number of students but also in the low number of academic staff that is influenced also by the low expenditures on higher education).

Table 2: Comparison of percentages of students enrolled in tertiary education in V4. (Source: Eurostat 2017; own calculations)

2015	number of students	% of population	% full time	% part time	Avg. number of students per member of academic staff
Czech Republic	395,529	3.75	95.88	4.12	23.97
Hungary	307,729	3.13	70.78	29.22	14.65
Poland	1,665,305	4.39	67.16	32.84	17.10
Slovakia	184,390	3.40	73.04	26.96	14.41

According to the distribution of students into bachelor and master studies the ratio in all V4 countries was nearly the same, a little bit higher number of bachelor students were in Hungary (Table 3). More than 80% of bachelor students studied at public institutions, only in Poland the percentage was around 73% and more than one quarter of students studied at private institutions (as Poland had the highest number of private HEIs – Table 1). As it was mentioned above the Czech republic had only a few percent of students studied at part time form of study – most of them studied at master studies (Table 3) but still the percentage was under 10% (at bachelor study under 2%) while in other countries it was around 20%, in Poland and in bachelor study one quarter of students studied at the part time form of study at the public institutions. The share of the master study student at public HEIs was again the highest in the Czech Republic. The reason lies in the tuition fees paid at the private HEIs and also in the fact that the public HEIs have higher credit and trust than the private ones.

Table 3: Comparison of percentages of students enrolled in tertiary education in Bc. or Master type of study in V4 countries. (Source: Eurostat 2017; own calculations)

2015	students enrolled in tertiary education							
	% Bc	% Bc public	% Bc private	% Bc part time public	% Master	% Master public	% Master private	% Master part time public
Czech Republic	59.89	85.20	14.80	1.17	33.64	91.14	8.86	9.59
Hungary	69.78	86.96	13.04	25.00	24.08	87.62	12.38	21.11
Poland	66.32	73.04	26.96	12.38	30.91	76.47	23.53	23.76
Slovakia	55.55	84.17	15.83	12.47	37.98	83.13	16.87	17.58

When we compare the fees, the situation was nearly similar in the Czech Republic, Slovakia and Poland while in Hungary the fees were much higher (Figure 1).

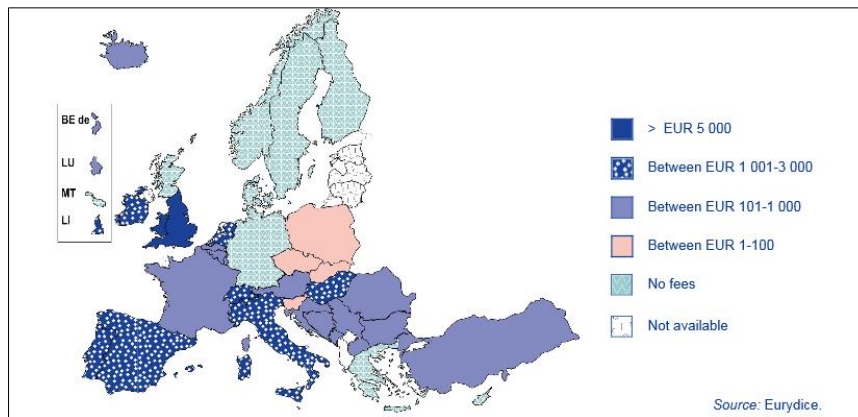

Figure 1: Most common fees including tuition and administrative fees in first cycle higher education programmes among full time students in 2016/2017 (Source: Eurydice, 2017)

The situation with the expenditures on education was completely different (Figure 2). Although in the Czech Republic and Slovakia the percentage oscillated around 9-10% (with exception of the year 2003 for the Czech Republic and 2003-4 for Slovakia), Poland had during all years the highest percentage in V4 countries though the decrease since 2007 is evident. The worst situation and mainly the worse trend could be seen in Hungary where the percentage was falling down since 2003. The same trend is visible from the government expenditure on education as the percentage of GDP (Figure 3) where Hungary was the leader in V4 countries in the years 2003-4 and 2006-9 but then it went down to the same level as the Czech Republic and Slovakia. Since 2010 Poland seems to be the best one with about 5% of GDP. But the main problem of the whole V4 is that the EU average in nearly all selected years oscillated around 11% so more than two times higher (Worldbank, 2017). The data show that the changes in expenditures on education are not influenced so much by the economic crisis but more by the policy of every government.

Figure 2: Trends of the expenditures on education as % of total government expenditures (Source: Worldbank, 2017)

Figure 3: Trends of the government expenditures on education as % of GDP (Source: Worldbank, 2017)

Comparison of the trends in government expenditures per tertiary student as percentage of GDP per capita (Figure 4) showed that all countries tended to the range 20-25% but only Poland seemed to slowly raise the percentage during the selected years. Other countries were more or less falling down with these expenditures. The main reason for this was probably the rising number of students in the tertiary education. The EU average was a little bit higher, in 2014 it was 26.7% (Worldbank, 2017).

Figure 4: Trends of the government expenditures per tertiary student as % of GDP per capita (Source: Worldbank, 2017)

Not only the expenditures or costs are important but it is necessary to see the benefits of the education (especially the social ones, on taxes or on unemployment). Based on the OECD (2016) research we see that the highest internal rate of return (in case of public costs) was in Hungary – but the gap between men and women was really big (9%) – Table 4. Only Slovakia was below the OECD average (10% for man, 8% for woman). Concerning the private costs and benefits (Table 5) the internal rates of return were higher in all countries, the highest one was in Poland but again a big differences between men and women existed. In this case all V4 countries were above the OECD average (14% for man, 12% for woman). In this sense tertiary education was very important in a view of benefits and financial returns in all V4 countries

Table 4: Public cost and benefits for a woman attaining tertiary education in equivalent USD converted using PPPs for GDP – year 2012 (Source: OECD, 2016)

The last part of the analysis describes the situation of the V4 countries in 5th pillar of the Global Competitiveness Index (Higher education and training). Table 6 shows the ranking of the countries in the period 2011-2015 from 140-148 countries. The Czech Republic and Poland had the best position (which did not improved during years). For Hungary we again see the big falling off. Slovakia was the worst in V4 countries but with nearly the same position. As the 5th pillar has 8 parts, we analyzed the situation in the year 2015 in each of these parts (Table 7). Out of the V4 countries the Czech Republic was the best one in 5 parts, Poland in 2 parts, Hungary in one and Slovakia was never the best of the V4. Poland had the best place (22nd) in the tertiary education enrollment rate – which was evident from the previous results. The Czech Republic had the best place (26th) in the local availability of research and training services. The same (26th) place was the best one for Hungary at the secondary education enrollment rate. But the results showed that all V4 countries had (and probably still have) problems with the quality of education system and the quality of management schools. Unfortunately the quality of the education system during the years 2011-2015 was seen (Table 8) as not improving (or maybe increasing but slowly than in other countries).

CONCLUSIONS

The main aim of this paper was the comparison of higher education in the V4 countries: the Czech Republic, Hungary, Poland and Slovakia. Each country has its own specific rules and different conditions connected with the tertiary education. The main differences can be summarized by these facts:

- The relative number of HEIs was the highest in Poland as well as the percentage population studied at HEIs, the percentage of students studied part time and the percentage of private HEIs.
- The Czech Republic had the highest % of students at public HEIs and high number of students per 1 academician.
- Most of the HEIs students in Hungary studied at the bachelor level.
- Hungary was the only country in V4 with high study fee.
- Expenditure on education as % of total government expenditures oscillated around 9-11% which was close to the EU average but the government expenditure as the % of GDP was under the 50% of EU average.
- All V4 countries were directed at the similar level of the Government expenditure per tertiary student as % of GDP per capita but only Poland did not decrease it rapidly.
- From the perspective of the Higher education and training as a part of the Global Competitiveness Index all V4 countries came down, mainly in the quality of the education system (compared to other world countries).

To conclude: although Hungary and the Czech Republic are characterized by a higher ratio of students incoming than those outgoing, while in Poland and Slovakia the situation is reversed (Kosmaczewska, Barczak, 2015), Poland seems to be the best one in V4 in some factors related to higher education followed by the Czech Republic. Hungary during few years lost its position and Slovakia was usually the last country in V4 though some changes were made. The analysis showed that in all V4 countries the situation in the education and especially higher education sector was not good compared to EU average. The main reason might lie in the low government expenditures on education and especially at the higher education. This factor influences the quality of the system itself. If no changes happen the V4 countries will deepen the distance from other EU countries.

ABSTRACT

The purpose of this study was to compare three different instructional methods (educational videos (EV), traditional coaching (TC) and mixed method (MM)) by means of the skill test scores (AAHPERD shooting and passing tests). Thirty nine (n=39) students (boys) aged 11.2 ± 0.6 selected for this study by random sampling method, enrolled in the basketball summer school held in the Sanhareeb Sport Club Duhok /Kurdistan Iraq. Instruction, practice, and testing for this study were held on six separate and successive weeks. Participants were randomly assigned to one of the three different teaching methods (EV, TC and MM) creating three independent groups of 13 students. The AAHPERD basketball test and the AAHPERD basketball passing tests were used to evaluate the shooting and passing ability. One way Anova and LSD tests were used for comparisons between three method groups. Results showed that the mixed method group (12.461 ± 2.145) surpasses the educational video (8.615 ± 1.325) and the traditional coaching groups (10.153 ± 1.463) in sequence, and the researcher indicates the reason to the effectiveness of the executed program by the coach and the compact between the (educational video) and the (traditional style of the coach) in which the mixture of both methods showed the appearance of the best result in learning the skills of shooting and passing in basketball.

Keywords: basketball, motor skills, fundamental skills, education method, coaching techniques

INTRODUCTION

Researchers, coaches and athletes are using different types of technology in order to teach skills and techniques in sports effectively. Moreover to improve athletic performance technology is now accepted as a popular field and play a very important role (Goggin et al, 1997, 280-290).

As an example Carpenter and Greenhill (1955,1958) used the closed-circuit television vs live teaching. No differences were found during this research between two teaching methods. Later work of Clark's logic has been showed affects and differences on learning by using sophisticated technologies like simulators used in medical training (Hague and Srinivasan, 2006, 51-58). On the other hand there are researches argues about the affects of technology on learning and attitudes (Dede, 1996, 2004; Kozma 1991, 1994; Mayer, 2008).

Using videos in education beside the classical teaching methods become an very important part of higher education. Videos used to support the classical education and served as a tool of cornerstone most of the courses. There were researches and meta-analyses showed that the technology can increase the affect of learning (Shmid et.,2014). There are also multiple studies have shown that the videos found very effective on education (Kay, 2012; Allen and Smith, 2012; Lloyd and Robertson, 2012; Rackaway, 2012; Hsin and Cigas, 2013).

Cicciarella (1983), Lynch et al. (2001) reported that the videos have been used during the cognitive instructions of students by watching the drills, that makes teachers, coaches or instructors spend much time with the students that needs more help during the physical education. Huwitz, 1985; Bazillion and Braun, 1998 also reported that

videos help to develop solving problems making decisions and better understanding the concept. Moreover using the video technology also give change to provide information about the athletic development by feedback and used to provide expert modeling (Hazen et al., 1990).

The results of the researches used the video technology in sports indicates that videos used as a part of the training regimen can provide positive interventions. Scott (1998) used the video modeling for adult tennis players for to improve the return rate of the tennis serves. Results suggested that the video technology is a promising for the sports performance researches.

There are other studies also demonstrated improvement on sports performance. Boschker and Bakker (2002) investigated the video technology affect on Wall climbing. The results indicated subjects climbed faster and fluent compared to subjects who did not watched videos about climbing.

SooHoo, Takemoto, and McCullagh (2004) used two techniques for to improve squat performance by using the technology. A video of an expert lifter and a audio tape instructed to the subjects. Results showed that both technology resulted in an improvement in squat technique.

Finally Vernandakis et al (2002) used multimedia technology for to teach skills in volleyball. Vernandakis used computer assisted instruction and classic coaching. Results indicated that there were no significant differences were found between two methods.

Literature surveys showed that there are no studies searched the affects of technology and classical coaching methods for teaching basketball skills. Therefore the the purpose of this study was to compare three different teaching methods educational videos (EV), traditional coaching (TC) and mixed method (MM) during the teaching of two basketball skills (shooting and passing) from subjects aged 10-12 years old with no basketball experience.

METHODS

Sample

Thirty nine (n=39) students (boys) (11.2 ± 0.6 years; 44.4 ± 4.8 kg; 1.51 ± 6.4 m) participated in this study by random sampling method, enrolled in the basketball summer school held in the Sanhareeb Sport Club Duhok /Kurdistan Iraq. All participants were healthy and physically active but had no experience in basketball.

Educational programs

The time of the training unit sections of the three groups related to the section (the general preparation, special preparation and the concluding section of the educational unit) are equal in time and the nature of the general and special exercises, and it was (20) minutes for all sections, and the specific time of the educational and practical section was (45) minutes. The researcher provided the inner hall with laptops, after installing the educational programs of the shooting and passing skills on all devices.

Educational video.

The educational part. researcher prepared the educational part according to the educational video technique, in which it included the script, sound, images, cartoons and visual parts of the levels and sections of the skill consequently. The video presented one of basketball professional players performing the searching skill. He repeated the performance in different corners. Those shots concentrated on some important details and points like the hand or the shape of the legs stem and the angle of leaning the body and sight besides the position of the feet, and ensuring to use the sound to explain each skill.

The practical part. After that the coach allows the players to try practicing the learnt skill , he doesn't interfere in correcting the mistakes, but he only determines the type of the mistake and asks them to review the educational video and repeat the performance.

The traditional coaching.

The educational part. The coach explains the educational skill to the players in his own way depending on self-experience and he practices the skill himself or asks a skill full player as a model to practice the skill in front of the learners many times meanwhile the coach explains the parts of the skill.

The practical part. The coach gives the chance to the players to practice the skill meanwhile he notices the performance and gives advices and directions to the players to correct their performance and make it reach the best.

Mixed method.

The educational part. The researcher prepared the educational part according to the educational video technique, in which it included the script, sound, images, cartoons and visual parts of the levels and sections of the skill consequently. The video presented one of basketball professional players performing the searching skill. He repeated the performance in different corners. Those shots concentrated on some important details and points like the hand or the shape of the legs stem and the angle of leaning the body and sight besides the position of the feet, and ensuring to use the sound to explain each skill, in this part, the coach interferes with his explanation of the skill, besides using a real pattern to practice the skill in front of the players.

The practical part. After that the coach allows the players to try practicing the learnt skill, and he interferes in correcting the

Skill Tests

The AAHPERD basketball shooting test. Strand and Wilson (1993) developed the AAHPERD basketball shooting test fort to evaluate the basketball shooting ability in basketball. It is appropriated for middle school students. One tester was needed for the successful completion of the test. Testing stations were prepared as shown in **Figure 1**. Five markers, from which students had to shoot, were placed on the floor. Students shot from 12- foot marks. Shooting spots A and E were measured from the middle of the backboard; those for B, C and D were measured from the center of the basket. Each shooting spot marker was 2 feet long and 1 inch wide. During the test, the student had basketball in hand, stood behind the shooting spots. On the “ready, go” signal, the student shoots, retrieves the ball, dribbles to another spot and shoots again. The student must attempt at least one shot from each of the five spots and must have at least one foot behind the marker on each shot. Four lay-up shots may be attempted, but not two in succession. The student continues the attempt to score until “stop” is called. All students had three trials of 60 seconds each; the first trial was a practice trial.

Figure 1. Testing stations for shooting

The AAHPERD basketball passing test. This test was chosen because it is an appropriate test for assessing basketball passing skills. The test was validated by the American Alliance for Health, Physical Education, Recreation and Dance in 1984, using senior high school students. The test retest approach computed reliability coefficients of .84 to .97 so the test is both valid and reliable. The test also required the participants to pass the ball quickly and basketball (Krause et al., 1999). **Figure 2** show the diagrammatic representation and set up of the test, which required a smooth wall surface of 30 feet.

Each station for the passing test was prepared as shown **Figure 2**. A restraining line 26 feet long was marked out on the floor 8 feet from and parallel to the testing wall. On the testing wall six boxes measuring 2 feet by 2 feet were marked out all 2 feet apart. Moving from the left side of the testing wall, targets A, C and E have their base 5 feet from the floor while B, D and F have their base 3 feet from the floor.

The player stood behind the 8-foot restraining line, holding a basketball and facing the far left wall target (A). The experimenter then played the CD, which emitted a three-bleep countdown, and the fourth bleep signaled the start of the test. Following the fourth bleep, each player performed a chest pass to the first target square (A), recovered the ball while moving to the second target square (B) performed a chest pass to the second target (B). The player then continued this action until they reached the last target (F). While at the last target (F), they threw two chest passes then repeated the sequence by moving to the left passing at targets E, D, C and so on. The only modification to the test was that it continued for just thirty seconds. Only chest passes were allowed.

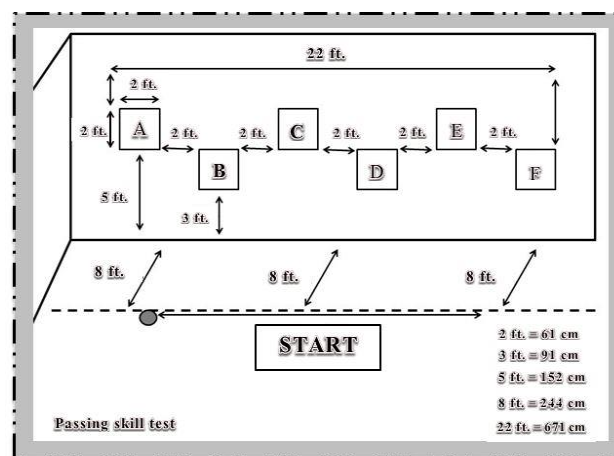

Figure 2. Testing stations for passing

Procedure

Participants were randomly assigned to one of the three different teaching methods: educational videos (EV), traditional coaching (TC) and mixed method (MM) creating three independent groups of 13 students. All participants had no formal training on learning the skills of shooting and passing in basketball. Prior to group assignments, participants were orientated to the purpose of the study and participant requirements. Following the orientation, informed consent was obtained from each participant. Instruction, practice, and testing for this study were held on six separate and successive weeks. The groups met for 45-minute, 4 times each week in an indoor gymnasium.

Exploratory experiments. We made the exploratory experiments on a sample out of the research sample and where (6) players in order to reach to accurate results before fulfilling the educational programs, as follows:

The first exploratory experiment. The researcher made the first exploratory experiment on Thursday and Saturday (7-9/7/2016) for the physical labels tests. The aim of this experiment was:

- Ensuring the relevance and clarification of the instructions of the research sample tests.
- Ensuring the logical sequence to make the chosen tests in the research.
- Ensuring the capacity and ability of the supportive work team to fulfill the measurements and tests.
- The validity of the devices and tools used in the tests.
- Counting the required time to execute the tests.³

The results of the experiment made an obvious image to the researcher and the work team of the nature of the work and its application way.

The second exploratory experiment. The researcher made the second exploratory experiment on Sunday (11/7/2016) to the two educational programs. And the aim of it was:

- Ensuring the validity of both educational programs
- The relevance of the educational unit's time and their divisions for the research sample.

- The validity of both educational programs sections and the response of the sample to them.
- Introducing the mistakes and the expected difficulties during the fulfillment.

The results of the second exploratory experiment were:

- The validity of both educational programs to the research sample.
- The relevance of the educational unit's time and their divisions to the research sample.
- Unifying the repetitions and times to the research sample.
- Avoiding some mistakes and difficulties throughout fulfilling the experiment

Pre-test of the skills. The researcher made the pre-test for the skills on Wednesday (13/7/2016) for equal between the three groups and prepared for the program study and show that all groups they are equal everything.

The main experiment. The educational programs were start on the three research groups on Thursday (14/7/2016) till (29/8/2016) in which (4) educational units per week for each group.

The post-tests. The post-test of the shooting and passing skills of the three research groups was made on Thursday (1/9/2016) by giving each student two try and for each skill of research skills, the recording the result of the test.

Scoring

The AAHPERD basketball shooting test. Two points were awarded for each shot made, either a shot from behind the shooting mark or a lay-up. One point was awarded for any unsuccessful shot that hits the rim from above, either initially or after rebounding from the backboard. No points were awarded if a shot was preceded by a ball-handling infraction. If two lay-ups occurred in succession, the second got no points. Only four lay-ups were attempted; any lay-up in excess of four scored as zero. Failure to attempt shots from all designated shooting spots voided a trial. Voided trials had to be repeated. The test score was obtained by totaling the two trials **Figure 1.**

The AAHPERD basketball passing test. The test score was obtained by totaling all the points scored over the duration of the (30) thirty-second test.

- Two points (2) were awarded for each chest pass that hit the target or on the target lines.
- One point (1) was awarded for every pass that hit between the targets.
- No points (0) were awarded if a player's foot was on or over the restraining line, or if a pass other than a chest pass was used.

Statistical Analysis

Scoring data were collected and compared between the educational videos (EV), traditional coaching (TC) and mixed method (MM). pre and post tests were compared by using one way Anova and LSD tests ($P < 0.05$). Throughout the text, data for all participants were averaged and presented as means and standard deviations.

RESULTS

Table 1 shows that there are insignificant differences among the three research groups in the skills labels tests for being the values of the false rates more than (0.05) which indicates the equivalence of the three research groups in those variables.

Table 1. The summary of the contrast analysis results among the three research groups in the skills labels tests by the research sample in the pre-test.

Variables	Groups	Mean \pm SD	F	P
Shooting	EV	5.384 \pm 1.609	0.334	0.718
	TC	5.000 \pm 1.080		
	MM	5.000 \pm 1.414		
Passing	EV	16.538 \pm 1.391	0.103	0.902
	TC	16.230 \pm 1.832		
	MM	16.307 \pm 2.097		

*Significantly higher ($P < 0.05$)

Table 2 indicates that there are significant differences between the pre and the post-test of the three research groups (the educational video, the traditional coaching, mixed method) in the shooting skill in which the amid accounts (Mean) reached in sequence (5.384 , 8.615), (5.000 , 10.153), (5.000 , 12.461) and the standard deviations (STD.) reached in sequence (1.609 , 1.325), (1.080 , 1.463), (1.414 , 2.145) and the counted (T) reached in sequence (7.584 , 14.090 , 11.366) and the false rate in sequence (0.000 , 0.000 , 0.000) it shows significant differences for being the values of false rate possibility smaller than (0.05) these degrees indicates improvement in the learners' level and getting benefit of the three training programs.

Table 2. The paired-sample T test the results of pre and post-test of the shooting skill in basketball.

Variables	Groups	Pre-test	Post-test	T	P
		Mean + Std.	Mean + Std.		
Shooting	EV	5.384 + 1.609	8.615 + 1.325	7.584	< 0.001*
	TI	5.000 + 1.080	10.153 + 1.463	11.090	< 0.001*
	MI	5.000 + 1.414	12.461 + 2.145	11.366	< 0.001*

*Significantly higher ($P < 0.05$)

Table 3 above indicates that there are significant differences between the pre and the post-test of the three research groups (the educational video, the traditional coaching, mixed method) in the passing skill in which the amid accounts (Mean) reached in sequence (16.538 , 30.230) , (16.230 , 34.230) , (16.307 , 36.230) and the standard deviations reached in sequence (1.391 , 3.218), (1.832 , 2.127), (2.097 , 1.832) and the counted (T) reached in sequence (15.435 , 23.439 , 25.019) and the false rate in sequence (0.000, 0.000, 0.000) it shows significant differences for being the values of false rate possibility smaller than (0.05) these post-test degrees indicates improvement in the learners' level and getting benefit of the three training programs.

Table 3. The paired-sample T test the results of pre and post-test of the passing skill in basketball

Variables	Groups	ts eperp	ts rpprp	T	P
		Mean + Std.	Mean + Std.		
Passing	EV	16.538 + 1.391	30.230 + 3.218	15.435	< 0.001*
	TI	16.230 + 1.832	34.230 + 2.127	23.439	< 0.001*
	MI	16.307 + 2.097	36.230 + 1.832	25.019	< 0.001*

*Significantly higher ($P < 0.05$)

Table 4 indicates that there are significant differences among the three research groups in the post-test (the educational video, the traditional coaching and the mixed method) in the shooting and passing skills in the post-test in which all the counted values of (F) reached in sequence (17.195, 19.952) and the false rate in sequence (0.000, 0.000) it shows significant differences for being the values of false rate possibility smaller than (0.05).

Table 4. The One Way Anova results of the contrast analysis in the post-tests among the three research groups in variables of the Shooting and Passing skills

Variables	Groups	Mean \pm SD	F	P
Shooting	EV	8.615 \pm 1.325	17.195	> 0.001*
	TI	10.153 \pm 1.463		
	MI	12.461 \pm 2.145		
Passing	EV	30.230 \pm 3.218	19.952	> 0.001*
	TI	34.230 \pm 2.127		
	MI	36.230 \pm 1.832		

*Significantly higher (P < 0.05)

Table 5 indicates the comparison of the averages of the shooting skill test results in basketball, the results showed the following:

- There was a significant difference in the Mean between the first experimental group and the second one, in which the difference was (1.538) degree by the false rate (0.026).
- There was a significant difference in the Mean between the first experimental group and the third one, in which the difference was (3.846) degree by the false rate (0.000).
- There was a significant difference in the Mean between the second experimental group and the third one, in which the difference was (2.307) degree by the false rate (0.001).

Table 5. The difference of the Mean and the false rate in the test (L.S.D) of shooting skill in basketball

groups	Mean Difference	Sig.	significance
EV - TC 8.615 – 10.153	1.538	0.026*	Moral for the second group Coach style
EV - MM 8.615 – 12.461	3.846	0.000*	Moral for the third group compact (video + coach)
TC - MM 10.153 – 12.461	2.307	0.001*	Moral for the third group compact (video + coach)

*Significantly higher (P < 0.05)

Table 6 indicates the comparison of the averages of the passing skill test results in basketball, the results showed the following:

- There was a significant difference in the Mean between the first experimental group and the second one, in which the difference was (4.000) degree by the false rate (0.000).
- There was a significant difference in the Mean between the first experimental group and the third one, in which the difference was (6.000) degree by the false rate (0.000).
- There was a significant difference in the Mean between the second experimental group and the third one, in which the difference was (2.000) degree by the false rate (0.046) for the second experimental group.

Table 6. The difference of the Mean and the false rate in the test (L.S.D) of passing skill in basketball

groups	Mean Difference	Sig.	significance
EV - TI 30.230 – 34.230	4.000	0.000*	Moral for the second group Coach style
EV - MI 30.230 – 36.230	6.000	0.000*	Moral for the third group compact (video + coach)
TI - MI 34.230 – 36.230	2.000	0.046*	Moral for the third group compact (video + coach)

*Significantly higher ($P < 0.05$)

DISCUSSION

By noticing the Tables 3 and 4, it shows that the third group surpasses the first and the second one in sequence, and the researcher indicates the reason to the effectiveness of the executed program by the coach and the compact between the (educational video) and the (traditional coaching) in which the mixture of both methods showed the appearance of the best result in learning the skills of shooting and passing in basketball.

The players got benefit of the video programs for containing techniques besides the static and kinetic images and video films working on explaining the kinetic skill in details, on addition to the coach's style which contained a detailed explanation of the kinetic skill performed by a model in several angles and styles, which mixed with the educational video in explaining and showing the best ways to learn the kinetic skills reaching the best performance. In which the video program executed by the researcher appealed the scientific principles of learning according to the abilities and preferences of the players by dividing the kinetic skills into small parts according to its logical sequence and work on comprehending the movement and understanding it correctly then performing it.

Muhammad & Hanan (2003), indicates that dividing the educational situation according to an educational video leads to increase the chances of performance and decrease the wrong reactions which leads finally to the correct performance and the positive and effective participation of the learnt skill. Hoffester (1995) mentions that the learners remember (20%) of what they hear and (30%) of what they watch and (50%) from what they hear and watch and thus increase the proportion of the ticket when the learner, the greater use of dialogue in learning faster.

The researcher adds the positiveness of the executed video which created a good educational environment by using all the senses of the learner and motivating him towards learning and helping him to think orderly to perform the skill which leaded him to comprehend the way of the correct movement, Wings (2000) agrees that using the video technique in the educational institutions including the athletic ones, aims to prepare an educational environment throughout which learning operation is effectively fulfilled.

By noticing the Tables 3 and 4, it shows that the second group surpasses the first and the second one in sequence, and the researcher indicates the reason to the effectiveness of the executed program by the coach which contained a detailed and complete explanation of the skill through the movement and the primer situation of standing position and determining the angles in this situation and the best way to catch the ball and the movement position from the beginning till the final part, and this means that the coach explained the skill from the primary, main and final situation of both skills personally and then using the pattern and later the players

performed the skill with correcting their mistakes by the coach. Hardyl (1995) noticing the pattern show by seeing gives the learner a future view to perform it and how it should be.

In conclusion, the subjects can learn the skills with those three methods selected for teaching. However mixed method indicates better results compared to video education and traditional coahing alone. On the other hand traditional coaching indicates better results compared to educational videos. The results of this study may give ideas to coaches and physical education teachers to chose the right teaching method in order to teach skills in a better way.

ABSTRACT

Examination, held to measure people's knowledge about any subject, is very important because it affects the future of individuals. This situation results in perceiving the examinations from a different perspective. It is thought that this research is important in terms of revealing people's feelings aroused by the concept of examination. This study was carried out to find out whether there is a difference between the Turkish and foreign students' metaphors regarding the concept of examination. For this reason, sample group of the study consists of a total of 200 students, 100 Turkish and 100 foreign students, studying in TRNC universities. The research data was obtained as a result of putting appropriate phrases into the places left blank in the sentence of "Exam is like/similar to; because.....". Since this research is a qualitative study, analysis of the relevant data has been performed using content analysis, percentages and frequency parameter, and also the participants' metaphors regarding the concept of examination have been analyzed by categorization.

Keywords: Examination, Metaphor, Student, Foreign Nationals, Turkish.

INTRODUCTION

In the Turkish education system, the concept of examination, which is a part of the lives of students, has importance as an indispensable part of their lives, starting with primary education and continuing with secondary school, high school, university, graduate and doctorate. Exams that take place effectively at all stages of life-long education are often considered as a difficult and anxious concept for many students (Boyacioglu & Kucuk, 2011). Various studies have tried to elucidate this situation (Tekbas, 2019; Guler & Cakir, 2013). The aim of examination is to determine the extent to which the objectives determined by the education program and practitioners are achieved. In other words, it is a basic tool used to determine the relationship between goals and achievements (Topbas & Toy, 2013, 288). The written and multiple-choice examinations are generally used as an evaluation tool in Turkey and the TRNC, whereas different auditing approaches and methods are used in different countries. In both countries, the examinations are mostly used for the purposes of evaluation, selection of the sufficient, elimination etc. In primary, secondary, high schools and colleges, two exams are usually administered in each semester. In other words, at least 4 exams (plus quizzes) are applied within each academic year (two semesters). These are called midterm and final exams. Apart from these, there are also student selection examinations in the transition to the upper level which will take place between the grades. In recent years, there has been two main examinations in Turkey: 1) Transition from Primary to Secondary Education Examination-TEOG in transition from secondary education to high school, and 2) Transition to Higher Education Examination-YGS and Undergraduate Placement Examination-LYS in transition from high school to university.

In many countries, there are certain selection and elimination examinations in the transition to higher education, as student qualifications/sufficiency are searched for at a certain standards in entry to a university. For example;

large-scale central university entrance examinations are applied in Japan, South Korea, China, etc. (Kalaycioglu 2015, 181).

In addition, various countries including USA, European countries, Asian countries such as China, Russia, Japan, Israel etc., apply different examinations such as high school graduation examination, central university entrance examination, university entrance examination and aptitude (special talent) examinations, for the university entry process (Gunay & Gur, 2009, 2-5). This situation indicates that even though there are different educational systems in all developed, developing or undeveloped countries in the World, the examination phenomena has a very important place in all those countries (Balci, 2009; Erginer, 2007).

The question of how the students who intensely confront examinations associate the concept of "examination" with a "metaphor" should be considered as a matter to be emphasized and pay attention. It can be predicted that the perceptions, thoughts and feelings of the students, who spend a significant part of their lives in exams, on the concept of examination can be better evaluated by means of metaphors.

The word "metaphor" is derived from the Greek word, *metapherein* (meta: beyond, upper, pherein: carry) meaning "moving from one place to another" (Karairmak & Guloglu, 2012, 122). The current dictionary of the Turkish Language Association defines this word with the concept of "metaphor". Again in the same dictionary, the word metaphor is defined as follows; "1. The word that is used in a different meaning other than the real one as a result of a relation or an analogy. 2. The use of a word or concept in a way other than its general acceptance, metaphor." (<http://www.tdk.gov.tr>). According to Lakoff and Johnson (2005) who have very important studies in the field of metaphor, the metaphor is to perceive and experience a phenomenon / case according to another phenomenon / case. The metaphor, a major perception tool, involves the transfer of information from a known area to a new / unknown area (Guveli & Ipek et al., 2011, 140).

In the study, college-level students are given a written opinion form, as the data collection tool of the study, including the sentence of (Exam is similar / like; because), then asked to associate the examination with a metaphor and explain why they associate it in this way. Thus, the student firstly defined the elements in his/her mind related to the concept of "examination" by depending on his/her emotions, thoughts and experiences, and then tried to explain why he/she thinks in that way. Thus, it has been tried to obtain the metaphors that both Turkish and foreign students studying in a university have been matched with the concept of examination.

Aim of the Study

The study aims to find out whether there is a difference between the metaphors of Turkish and foreign students regarding the concept of examination. For this purpose, answers for the following questions were searched:

1. What are the metaphors of the undergraduate students (Turkish-foreign) studying in the TRNC regarding the concept of "examination"?
2. What conceptual categories do these metaphors bring to the stage?
3. What are the similarities and differences between the Turkish and foreign students' metaphors regarding the concept of examination?

METHOD

The study used the phenomenology design as one of the qualitative research strategies to reveal the "individual's experiences, perceptions and implications related to a phenomenon" (Yildirim and Simsek, 2013, 84). This design focuses on "a phenomena that we are aware of but do not have an in-depth and detailed understanding"(Yildirim and Simsek, 2013, 78). The "content analysis "approach is used in the analysis of qualitative data, and the data obtained at the end of the data collection process are summarized and interpreted according to the pre-determined themes (Yildirim and Simsek, 2013, 259).

Study Group

The students studying at TRNC universities constitute the universe of this study, and 100 Turkish and 100 foreign students studying in these universities (200 students in total) also constitute the sample of this study. The sampling groups were selected randomly among the students in science and social sciences. The Turkish

students in the study are the Turkish citizens who study in different departments of the universities as follows; (Turkish Language Teaching, Special Education Teaching, Pre-School Teaching, Child Development, Social Services, International Relations, Political Science, Public Administration, Business Administration, Banking and Finance, Dentistry). The foreign students in the study participated from different departments of the universities as follows; (Dentistry, Medical fields, Graphic Design, Nursing, Civil Engineer, Mechanical Engineer, Computer Engineer, Banking and Accounting, Banking and Finance, Computer Informatics, Aeronautical Engineering, Marketing Management, Architecture, Health Sciences, Pharmacy, English Language and Literature, Law, Psychology, International Relations, Environmental Education, Translation and Interpreting), and they are also from different countries predominantly in Asia and Africa as follows; (Syria, Palestine, Lebanon, Iraq, Jordan, Qatar, Oman, Iran, Thailand, Turkmenistan) and (Egypt, Morocco, Sudan, Nigeria, Zimbabwe, Ghana, Rwanda, Kenya, Somalia, South Africa).

Collection of Data

An open-ended written opinion form was used as a data collection tool in the study. The measuring tool used for data collection was created by means of an extensive field literature review, and an expert opinion about the tool was received, then the final version of the tool was designed in the direction of these opinions. In order to collect data, the students were asked to fill the blanks with appropriate phrases in the sentence of "Exam is similar/like.....; because ". In this way, the relevant metaphor and reasons for choosing that metaphor were obtained (Yildirim and Simsek, 2013, 242).

Analysis and Interpretation of Data

Since this research is a qualitative study, analysis of the data has been performed through content analysis, percentages and frequencies. In addition, the participants' metaphors related to the concept of examination were analyzed by separating them into conceptual categories. In order to ensure reliability in this study, the written opinion forms, justifications and conceptual categories were presented to a specialist in Educational Sciences. After the metaphors and categories were matched, these data were compared with the matches made by the researcher. In order to determine the reliability of this comparison, the formula of "Reliability = Consensus / Consensus + Dispenses" (Miles and Huberman, 1994) was used, and as a result, the relevant Reliability values were calculated as follows; Reliability = $87/87 + 6 = 0.93$ for Turkish students; Reliability = $82/82 + 7 = 0.92$ for foreign students. These results were found to be sufficient in terms of the reliability of our study.

RESULTS AND INTERPRETATIONS

In this section, the results obtained from the form including the sentence of "Exam is similar/like.....; because" were examined under separate headings. The results were examined in two separate main tables. The categories of metaphors, student numbers and percentages were specified in the Table-1, and the categories, student numbers and percentages of the metaphors set forth by the Turkish and foreign students were specified in the Table-2.

Table 1. Conceptual categories, number of students (f) and percentages (%) of the metaphors revealed by Turkish and foreign students regarding the concept of "examination"

Conceptual categories (Turkish students)	f	%	Conceptual categories (Foreign students)	f	%
Education and examination system	27	29.03	Exam Related Feelings	26	29.21
Exam Related Feelings	24	25.80	Measuring and Evaluating Action	24	26.96
Life and experience	16	17.20	Education and examination system	11	12.35
Measuring and Evaluating Action	9	9.67	Negative criticism	9	10.11
Targeting and Achieving Results	7	7.52	Life and experience	9	10.11
Belief/Religion-based Concepts	5	5.37	Targeting and Achieving Results	6	6.74
Negative criticism	5	5.37	Belief/Religion-based Concepts	4	4.49
TOTAL	93	99.96~100	TOTAL	89	99.97~100

According to the table given above, the metaphors revealed by Turkish students most frequently concentrated under the following categories with the specified concentration ratios; "Education and Examination System" (%29.03), "Exam Related Feelings" (%25.80), "Life and Experience" (%17.20), "Measuring and Evaluating Action" (%9.67), "Targeting and Achieving Results" (%7.52), "Belief/Religion-based Concepts" (%5.37) and

"Negative Criticism" (%5.37). On the other hand, the metaphors revealed by foreign students most frequently concentrated under the following categories with the specified concentration ratios; "Exam Related Feelings" (%29.21), "Measuring and Evaluating Action" (%26.96), "Education and Examination System" (%12.35), "Negative Criticism" (%10.11), "Life and Experience" (%10.11), "Targeting and Achieving Results" (%6.74), and "Belief/Religion-based Concepts" (%4.49). As can be understood from these data, most of the metaphors produced by the foreign students (it is the second for Turkish students) are under the category of "Exam Related Feelings". This situation indicates that the examination phenomenon means stress, anxiety, fear, distress and excitement for many of the students from different parts of the world (from Turkey, TRNC, Asia, Africa in our study) with different education systems. It can be reached that besides the category of "Exam Related Feelings", there is a closeness in percentage between the categories of "Targeting and Achieving Results" and "Belief/Religion-based Concepts". The categories in which Turkish and foreign students differ significantly are as follows: "Measuring and Evaluating Action", "Education and Examination System" and "Life and Experience". That is, 26.96% of the foreign students associated the concept of examination with the category of "Measuring and Evaluating Action", whereas only 9.67% of the Turkish students related it to that category. A difference of 17.29% was observed among these student groups for the category in question. Moreover, %29.03 of the Turkish students associated the concept of examination with the category of "Education and Examination System", whereas only %12.35 of the foreign students related it to that category. On the other hand, %17.20 of the Turkish students associated the concept of examination with the category of "Life and Experience", whereas only %10.11 of the foreign students associated it with that category.

Table 2. Conceptual categories, student numbers (f) and percentages (%) of the metaphors revealed by Turkish and foreign students regarding the concept of "Exam"

Category	Metaphor within the scope of the category (Turkish students)	Metaphor within the scope of the category (Foreign students)
a. Measuring and Evaluating Action	An information measuring instrument, Evaluation, Law, Control, Meter, Proof of our learning, Measurement, Filter, Intelligence test	A mirror, Calculator, Evaluating yourself(2), Final stage, Interrogation, Jig-saw puzzle, Judgment, Knowledge test, Learning a game, Learning to cook different meal, Measurement, Meter, Opportunity, Right balance, Scales, Shopping, Test, Test of knowledge, Test of the level of learning, Test what we've learnt, Testing myself, Testing students ability, Using non-calibrated scale
b. Belief/Religion-based Concepts	Judgment Day(2), Grave Question (Endless question), Nightmare, As-Sirāt (hair-narrow bridge)	Angel of death, Devil, Hell(2)
c. Negative criticism	Relentless disease, Eysan in Ezel, Magnet, Death, Fatal disease	Executed, Executed-boring module, Funeral, Nightmare and jail, Pain in the neck, Torture, Very hard, Walking in high heeled shoes, Writing Chinese that I won't know/love
d. Life and experience	Barbed wire, Seasonal work, Life (3), A Puzzle part of our life, Challenges of life, Breath, Physiological need, Thief, Everything in our life, Life tree, Walking a long way, Obstacle to be overcome, Door, Occupation	A busy life, Fun party, Judgment day, Life line, Life(2), My life, Death, Fun or hell
e. Targeting and Achieving Results	Going the same place in different ways, Reaching the summit of the mountain, Power, Crop, Ladder, Field, Field crop	A meal that I can enjoy, A Wall that is so high you can't climb, Borderline of future, Egg, Route to go, Rugby match
f. Exam Related Feelings	A fireball, Reaping machine, Chinese torture, Tension-restlessness (2), A fearful dream, Anxiety and / or stress (7), Anxiety-stress-fear-excitement, Horror film, Fear and stress, Death, Mental disorder-anxiety, War, Labyrinth, Stress machine, Disease (2), Mental affliction	A sea or sky, Anticipation and dread, Anxiety, Burning sun, Crying, Dark room without any kind of light, Disease, Enemy, Football match, Horror movie, Hurricane, Nightmare(2), Injection, It's fear and horror, Panic attack, Panicking, Rush hour, Storm cloud, Stress, Stress & anxiety, Suffering, Terrible, To judgment, To watching my cat being killed, War
g. Education and examination system	Horse racing (2), Pressure tool, Pressure, Loading information on a computer, A Race, An empty item, Empty paper, Trial board, Putting a Tile on wall, Labor theft, Donkey, Memorizing system, Memorizing, Hippodrome, Uphill and downhill road, Turtle running after rabbit, Pessimism, Running marathon, Running, Robot students, Sports, Execution of an innocent person, Forgetting, Competition program, Talent and intelligence work	Boring thing, Broken tool, Trial, Collaboration & game, Difficulty, Disaster or calamity, Experience, Future generation, Happiness, Slavery, Torture

It is thought that important deductions and analyzes can be provided through the metaphors given in the above table. For example; the fact that Turkish students' metaphors about the concept of examination concentrated on the category of "Education and Examination System" and "Exam Related Feelings" rather than the category of "Measuring and Evaluating Action" is thought to be because of their negative perceptions on the education and examination system in Turkey and TRNC. The fact that only 9.67 of the 93 students related the exam to the category of "Measuring and Evaluating Action" leads us to consider that the evaluation dimension of Turkish education system has created a sense of serious inadequacy in the students' perceptions towards the exam. Accordingly, it is observed that the Turkish students mentioned at most about the education and examination system (and related issues) in metaphorical categories. The Turkish students who associate the exam with the measurement-evaluation usually have created positive and objective metaphors. For example; the following metaphors mentioned by them are positive content metaphors: "Meter: If the meter measures the length of something, then the exam also measures our own knowledge and competence in the same way." "Control: Measures how much information is received. The exam shows how knowledgeable and inadequate we are in our lives. It helps us to complete our deficiencies."

On the other hand, the foreign students' metaphors about the exam, contrary to those of the Turkish students, are determined to concentrate on the category of "Measuring and Evaluating Action" rather than the category of "Education and Examination System". It is interesting to find that similar to Turkish students, foreign students had positive and objective approach related to measurement and evaluation. According to the foreign students, the exam the benefits of enabling them to make self-assessment, measure and test their own knowledge and abilities, and to determine their own deficiencies. For example; "A mirror: An exam is like a mirror for me; because it is a reflection of everything one would have learned during the lectures will be reflected in the exam true reflection of oneself", "Opportunity: You get the chance to see how much you gained knowledge from studying and put more effort if you see your knowledge is not enough. Exams are always a chance." We see that only one of the foreign students touches upon the negative aspect of the examination: "Using non-calibrated scale: Because a lot of students sometimes turn to cheat, and others may have special problems."

In the *Belief / Religion-based Concepts* category, we see that two groups have close frequency with each other. When the metaphors in this category are reviewed; we see that Turkish students used religious metaphors by making connection with the first meaning of each religious concept. Some metaphor examples used by Turkish students are as follows: "Judgment Day: Questions will be asked in the Judgment Day, then the right things will be separated from the wrong ones. You will pay the price of what you did wrong... ", "As-Sirāt (hair-narrow bridge): Those who can pass the exams have a good profession and live a life like in the heaven, but those who do not pass the exam fall from the bridge and live a life like in the hell." The religious metaphors used by foreign students are weakly connected in the first meaning of the words. For example; "Devil: Exams was the last thing that I didn't want to hear from because I am a person who would want to finish studying all the units that we would have done in the class for me to be motivated to write anything, otherwise without me being not prepared I will be confused and not sure of what I am going to write. I'm really afraid from exam." Here, the exam with the features that the student does not want to hear anything about it, is afraid of it, has a mind confusion for it, evokes the evil in our minds. However, there is no apparent direct relationship as in the concepts of Judgment Day and As-Sirāt (hair-narrow bridge).

The negative elements in the *Negative Criticism* category directly or indirectly associated the exam with a bad concept. In this association, we can state that the metaphors of foreign students are mostly harder, stronger and more specific than those of the Turkish students. We can assert that the metaphor of "fatal disease" and "magnet" mentioned by the Turkish students are particularly interesting. We can also point out that the metaphors of "death and relentless disease" also directly focused on the negative side of the concept of examination. Among the foreign students' metaphors including "Executed, Nightmare and jail, Torture/ Pain in the neck, Walking in high heeled shoes, Writing Chinese that I won't know-love", the first three can be judged to be more rigid and

the other three can be evaluated as authentic, and it can be stated that the examination is directly regarded as negative.

The “*Life and Experience*” category of the Turkish students is ranked as the third following the categories of “Education and Examination System” and “Exam Related Feelings”. This also demonstrates that for the Turkish students, the examination is a crucial concept that embodies indispensable, complex, good and bad elements like life: The metaphors including “Barbed wire, Challenges of life, Breath, Physiological need, The uncertainties in life, Thief, Everything in our life, The need of life” show us the importance given to the concept of examination. For example; the metaphors including the followings indicate that the concept of examination also includes experiences, difficulties and hardships like life: “A barbed wire: As you get closer to it, you suffer, and as you touch it, you burn. Life sometimes resembles to a cruel teacher, first makes an exam and then teaches. ... The exam, like a barbed wire, teaches us to protect, to be protected and to stand strong and stable against what is experienced. ” and “Everything in our lives: whatever we do, actually we pass through an exam or an interview. Even when we born, we go through thousands of difficulties, examinations...” We can see that the metaphors of the foreign students related to the life are 7.09% less than those of the Turkish student, and they do not associate the exam with life as much as the Turks. However, we can also see in the related associations that the point on which foreigners emphasize in the life-exam matchup includes experiences, difficulties and troubles. This means that both groups regard the examination as a concept that includes ups and downs, difficulties, experiences and troubles like life. However, we can stated that the Turkish students have a stronger interest in life than the foreign students.

When we examined the “*Exam Related Feelings*” category, we can see that the examination is an element of stress, distress, anxiety and excitement for both groups. In the table of foreign students, the exam related feelings category placed on the top, while it placed in the second rank with a little difference in the table of Turkish students. When both metaphors and reasons were examined, from the students’ metaphors and comments, we can easily understand that both Turkish and foreign students have an intense stress, anxiety, fear and excitement before, during and after the exams, that this situation reaches to the extent of affecting their success and concentration, and may cause disturbance, insomnia and even the psychological disorders.

In the “*Education and Examination System*” category, we can see that the Turkish students expressed more metaphors than the foreign students. From the metaphors and reasons of the Turkish students, we can easily understand that they have important complaints and problems about the education system. These complaints and problems relate primarily to the fact that the evaluation and elimination which will affect their educational life (for example; university entrance exam, transition to high school-TEOG exam, midterm and final exams etc.), are only dependent on the 1-2 hour examinations. Also, another important point that has been emphasized is the fact that Turkish students are being competed in an exam marathon throughout their lives almost in an atmosphere of a competition. As a matter of fact, some of the students associated the concept of examination with the metaphors such as race horse, race, marathon, and hippodrome. For example: “Horse race: All people are in a meaningless race. This also determines the system. Everybody enters exams without being asked the question of ‘what is your interest/ability’. Not everyone is the same ... Then why is the examination system same for everyone? This race will never end, and all humanity will be condemned to fail.” In addition, another criticism towards the general education system is related to the way the system encourages students to memorize. For example; “Memorizing: Is the memorization by forcing ourselves of the information that most of the time we do not use and will forget later.” Besides these, the students made many more criticisms about the system: “Turtle running after rabbit: People's brain structures are different. Therefore, not all people's brains work in the same way, but they try to make sure that all people think in the same way through the examination system. It's really impossible. It's as ridiculous as to make a turtle run as fast as a rabbit.” There is a criticism in this metaphor for the fact that it is wrong for students to evaluate their intelligence according to a single shape/mold without regarding to their intelligence. Another example is as follows: “Donkey: The test is part of a system that enslaves people, puts them into a continuous race, and creates a single type of human being. I wish everyone can get hands-on training without examination according to the profession desired. This system puts too much burden on people.” In this example, it is mentioned that the Turkish education system unnecessarily loads too much information on students and that students cannot get the correct education in the fields suitable for their

abilities. Depending on these, some students also considered the examinations to be unnecessary, ridiculous, and pointed out that different measurement tools should be used to assess students. According to the results obtained, although there is a high level of anxiety and stress among the foreign students, we can see that they did not make intense criticism about the system. This situation is seen as a striking and interesting result. When we look at the metaphors and reasons given by the foreign students, we see that their comments and problems are more about the exam itself. For example; “Disaster or calamity: It’s not a fair to evaluated students by exam. Because maybe this student was sick the day before the exam and he can’t study well. In my opinion we can replace it by activities.” “Future generation: A good way to test a students’ understanding of a certain subject when it’s done consistently. But on the other hand cheating has become something a lot of student rely on which takes away the whole benefit of the exam. So a solution must be found. Other ways the generation will fall off. Only good test and education can make our future.”

CONCLUSION AND DISCUSSION

Table 2 shows what the metaphors of the undergraduate students (Turkish-foreign) in the TRNC are associated with the concept of "examination". These metaphors are also involved in the aim of the study. According to this, "Education and Examination System" (29.03%) was observed as the most intensified category among the Turkish students and "Exam Related Feelings" (29.21%) was observed as the most intensified category among the foreign students. When we look at the conceptual categories brought by the metaphors, we can see that these are collected under 7 different categories: Education and Examination System, Exam Related Feelings, Life and Experience, Measuring and Evaluating Action, Targeting and Achieving Results, Belief/Religion-based Concepts, Negative Criticism. 29.21% of the foreign students and 25.80% of the Turkish students has emphasized on the emotional stress, anxiety, distress and excitement about the concept of examination. This results in that the examination arouses "negative" feelings for the students participating in the study. Karasahinoglu (2015), similar to this study, found that the students described the concept of examination as an anxiety with measurement and evaluation. However, Karasahinoglu (2015), unlike this study, has come up with several different categories. For example; Feedback, competition, threat and entertainment are some of these categories.

When we examine the criticisms of Turkish students about the education system, we can easily see that they focus on the negative aspects of the examination. Paris, Lawton, Turner and Roth (1991) also stated that the students negatively considered the education system and especially the examination as insignificant/unimportant. We see that there is no obvious problem with regard to the system in foreign students. We can also see that both groups have more pessimistic and negative concepts than the other categories in the category of worse concepts and elements. We also observed that Turkish and foreign students made more positive associations in the categories of “Measuring and Evaluating Action” and “Targeting and Achieving Results”. Taking into account of the whole study and examining all the metaphors of Turkish students, the examination appears in our minds as a concept measuring the information given in a distorted education system, being a source of anxiety-stress, including difficulties, troubles and requirements similar to life, and helping to achieve certain goals. When we look at all the metaphors of foreign students, the examination appears in our minds as a concept measuring knowledge and abilities of the students as well as being a source of anxiety and stress.

RECOMMENDATIONS

- Due to the high rates of examination anxiety of foreign and Turkish students, quality improvement studies should be carried out for the exams in the respective education systems,
- Students should be assisted by psychological counselors in order to avoid anxiety and fear,
- Education policies should be revised considering the fact that Turkish students emphasize on the existence of a problem with examinations especially in the education system.

ABSTRACT

In the Third millennium, it is important to equip learners with the tools they need to deal with uncertain everyday situations independently and with confidence. This case study presents and analyses a sequence of episodes that documents the mathematical thinking of one student's group about two random phenomena. The design activities, implemented in problem solving conditions, use games as a means for investigating and studying aspects of sensible reality. The methodological approach favours the experiential-symbolic-reconstructive model and uses the computer as a pedagogical tool through programming practice, with the aim of helping the students in the construction of the meaning and interpretation of probability.

INTRODUCTION

The formal development of probability learning is closely related to a series of paradoxes that show the disparity between intuition and conceptual development in this field. For example, many students think that the events "Get 5 and 6" and "Get two times 6" in the launch of two dice are equally likely to occur (Batanero, et al., 2005). Many people's spontaneous judgments on probabilistic results are partial and sometimes erroneous; incorrect assessments of some random situations are often expressed as preconceived opinions and superstitions (Fischbein, & Gazit, 1984). Learning about probability is essential to help prepare students for life; everyday life is permeated by random phenomena (Beltrami, 1999; Chernoff, 2008, Fandiño Pinilla, 2010). For this reason several school curricula include probability from the first and second level of education (e.g., Australian Curriculum, Assessment and Reporting Authority [ACARA] 2010; MECD 2015; Indicazioni Nazionali 2012, Ministerio de Educación Pública [MEP] 2012; Ministry of Education [ME] 2007).

According to Hawkins (1990) the calculus of probability cannot be reduced to the teaching of conceptual frameworks but must foster in students the development of thought processes, which lead to correct intuitions. The need to develop appropriate probabilistic intuitions is a basic component of the teaching of probability (Feller, 1968). Accordingly, a teaching program that intends to develop intuitions and promote informed knowledge of probabilistic facts should provide students with active experiences of stochastic situations (Frassia, 2016). Therefore misconceptions cannot be modified only through formal and rigorous definitions, but should be overcome through a gradual process of simulation experiences in which the learner is directly involved. As far back as in the last century Bruno De Finetti (1957) had stated that: 'Learners should experience the consistent flow of general ideas from detailed problems, and from particular observations to general theories, the continuous transition from the concrete to the abstract and from the abstract to the concrete, ideas that are based on the intuition of a single magical reality, in which all conceptual resources serve the practical issues and all the practical problems contribute to conceptual development, this and that in turn, means and end, overcoming any form of antagonism'.

In Italian secondary schools teaching practice, unfortunately, the calculus of probability has often been overlooked. This generalized ignorance of even the most elementary notions determines the spread of wrong convictions and/or misconceptions, which border on superstition (Fischbein, & Gazit, 1984; Ang, & Shahrill, 2014; Erdem, & Gürbüz, 2016). Nowadays computers can act as mediators between the concrete and the abstract thanks to the relationship between Mathematics and computer technology: the principle at the basis of the latter is part of the former, while the rapport is also extrinsic because the latter has highlighted and extended the former's application and theoretical potential. As a result the computer -within a suitable methodological framework- can become an indispensable and continuous impulse for the teaching and learning of Mathematics; moreover, the use of computer technology through the practice of programming represents a highly educational mental training (Kuzler, 2000; Lye, & Koh, 2014), while at the same time sensible reality problems can effectively be solved or simulated. The practice of programming represents both a constructive and cognitive activity in so far as it allows the students to acquire abilities, strategies and techniques for solving problems through the notions of variable, procedure, repetition and re-occurrence that are also common to other school

disciplines (Liao, & Bright, 1991). To sum up, programming represents relevant experience that leads students to the full acquisition of mathematical meaning, and contents are no longer just abstract notions difficult to grasp (Bell, 2013).

THEORETICAL FRAMEWORK

The theory of Probability was initially used in gambling alone, and it began to be used in various scientific areas only in the second half of the last century. However, despite its importance, in many countries the concept of probability has only recently been included in the Mathematics curriculum and only became a field of research only in the twentieth century (Gürbüz, 2010; Amodio, & Depueto, 2014).

Fischbein (1975), Steinbring (1991) and Pratt (2005) have stressed the importance of the calculus of probability for student education. In recent years, the reasons for including probability in the school curricula have been highlighted several times (Gal, 2005; Franklin, et al., 2005; Jones, 2005; Batanero, & Diaz, 2009), emphasizing also the need for a connection between theoretical and experimental activities. Introducing probabilistic reasoning into everyday classroom practice requires the integration of theoretical and experimental activities.

The experimental activity is essential because it trains the students to formulate precise questions, to register reflections, and reach a common synthesis; the theoretical activity complements the experimental as it trains the students to 'order' ideas so they can evaluate events rationally and correctly interpret real world phenomena (Frassia, 2014, 2015). Furthermore, it is that reciprocal dynamics of theoretically computed probabilities and observed relative frequencies that may best contribute to the development of efficient probabilistic intuition (Fischbein, & Gazit, 1984; Bonawitz, et al. 2014). The combination of games and simulation could be a successful strategy for the development of probabilistic thinking. Game-situations offer good opportunities for learning (Speiser, & Walter, 1998; Vidakovic, et al., 1998). At the same time simulations allow to develop students' mental models in relation to complex situations or problem solving strategies. Games and simulations represent real 'experiential exercises' because they constitute a real opportunity for students to interact with knowledge. Gaming experiences and simulations offer excellent learning opportunities for all students, even from a motivational point of view (Ke, 2014). A simulation can be used as a pseudo-concrete model for different real situations, in this case offering the chance of working without mathematical formalisms. The simulation acts as a mediator between reality and the mathematical model; it is an educational tool, which serves two purposes: it helps students improve probabilistic intuitions and the teacher in the various steps of modelling (Beanery, et al., 2005). The use of the computer for the simulation of even simple situations and random processes is of great help because it allows the repetition of the phenomenon an increasing number of times, which is not always feasible. It also enables students to build models, to gain experience with random phenomena and predict the behaviour of the same, something hardly possible without fast random generators. Ultimately, in probability teaching and learning the computer is a support tool for creating simulations and for generating data. Along these lines, studies carried out by Pratt (2000) show that probabilistic reasoning can be explained as part of a broader perspective that encompasses different types of resources for learning situations. For example, the use of programming environments aimed to the teaching and learning of mathematics gives learners the opportunity to build and/or process a different type of interaction that entails the writing of a resolving algorithm and the resulting implementation in language (Aydin, 2005). Compared to real or experiential simulation, virtual or symbolic simulation implies two or more variables, which means that the student is cognitively engaged in more interconnected tasks at the same time (Cosmides, & Tooby, 1996). Virtual or symbolic simulation can also be performed with 'closed software': in this case, students would remain external to the development of the phenomenon and would thus be unable to follow the process of construction of meaning.

Probability teaching and learning can be fully achieved through strategic choices such as cooperation and constructivist activities (Barab, et al., 1999).

METHODS

The calculus of probability is actually one of the most stimulating branches of mathematics, also because of its many applications (Gigerenzer, et al., 1989; Greer, & Mukhopadhyay, 2005), and includes three different approaches: classic, frequentist and subjective (Chernoff, 2008). The classic approach to probability has long been dominant in Italian secondary schools. The majority of students find this approach based on combinatorial calculus quite hard especially because of the calculations involved in solving the formulae. The difficulties in the classic approach have so far represented a real obstacle to classroom teaching and learning of the topic, not only in Italy but also in other countries (Batanero, et al., 2005). However, in recent years the growing interest for statistical methods and the use of information technology have contributed to the study of probability as a limit of stabilized frequency (Biehler, 1991). The modelling point of view was adopted in the last years, linking probability teaching with the statistical thinking. The introduction of efficient computers in secondary education allows us to simulate models resulting from statistical observations and to introduce students to the large field of statistical inference. The advantage to using simulations is that we can overcome much of the difficulty

encountered when using the formal rules. Therefore, the use of computers as pedagogical tools - through programming - necessarily implies re-thinking about how students learn but especially about how we teach. This means identifying and experimenting with didactical strategies so that students can have meaningful experiences in class. The authors have based the design activity on the present case study, which involved two classes of a higher secondary school, operating in synergy with researchers in Didactics of the Department of Mathematics and Informatics of the University of Calabria (Italy). The computer-based activity inherent the concept of independence between events adopts a frequentist approach and includes the simulation, real and then virtual, of two random phenomena relating to the drawing of two cards from a pack of poker cards. This way, students have the real chance to experience learning environments based on the experiential-symbolic-reconstructive combination. The specific objective is to offer opportunities for exploration, application and evaluation of different aspects relating to the drawing of two cards from a pack of poker cards. Comparison on different tasks is an opportunity for reflection on both the data obtained from different angles, and on the identification of new connections (Cosmides, & Tooby 1996). The intellectual involvement of the students through (real and virtual) simulations adds concreteness and enhances learning because it enables the comparison and analysis of observed data against the expected results (Lee, et al., 2010). The research study involved 44 students, attending class IV (Year 12) from the “Liceo Scientifico - E. Fermi”, Cosenza (Italy). The sample of students already had some prior knowledge of the programming environment MatCos, because used the software during the lessons. The sample of students had already studied the first concepts relating to the calculus of probability in the traditional way with the same teacher, who did not use any didactic software. This paper reports and observes in particular the evolution of a group student on the topic of some random phenomena by analysing their conversations.

A COMPUTER-BASED ACTIVITY

Some probabilistic ideas are closely connected to the field of Statistics. An example of a modelling framework for statistical thought), which describes the complex thought process involved in solving real-world problems, was developed by Willd and Pfannukuch (1999).

On this basis, the model of computer-based activity is circular and follows the pattern in Figure 1:

Figure 1: Design activities cycle.

The pattern in Figure 1 facilitates the study of random phenomena because it allows to compare the results with those dictated by the theory; the student judges that the empirical results are close to the theoretical ones the more the greater the number of trials made. The transition from the experience in the construction of the meaning takes place after the actual simulation through the implementation of simple algorithms, implemented in the programming environment MatCos. The use of a programming environment like MatCos adds value because it helps the students to reinforce their skills in handling mathematical language (Costabile, & Serpe, 2012, 2013). The virtual simulation through the programming is a constructive activity and cognitive as it allows the student to acquire skills, strategies and techniques to solve problems using the concepts of variable, procedure, repetition and recursion, which are also, transversal concepts to other school subjects. The design teaching setting based on game allows students to exercise their critical thinking skills, problem solving, creativity and collaboration.

REAL SIMULATION

The teacher divides the class into group of 3-4 students and distributes a pack of poker cards to them. Secondly, the teacher delivers the first problematic situation.

Two extractions with replacement are performed from a pack of poker cards. The player wins if she or he extracts at least one hearts. What is the probability for the player to win?

As a result of the stimulus provided by the teacher, students begin to formulate some hypotheses. Common judgment goes as follows:

“In a pack of poker cards, there are 13 hearts on a total of 52 cards. If we extract a single card the probability of obtaining a heart is $13/52 = 1/4$!”

There follows the discussion of the group of students taken into consideration:

Anna: We can think of two extractions with replacement as two draws from two different packs of cards, that is, we take two packs of poker cards P1 and P2, and we draw a card from P1 and P2!

Simone: Clever!

Paolo: Then I have two equal chances...

Anna: Yes, you mean that the chances to extract one hearts from each of the two packs (which are identical) are the same!

Paolo: But we want to establish the probability of the event 'at least one hearts', how shall we do that?

Simone: In my opinion, the probability is 1/4 ... the hearts are always 13 of 52 in both extractions, are they not?

Paolo: Yes, maybe you're right ...

Anna: I'm not convinced of what you are saying!

After the discussion, the students, prompted by the teacher, begin to simulate the proposed situation. At the same time, the teacher guides them through a careful analysis of the text, pointing out the meaning of words, and invites them to register the results on a chart, in order to remember them later. After 30 repeated tests, the groups compare the results obtained. At this point a discrepancy of results will become evident; and here is where the teacher initiates a guided discussion, after which the need to repeat a large number of tests emerges to obtain significant results. An answer to this need is provided by the use of computers, used to simulate random events.

VIRTUAL SIMULATION

The next step involves the computer simulation of the proposed situation with MatCos. This phase has a strong educational value because students have a real opportunity to use and show what they learnt in the first phase. Also at this stage the writing of the algorithm gives rise to a constructive debate on the analysis of the event. The problem is here 'dismembered' and each part is a crucial step of the solving algorithm.

Here's a transcription of dialogue between the teacher and the student group:

Luisa: Let's think of when the event occurs of which we want to calculate the probability!

Anna: Well, you're absolutely right!

Teacher: 'At least one' does not mean exactly one, but 'greater than or equal to one'. Then, the player wins if he or she gets one hearts from P1 and one non-hearts from P2, or if he or she draws one non-hearts from P1 and one hearts from P2, or if they draw one hearts from P1 and one hearts from P2!

Paolo: That's right, so we need two whole variables ranging from 1 to 52 including the extremes, to memorise the results obtained from the extraction of two cards from two packs!

Luisa: But how can we say if it is hearts or not?

Paolo: We can think of a correspondence between natural numbers from 1 to 13 with hearts and those from 14 to 52 with a different suit from hearts!

Anna: Perfect! Now everything is easier, by entering the two variables into a cycle and the control with 'if' with the appropriate increase in the counter of favourable cases, we have done it!

At the end of the discussion, the simulation concerning the proposed issue will follow, and the subsequent coding in the MatCos programming environment. Constructing the algorithm is an important and delicate phase because the students have to design the 'finite sequence of steps' that enables the computer to get to the solution. The steps of the algorithm of the two simulated extractions with replacement from a pack of poker cards are the following:

1. Assigning the number of simulations;
2. Initializing a counter to record the number of successes;
3. Cycle for the simulations:
 - a. Assignment of two variables (to which the result of the extraction for each card is assigned);
 - b. Control action to verify the drawing of at least one hearts and appropriate increase of the counter.
4. Calculation of relative frequency;
5. Printing of the relative frequency;
6. Representation of results obtained on a histogram.

The implementation of the algorithm in programming environment MatCos is as follows:

```
n=readnumber; cf=0;
for(i from 1 to n)do;
  a=int(random(1,52.99)); b=int(random(1,52.99));
  if((a>=1) and (a<=13))or((b>=1)and (b<=13))then do;
    cf=cf+1;
  end;
end
p=cf/n;
print("in ", n , " extraction with replacement, we have obtained at least one hearts ", cf , "
cases"); histogram(cf,n-cf); histogram(p,1-p);
```

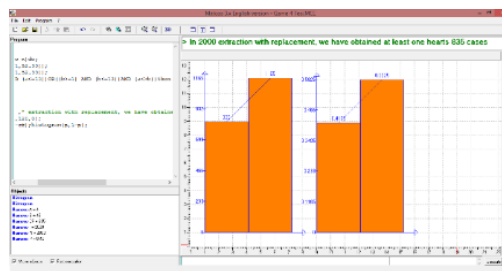

Figure 2: Output first problematic situation with $n = 2000$

The output of the virtual simulation yields results, which differ from the predictions, which confirmed a victory with a percentage of 25%; this offers the chance to analyse the meaning of the probability assigned to the event.

Luisa: Simone, I think your solution is far from the value of the probability!

Anna: Ehm...yes! Let's think a little...

In a pack of poker cards there are four suites; if we draw a card we have 4 different possibilities...either hearts, spades, diamonds, or clubs.

If we put the card back in the pack and we draw another we have again 4 different possibilities.

So with two extractions with replacement there are 4 times 4, that is 16, possible cases.

Simone: And how many favourable cases?

Paolo: Clubs-clubs, clubs-spades, hearts-diamonds, hearts-clubs, spades-hearts, diamonds-hearts, clubs-hearts!

Luisa: 7! So 7 out of 16!

COMPARISON WITH THE THEORETICAL MODEL

Finally, students must use algebra to solve the proposed game, and compare the results with the numerical values of the relative frequencies obtained in the virtual simulation. At this point, the teacher intervenes; the event of which we want to calculate the probability is as follows:

$E = \text{"Extraction of at least one hearts in two extractions with replacement"}$

The event is realized if in one of the two extractions you get one hearts or if you get one hearts in both.

In order to summarize the situation, it seems appropriate to make use of the tree diagram (Figure 3):

Figure 3: Tree diagram relating to the extraction with replacement of two poker cards.

The possible cases are in total 16, the favourable cases 7, and then the probability of E is:

$$p\left(\frac{7}{16}\right) = 0,4375$$

As all branches are equally probable. The students should find that the theoretical results agree with the numerical value of the relative frequencies obtained in output.

NEW PROPOSAL

At this point, the teacher proposes to the students the same problematic situation with some variations:

Two extractions without replacement from a pack of poker cards are done. The player wins if at least one hearts is extracted. What is the probability for the player to win?

A small variation of the problematic situation becomes an opportunity for a new exploration: students, confident from previous experience, make some predictions about the probability of the player to win; influenced, too, by the results obtained previously almost all settle on a probability of 43%, because as some of them say:

"The fact that we do not replace the first card extracted does not change the final result".

The teacher for her part continues to maintain a neutral position so as not to affect the predictions expressed by the various groups, that this time proceed immediately to designing the algorithm of the new situation, so it can be implemented on the computer. During the drafting of the algorithm, substantial differences with the previous algorithm begin to emerge:

- Anna: This time we cannot expect to extract two cards from two different packs of cards. The first time we draw a card and the situation is very similar to the previous case, but in the second extraction, we find ourselves a pack of cards with one less card, 51 cards. Also, we do not know if there are 12 or 13 hearts, it depends on what we extracted earlier!
- Simone: Then we have to modify the algorithm ...
- Paolo: Sure, but I think it is enough to establish the condition that the two variables are different!

After the discussion, the students agree that it is enough just to add in the control action the instruction ‘*a different from b*’ to the previous algorithm, where *a* and *b* are the variables associated with the two cards extracted. Below is the program output.

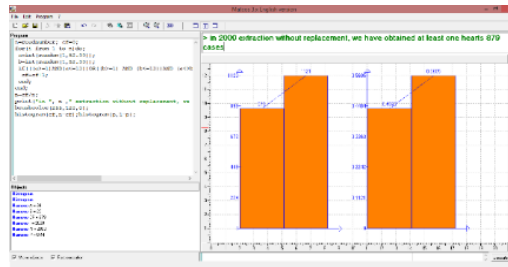

Figure 4: Output second problematic situation with $n = 2000$.

At this point, the groups are able to operate a comparative analysis of the results obtained experimentally with the aid of the computer with the theoretical results, obtained also with a tree diagram. Indicated with:

$F = \text{“Extraction of at least one hearts in two extractions without replacement”}$

and H, D, S, C extraction of one hearts, diamonds, spades and clubs, respectively, we have:

$$p(F) = p(HH) + p(HD) + p(HS) + p(HC) + p(DH) + p(DS) + p(DC) + p(SH) + p(SD) + p(SC) + p(CH) + p(CD) + p(CS) + p(CD) \approx 0,4245 < 0,43$$

At this point, the teacher highlights what has already emerged during the discussion of the various groups: in the first problematic situation proposed the second extraction is not affected by the previous extraction as it occurs in the same situation. The second problematic situation is different, though. As a result of the first extraction, the pack of cards has now one less card. Also, the extraction of the second card is influenced by the earlier extraction. The fact that at first the students do not see a difference between the two situations highlights the usual resistance to accept that the probability of the occurrence of an event depends not only on the event itself, but also on the environment in which it occurs. Afterwards, the teacher introduces the definition of independent events and more examples and suggestions for exercises complete the experience.

DISCUSSION

From the students’ conversations it is apparent that they had no difficulty in determining the probability relative to elementary events, as shown also by Simone’s initial observation. However, in different steps of the conversations the authors noticed some very interesting elements which were analysed according to the design objectives. For example, in the conversation Anna says: “*We can think of two extractions with replacement as two draws from two different packs of cards, that is, we take two packs of poker cards P1 and P2, and we draw a card from P1 and P2!*”. She shows logical and abstraction skills by correctly interpreting the problem posed by the first problematic situation: she associates the two events “*Extraction with replacement of two cards from a pack of poker cards*” and “*Simultaneous extraction of two cards, each from a pack of 52 poker cards*”. At the same time, in the first conversation we register Simone’s consideration as an ‘incorrect intuition’ because it associates the compound event of the first problematic situation to the elementary event relative to a single extraction. Regarding this, it is important to notice also Anna and Paolo’s doubts, which they express but that remain unmotivated. Furthermore, in the first conversation Luisa listens carefully to her peers’ observations but she doesn’t take part actively. After the real simulation, Luisa’s attitude changes: she indeed participates in the discussion pointing to the importance of considering the cases which verify the event whose probability we want to calculate. After this, the teacher’s intervention on the meaning of “*at least one*” as part of the game instructions is essential. Another interesting element was registered during the writing of the algorithm for first problematic situation, finalised to the virtual simulation. Paolo’s intuitions about the choice of casual variables to be assigned to the two cards to draw, are in fact fundamental for structuring the algorithm. Finally, the output obtained in the virtual simulations offers the chance to reflect and reach the correct solution of first problematic situation. Regarding second problematic situation the students - influenced by the experience so far- start from the idea that the value of the probability required is not different from the previous value. However, their initial conviction begins to waver when they have to think up the algorithm for the virtual simulation of second problematic situation; Anna in fact says: “*This time we cannot expect to extract two cards from two different*

packs of cards. The first time we draw a card and the situation is very similar to the previous case, but in the second extraction we find a pack of cards with one less card, 51 cards. Also, we do not know if there are 12 or 13 hearts, it depends on what we extracted earlier! ”. Anna’s comment is noted by her peers, who now understand the importance of modifying the conditions in the control instruction of the previous algorithm so as to be able to carry out the virtual simulation.

CONCLUSIONS

To conclude, the model of computer-based activity favours the interpretation, description and representation of the observed phenomena, strengthening the process of construction of concepts. The choice to present some random phenomena through the practice of programming stems from the need to propose methods which are alternative to traditional teaching. In the majority of cases, traditional methods deal with the calculus of probability as a series of properties and results to be applied in often limited contexts, and therefore inadequate for a real understanding of its meaning. Through the analysis of the students’ conversations, we can consistently observe and monitor how their thinking evolves and how they re-organise their interpretations during the activity. The model of computer-based activity plays an essential role because it helps the students to develop good *problem solving* skills; in particular, simulation aids the understanding of the concept of probability of an event, assigning to it a ‘degree of reliability’ in the prediction of random phenomena. The realisation of simple programming codes stimulates learners’ analytical skills, while at the same time it trains them to use the formal language of programming. Finally, the model proposed exploits the potential of computers to reinforce the main probability concepts from the semantic point of view, and to add to the traditional theoretical background the algorithmic and constructive aspects of Mathematics.

Computing Teachers in Basic Schools and Their Role in Education Today

Hana BUČKOVÁ

Faculty of Education

Palacký University Olomouc

Czech Republic

hana.buckova02@upol.cz

ABSTRACT

The methods of teaching in basic schools have been changing in the emerging knowledge society, as it is indicated by the utilization of and approach towards modern and communication technologies. One of the major changes concerns the teaching and learning of information and communication technologies, and the related training of future computing teachers. At the same time, however, the question arises concerning further training of the teaching staff who teach the subject but did not pass respective undergraduate training. Therefore, it is imperative that these teachers complete their education in courses or as part of further education of teachers. The role of computing teachers extends, among other things, to developing educational materials, creating websites, and understanding the field of computer networks.

INTRODUCTION

During the 20th and 21st century, there was a very rapid development of technical and technological means. These technologies became a source of stimuli and were also applied in the field of education. What were the technological means permeating the field of education, what expectations were associated with the introducing of technological means and what was the reality in school environments, what results were reached or, alternatively, how many visions remained unfulfilled (e.g. Cuban 1986; Maddux, Johnson 2003; Mehlinger, Powers 2003)? To educate with new objectives, to educate differently, to educate dynamically, to develop key competences of pupils in a new environment using information and communication technologies is a challenge for teachers today.

1 DEVELOPMENT OF INFORMATION AND COMMUNICATION TECHNOLOGIES IN THE SECTOR OF EDUCATION

Education in the Czech Republic has changed considerably over the last 15 years. It is precisely the development of digital technologies and their entering the life in schools that is one of the key causes of many changes. While at the turn of the 21st century it was rather an exception for a school to have an access to the internet, currently the vast majority of schools are connected to the internet, they are equipped with computers, the agenda of schools is largely or entirely processed in an electronic form. The number of computers in schools has been continuously increasing, the equipping of schools with interactive whiteboards and other digital technology has improved (e.g. MEYS, 2014; Neumajer, 2015). The equipping of schools must always be seen in a broader context, as it cannot be a purely technological process, but also the pedagogical process.

Computer supported learning is constantly developing and changing, because it reflects the development of technologies. The field of information and communication technologies underwent significant changes in the 1990s, which resulted in the rapid expansion of the internet and one of its services - the developing and using of websites that have become a part of school presentations and the life at schools. The concept of computer supported learning was implemented in the Czech Republic with the support of the MEYS in the framework of the INDOŠ project. One of the main reasons for this project is the dynamic development of one of the newer concepts, which is e-learning. E-learning is an educational process in which the information and communication technologies that work with data in their electronic form are used. Methods of application of ICT means depend on educational objectives and content, the character of educational environments, the needs and capabilities of all actors of the educational process (Zounek 2006).

2 MODERN TECHNOLOGIES USED BY TEACHERS IN PREPARATION FOR THEIR LESSONS

Modern technologies help teachers to prepare for their lessons. If teachers choose to create their lesson plans and materials in the electronic form, they have access to various computer programs, for example text and graphics

editors, programs for processing photos and videos or programs for creating animations that can be used to develop a wide variety of teaching materials, and not only text documents (or hypertext documents with links to other resources), but also for example a variety of presentations, image documents (photos, scanned materials), interactive models or multimedia learning materials combining text, video, and audio resources. ICT also enable teachers to distribute teaching materials to pupils by means of CDs, websites or other on-line teaching contents. In addition to general programs, teachers can use specialized computer programs, for example for the creation of tests or mind maps (Balanskat, Blamire, Kefala 2006).

3 UNDERGRADUATE TRAINING FOR COMPUTING TEACHERS

The concept of the subjects focusing on utilization of information and communication technologies by pupils and the overall developments concerning integration of information and communication technologies into the education process in basic schools gave rise to the need to train computing teachers who would be able to teach the aforementioned subjects and also have mastered the basics of administration of school computer networks, effective work with multimedia and graphics, the methods and forms of education supported or managed by information and communication technologies, and hence be able, among others, to also serve as ICT coordinators. At the same time, there is a certain “necessity” that the present teachers who studied at the faculties of education without obtaining any training in information and communication technologies should complete their education in the field through self-learning or in courses of further education of teachers (Polakovič, Dubovská, 2016).

The basic framework of the skills and knowledge that teachers of informatics or informatics-oriented subjects should master so that they could ensure education that would meet the requirements of the current curriculum documents (e.g. framework educational programmes, etc.). However, the questions arise whether that is the case or whether future computing teachers are instructed on all the study areas and obtain necessary competences for their future teaching practice during their undergraduate education, and most of all whether the present computing teachers who graduated at the time when no coherent concept of the teaching and learning of these subjects existed are able to teach the relatively newly defined teaching content.

4 COMPUTING TEACHER AS AN EXPERT

The studied issues can be detected in the area of informatics related educational activities in basic schools and also alongside the further development of relevant digital competences of children and young people. The challenging area is the content of informatics and educational activities, which is seen as a range of topics that reflect the current status and recent trends (Android, IOS features to Gmail), and the fields of information and communication technologies, including the current requirements for the development of pupils’ digital competencies. Another problematic area is the progress in the structuring of the approach toward the development of pupils’ digital competencies. Competencies are seen as concretization of relevant key competencies or as components of digital literacy of basic school pupils. Questionable is also the complex of respective competencies of the teachers who participate in implementing compulsory informatics subjects. And the last area is the integration of development of digital skills into the educational activities realized within the school environment and life (Štípek, Rambousek, Vaňková, 2015).

The teacher is a key element in shaping the final form of the curriculum that is implemented during informatics lessons in basic schools. A number of factors are introduced to the curriculum designing process intentionally as well as accidentally. These factors then influence and regulate the process. In particular, it is necessary to consider the *Framework Educational Programme* (hereinafter referred to as FEP) and the *School Education Programme* (hereinafter referred to as SEP) and, in addition, also the local physical conditions and internal factors on the side of the teacher - in particular the time the teacher has at his or her disposal to prepare for teaching and his or her didactic skills. The teaching content is formed with respect to the expected competencies of pupils that are linked to the level of technological and social development. It reflects the challenges and life situations that pupils need to be prepared for. These are also subject to continuous changes and the teaching content must reflect them, otherwise education would have no effect. This fact was also noted by O. Neumajer (2016), who states that “*It is obvious that amendments are necessary because the current wording of the educational area of Information and Communication Technologies in the FEP for basic education has not changed since its origin in 2004.*”

The outlined facts are sufficient enough to clearly suggest that many of them operate as variables in the context of the resulting form of instruction, which leads to the *differences in the concept of the informatics teaching content in basic schools*. This brings us to the essence of the studied problem. The aim is to use the research base for determining the factors with influence on the shaping of the teaching content and to identify the thematic units of the teaching content that are taught at schools. The research will also seek to find out how teachers evaluate individual thematic units from different perspectives (topicality, usefulness, performance requirements for implementation, etc.).

Theoretical research methods (e.g. analysis, comparison, and synthesis) will be used in the studying of the given issues. On the empirical plane, methods typical for pedagogical research will be applied, when the main goal will be to determine the form of the teaching content which is implemented in the informatics tuition at basic schools. We will determine the current level of education by means of an interview and a questionnaire. The results will be evaluated by statistical methods.

In the modern form of training of future teachers, this is related mainly to relevant competencies based on contemporary trends in education. By competencies, we understand a combination of knowledge and skills with the ability to use them in a specific situation in practice.

The training aimed primarily at preparing future teachers of information and communication technologies corresponds to the structure and content of the implemented teaching-learning process. Demands placed on computing teachers are cumulative and the teachers are expected to meet them at basic schools based on network services that have been developing rapidly and so it is necessary that the teachers respond to such changes. Mastering such activities requires knowledge of several mutually interconnected areas.

1. The first area is the operation of computer software and hardware. Computing teachers are acquainted in detail with how to build and configure a computer from individual components. Teachers are able to set up or repair all the attributes required for correct operation of a computer. They can connect any peripheral devices and install them to the operating system. They are able to configure and manage operating systems. The extent of their knowledge and skills is higher. Teachers are able to create advanced projects and presentations designed to support teaching.
2. The second area to be mastered by computing teachers is the knowledge and skills necessary for creating Web-based presentations. This study field also includes scripting languages. Computing teachers are able to create advanced website presentations. (Osif, 2003)
3. The third area is the operation of computer networks at the level of an administrator. Computing teachers are acquainted with the configuring of network operating systems of various manufacturers. Teachers are able to install and configure these operating systems under the conditions of basic schools with respect to the INDOŠ project. (Horák, 2001)
4. The fourth area of the knowledge and skills of computing teachers is the creating of graphical 2D and 3D still images, both in the vector and raster form.
5. The fifth area is the creating of animations and video sequences, including the presentation of resulting projects.
6. The sixth area is the knowledge concerning utilization of a computer as a teaching and learning tool. By this we understand creation of various pedagogical and didactic presentations to support the educational process.

5 STRATEGIES OF DIGITAL EDUCATION IN THE CZECH REPUBLIC

In line with the priorities of the Strategy of Educational Policy of the Czech Republic until 2020, the Digital Education Strategy focuses on creating the right conditions and setting up the processes that will lead to the objectives, methods and forms of education corresponding to the current state of knowledge, to the requirements of social life and the labour market, affected by the development of digital technologies and the information society in general. The mission of the Digital Education Strategy is to initiate changes both in the area of methods and forms of education and in the area of educational objectives. A whole range of changes will be required and it cannot be expected that all of them will have been implemented until 2020. The developments in the area of digital technologies and, in this connection, also the development of the teaching content or scientific knowledge in the field of pedagogy are very dynamic and cannot be reliably predicted. Therefore, it is individuals who are in the centre of attention of the Digital Education Strategy and who have to become versatile personalities with support from schools and other education actors outside schools, prepared for the life and employment at the time the characteristics of which are unknown to us to a large extent. That is why the Digital

Education Strategy cannot be considered to be a strategic document in the long run. It must be regularly evaluated and updated. The Digital Education Strategy formulates three priority objectives that the first interventions will be directed at:

- to open education to new methods and forms of teaching by means of digital technologies,
- to improve competencies of pupils in the area of working with information and digital technologies,
- to develop informatics thinking of pupils.

These objectives cannot be achieved without consistent support provided to teachers. Teachers will bear the main weight of the planned transformation. They must be won for the planned changes, provided a wide and varied offer of trainings and sufficient methodological materials. Their activities in introducing creative approaches to education and innovations to teaching must be acknowledged and appreciated accordingly. Alongside, it will be necessary to ensure that digital infrastructures are built in schools and the access to digital teaching and learning resources both at school and outside of it is free of discrimination. It will also be necessary to support modernization and innovation processes both in education and the management of schools and the educational system in general, and concurrently to develop ways of monitoring and evaluation of the efficiency of these processes. All the aforementioned elements of the strategy will have to be significantly supported by activities that will enable to understand the processes of integration of digital technologies into the education of the general public (MEYS, 2014).

CONCLUSIONS

The changing life of the whole society is also reflected in schools where utilization of information and communication technologies in the pedagogical process brings along changes requiring computing teachers to be trained so that they would be able to be administrators of computer networks and to use education programs. They are also able to advise other teachers, ICT users, on any issues arising in this field and concurrently guide their pupils through the world of information and communication technologies.

The research was funded from the “Attitudes of pupils and teachers to the teaching content of informatics as a school subject in basic and secondary schools” project of GFD PdF UP.

Concept of Educational Values in the Prism of Pupils From Roma Families

Iva STAŇKOVÁ

istankova@fhs.utb.cz

ABSTRACT

The issue of the education of Roma pupils is gaining importance of late, especially with regard to their professional development, future employability, and their successful inclusion in society. The socialization of this group is influenced by important determinants specific to the social and cultural environment of Roma families, as well as by their living in areas affected by social exclusion and a number of negatively impactful, even pathological, social phenomena. In the context of the reproduction theory of society and the subsequent theory of social and cultural reproduction as it applies to the field of education, children from Roma families are at risk for early departure from the education system. One of the key factors determining the pupils' decision in this area is the perception of the value of education. How much importance Roma pupils place on the education in their lives influences their educational aspirations as well as the potential for upward learning and social mobility.

INTRODUCTION

Central European countries are not confronted with cultural and ethnic diversity as much as the countries of Western Europe (Hladík, 2016). The Roma minority is one of a number of ethnic and national minorities living within the territory of the Czech Republic. Their differences from the majority population are largely cultural, specific to their emic subcultural history, lifestyle and folkways, mentality and cultural traditions. The story of this minority is long, characterised by persistent experience of social exclusion, the existential experience of poverty, a paucity of opportunities compared to that of the majority population, constant cross-cultural misunderstanding, and even a culturally-enshrined desire to find and establish a home-place and achieve the recognition and validation enjoyed by so many other minorities in the Czech Republic.

In the scope of socio-pedagogical practice with the Roma minority, we often encounter the problem of very low professional and educational confidence. Children from families of lower socioeconomic status, including many Romani families, naturally follow as adults the same life path modelled by their parents and, understandably, adopt their parents' opinions that the pursuit of higher education and a professional career is for non-Roma and, therefore, inappropriate for Romani to pursue. Nonetheless, there is a growing awareness among the Roma minority of the need for higher education to cultivate professional success and a prosperous future, as well as a growing interest in other forms of education of adults. Unfortunately, the prospect of re-entry into an educational system and getting a vocational certificate or, additionally, passing the graduation exam (*maturita*) is at best an uncomfortable one for Romani people and, thus, they are dependent on retraining courses organized by labour offices or other forms of further education arranged by various non-profit organizations. Numerous research studies indicate that educational deficiency is one of the main factors contributing to the social and economic exclusion of Romani people. Experts agree that school system is, in the long term, one of the most effective tools for alleviating the impact of marginalization of Romani people and creating opportunities for meaningful and inclusive social interaction with the greater Czech society. Systematic steps supporting school success and educational opportunities for Romani children are typically associated with high expectations and an immense investment of financial and human resources. Increasing the upcoming generation's educational level is a precondition for change, the intended result of which is upward mobility and enhanced lifestyle potential (Navrátil, 2003). However, achieving an advanced level of education is subject to important factors arising from individual approaches, family environments, social circumstances, subjective interest, as well as such ethical considerations as employers' requirements, supply, the relative value and availability of various forms of education, financial possibilities, and others. It is true that in some cultures (Romani, for example), the number of children who attend high schools or universities is substantially smaller in comparison with children from the majority culture (GAC, 2007). These kinds of statistics lead to a speculation as to whether the presence of this phenomenon is caused primarily by lower intellectual abilities and talent among the subculture in question, or by reduced cultural capital available to this subgroup, its individuals, families and children. Educational cultural capital not homogenous, as it differentiates itself in accordance with a panoply of variables. Educational disproportions are clarified in the context of several sociological and socio-cultural theories, which define mechanisms and determinants of educational opportunities and paths. In light of such theories, we can identify strong transgenerational reproduction of economic and social status in members of Romani minority. A great deal of research shows that most Czech Romani people replicate the social status of their parents and thus occupy the lowest floors of the Czech social structure, inevitably conferring permanent economic deprivation

(compare Mareš, 2003; Sirovátka, 2003, 2006; Šimíková, 2003). In spite of that, some from this group nonetheless manage to overcome these systemic barriers by escaping the mechanisms of social predestination, demonstrating as a result increasing educational achievement and subsequent social mobility.

The precondition for social success and a prosperous lifestyle is one's level of education. Thus, the question of education of Romani pupils becomes not only a pedagogic problem, but also an issue of geo- and socio-political, cross-cultural, and historical importance. Many books agree; one of the main factors in the educational deficiencies of Romani pupils is the different sociocultural environment from which they come from and which influences them in the process of socialization (compare Gulová, 2010, GAC, 2007). Factors of a rather subjective nature intervene in the student's decision to pursue or discontinue further education - motivation disposition, attitudes, aspirations and others. However, even these subjective factors are determined by affiliation with a particular social class. While all classes place emphasis on education, among the lower strata, the portion of those who prioritize education highly tends to decrease. According to Brüggemann (2012, p. 50), the shared supposition is that marginalization in education of the Romani is associated with low level of aspiration and with the perception that higher education is undesirable to the Roma minority and, because of the fear of loss of cultural identity, it needs to be rejected. In this case, the culture is the crucial factor causing the low educational aspirations of Romani pupils, especially the girls who prefer traditional Romani values. Nevertheless, according to research conducted by the UNDP/World Bank/EC Regional Roma Survey (Brüggemann, 2012, p. 50) the differences are proven, but the experts did not conclude that the level of aspiration would be associated with cultural or ethnic origin.

Much research shows that most of the Czech Romani people end up having the same social status as their parents. As Šotolová (2000, p. 39) states, conclusion of compulsory education means the end of education for many Romani people in general. Those who decide to continue their education at high school often attend vocational school, but many of them opt to terminate their studies entirely after only a few months. This decision typically has a negative impact on the former student's employability; people with only an elementary education are rarely qualified for anything more than low-paying positions in unskilled labour, severely limiting their financial prospects and condemning many of them to long-term unemployment.

Educational paths and educational chances of Romani pupils in marginalized Romani localities were studied by GAC 2009 researchers. The study illustrated the presumption of differences between the educational paths of Romani and other children, respectively, who attended schools in marginalized localities in the territory of the Czech Republic. The results of the analysis proved the hypothesis that Romani children are less successful academically than other pupils. Still, there is evidence of positive results for some Romani students, which is as a minority of these did continue their studies at higher education institutions after high school. Such students prove that a Romani heritage does not necessarily condemn one to no more than an elementary education, and they should be highlighted as role models, not only to the Romani specifically, but to all Czech students generally.

EDUCATION AS A VALUE

Values lie at the core of many scientific disciplines and fields of study. In the area of pedagogy, especially the youth values systems, education as a social value in itself, as well as the intrinsic value of the goals and contents of formal education defined in the educational programs, are important to youth development (Průcha, Walterová, Mareš, 2008). The influence of the value system of an individual in the course of their upbringing and education is extremely important. Within the value system, the educational value is crucial. Individual's attitude towards education in environments which privilege educational value is different from environments with low preference. Analogically, the value specifics of an individual are reflected in each educational activity (Sak, 2000). The degree of significance an individual attributes to the value of education shapes their educational process and is reflected in their attitude towards school, academic success, and even in the quality and intensity of home preparation for classes. If this value is not included in the hierarchy of family values common to a certain culture, and an individual does not attribute to it at least some value, it is harder to influence the individual in the social-educative process at school. The absence or deprioritization of this value in the individual's value system is negatively reflected in both their educational and professional paths. The values with which a child begins the process of education -- essentially, the values gained prior to participation in formal schooling-- have a major influence on his or her understanding of the role of education in society (Katrňák, 2003). Cultural variation also contributes to differences in the perceived value of education, in the meanings attributed to education, and education's relative position in the ranking of value preferences of their participants. This does not have to mean that pupils from cultural background other than the Czech majority population do not attribute any meaning or value to education. Rather, it means that, sometimes, adherents of different cultures assign importance to different values, taking into consideration such varied aspects of life as strong self-identification with their ethnicity, devotion to their family or values supporting collective living.

Research results that address the concept of education within the Romani culture specifically are somewhat ambivalent. On one hand, the Roma appear not to perceive education as a prominent value; on the other, Roma ethnics, axiologically, perceive education quite differently from the majority society, and the placement of education as a value is usually lower. However, this is not to say that Roma do not consider education to be of no value at all, simply that it holds a lesser relative value than it does in the surrounding culture (Kaleja, 2013).

The field of values, value orientations and preferences is a frequent topic of discussion in social scientific literature. However, these are rarely the primary focus of the research in which they appear (Prudký, 2009) mainly because experts still face the complex issue of establishing a firm grasp of this elusive topic and discovering solid methods for measuring values. Approaches to measuring values so far work with or are inspired by the models by Hofstede (1980), Rokeach (2000), Inglehart (1990), Schwartz (1992), and, within the Czech and Slovak research context, models by Sak (2000, 2004) and Vonkomer. In spite of the fact that there is a wide range of extant studies so far, researchers still seek new schemes, models and inspirations in order to approach measurement and codification of values (Prudký, 2009).

This research project is narrowly focused on the value of education and its goal is to specify the importance of the value of education and its rank among value preferences of the pupils from different cultural backgrounds, though this group's perception of the role of the value of education may differ from that of the majority population. Thus, we build upon the aforementioned models and approaches. With respect to particular targeting, we intend to investigate the value of education for children from Romani families in more detail and from multiple points of view, and thereby to combine already-verified research tools and to further supplement these with a separate research strategy. We prefer using exploratory, rating and projective methods. However, in order to have a more in-depth look into the issue and to comprehend how pupils and their parents understand the value of education, the research will be enriched with other methods, such as in-depth interviews with both pupils and their parents, in the framework of a quantitative approach.

METHODS

The main aim of this project is to find out how much importance the pupils from the Roma environment place on educational value, as well as to analyse areas that influence the individual construction of the educational value within a particular target group and interpret these in a descriptive way. The focus is on the following areas:

- ✓ the state of education (educational aspirations, the relative placement of educational value within the overall values system)
- ✓ the area of motivation and the reasons for education
- ✓ the area of educational support
- ✓ the area of importance, conception and understanding of education
- ✓ the area of determinants regarding the conception of education

Description of the 1st wave of the research, "Education as a value"

In the first quantitative wave of the research, the focus was on the relative placement of education among value preferences of the Roma pupils, on their educational aspirations and their reasons for education. We performed a questionnaire survey in selected localities of the Zlín and Olomouc region in the Czech Republic (with respect to the high diversification of the Roma ethnicity, we focused on intentionally selected localities and processed the data for each locality separately). Given the specific research sample and recommendations made by experts, we decided to create a questionnaire of our own design.

The research was carried out among selected group of the youth and was subject to clear, predefined criteria:

A) The research sample of the Roma pupils:

- selected locality of the Zlín and Olomouc region
- pupils from 6th to 9th year of primary school
- self-identification with the Roma ethnicity

B) Research-comparative sample from the majority population

- selected locality of the Zlín region
- pupils from 6th to 9th year of primary school

The research was conducted at elementary schools found in the following localities: Přerov, Holešov, Otrokovice, Vsetín and Nedašov.

Selected research questions from the 1st phase of the research:

What is the hierarchical position held by education in the value system of pupils from the Roma background?

What are the educational aspirations achieved by the Roma pupils?

FINDINGS

The table presents a comparison of the results concerning the position held by the value of education in the overall value preferences of the investigated groups of pupils. They were instructed to rank presented values according to their importance in life and assign a rank to an individual value, in order from 1 to 15, with 1 being the most important and 15 being the least important.

Value	ROMA	NON-ROMA	Order of Values/ROMA	NON-ROMA
Health	3.06	3.41	1	1
Satisfied family and children	3.69	5.54	2	3
Love	5.04	5.07	3	2
Sufficient financial situation	7.24	8.15	4	8
Truth	7.46	8.55	5	9
Friendship	8.00	6.46	6	4
Freedom	8.24	7.70	7	7
Life partner	8.53	7.15	8	5
Education	8.56	7.44	9	6
God (faith)	8.57	9.79	10	12
Interesting job	8.96	9.15	11	11
Peaceful life	9.48	9.09	12	10
Environment	9.94	10.46	13	14
Personality development	10.24	9.97	14	13
Helpfulness	11.70	10.57	15	15

Figure 1: Comparison of Value Preferences

The research shows that, in comparison with the pupils from the majority population, the Roma pupils assign education a lower position in the hierarchy of values; however, they do not place it last. As far as complex comparison of value preferences are concerned, we find that the values systems of the Roma pupils and non-Roma pupils are similar. The Roma pupils prefer values such as *Health*, *Love*, *Satisfied family and Children*. Conversely, they sideline such values as *Peaceful life*, *Interesting job*, *God (faith)*, *Personality development*, *Environment*, and *Helpfulness*.

Another field on which we concentrated during the research was a comparison of educational aspirations of all samples of pupils.

Figure 2: Educational Aspiration Graph

As we can derive from the graph, we get consistently different results from the two groups when enquiring about educational aspirations. While, among pupils from the majority population, aspirations to achieve secondary (37%) or higher education (41%) predominate, the Roma pupils are more reluctant in their aspirations; most would be satisfied with completing secondary education with a vocational certificate. 21% of the Roma respondents want to complete the graduation exam (*maturita*), and only 9% aspire to higher education.

DISCUSSION

The results confirmed that Romani pupils include educational value among their value preferences; nevertheless, they rank it lower than do pupils from the majority population. Thus, we can validate Romani students' awareness of the significance of education to their future professional opportunities. This is supported by the fact that almost 75% of Roma pupils have set for themselves the goal of completing secondary education, even though it is apparent that the Roma prefer vocational training. However, whether they will complete their studies at the secondary education institution remains in question because, as Šotolová (2000) states, the end of mandatory education, for many Romani people, still signifies the end of their educational process overall. In this respect, we need to concentrate on support for such pupils during their studies, on improving the educational results of Roma pupils, on eliminating Roma students' premature withdrawal from the secondary education system, on increasing the number of those who successfully complete their secondary school studies, and, possibly, on motivating them towards further studies at higher educational institutions.

The goal of this contribution was to outline individual steps and intermediate results of the research project tracing the concept of value of education among pupils coming from Romani families. Based on the primary data, it is apparent that education as a value holds a different position in the value systems of Roma pupils than it does in that of the majority population, and that educational aspirations of these pupils are different. Subsequently, we can confirm that socio-cultural influences in the process of construction of the individual's value system, as well as the value of education itself, are important, from the view of members of the Roma minority. In the future steps of our research, we will focus on these determining influences in detail and we will try to apprehend the reasons for education motivating these selected groups of pupils, analyse their opinions and attitudes towards education and describe the concept of education from the pupils' and their parents' point of view.

ACKNOWLEDGMENTS

This article was based on the grant project IGA/FHS/2017/006 - The concept of educational values from the perspective of pupils from different cultural backgrounds. However, any mistakes that remain are my own.

ABSTRACT

The purpose of this study was to analyze the content of 245 articles published in various journals and indexed in Scopus database between 2014 and 2017. These articles were examined and screened on the basis of keywords of organizing, academic achievement, student and education. As a result of the screening, 30 articles were reached. In the content analysis research, articles were reviewed in terms of the years they were published in, journals where they were published, number of authors, countries and regions, disciplines, data collection method and number of keywords. The data were subsequently analyzed by the content analysis method. According to the findings, it has been found that most studies were carried out in the United States. Most of the articles included in the study were published in 2016. As a result of the research, it has been ascertained that the qualitative researches are in a majority in the educational researches in recent years whereas the number of those who use the mixed research method is very low.

Keywords: Organization, academic achievement, student, education, content analysis

INTRODUCTION

At the present day, knowledge influences every aspect of human life swiftly and without any limitation. Thus, individuals cannot remain indifferent to educational institutions and educational programs with this emerging interaction. Educational institutions have certain missions. These involve educating individuals with learning abilities who think, attach meaning to what they think and keep up with the age they live in. The learning process which begins with the birth of the individual gains pace with the developments taking place within the process. In conclusion, keeping up with the change and development is directly proportional to the education one gets. The students can develop their skills during the narration of the teacher within the understanding of education-teaching which is in line with the requirements of the time. In this kind of education, it is aimed to make the student use the knowledge rather than memorize it, generate new knowledge and briefly to make him think (Özden, 2005).

One of the basic elements of the education system is the teacher. The success desired to be achieved in the education system is linked with the qualities of teachers and other educational staff who will be influential in the system. No education model is capable of generating services exceeding the quality of the staff to run the model (Gülsün & Atalar, 2014).

Technologies in modern education serve as a practical tool in the implementation of education systems which have more pedagogical features than the conventional ones. These technologies direct the education process in achieving the educational activities and qualities at the desired level. Also, they enable each student to opt for individual tendency paths which take into account their cognitive skills, motivations, tendencies and other personal qualities (Zakirova & Koletvinova, 2014).

Education involves structuring of educational organizations to fulfil aims in line with the national education policies of a country, taking precautions to train a workforce in the quantity and quality to meet the aims and carrying out relevant tasks effectively.

The precondition for the organizations to be productive and successful is to be established and run as based on organizational principles. Thus, organizations established and run as per these principles can be more successful in terms of harmony and competition against other systems and fulfil the organizational objectives as planned.

An organization's using the available human resources, time, materials and accurately and productively in order to attain its objectives is called management (Tortop & vd., 2016). Management is using the individuals in charge of running of organizations as well as the predetermined aims of the operation of the organization in a proper way.

This research aims to determine the tendencies of studies made between 2014 and 2017 on the subject matter of “organizing”, “academic success”, “student” and “education” by means of data screening in Scopus, the database most commonly used for this purpose.

The Objective and Significance of the Research

The aim of this research is to clarify the present situation and shed light on future studies by analysing the articles on “organizing, academic success, student and education” entered in Scopus database between 2014 and 2017 in terms of the research subject, research methodology and suggestions.

In line with the designated purpose, answers were sought to the following research questions;

1. In which journals were the articles published?
2. What is the distribution of articles in terms of number of keywords, number of authors and data collection methods?
3. What is the distribution of articles in terms of year of publication, countries they were written in and disciplines?

METHODOLOGY

Research Model

Within the research, 30 studies related to “organizing, academic success, student, school and education” which have been made available in the Scopus database have been analysed and these studies have been assessed by means of content analysis. Content analysis is a research method used to classify, organize and compare texts to draw conclusions (Cohen, Manion and Morrison, 2007). Krippendorff (2013) argues that content analysis is equally valuable and valid in emphasizing a text and also identifying its scope.

Data Collection and Analysis

The classification form formed by the researchers was used as the data collection tool in this research and it includes sections for the year of publication, data collection methodology, number of authors, number of keywords, number of references and journals the articles were published in.

In selecting the keywords, the opinion of an educational administration and supervision expert has been taken and screening has been carried out accordingly. Initially the abstracts of the articles have been examined following the Scopus screening results obtained by using keywords and subsequently the full text have been reached within the Scopus database. Articles the full texts of which could not have been reached have been excluded from the research group.

The data have been analysed through content analysis methods, that is, in terms of percentage and frequency. The goal of descriptive analysis is to present to the reader the findings obtained in an arranged and interpreted way (Yıldırım & Şimşek, 2011).

Study Group

In the research, 245 articles made available on Scopus database between 2014 and 2017 have been screened for “organizing, academic success, student and education” and 39 articles have been selected through sampling method. Scopus has been preferred as it has the largest database in the world. It is the world's largest abstract and citation database of peer-reviewed research literature and contains scientific journals, books and conference reports (www.elsevier.com). Furthermore, it is the only database updated daily and not just weekly (Scopus, 2017).

FINDINGS

1.1. Distribution of Articles by Year of Publication

Consequent to the screening of the keywords “organizing”, “academic success”, “student” and “education” in Scopus database, 30 articles published between 2014 and 2017 were reached. The distribution of these articles is given in Table 1. The examination of Table 1 reveals that 5 articles pertained to the year 2014, this figure doubled and the articles amounted to 10 in 2015 and the number of articles rose to 16 in 2016, indicating that 2016 has been the year with the biggest number of articles. In 2017, however, only two articles were written and the figures reveal that 2017 has been the year with a limited number of studies.

Table 1. Distribution of Articles by Year of Publication

Year of Publication	Number (n)	Percentage (%)
2014	5	16,67
2015	10	33,33
2016	13	43,33
2017	2	6,67
Total	30	100,00

1.2. Distribution of Articles by the Journals They Were Published In

The distribution of articles by the journals they were published in is given in Table 2. According to the findings obtained, 6, 5, 4, 2 and 2 articles were published respectively in Journal of Education Administration, BMC Medical Education, Journal of School Health, Journal of Educational Administration and History and Journal for Multicultural Education whereas 1 article was published in each of the remaining sources. It is also seen that the majority of studies were contained in journals of health sciences.

Table 2. Distribution of Articles by the Journals They Were Published In

Name of Journal	Number (n)	Percentage (%)
Journal of Educational Administration	6	20
BMC Medical Education	5	16,7
Journal of School Health	4	13,33
Journal of Educational Administration and History	2	6,67
Journal for Multicultural Education	2	6,67
Administration and Gender in Eretz Israel	1	3,33
Advances in Health Sciences Education	1	3,33
Community College Journal of Research and Practice	1	3,33
Educational Research for Policy and Practice	1	3,33
International Journal of Disability, Development and Education	1	3,33
International Journal of Educational Management	1	3,33
International Journal of Educational Development	1	3,33

1.3. Distribution of Articles by Number of Authors

Table 3. Distribution of Articles by Number of Authors

Number of Authors	Number (n)	Percentage (%)
One author	6	20
Two authors	6	20
Three authors	6	20
Four authors	6	20
Five authors	5	16,67
Eight authors	1	3,33
Total	30	100,00

The distribution of articles under the research by the number of authors is given in Table 3. The examination of Table 3 leads to the conclusion that the percentage of articles under the research which are written by one, two, three and four authors was 20% for each. It has also been found out that 16,67% of the articles was written by five and 3,33% was written by eight authors.

1.4. Distribution of Articles by the Countries/Regions They Were Written In

The distribution of studies by countries/regions is given in Table 4. It has been found out that 13, 6 and 2 articles were written respectively in the USA, Australia and France whereas 1 article was written in each of the remaining countries. In the light of the findings obtained, the USA has been the country where the majority of the studies, that is, 13 studies were made and it can be concluded that the researchers in the USA attach importance to the issues of organizing in education and academic achievement.

Table 4. Distribution of Articles by the Countries/Regions They Were Written In

Country	n	%
America	13	43,33
Australia	6	20
France	2	6,7
Africa	1	3,33
Cambodia	1	3,33
Canada	1	3,33
Denmark	1	3,33
Greece	1	3,33
Israel	1	3,33
New Zealand	1	3,33
Saudi Arabia	1	3,33
Spain	1	3,33
Total	30	100

1.5. Distribution of Articles by Disciplines

The distribution of articles by disciplines is given in Table 5. It has been found out that 18 of the articles (60%) were written in the discipline of social sciences and 12 of them (40%) were written in the discipline of health sciences. In the light of the findings obtained, it is seen that the majority of the studies were made in the discipline of social sciences.

Disciplines	Number(n)	Percentage (%)
Social sciences	18	60
Health sciences	12	40
Total	30	100,00

1.6. Distribution of Articles by the Research Types Used

Distribution of Articles by the Research Types Used

Research methodology	Number (n)	Percentage (%)
Quantitative	16	53,34
Qualitative	13	43,33
Mixed	1	3,33
Total	30	100,00

The examination of Table 6 reveals that of the articles about whose methodology we could obtain information, 16 were written through quantitative method, 13 were written through qualitative method and 1 of them was written through mixed research method. Based on these conclusions, it is seen that in 53,34%, 43,33% and 3,33% of the studies, the quantitative, the qualitative and the mixed research methods were employed respectively. It can be concluded that the researchers prefer the quantitative method over the qualitative one and the mixed research method is used less in studies.

1.7. Distribution of Articles by the Number of Keywords Used

Distribution of Articles by the Number of Keywords Used

Number of keywords	Number (n)	Percentage (%)
3 and below	1	3,3
Between 4 and 5	1	36,7
Between 6 and 10	18	60
Total	30	100,00

The distribution of articles by the number of keywords used is given in Table 7. As per Table 7; in 3,33%, 36,7% and 60% of the articles under the research, 3 and less, between 4 and 5 and between 6 and 10 keywords have been used respectively.

DISCUSSION AND CONCLUSION

In the screening made by using the keywords of “Organizing”, “academic achievement”, “students” and “education”, it has been found out that relevant studies were mostly made in 2016. While the percentage of studies pertaining to 2014 was 16,67%, it has been ascertained that the studies doubled and amounted to 33,33% in 2015.

When the findings are analysed, it is seen that the Journal of Education Administration ranks first and it is followed by BMC Medical Education. Journal of Education Administration is focused on educational administration studies since the day it was established. Also, it is the first peer- reviewed journal in the field of education leadership and administration (www.emeraldgroupublishing.com).

When the distribution of studies which are the subject matter of the research are analysed by the countries/regions, it has been found out that USA is the country where the majority of the studies were made with 13 studies and it was followed by Australia and France with 6 and 2 studies respectively. According to Ortaş (2002), the USA takes the lead in the scientific research ranking. Cherrstrom et al (2017) have discovered as a result of their 10-year (2006-2015) content analysis on adult education that the country with the biggest number of publications is the USA.

In terms of disciplines however, studies on social sciences rank first with a percentage of 60% and it is followed by health studies with a percentage of 40%.

When the research approaches of the publications were examined, it has been concluded that the studies were mostly made through the quantitative method yet qualitative researches were also widespread. However, studies made through the mixed method were less preferential. Sözbilir et al (2012) also obtained

similar results in the content analysis they conducted in a similar manner and put forth that the qualitative and mixed methods were the most preferred methods after the quantitative method. In another similar study, Selçuk et al (2014), concluded that the quantitative method was the most widely used method consequent to the content analysis they conducted. In their study conducted by analysing the tendencies of the researches published in the Education and Science journal, they found out that the qualitative, mixed and literature review methods were the most preferred methods after the quantitative method.

When the research methods of the studies were analysed in terms of disciplines, however, it has been discovered that the qualitative method was preferred more in studies on social sciences whereas the quantitative method was preferred more in the field of health sciences. Since the mixed method was not preferred much, it is believed that conducting researches through the mixed method could make valuable contributions to science.

When the articles published as from 2014 are analysed, it can be said by judging on the developments over such studies that organizing and the academic achievement of students will become an integral part of future studies and the range of application will further expand.

ABSTRACT

The aim of this research was to investigate the contribution of Virtual Microscopic Simulation (VMS) to unveil students' misconceptions the physics concepts (Heat Transfer). Our simulation was produced using the software Macromedia flash. This research evaluates the progress of concept by students (20-22 years old) after one lesson (90 minutes) in three step scenarios: Predict of a problem, Experience using only VMS, Reflect from the difference between prediction and what happens in the experience. The results VMS related to heat transfer was evaluated through a pre-, post-, and retention test. The tests scores were analysed using both qualitative and quantitative methods. The findings suggested that the VMS helps students to achieve better conceptual understanding and enables students to retain their understandings to unveil students' misconception.

Keywords: Virtual Microscopic Simulation (VMS), Students' Misconceptions, Learning; Physics, Heat Transfer.

INTRODUCTION

Physics concepts, in nature, consist of both microscopic and macroscopic properties (Gould & Tobochnik, 2010). Macroscopic properties could be observed and measured easily. Hence, macroscopic properties generally well understood. In reverse, microscopic properties could not be understood very well (i.e. misunderstanding or misconceptions). A remarkable example of microscopic physics is heat transfer topic. We use the topic in everywhere in daily life events, for example; the process of cooking water, convection occurs in heated water long into water vapour. In the sense of particulate nature of matter; water particles which are very difficult to observe by naked eyes, especially motions and interaction of particles, for this reason simulation to visualize is needed. Visualization of the movement of the water particles also enhances learners to more easily understand and to more meaningful conceptual development (Gould & Tobochnik, 2010).

In the literature, there have also been lots of studies (e.g. She 2003; 2004b) showing that the use of virtual simulation can remediate learners' misconceptions and can provide in depth and sound understanding. Other obvious examples in science concepts as follows; Finkelstein, et al. (2005) showed that the use of virtual media

can help learners in building-related conception of velocity and acceleration in the motion of projectiles; Atasoy & Akdeniz (2007) showed that the use of computer simulations in learning Newton's laws of motion can help reduce misconceptions that occur in learners; Trundle & Bell (2010) showed that simulation to draw scientific moon shapes or in their conceptions of the causes of moon phases. Miklopoulos and Natsis (2011), the three treatments were equally effective in facilitating desired conceptual change the use of simulation media on climate change materials to facilitate construction of the transformation in the conception in the minds of learners; Olympiou, Zacharia, & de Jong (2013) showed that the use of media simulation of light and colour dispersion is effective in helping students to construct its conception so that the ability to understand can be improved; Srisawasdi & Kroothkean (2014) showed that the use of virtual simulation media on the concept of light waves could improve understanding of the concept of waves and the process of conceptual change students towards scientific conception.

As aforementioned, the studies indicated that simulation has commonly been used to achieve sound understanding. However; many of them (e.g. Atasoy & Akdeniz, 2007; Spyrtou et al. 2009; Maheshwari, 2011; Nguyen et al., 2012; Alsultanny et al., 2014; Akkoyun & Careddu, 2015) do not provide visualization of the microscopic feature of the physics concepts. Therefore, students confronted many misconceptions though after different levels of schooling. This is because the materials physics are microscopic so that learners difficult to absorb all the material well enough.

Computer simulations used for learning purposes generally involve a model of a phenomenon system with which the learner interacts. In such perspective, learners build their own knowledge by conducting experiments and by observing the effects of the experiments. Physics simulation experiments overcome the drawbacks of traditional physics teaching and promote reforming the methods of physics classroom teaching under the new curriculum ideas (Li, 2009). Computer simulations have become progressively more dynamic and higher interactive over the last three decades and along with their multi-representation nature have gained a position along the tools of high educational value. Their affirmative impact to students' science learning has been confirmed through numerous studies in the literature.

Information and Communication Technology (ICT) challenges students to learn physics. Physics on a particular concept needs computer aided instruction to explain the concepts of physics which are microscopic. Various computer applications have been developed and used in teaching physics, such as spreadsheets (Dory, 1988), laboratory-based computer (Thornton & Sokoloff, 1990), multimedia (Crosby & Iding, 1997; Wilson & Redish, 1992), simulation (Andaloro, Bellomonte & Sperandeo-Mineo, 1997), environment exploration (Teodoro, 1993) and an intelligent tutor (Jimoyiannis & Komis, 2001). In addition, the results are often used to guide the design of software for the education and development of evaluation tools. Students know that the basic concepts of physics learned will be useful in developing various products (project) based on the concept (Wibowo, & Suhandi, 2013).

The use of computer simulation applications have developed new research area in physics education, in general, to change the frame in which the teaching of physics elusive and implemented. Among the various applications of computer simulations are of special importance in learning Physics. Simulation aims to increase the potential of teachers in learning and to facilitate learners actively involved. Computer simulations have wide a range of opportunities for concept modelling and process. Simulation also provides a bridge between the knowledge of students before and after learning of physics and to help learners develop the scientific understanding through active reformulation and to decrease misconceptions or to provide conceptual change. The development of a variety of media visualization of physical phenomena that are very abstract and microscopic until today have been used for the sake of learning physics, among others; Newton's laws of motion simulation by Savinainen & Scotr (2002), Atasoy & Akdeniz (2007), Macabebe et al. (2010), Saglam-Arslan & Devecioglu (2010), simulation of Optical by Djanett et al. (2013), & Kaewkhong et al. (2010), simulation of thermal expansion by She (2003), simulation of heat transfer by She (2004b), simulation electricity and magnetism by Dega et al. (2013), simulation of climate change by Miklopoulos and Natsis (2011), Trundle and Bell (2010). The aim of this study was to investigate the contribution of Virtual Microscopic Simulation (VMS) to unveil students' misconceptions the physics concepts (Heat Transfer).

THE STUDY

The aim of the present study is to explore the effects of simulation (VMS) on students' conceptual understandings and conceptual change. To achieve the aim, the mixed-method research through a mixture qualitative of quantitative in a research study was utilized (Creswell, 2008). In this regard, same test was implemented as pre-, post-, and retention with in one group experimental design, as exposed in Figure 1.

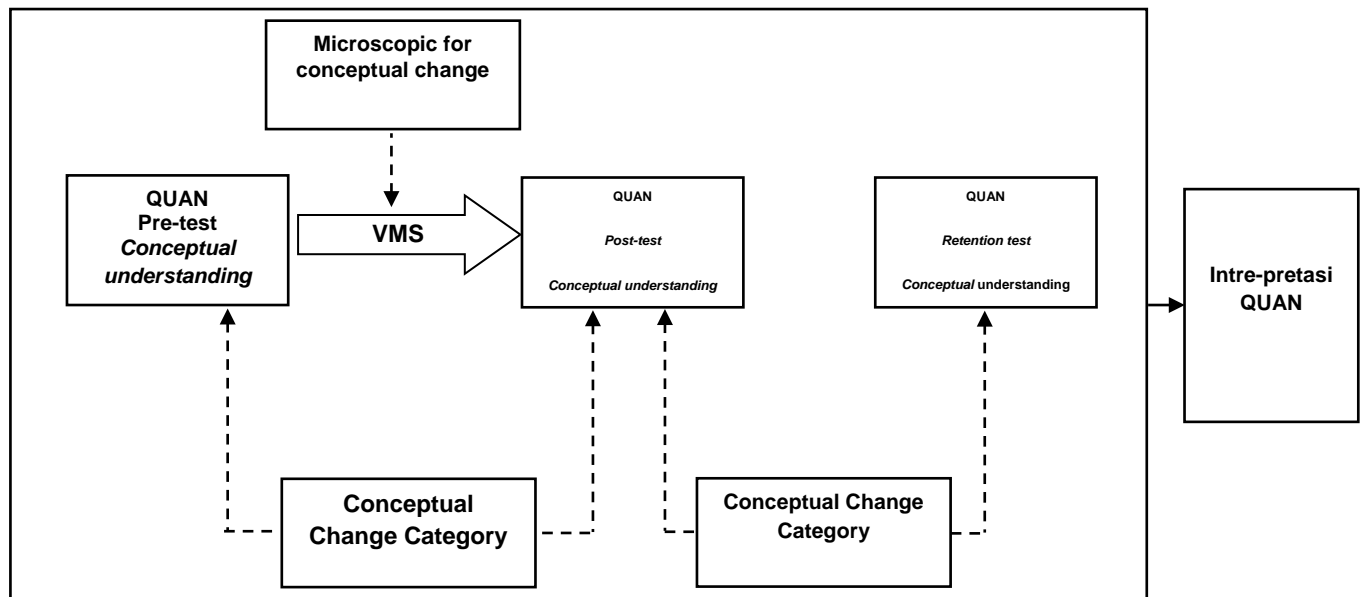

Figure 1. Representative schema of the research design

The study was conducted on 50 students, whose age ranging from 20 to 22. Before the treatment, the pre-test was applied to determine students' prior understanding about heat transfer (conduction, convection, and radiation). The treatment was utilized using Virtual Microscopic Simulation (VMS) in the experimental group. After the treatment; the same test was administered as post-test to all students. Lastly, the same test was administered as retention test for retention of students' understandings.

FINDINGS

Learning materials

The treatment (i.e. VMS) consists of three parts concept, namely conduction, convection and radiation. Simulation is used to build understanding of heat transfer concept. This media is created using Macromedia Flash 8 main software and design drawings using the Corel Draw.

Figure 2. Main menu display of VMS

Figure 3 is a picture of conduction of the metal when heated. When the metal is heated to other end of the metal will feel the heat, but we know what kind of heat propagation. This simulation seeks to explain how explanation there is. Besides, the most important part of the simulation is to explain microscopic constituent particles of metal when heated. VMS conduction section there is two parts is material conductivity A and conductivity material B.

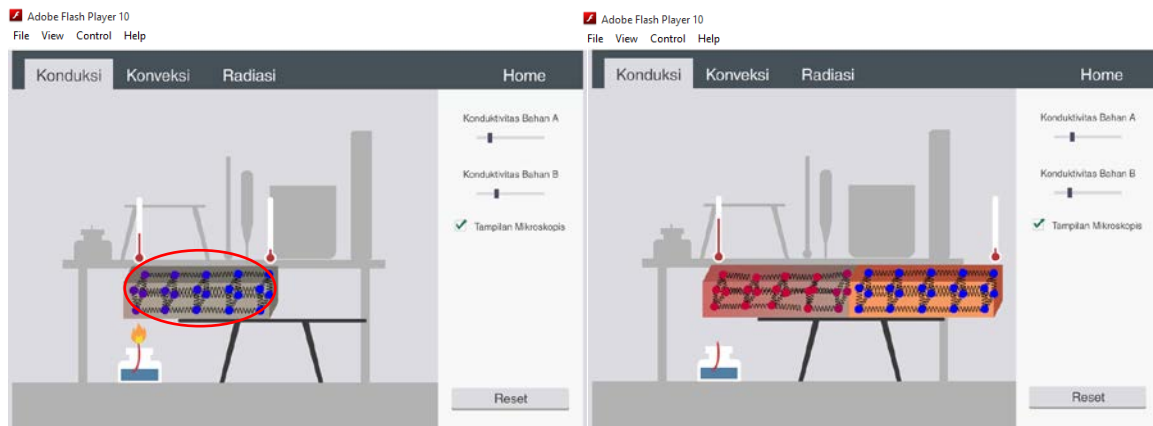

Figure 3. VMS conduction: microscopic of the material is heated

Figure 4 and 5 are pictures of VMS media convection; these simulations explain how the movement of water particles is heated. Water heating is carried out in three different places, namely in the mountains with a pressure of 38.6 kPa, around the beach with a pressure of 101.4 kPa and at a pressure of 476.2 kPa. The movement of water particles in the simulation in detail and show the most important part of this simulation is to explain the movement of microscopic water particles when heated.

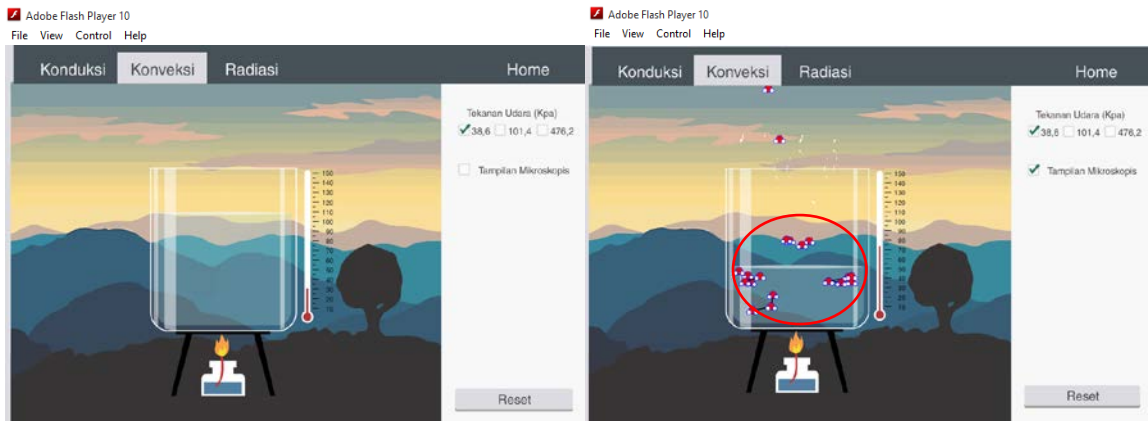

Figure 4. VMS convection: microscopic of heat the water in the mountains (38,6 Kpa)

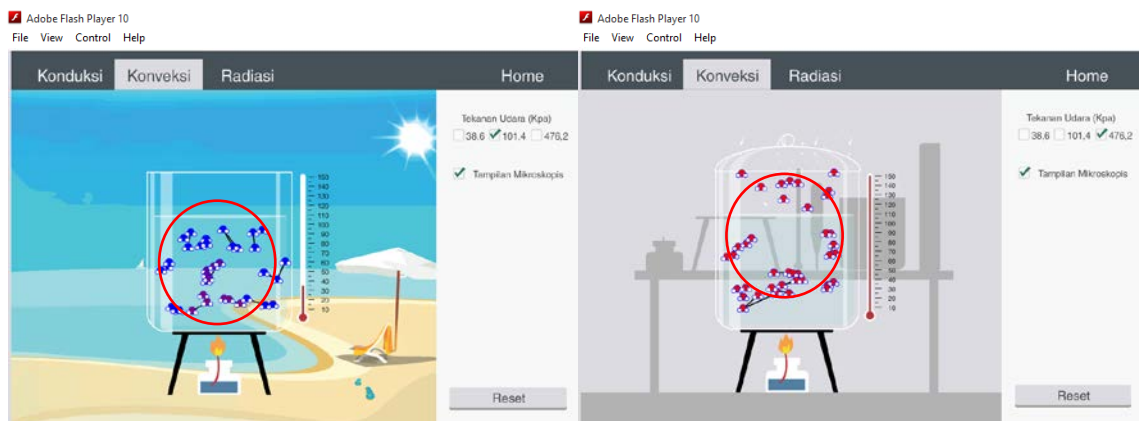

Figure 5. VMS convection: microscopic of heat the water at the beach and (101,4 Kpa) and (476,2 Kpa)

Figure 6 is a radiation image VMS media, these simulations explain how radiation with electromagnetic waves do. This simulation shows wave source toward premises exposed to intense radiation difference of temperature, 2500 K, 3000 K and 4000 K. The constituent particles move in this simulation the show with detail as well as the most important part of this is to explain the microscopic simulations.

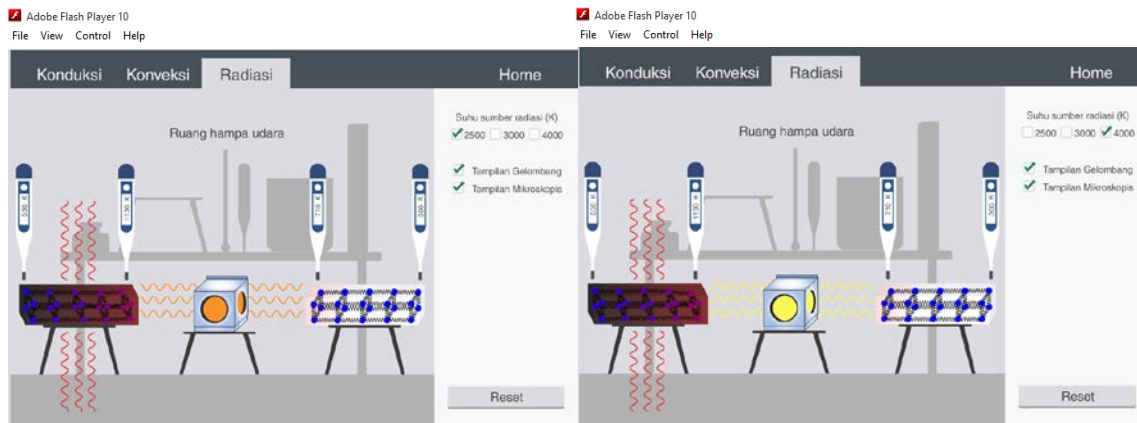

Figure 6. VMS radiation: microscopic of the material is heated to a temperature of 2500 K and 4000 K

Learning strategy use VMs for learning the physics-oriented conception of the material conversion of heat transfer with the following characteristics: (1) display the physical processes of heat transfer in microscopic and macroscopic and as closely as possible with the actual process; (2) accommodate the student misconceptions in the material of heat transfer; (3) includes a simulation of the phenomenon of conduction, convection, and radiation; (4) using a constructivism understands that covers the process of assimilation and accommodation; and (5) give the expansion of the learning experience (extension), in order to strengthen the construction of conceptions on students.

Data Analysis

The classification of categories set five by She and Liao (2010) in Table 2 were used to analyses the data obtained from the heat transfer concept. The scoring of the text was achieved by the evaluation of the data in the first tiers, second tiers and three tiers.

The students' written responses to open-ended question items were analysed quantitatively. The analyses showed students' understanding (pre-, post-, and retention-test) and changing their understandings from pre-, post- and retention test. As analysis procedure, we used three-stages in early outlined, firstly, the researchers began with repeatedly read the students' written responses (pre-, post-, and retention-test). After that step was the advance of a common conceptual understanding rubric that useful to all items and then item specific rubrics consistent with key concepts of heat transfer. The qualitative data collected from students' responses to the items were quantitative into a numerical score based on the item-specific rubrics. This numerical score represented the students' level of conceptual understanding about heat transfer. In order to use statistical analysis for students' conceptual understanding scores, the normal distributions of data were not met for their scores. As a result, nonparametric statistics of Wilcoxon Signed Rank Test used to check significantly difference for their conceptual understanding scores on the pre-, post-, and retention tests. Next, the quantitative content analysis including five categories (given in the Table 2) based modification from She and Liao (2010).

Table 2. Quantitative analysis categories

Category	Representation
Progress (PG)	coverage the student's conceptions improved
Maintain-Correct (MC)	degree to which the student's conceptions be maintained correctly
Maintain-Partial Correct (MPC)	degree to which the student's conceptions be maintained as partially correct
Maintain-Incorrect (MIC)	degree to which the student's conceptions be maintained as partially incorrect
Retrogression (RG)	degree to which the student's conceptions retrogressed

However, analysis representation of the change of students' conceptual understanding as elicited in students' written responses. The number of conceptual change was described by respective percentages for PG, MC, MPC, MIC, and RG from pre-test to post-test and from post-test to retention test.

Analysis of conceptual understanding score

To explore the effectiveness of the virtual microscopic simulation (VMS) on the students' conceptual development of heat transfer, statistical analysis was performed and given in the Table 3. The results indicated that there was a statistically significant difference with overall pre-, post-, and retention-test scores of conceptual understanding on heat transfer. The results of Post hoc analysis with Wilcoxon signed rank test indicated that the students through a great progression of their conceptual understanding of heat transfer considering from pre-test to post-test and the post-test score was significantly better than the pre-test, show $Z: -4.33, P(\text{post} > \text{pre}) < 0.012$.

Besides, a great progression of their conceptual understanding was established on a discrepancy between pre-test and retention-test scores, and the retention-test score was significantly better than the pre-test, show $Z : -4.33$, $P(\text{post} > \text{pre}) < 0.012$. Though, they too ended a slight reduce of conceptual understanding scores from post-test to retention test and its difference was also significantly, show $Z : -2.27$, $P(\text{post} > \text{pre}) < 0.023$.

Table 3. Statistical results of Wilcoxon sign rank test of conceptual understanding

Types of Tests	SD	Mean (max. = 20)	Mean Rank	Post hoc comparison
Protest (a)	3.02	8.15	1.38	(b) > (a)*
Post-test (b)	2.84	17.25	2.58	(b) > (c)*
Retention test (c)	2.95	11.65	2.18	(c) > (a)*

In summary, Table 3 indicated that there was a statistically significant difference among overall pre-, post-, and retention-test scores of conceptual understanding on heat transfer. The result indicated that the students' conceptual understanding showed significant improvement after simulating by the VMS (as of 8.15 to 17.25), other than they ended a slight reduce as of post-test to retention test (as of 17.25 to 11.65). Post hoc analysis with Wilcoxon signed rank test conducted with adjustment applied and the results indicated that the students blot a great progression of their conceptual understanding of heat transfer from pre-test to post-test and the post test score was significant.

Analysis of conceptual change category

The effectiveness of VMS on the students' conceptual development on heat transfer was also investigated in this study. Five categories (PG, MC, MPC, MIC, and RG) were used to interpret a transitional change of students' conceptual understanding from pre-test to post-test and post-test to retention test. The percentages of the quantity of conceptual change on the transitions were presented in Figure 7 and 8.

Figure 7. Pre-test, post-test of conceptual change on heat transfer

Figure 8. Post-test-retention test of conceptual change on heat transfer

Figure 7 to pre-test post-test of conceptual change on heat transfer, the percentage of the Progress (PG) category

was higher than any other category. The conceptual change on conduction concept percentages was for Progress (PG) 72.00, for Maintain-Correct (MC) 16.50, for Maintain-Partial Correct (MPC) 6.00, for Maintain-Incorrect (MIC) 3.50, for Retrogression (RG) 2.00 respectively. The conceptual change on convection concept percentages was for PG 85.00, for MC 2.50, for MPC 4.00, for MIC 6.00, for RG 2.50 respectively. The conceptual change on radiation concept percentages was for PG 75.00, for MC 1.00, for MPC 5.50, for MIC 7.50, for RG 11.00 respectively. This result indicated that there was an understanding development of the students after learning to use the VMS.

Figure 8 displayed the percentages of the quantity of post-test retention test of conceptual change on heat transfer. The conceptual change on conduction concept percentages was for PG 24.00, for MC 55.00, for MPC 9.00, for MIC 6.50, for RG 5.00 respectively. The conceptual change on convection concept percentages was for PG 17.00, for MC 76.25, for MPC 1.75, for MIC 4.00, for RG 1.00 respectively. The conceptual change on radiation concept percentages was for PG 23.00, for MC 48.50, for MPC 14.00, for MIC 8.50, for RG 6.00 respectively. This result indicated that there was consistency of student understanding after learning to use the VMS.

CONCLUSIONS

This research informed the impact of innovative teaching method called Virtual Microscopic Simulation (VMS) for the development of students' 'conceptual understanding' of heat transfer by showing the cognitive process of conceptual change (misconception). The result showed the increasing of students' conceptual understanding scores from pre-test, post-test, and retention test to statistically significant effect across three concepts of heat transfer. This indicated that the teaching method effectively helped student construct a more scientific view of heat transfer. The result is consistent with the research findings that students performed better achievements with learning from computer simulation (e. g. Savinainen and Scotr, 2002; Atasoy and Akdeniz, 2007; Spyrtou et al., 2009; Macabebe et al., 2010; Saglam-Arslan & Devecioglu, 2010; Kaewkhong et al., 2010; She, 2003; She, 2004b; M Trundle & Bell, 2010; Iklopoulos & Natsis, 2011; Dega et al., 2013; Djanett et al., 2013). The results showed that the percentage of the progress (PG) category was higher than another category.

In addition, students' conceptual change in this research was a deep process of reconstructing students' alternative conceptions into scientific conception, called radical conceptual change, and the process of conceptual change could be encouraged by the promoting with VMS.

Co-Operative Education Guidelines: Architecture Degree Program, Phranakhon Rajabhat University

Thanawuth KHUNTHONG

*Phranakhon Rajabhat University,
Thailand*

tkunt_2002@hotmail.com

ABSTRACT

This research on the Co-operative Education Guidelines: Architecture Degree Program of the Faculty of Industrial Technology, Phranakhon Rajabhat University has an objective to study the guidelines of the curriculum development, a co-operative program based on (1) the organizing of a participatory learning process to achieve the standard knowledge, and (2) the professional skills practicing from real experience through multilateral cooperation between educational institutions, establishments and the Council of Architects of Thailand. The researcher has surveyed the need from “establishment samples” which employ the architect graduates in 2014-2015. The data from 22 of 25 samples or 88% shows that: the graduates’ performance assessment in term of knowledge and ability was at the highest level, that was 81.7% average; the result from the need analysis of characteristics and qualities of desired performance graduates in term of 6 areas of learning result, shows the establishments’ priorities as follows: (1) working skills, (2) self-concept, (3) cognitive skills, (4) cognitive performance, (5) moral, ethics and professional ethics, (6) numerical analysis skills, communication and use of technology.

The Co-operative Education Program using Tyler's developed curriculum includes (1) the curriculum design, (2) the content frameworks, the participatory learning processes, (3) the professional skills training, and (4) the learners’ learning outcomes. After that the draft curriculum was raised. Then five experts were selected for consensus based on 5 criteria. If the consensus meets the criteria, it can be assumed that the projected issue is indeed occurring.

Moreover, the Thin Sandwich developed curriculum is a co-operative program that switches students to continuous learning throughout the course, a module system bringing related content courses together, a link of knowledge from the classroom to work, a project-based 20 problems, and then requested the 4th year students to choose cooperative education 6 (not less than 540 credits) before entering the job position of an architect practitioner at the establishment for at least 4 months.

At this stage, advisors are available to assess the students’ competency in the job by shadowing. The proportion of the evaluation is from 80% and 20%. Finally, in the final semester, students prepare their Thesis proposal in Architecture 8 (24-0) before graduation.

INTRODUCTION

The Co-operative Education is a system that offers instruction in schools, in contrast to the work of students in a systematic way by cooperation between establishments and educational institutions. Cooperative education is an educational system that combines learning with practice. Focusing on the student work in the workplace, switching to theoretical classroom lessons before graduation and enter into their career is to promote the quality of graduates and to meet the quality of the establishment.

It consists of two major concepts: 1) the recognition of the career importance career development and entry into graduate work systems. (2) The development of the quality of graduates according to the professional standards meeting the needs of the labor market according to the "learning by doing" principle. Architectural Revised Edition 2013 Phranakhon Rajabhat University is a 5-year undergraduate degree program that has been accredited by the Council of Architects.

The purpose is to produce a professional architect by adhering to the principles of developing the knowledge and standards of professional skills and starting the first course. In the year 2004, the curriculum was revised twice in the year 2006 and BE 2556. The curriculum was organized according to the National Higher Education Curriculum Framework, 2009 to the present.

In the year 2018, the "Architecture Curriculum" will need to be updated. This is in accordance with the announcement of the Commission for Higher Education, “The Guidelines for the Implementation of the National Higher Education Curriculum Framework, 2009”. The Board of Directors has agreed to develop the curriculum

in co-operative education. Focusing on integrating the learning with professional work in architecture and preparing students to have the potential to enter professional practice in quality to create the desirable characteristics of graduates to meet the needs of graduate users and in accordance with the Council of Architects' Committee on Architectural Standards in Architectural Regulations, Council of Architects, on -the certification of a bachelor's degree and a certificate in the field of Architectural Controls, 2002.

The research on “Co-operative Education Guidelines: Architecture Degree Program, Phranakhon Rajabhat University” was designed to develop curriculum to integrate learning with continuous learning throughout the curriculum, based on the "learning from doing" principle, Experiential learning, Authentic learning, and Project-based Instruction. This must be in accordance with the establishment's context. It resulted in the development of graduate quality according to academic standards, and profession needs of the country labor market.

THE STUDY

Research objective

The objective of this research aims to guide the Co-operative Education and development of Bachelor of Architecture, Phranakhon Rajabhat University to integrate learning with continuous learning throughout the course.

Research scope

Guidelines for Co-operative Education Guidelines: Architecture Degree Program, Phranakhon Rajabhat University is to develop the curriculum in accordance with the Bachelor Degree Standard Requirement notification, the Ministry of Education, 2015, and the Framework for National Higher Education Qualifications 2009 (Thailand Quality Framework, TQF), and the Regulation of the Council of Architects (Thailand)

Sample population

1. The population is the total of 364 establishments in the Bangkok metropolitan area and the metropolitan area registered as juristic members of the Council of Architects.
2. The sample are from establishments in the Bangkok Metropolitan and Vicinity and are registered members of the Council of Architects' Juristic Personnel and 25 graduates in the academic year 2014-2015.

Research implementation

Phase 1: Basic Information and Research

1. Study documents related to curriculum and curriculum development with content analysis.
2. Conduct a performance evaluation questionnaire / questionnaire for desirable traits and competencies.
3. Take the survey to 5 experts for an index of content validity. Then improve the question, according to expert opinion.
4. Send the survey to the sample establishments to answer the questionnaire.
5. Use the data obtained from the questionnaire to analyze the mean, percentage and standard deviation to find the results of the performance evaluation of the graduates and the results of the evaluation of the characteristics of graduates and the desirable performance of the establishments.

Phase 2: Curriculum Development

Using of Tyler's curriculum development model with Futures Research:

1. Set up a group of experienced and knowledgeable specialists in each area to develop 6 curriculums, including 2 course lecturers, one curriculum expert and one teaching expert, one cooperative education expert, frame expert. 1 National Higher Education Quality Award, one of the Council of Architects.
2. Identify the issues that will be collected in Tyler's curriculum: 1) The purpose of the course, 2) The learning process, 3) The experience, 4) The assessment of the learner.
3. Bring all four issues to a semi-structured interview in the form of open-ended and non-directed questions. (Non-directive Open Ended) and collect data from the interview using Cumulative Summarization Technique.
4. Bring the data from the interviews to analyze and synthesize to form a closed-end questionnaire to collect data from the experts in the second round and analyze trends towards the central and distribution.
5. Perform data analysis. To find a consensus based on a criterion using a 5-level median with a median of more than 3.5, the range between quartile 3 and quartile 1 is less than 1.5, and the difference between median and normality does not exceed 1.0. If the consensus meets the criteria, it will conclude that the projected issue will definitely occur.
6. Focus Group with 11 lecturers and instructors, to comment on the curriculum development.
7. Bring the information obtained to develop the curriculum. To comply with the Notification of the Ministry of Education Regarding Criteria for Bachelor Degree Programs, 2015, Framework for National Higher Education Qualifications 2009, and the Council of Architects.

8. Organize the draft curriculum. There are representatives from the establishment as a total of 8 users and then commented to analyze the content. To improve the course completely.
9. Prepare summary and report of research results.

FINDINGS

Results of the sample survey shows that the graduates in 2014-2015 from 22 establishments out of 25, representing 88 percent.

1. The average performance of the graduates is good. The mean score of 78.67% was very good. The average score of 81.7 percent was classified as

- 1) Fifty-two got 80% (Very good)
- 2) Thirty-two got 32% (Good) and
- 3) Less than sixty-five got 16%

which corresponds to a survey of 61% of establishments that indicated their willingness to work in the office.

Table 1: Performance Appraisal of Graduate Graduates in Academic Year 2014-2015.

Items	Year 2016 (%)
Work Achievement	74.3
Knowledge and Ability	81.7
Responsibility	78.8
Personality	79.9
The desire for students to work in office	61

2. The Result of the desirable characteristics of Graduates from the entrepreneurs shows that the needs and characteristics according to the course achievement goals are as follows:

- 1) Skills
 - 2) Attitude
 - 3) Knowledge
 - 4) Moral and professional ethics
 - 5) Numerical Analysis Skills
 - 6) Communication and use of technology
- (Details as shown in Table 2.)

Table 2: Desirable characteristics and competencies of Graduate Entrepreneurs Candidates Completed in Academic Year 2014-2015.

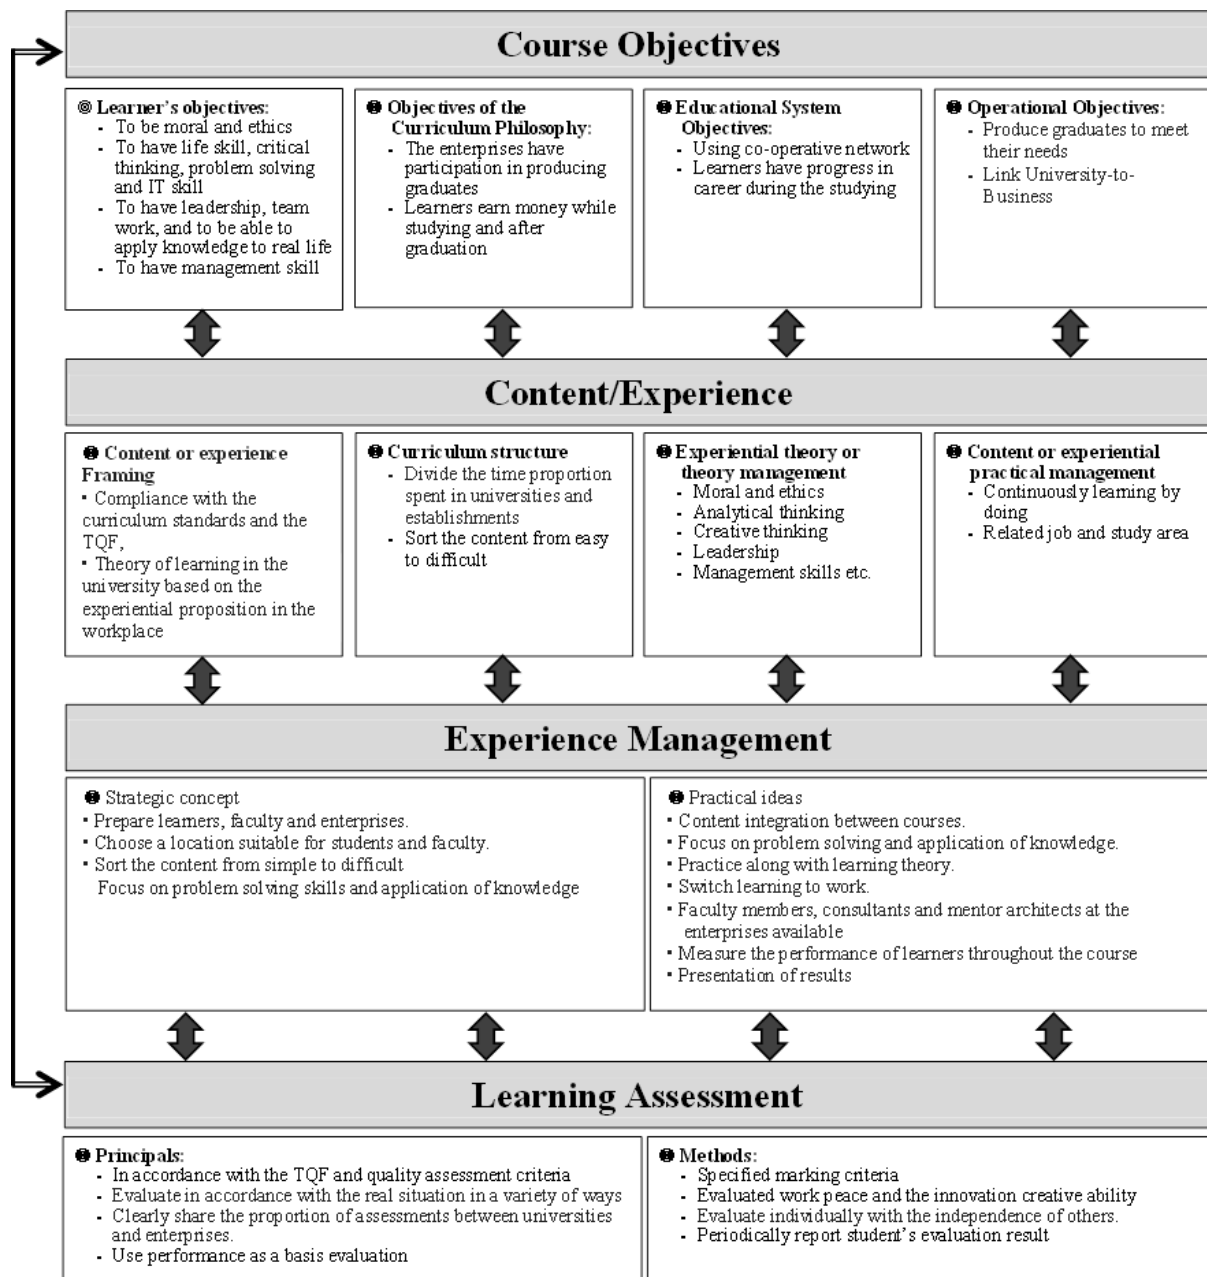

Priority	Features	The graduates' desired characteristic
1 st	Skill	The ability to practice professionally. The creativity of architecture applying, such as building techniques. The modeling. The quality presentation and presentation skills.
2 nd	Self-Concept	The good attitude to work. The responsible for duty. The interactions. The coordinate communication with colleagues. The self-development in all aspects.
3 rd	Cognitive Skills	The assigned tasks priority. The correct assigned task communication. The way to think of a systematic solution.
4 th	Knowledge	Principles and theories in the field of architecture. Architecture growing.
5 th	Moral, and professional ethics	Being honest, disciplined, punctual and self-responsible.
6 th	Numerical Analysis, Communication and Technology Skills	The critical and appropriate use of information technology.

Principles and Concepts of Co-operative Education in the Bachelor of Architecture Program, at Phranakhon Rajabhat University

Co-operative Education for Integrating Learning with Curriculum Work has some important elements in Tyler's format: (details as shown in chart 1).

1. The aim of the cooperative education program is to focus on integrating learning and working, which is aimed at the learner. Purpose of Philosophy Educational Management System Purpose and Purpose of Implementation.
2. The content and experience needed to provide the learners with the curriculum structure, the framing of the content and experience, the content management and the theoretical or experience, and the content management and practical experience.
3. Forms and methods of organizing learning experiences include strategic concepts, and practical ideas.
4. Evaluation of learners' learning includes principles and evaluation methods.

Chart 1: Principles and concepts of co-operative education in the Bachelor of Architecture program.

Co-operative Education Model for Integrating Learning with the Work of the Bachelor of Architecture Program Architecture Phranakhon Rajabhat University.

The format of the instructional plan is "Thin Sandwich" by switching to continuing education throughout the course. Organize module learning (Module) by bringing together related content courses. There is a linking of knowledge from the classroom to the work by doing the course. Project-based Learning includes 20 propositions.

The fourth year students choose to study co-operative education 6 (not less than 540) to work in the position: architects practice at the establishment for at least 4 months, there is an advisor to monitor the competency of the students. Job Shadowing divided the proportion of teachers by 80% and 20%. Then, in the final semester, students must prepare a Thesis in Architecture 8 (24-0) before graduation. (See chart 2).

Chart 2: The instructional plan is "Thin Sandwich" Course.

DISCUSSIONS

Based on the research results the researcher has found that it is in line with the harmonious mix of classroom work experience and classroom learning (Kramer, M. and Usher, A., 2011: 1), Academic and Professional under the working environment that is part of the curriculum (Franz, J., 2007).

There is an opportunity for students to apply and integrate the theoretical knowledge gained from their learning and practical experience in real-world workplaces (Martin, A. and Hughes, H., 2009: 8. However, the researchers also have the expectation. Interoperability between universities Establishment and Council of Architects To prepare standards for students to enter the cooperative education process.

The roles and responsibilities of co-operative advisors and cooperative education personnel are defined, including networking with a ready-to-go cooperative education facility. This will be beneficial and will result in the development of graduate quality in accordance with professional standards according to the curriculum objectives.

CONCLUSIONS

Research Results, Co-Curricular Guidelines for the Architecture Program Phranakhon Rajabhat University factors that influence the co-operative development of the curriculum are as follows.

- 1) Develop students' knowledge and skills to suit professional practice.
- 2) Preparing the readiness of schools and enterprises. Especially the availability of students. Advisors and Architects.
- 3) Establish standards and management systems for cooperative education within enterprises.
- 4) Creating academic and professional networks to support cooperative education.

There is an integrated guide to co-operative education in the curriculum. There should be a restructuring of teaching and learning as a project based learning approach for cooperative students to "learn from doing" by delegation. "Architectural Design" is a real project in the establishment with a mentor and a nanny caretaker.

By the results of the implementation of the project: students can apply to the thesis layout course and the course of theses in architecture. In addition, they have enhanced their professional knowledge. In the CPD and academic institutions it should be counted as the academic or research task of the teacher to determine the academic position.

Acknowledgement

Thank you to the Research and Development Institute and the administrators of Phranakhon Rajabhat University for your support to this research. Thank you all the establishments for providing information in this research. Thank you for the contribution from many universities' research results, such as Rangsit University, Sripatum University, Naresuan University and others.

I also thank for the related articles from the Council of Architects which is very useful for this research. The researcher would like to present this acknowledgement to all benefactors.

ABSTRACT

Corporate social responsibility managers define and oversee the objectives related to sustainable production, environmental protection, the wellbeing of employees and positive impact on local communities and society as well. Their decisions influence how enterprise and their stakeholders can benefit in a socially responsible way. This article is trying to draw attention that CSR evaluation and reporting enable to sustain the CSR decision making process. It is based also on the empirical findings from the preliminary survey carried out among Slovak companies focusing on managers and their relation to make CSR decisions.

Keywords: corporate social responsibility, management, decision making, reporting

INTRODUCTION

Corporate social responsibility (CSR) is a “topic, which has already become an inseparable part of modern management theory and praxis” (Remišová, 1999). Corporate social responsible enterprises are highly motivated and keen to make sure that their productions, business, processes, and products are sustainable, ethical and environmentally friendly. „The changes in economy, new technology, innovation as well as other factors such as globalization and sustainability influence the whole society” (Lorincová, Hitka, Balážová, 2016). Enterprises are not isolated economic entities, but they influence and they are influenced by a broader group of stakeholders (community, society). Growing pressure to increase enterprise’s performance both now and in the future demands managers with the ability to define performance goals develop a relevant CSR project (its scope, schedules, budget, etc.) and manage it. They ought to be able to detect and analyse emerging issues, prioritize complex initiatives and make decisions to impress enterprise’ CSR strategy, maximise its profitability and increase the positive impact to an enterprise’s surrounding. The CSR expert Alberto A. Pinillos says, that the CSR manager’s responsibility is “to identify ahead of time the social and environmental risks or opportunities that may not be relevant in the near term, but will be so in the medium to long term — and then place them in front of the appropriate organizational decision makers.” This requires the ability to work either independently either collaboratively with top managers on the strategic level and department leaders on the tactical and operational level of management.

The significant question that scholars and professionals have been trying to answer is not “Why enterprise (should) implement CSR?” but “How does enterprise engage in CSR?” Consecutively there is a discussion, that what is more important: to hire a high skill CSR manager or to educate all managers of the enterprise in the field of CSR? Evidently to find the right answer we should distinguish between the short run, when enterprises still have a lack of these professionals and long run, when we need to get CSR to the enterprise’s culture. When we analysed the current labour market the demand for CSR managers is growing as more and more stakeholders are becoming aware about issues concerning climate change, sustainability, human rights and the impact of the enterprises to their surroundings. These altruistic endeavours provide not only positive image for the enterprise, but also bring

benefits for business in the long-run. Currently these are, the more required CSR manager's knowledge and skills in Slovak enterprises:

- to create and implement corporate social responsibility strategy on the whole level of management,
- to communicate and educate corporate social responsibility on top level, middle level and of course on the first level of management,
- to set up CSR goals and objectives, because the primary purpose of a business is to maximize profits for its owners or stakeholders while maintaining corporate social responsibility.
- to create and develop CSR activities encompassing community, workplace, environment and marketplace topics,
- to establish partnership programmes and CSR network to engage stakeholders and develop relationships with them, etc.

The above mentioned skills are only sprigs what are expected actually from CSR managers. Our point of view is that today's CSR managers should educate all managers of the enterprise to make their decisions in a corporate social responsible way. This is a reason why our pilot survey was focused to identify what are the main factors which can affect CSR's managerial decisions. The authors of this article assume that by understanding these factors managers can be encouraged to act more responsibly. Our pilot survey is just the first step to be done to obtain all immediately available information about the relevant issue. The primary objective was to identify both CSR and decision making aspects and collect information from real business conditions.

SURVEY AND FINDINGS

We know, that wide range of stakeholders making their everyday economic decisions. Managers also face decisions, but sometimes make unsustainable choices. What can their decision making process towards CSR improve to make it more effectively? Our preliminary survey is reflecting opinions of 89 managers (12 CEO, 26 CSR practitioners and other managers on the middle level) from Slovakia and Romania. The survey was undertaken from September 2016 to May 2017 using a semi-structured questionnaire and interviews. Our questions issued from basic definitions of CSR and decision making (Fig. 1). Authors understanding of CSR is closely linked to definitions such as "Social responsibility is the obligation of decision makers to take actions which protect and improve the welfare of society along with their own interests" (Davis, 1975) and "Corporate social responsibility encompasses the economic, legal, ethical, and discretionary (philanthropic) expectations that society has of organizations at a given point in time" Carrol (1991). Drucker (1967) says that "whatever a manager does, he does through decision-making" and Trewatha & Newport (1982) argued that "decision-making involves the selection of a course of action from among two or more possible alternatives in order to arrive at a solution for a given problem".

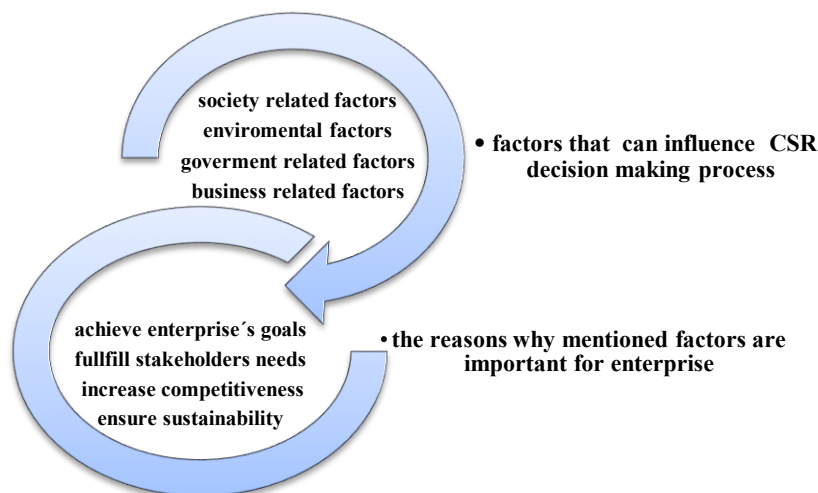

Fig. 1. Basic logical relation what can influence manager's CSR decisions

Firstly, we introduce some basic characteristic of the overall sample of respondents and in the following paragraph analyse some responses that were given.

Fig. 2. Basic characteristic of overall sample of respondents

Management science declares that decision making is a cognitive process and one of the most critical processes in every enterprise. Corporate social responsible decisions making brings the opportunity for creating shared value and smart partnering. To make it effective, the information should be gathered thoroughly because all social and environmental decisions must be realized in the context of their economic consequences. And this is the question which factors influence CSR related decision making to allow managers to be simultaneously socially and environmentally responsible and also economically viable.

Table 1: The level of importance of related factors influence good CSR related decision making

Factors influence CSR decision making process	Mean value	Rank	Internal/External info
Data about customer CSR satisfaction	4,89	1.	external
Enterprise's CSR performance indicators	4,87	2.	internal
Reporting CSR activities of the enterprise	4,75	3.	internal/external
Education in field of CSR	4,06	4.	internal/external
Knowledge of industry standards	4,00	5.	external
Information about welfare of the local community	3,99	6.	external
Data about employees 'satisfaction and work conditions	3,99	7.	internal
Understanding of link between performance and CSR	3,74	8.	internal/external
Benchmark CSR performance	3,56	9.	internal/external
Public relation of the enterprise	1,56	10	internal/external
Marketing activities and advertising	1,05	11	internal/external

Note: Answer on the 5 point scale with 1= strongly disagree, and 5= strongly agree

Key findings of this preliminary survey (with part 2. interview) are that managers mainly emphasize the role of understanding measurement of customer CSR satisfaction, CSR performance indicators and CSR reporting to bring the enterprise in line as well as developing CSR reports that provides clear direction also in manager's decision making processes. Clarifying enterprise's current portfolio of the CSR initiatives and achieved benefits helps to make other better decisions. On the other hand strong influence of advertising to CSR decision making process hides potentially dangerous if it proves a gap between the enterprise's statements and actions. CSR in all concerned enterprise permeates almost every decision taken by managers. All top issues belong to the economically-bound issues, where "financial literacy belongs to the most important competencies" (Kozubíková, 2016) As you can see marketing activities and advertising aspect are ranked as the least important issues influencing good CSR related decision making.

Fig.3. Survey results: Do you thing that EU Directive on non-financial reporting has a positive impact the quality of CSR decision making?

Reported data in Fig. 3 shows that 67% (42+25) of managers agree, that EU Directive on non-financial reporting has a positive impact the quality of CSR decision making. It shows that managers think that there is a strong interest to get qualitative data for decision making.

Fig.4. Survey results: Do you thing that there is a positive relationship between CSR and corporate financial performance?

To underlay results in Fig. 4 even some empirical studies detect curvilinear (U- shaped) relationship between corporate social responsibility and corporate financial performance, but more common are those with positive relationships (e.g. Rodgers at al. 2013, Erhemjamts et al . 2013, Margolis, Elfenbein and Walsh 2007)

DISCUSSION

As corporate social responsibility is a dynamic concept evolving along social norms, it must be included in decision making processes through all the enterprise. “The decision makers would be helped by having available a general well-researched list of factors for some of their complex decisions in order to have greater assurance that their decisions are comprehensive and right. To do that, they must have wide exposure and be familiar with the full spectrum of human values and environmental opportunities.” (Saaty, TL, Begicevic, N., 2010)

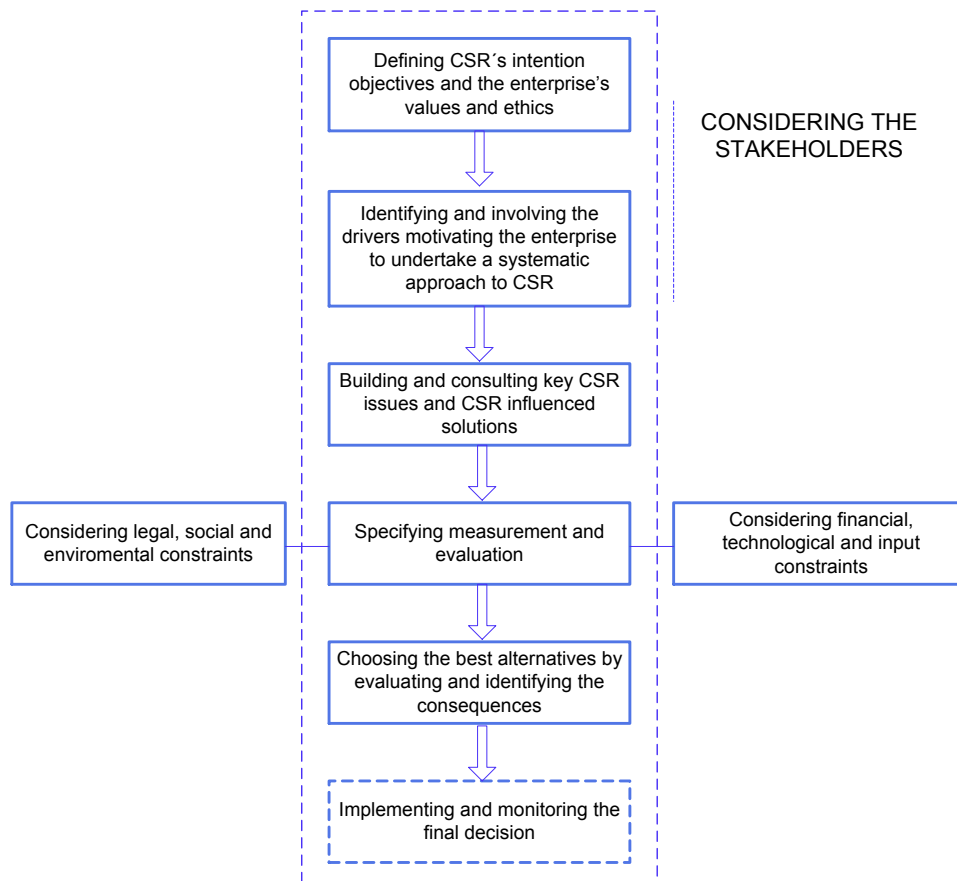

Fig. 5. CSR's managerial decision- making process

It means that not only CSR manager's decisions making processes are influenced by external and internal factors, but all CSR related strategic and operative decisions and activities implemented in the enterprise. Different stakeholders with varied typologies and power affect choices when managers are prioritizing CSR requests. Fig. 5 is showing our suggested CSR's managerial decision- making process. As time and resources are limited, managers should concentrate to areas where business notably interacts with society. Then by understanding issues both from a business and a societal side the creations of mutual value are easier. Long-term relationships with right partners (stakeholders) bring a greater opportunity to apply win-win strategy and achieve substantial benefits. Managers who want to make right CSR decisions need to have a long-term mind-set backed up by measurable commitments and actions. To choose the best alternatives managers can use the balance sheets. All these activities must consider the stakeholders. Unfortunately, managers often forgot that "economic policy has an essential impact on the process of managerial decision making" (Malichová at al., 2016) even on daily routine work. Examples of bad decisions are e.g. that "controversial environmental donation policy led to the devastation of large areas of arable land, a worsening of food availability and unprecedented market distortions among other things" (Klieštiková, Křižanová, A., Čorejová, T., Král, P., Špuchlřáková E., 2017). Certainly managers should try to balance any cost of decision with any benefits, it means to focus on where extra expenditure is necessary in order to make a decision in a social responsible way, against the savings and /or benefits that accrue from these same approach. "The purpose of these is an effective use of potential resources and their rational investment, an effective sourcing from surrounding economic area and their usage and to eliminate business risks "(Chodasová, Tekulová 2016). This background is important e.g. in decision –making process related to:

- impact on costs of adding a new product or service feature in a social responsible way,
- reducing the enterprise's carbon footprint or other negative environmental impact,
- return of investment in green technologies or other social or environmentally indicated research,
- good relationships with suppliers, who treat their staff fairly,

- reducing outgoings by cutting down enterprises' consumption of valuable resources,
- impact for better recruitment process by attracting the best candidates,
- interaction with actual employees, securing staff safety and satisfaction,
- cooperation and impact on local communities,
- minimization of energy consumption,
- establishing charity partnership programmes,
- etc.

CONCLUSION

The enterprise's interactions and interdependencies with society are many and complex. However, long term commitments of corporate social responsible approach bring significant business opportunities. The tests for all managers are whether they can make decisions which meet the challenges and impact that lie ahead for the enterprise in a socially responsible way. It is important for enterprise to strengthen the business by contributing to society simultaneously. We believe that CSR related and influenced the decision process will become a part of routine business interactions and practiced everywhere to create value for both business and society at the same time. It's helping also creatively address key business issues and strengthen business.

ABSTRACT

Throughout human history, the pursuit of beauty has become an indispensable part of society. Among these pursuits are various cosmetic products with herbal and chemical content. Cosmetics comes out as an indispensable product of modern society; because it completes our life, makes us feel good, even directs our life and has various effects. Cosmetics are spreading to a wide range of shaving products, which are part of men's everyday life, from women's makeup products, soaps to toothpastes, colones to perfumes, skin care products to shampoos. These products, usually used without regard to the chemical substances in their content and targetting mostly women, negatively affect our health when used unconsciously. The most important one of these effects is 'toxicity'.

In this sense, the most striking materials (heavy metals, hair dyes, hair lighteners, powders, nanotechnology products, parabens) are emphasized. In this study, the health effects of certain chemical substances in cosmetics products, which should be legal regulations such as drugs, were discussed with current researches and aimed to increase the awareness of the society (especially women) on cosmetics products.

In order to avoid these substances, which negatively affect our health, it is firstly necessary to raise awareness and consciousness of both health professionals and consumers of cosmetic products. For this reason, it is recommended that health professionals integrate cosmetic products and health effects into vocational training programs, raise awareness of legal regulations and sanctions on consumers concerns.

Key words: Cosmetics, Toxicity, Health Problems, Awareness

INTRODUCTION

Cosmetics are all kinds of products, which are used to change the appearance, smell, clean, protect ; including hand soap, deodorant, sun cream and lotions, lipstick, nail polish, makeup material applied to the human body. Used by people to look healthy, attractive and beautiful, these products have become an indispensable part of our life. Helping to have a beautiful, well-groomed and healthy body, cosmetics allow people to feel good about themselves physically and emotionally by raising their level of confidence.

Since beauty and well-being usually make women come to mind, the cosmetic sector has taken this mass as a target. But as the time progresses, the interest of the male group in the cosmetic products has also increased. Increasing the importance of external appearance in the working life, the increasing number of beauty salons and increasing variety of products in the cosmetics market have also increased the consumption of cosmetic products. In addition to looking beautiful and attractive, they have also sought new products to reduce signs of aging. In line with these demands, cosmetic products that reduce lines and wrinkles, prevent coloring, and increase the soft appearance of the skin have started to develop rapidly (Choi,CM.,Berson DS. Cosmeceutical, 2006). However, the content of these products has been supplemented by many and various chemical substances that help heal wounds and assist metabolic processes. It is emphasized that the application of chemical

substances to the skin involves more risks than swallowing. Since the only help that consumers can find out about what kind of a product they are using are the contents, they distinguish harmful substances by looking at them here. As a result of a research on cosmetic use, it has been found that consumer information is under the effect of product label; for example, a product that is claimed to be natural by more than half consumers believes is thought to have natural ingredients (Lewis, 2004). But listing up all the contents is not always doable. According to another research result, 99.7% of the total 7497 care products examined in our country contain at least one chemical substance which has not been researched until now (The Other Side Of Cosmetic Products, 2012).

Danger Related to Cosmetic Products

One of the dangerous substances in cosmetic products is phthalate (2-ethylhexyl). During pregnancy; anomalies can occur in the fetal reproductive system when encountering phthalate or its monoester metabolites, which are components of many cosmetic products such as nail polish, lotion, soap, cleansers, hair care products and room spray. (Durmaz, Özmert, 2010, Koniecki, Wang, Moody, Zhu, 2011). Products containing this substance can cause infertility, cancer and organ dysfunction. It is also emphasized that the amount of phthalate exposure increases in line with the variety of cosmetic products, and that this affects human health (Russ, 2009). In Europe and America, the use of phthalate, which is found to cause health problems (especially in the reproductive system) is restricted and its use in children's products is prohibited (Koniecki D, Wang R, Moody RP, Zhu J. 2011). A study in South Korea revealed that phthalate was found in 102 products when examining cosmetics in four different categories (hair, care product, deodorant, perfume and nail polish) (Koo, Lee, 2004). All this data gives us the conclusion that the use of cosmetic products, especially those used by pregnant women, should be controlled. It is also necessary for health professionals to include the health effects of cosmetic products on pre-pregnancy care services.

Chemical substances are used blindly. Consumers need to know the safety dose of the chemical substance they use for their body and to make a consumption in this direction. The fact that in America, where every woman uses an average of 2 kilograms of cosmetic products annually, cosmetics also cause cancer, allergic reactions and birth defects in addition to containing 800 grams of toxic substance; validates the news above. (The Other Side Of Cosmetic Products, 2010). A report released in September 2002 and supporting the findings of this research was as follows: The high price of beauty: a study conducted by the US National Institute for Occupational Safety and Health revealed that 800 noxious chemical substances were present in cosmetics. A study of 2,983 chemicals used in cosmetics revealed that 884 of them caused toxic tumors, 218 caused reproductive disability, 314 caused mutation and 376 caused skin and eye related diseases.

Hair Dye

It has been found that general leukemia risk increases by 50% with the use of hair dye, and by 150% if the exposure time exceeds 16 years. Women who dyed their hair 1-4 times a year have a 70% greater risk of ovarian cancer compared to non-dyed women, whereas for women who dyed 5 times a year or more this risk is above 100%. Some studies have shown that there is a link between hair dye use and non-hodgkin lymphoma (50% more risk).

Chemical Events During Hair Color Change

The hair-color changing preparations oxidize the melanin pigment that gives the hair its color and thereby change it. The change of the color is based on complex chemical reactions. By bringing the color changing agent and the oxidation material together, the agent and the acid by which the hydrogen peroxide preparation is stabilized get neutralized. Now oxygen can be separated. Since the alkaline hair contained in the coloring agent dissolves with strong acids, the oxidizing agent may be effective on hair. The active oxygen, which binds and oxidizes pigments, is separated. In the meantime, some of the hair dye is reduced or chemically changed so that they lose their color. So the color of the hair changes. Alkaline residues must be neutralized and purified from the hair by a final treatment with 33 acid-reacted preparations (Strengthening Vocational Education and Training System Project, Beauty and Hair Care Services, Hair Care Cosmetics, 2007).

Paraben

Paraben is included in many products. Because of its antimicrobial properties, it is used in almost all cosmetic products, food products and drugs. These materials, which are very common in use, are cheap and have low toxicity levels. According to European Cosmetic Direction, the amount of parabens which cosmetics should

contain is determined as 0.4% for single ester and 0.8% for ester mixtures. The paraben group consists of methyl paraben, ethylparaben, propylparaben, isopropylparaben, butylparaben, benzylparaben. Daily use of parabens in cosmetic products is estimated to be 17.76 g in adults and 378 mg in newborns (Int J Toxicol, 2008).

The 1994 risk assessment of the European Commission Food Scientific Committee (SCF, 1994): This risk assessment of the committee in 1994 concluded that methyl, propyl and butyl-parabens showed that there was no genotoxicity in in-vitro and in-vivo mutagenicity tests, and that butyl-paraben did not cause cancer in rats. Reproductive toxicity and teratogenicity studies in rats with 10% ethyl paraben diet did not have a negative effect on reproductive performance. However, it has been reported that even though it is not proven definitively, it leads to some anomalies on the fetus and therefore it is necessary to renew teratogenicity studies. It has been reported in elimination studies that methyl, ethyl and propyl-parabens are well absorbed by the body in metabolism, metabolized by the hydrolysis of ester bonds in very high amounts (approx. 99%), and excreted by urine. Especially in some specific studies with propyl and butylparaben, it has been reported that cytokinesis has increased in the anterior region (there is no such anatomic structure in humans) prior to the mastoids in which the rats store their nutrients. In the light of this assessment, the scientific committee identified a temporary daily intake limit (ADI) of 10 mg/kg for methyl, ethyl, propyl parabens and their sodium salts. The reasons for being temporary are the above-mentioned possible effects on the fetus and the need for further studies clarifying cell proliferation in anterior segment of rats' stomach (EC The Scientific Committee for Food (SCF), Reports of the Scientific Committee for Food, Opinion on p-hydroxybenzoic acid alkyl esters and their sodium salts expressed on 1994).

Powders

They are powdered solid materials used only as a preservatives, and have no therapeutic interest. As carriers, the effects are very weak; they can not provide adsorption and hence penetration, thereby only antimycotic, antibacterial, antipruritic drugs can be added for their superficial protective effect. The main effects are increasing evaporation surface, thus accelerating the evaporation (particularly evaporation of sweat) and reducing moisture. They also reduce the friction and give a slight slippery with the help of simple rotation motion, and they can also provide a protective effect by creating a new layer. Due to these properties, they are used especially to prevent the development of irritation, intertrigo, fungus etc. at points of curling. Since their power is not enough to vaporize such liquid and forms a layer like sloughy pat or mud which is very suitable for bacteria and candida to replicate, they are not used in watery and pale lesions. In addition, inorganic powder particles such as "talc" may also cause foreign body reaction. Even though they can be applied 2-3 times a day, previous wastes should be cleaned. The application is in the form of spreading or buffering to the skin.

The powders can be divided into inorganic and organic (maize, wheat starch) subgroups, but organics are not used commonly as they are quickly deteriorated. In addition to titanium dioxide, bentonite and kalamine; the most commonly used inorganics are talc and zinc oxide. (Aydemir, 1997).

Skin Care Products

The most commonly contact dermatitis occurs due to the use of cosmetics and skin care products. Contact dermatitis results of an inflammatory reaction that either destroys the deep barrier function of these products or causes epidermal damage or immunological events that are related to skin sensitization. 5-10% of side effects due to cosmetic applications are contact dermatitis. It manifests in clinically similar situations. In the applied skin area, subjective symptoms such as itching and burning, as well as erythema, edema and vesicle formation, desquamation, followed by watering and crusting. Scratch formation and erosion may occur in severe conditions. The cosmetics that lead to these reactions are: skin care products (28%), hair care products (24%), facial cosmetics (11%), nail care products (8%), perfumes and fragrances (7%) and sunscreen creams (3%). The most common dermatologic chemical agents found in the contents of these cosmetics are; lanolin, glycerylthioglycolate (content of perm solutions), propylene glycol, toluenesulfonamide (nail polish) and paraaminobenzoic acid (sun barrier cream). The recovery of contact dermatitis depends on the removal of the responsible allergen. In cases where the allergen can not be detected, the responsible substance may be found by performing a patch test. This condition is usually corrected with the use of topical corticosteroids (Adams, Maibach, 1985).

Creating a Collective Alzheimer Awareness in Basic Design Education Through Costumes Designed with the Theme ‘Missing Years’

Aysen CELEN OZTURK

Eskisehir Osmangazi University

Architectural Department

TURKEY

acozturk@ogu.edu.tr

ABSTRACT

In the present study, the concept of “memory loss due to Alzheimer” was scrutinized as a design problem in architecture department basic design course, for young individuals to recognize the increasing prevalence of the Alzheimer's disease worldwide and in Turkey and to raise social awareness in the society. Initially, the students discussed how memory loss can be presented as a design. Later, using two and three-dimensional presentation techniques, they turned their designs into material products. In basic design education in architecture, “learning by doing” method was used. The problems presented in Basic Design course are supported not only by the discipline of architecture but by different disciplines as well. In creating the problem presented here, fashion design discipline, which is similar to architectural construction techniques, was utilized. Both disciplines are based on human scale. Furthermore, “Fashion design” was chosen since it is an interesting and intriguing, easily accessible design discipline that people from all walks of life could relate to. The building and production approaches of both disciplines that determine the main construct of design using a concept, are also similar. Construction and production techniques are determined by materialdetail solutions. Thus, the students of architecture were asked to design an “Alzheimer’s Awareness Costume with the theme of Missing Years” and to present the costume in a fashion show to arouse interest. The “Awareness Fashion Show/Exhibition,” organized in collaboration with Eskişehir Alzheimer's Association was presented to all at a predetermined venue in Eskişehir urban center.

Keywords: Basic design education, Fashion and Architecture, Alzheimer’s Awareness, Spatial/Temporal Disengagement, Items of Forgotten Memory.

INTRODUCTION

Today, universities focus on their students’ emotional and intellectual development as well as their vocational education. University education no longer tackles with only acquisition of material knowledge, but also focuses on current social problems. Thus, the most prevalent disease of the future, “Alzheimer’s disease” was addressed as a social problem in the present study. The world population is gradually getting older and the average life expectancy is getting longer. The World Health Organization calculated the rate of population over 65 years to the total population as 10% today and predicted the same rate as 16% in 2050 (Arslantaş et al., 2009). According to Turkish Statistical Institute figures, while the rate of the population over 65 to total population was 7.5% in 2012, it was expected that this rate will be 10.2% by 2023, 20.8% by 2050 and 27.7% by 2075 (Ozturk, 2017). Based on this data, universities and all educational institutions are responsible to devise pertinent projects to attract social attention to Alzheimer’s disease and increase collective awareness on the issue.

In design disciplines such as architecture, interior design, industrial design, fashion design, etc., when design is considered as an act of problem solving, the “Basic Design” course provides abstract and conceptual thinking which is the most basic tool of the act of design. Basic design course makes it possible to analyze a given problem, to conceptually deconstruct the same, to reach an abstract plane from the tangible, to produce ideas, and then to return to tangible (Erdogdu, 2016). Especially during the “Basic Design” training in the freshmen year of architecture education, the cognitive formation of the abstract, the development of creativity, critical thinking and perceptual awareness, three-dimensional thinking, are among the most important development of skills. The basic design course studio possesses the most significant contextual weight in time and effect at the beginning of architectural education. The design logic commences to form in this course. In the design studio, it is important to discuss the predesigned products rather than the instruction of design. L. Bruce Archer defined design as systematic research, the knowledge of manmade objects and systems or the determination of the view, composition, structure,

objectives, values and the meaning of the abovementioned objects (Archer, cited by Bayazit, 2004). The designers work with an imagined future reality; the designer describes and creates the non-existent (Jones, cited by Yürekli, 2004). The most important characteristic of the act of design is the need to think about the future and to identify future problems. The designer should learn to strengthen and utilize intuitions and common sense, and thus could 'speculate about the future' (Yürekli, 2004). Recently, the schools of architecture were criticized that they instructed the “basic design courses” in stereotypes, reducing the course into instruction of the form, without improving creative skills. In today's rapidly changing environment, it was argued that there is a need for a curriculum, which constructs a mental structure that can produce flexible, dynamic, and novel probable situations and an inquisition process (Yurtseven, 2011).

In the present study, which continues the abovementioned debate, the utilization of interdisciplinary work in the basic design course was studied. The transformation of the knowledge in different disciplines and theoretical heuristic approaches also affect the final products. Students who discover relational approach to architecture through various disciplines would present their unique designs with their unique presentation methods and would transfer rich cognitive images to the final product in the design process (Avcı, 2011).

In the present study, the discipline of fashion design was selected as an instrument in transferring the memory loss caused by Alzheimer's disease to the design. The main objective of the study was to draw attention to Alzheimer's disease, which is the greatest health and social problem of today and the future, and to contribute to future studies by creating a social awareness on the issue. The fashion design discipline was selected since it has become an important discipline that people from all walks of life could relate to and it is an interesting, intriguing, and an easily accessible design discipline.

The main topic of the present study was the “memory loss caused by Alzheimer's”, and the content was examined theoretically and the problem of “Alzheimer's Awareness Costume Design with the theme of Missing Years” was developed empirically. It was expected that the uncertainty of the problem and the necessity of defining it in detail by the designer, rather than providing a final definition of the design problem, would promote abstract concepts such as intuition, common sense, emotional intelligence, flexibility and creativity. The resulting product, “Alzheimer's Awareness Costume Design with the theme of Missing Years”, was presented in a fashion show, arousing interest.

THE STUDY

Eskişehir Osmangazi University (ESOGÜ) Architecture Department renamed the freshmen “Basic Design” course as “Introduction to Design I and II” studio with a change in the curriculum in 2012. Within the scope of the studio, several basic design problems are discussed throughout the academic year. These design problems are often introduced in a vague structure without sharp limits to improve mental creativity and abstraction skills. The design approach is learned by practicing and experimenting in the studio. Students are asked to produce three-dimensional models using hands-on “learning by doing” method and explain their designs. The overall aim was to develop the “critical thinking and producing approach” of the freshmen architecture students based on their designs. Instead of theoretical instruction, the construction of nurturing concepts in architecture using different disciplines (art, sociology, philosophy, medicine, natural sciences, etc.) and developing a discussion-ideas through these concepts was the basic approach in the Design Studio.

In architecture education, the words studio and workshop are occasionally used synonymously. Hence, it is essential to make a distinction between these two terms, since there are fundamental differences in terms of their implementations. In workshop spaces, student work is revised by instructors and the final products are shaped according to the direction provided by the coordinator. In a hierarchical, canonical structure, a study for a product with a predetermined outcome is the subject matter. Nevertheless, the studio environment is different from such structure with respect to its focus on development rather than the correction of the final product. Accordingly, the work in the studio is criticized and most of the studies are carried out in groups. The student work is expected to be developed according to the criticisms and interpretations of the studio instructors who teach the course together. The hierarchy between students and teaching staff is perceived less and the design process is more important than

the final product (Lang, 1998). Therefore, Introduction to Design course in Eskişehir Osmangazi University (ESOGÜ) Architecture Department is taken into consideration from the viewpoint of a studio.

Once the relevant literature is reviewed, it is possible to observe that two major paradigms play an important role in the development of architectural design education. One of these paradigms is Ecole des Beaux-Arts, which first applied the studio system. In Dewey's early period study at the beginning of the 19th century at Ecole des Beaux-Arts regarding the basic design system in architectural education, it was observed that students discussed the problem in a collaborative manner with their instructors, shared an intensive process and simultaneously experienced the means to design (Tschimmel, 2010). This paradigm was criticized for its formal and stylistic approach to design, which repeats the precedents in the history, for its two-dimensional and symmetric composition approach, and elitist and aristocratic attitude (Uluoglu, 1990). The second paradigm of architectural design education is the Bauhaus school. It is possible to assert that the ultimate difference of the Bauhaus from the Beaux Arts model is to free the student from any kind of conditioning and bring his creativity, imagination, individual expression possibilities to the forefront.

In addition, Itten, the founder of the Basic Design education in Bauhaus, aimed that the student could question the previously acquired patterns of thought, could consider the problems before deciding and could experience these within a personal integrity (Arıdağ & Leo, 2012, citing Lerner).

Similar to the education method defined in Dewey's book, "Freedom and Culture", the design studio should have a structure that does not solely provide information to students, but makes them accustomed to finding the paths to problem solving and provides students the habit of thinking for this purpose (Dewey, 1987). Concurrently, Dewey points out learning by doing as an important way to establish causal relationships between objects, concepts, in his books "Experience and Education" (Dewey, 2007). According to Dewey, it is important to grasp relationships in the design studio and construct similar relationship in other circumstances and other time periods, to interpret or decipher other situations (Özkar, 2009). In this sense, Dewey's method, which allows the student to freely discover oneself and allows him/her to learn by doing, was adopted as the instructional methodology in the Introduction to Design course in Eskişehir Osmangazi University (ESOGÜ) Architecture Department.

Architecture and fashion design, which are both design activities regarding humankind, exhibit similarities in terms of tectonic and structural strategies. Architecture and fashion have common concepts regarding design theories. Design is referred as a problem-solving process by individuals. Gully asserts that, even in fashion design, problems regarding clothing is related to the resolute aesthetics proposed by the designer. Such solution should have a connection with the human body in terms of design style, color, fabrication, proportion and pattern (Chinwendu, 2014). Both architects and fashion designers tend to use similar techniques such as the use of geometry to create form where they both begin the process with a skeletal structure then add other elements to support it, occasionally these elements could be draped or even suspended. Even though there are connections between architecture and fashion as pointed out above, there are some modifications in scale, materials, sizes, shapes and proportions as well.

One of the main methods of improving educational process in the Architectural Schools is systematic and gradual development of skills to create tectonically embodied space. In Eskişehir Osmangazi University, Architecture Department the complex three-phase model for acquisition of the tectonic skills is employed. At every phase, the tectonic skills are improved progressively. In the first phase (initial year), the reveal of tectonic characteristics in nonarchitectural objects is treated as an experimental stage that sums up the analysis of the nature of materials. In the second phase (intermediate year), the cognition of tectonic systems in architecture and their types are approached as the analytical stage for studying the evolution of tectonics. In the third phase (third and fourth years), tectonic systems are interpreted as the final stage which develop skills in tectonic treatment of a form in terms of architectural composition and architectural design. At this phase, the design aims to secure coherent educational system and interdisciplinary connection via the tectonic subject. The aim is to encourage students to avoid mannerism and incapacity related to the form and instead to accentuate simple visual characteristics of architecture and to comprehend truthful possibilities in creating tectonically embodied space.

In the first-year Introduction to Design course, the concept of tectonics was analyzed in the light of etymology via its comparison with terms such as *techne*, *technique*, and *technology*. The main idea of the studio's methodology commences with Aristotle's concept of *techne*. According to Aristotle, everything in the world is a matter that gained form, and the essence of any matter is its potential to become and do something. The matter performs its essence as a form. Aristotle, and thenceforward Heidegger, mention the four causes in the formation of *techne*. These causes are, *hyle* (the material cause), *eidos* (the formal cause), *telos* (the ultimate cause) and *logos* (the effective cause). According to this idea, *techne* is "knowing by doing, doing by knowing" (Ergül, 2015). During the studio work, this conceptual substructure was utilized as the "knowing by doing, doing by knowing" technique. It was previously suggested that technology is a mode of revealing the essence of the materials. As presented in Diagram 1, organized knowledge for production technics could be formulated in order to transform raw material into useful instruments, which reveal the means they were made in contrast to natural objects.

In this study, the students were primarily requested to choose and develop a past memory item to explain the memory deficits caused by Alzheimer's as design decisions. As seen in Table 1, the designs were taken into consideration as matters that belong to the past, namely, Daily objects, culture and art objects, famous artists, forgotten technological images, and forgotten items of romantic sentiments. Starting with such conception, the nature of the materials was analyzed, assembly techniques were developed and a holistic body structure was created in order to design costumes with three-dimensional multipartite materials. In the creation of the whole, materials' tectonic function independent of the body was discussed during the course. According to Gottfried Semper, assembly is a contemporary fragmentation experience and it allows a discourse that eliminates the metaphysical content of the duality between construction and representation. Assembly presents its tectonic form in its disconnectedness (*dis-joint*) (Özkan & Akçakoca, 1997). The experience of assembly constitutes an important mental process in the formation of the tectonic construct by the students. According to Louis Kahn design should as well transform the nature of the present matter via technical means ("by technique") and enlarge its environment (Güvenç, 1997). The three-dimensional and piecemeal techniques of materials enable the act of making that allows the creation of tectonic construct. Therefore, various joint and assembly techniques (knitting, sewing, stapling, etc.) were developed and the surface properties of materials were altered via the employment of these techniques.

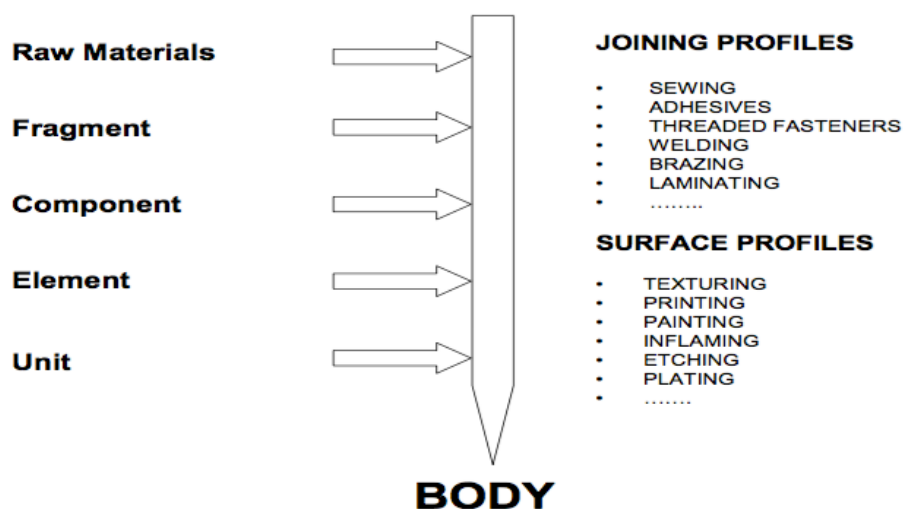

Diagram 1: Methodologies of creating tectonics and making Technologies

FINDINGS

Within the scope of basic design studies in Eskişehir Osmangazi University Architecture Department, this study intended not only to inform students on Alzheimer's, but also to explore significant consequences of the disease, such as "spatial/temporal loss," through transforming the items of forgotten memories (audio tapes, black and

white photos etc.) into costumes and a costume exhibition. In this framework, the designs were analyzed and were presented in 5 distinct groups in Table 1. These distinct groups constitute of items deleted from past memories (newspaper headlines, typewriters, pay phones and twig brooms), collectors of cultural and everyday life (audio tapes, 33 rpm records, black and white film strips etc.), childhood games in the past (abacus, pog game chips, Tetris, the Friendly Ghost etc.), past images (good-bad memories, memory boxes, spinning toy etc.) and romantic memory items (love letters, photo albums, archives, seals, etc.).

As presented in Diagram 1, raw materials (such as paper, cardboard, linear elements as wires, etc.) were transformed into three-dimensional objects from their two-dimensionality via geometric organizations and various making methods (knitting, stitching, etc.). Costume designs with structures that acquire stability via establishing a relationship with the body through partial contact were created. The designs that were outcomes of group work were presented initially to the jury members by one individual from the group, and then were developed and finalized, and finally presented to the inhabitants of the city to improve awareness of Alzheimer's. Emotional moments were experienced at the fashion show, to which Alzheimer's patients and their relatives joined, and the costumes were observed with enthusiasm. This study is considered as an important experience for students to experience design practice through a different discipline, in addition, it is as well a significant experience in terms of researching on an important social problem and developing a design thinking through examining its complications, and presenting the design interactively to receive its implications.

Table 1: Abstract representation of the items/images of the forgotten memories through costume design.

DESIGNS	ITEMS/IMAGES OF FORGOTTEN MEMORY	MAKING METHODS
	1. Newspaper headlines	Knitting 2-dimensional newspaper papers after transforming them into 3-dimensional strips
	2. Classic typewriter	Combining circular section cardboard typewriter keys with metal structure
	3. Pay phone	Creating surface texture with electric cable knitting method and metal pulley
	4. Twig broom	Creating surface texture via knitting of bushes and attaching them by metal clamps
	5. Audio tapes	Creating texture via knitting audio tapes
	6. 33 rpm records	Combining the circular elements produced as 33 rpm records within different geometric organizations
	7. Audio tapes and veils	Providing an irregular fabric through the tight pattern of audio tapes that pass through the scattered gaps of the veil membrane
	8. Black and white film strips	Obtaining a volumetric textile material in flexible geometric forms by passing thin wires through the top and bottom holes of the film strips
	9. Abacus	Creating a wearable costume with the curvature construction of metal bars and wooden beads, referring to abacus, the counting element of our childhood
	10. Casper the Friendly Ghost	Fixing the image of the cartoon character Casper (the Friendly Ghost) into the transparent triangular prisms and clothing the body via a metal construction
	11. Pog game chips	Creating a surface of geometric organizations through the 2-dimensional pop game chips image pieces
	12. Tetris	Fixing colored Tetris blocks to a metal construction with different geometric organizations
	13. Spinning toy	Creating a spinning toy by knitting a linen thread around the body that constitutes a formwork for the spinneret through the use of kraft paper and the combination of three-dimensional geometric patterns
	14. Photo albums	Creating geometric patterns that originate from the habit to keep all our photos in albums and frames in the past
	15. Erasable photo storages	Making old printed photos portable via mobile storage
	16. Good and bad memories	Geometric abstraction of good and bad memories as black and white memory elements
	17. Archive and seal	Creating a three-dimensional surface texture from the two-dimensional kraft paper to represent the old archival images
	18. Türkan Şoray, old Turkish movie actress	Türkan Şoray's image, one of the strong images of Turkish cinema, is transformed into a three-dimensional textile element through the combination with two dimensional kraft paper and geometric forms
	19. Autograph love letters	Transforming the old autographed love letters on paper into three-dimensional representation to constitute a surface texture
	20. Empty photo frame	An object of photographic images in the past, the photo frame, is constructed as a structure

Figure 1 and 2. Exhibit of Alzheimer Awareness Costumes at the fashion show.

Figure 1 and 2 presents the dramatic representations of the costumes selected from the musical archives of the past. One of the most important advantages of the conducted study was the evidence that university students are interested in community problems and that they could show determination in addressing these problems. The comments received from the students indicated that they heard of the “Alzheimer’s disease” until then, yet they did not have substantial information on the subject, and would be willing to work on social projects in the forthcoming processes.

CONCLUSIONS

One of the most important constituents of architectural education is ‘knowing by doing/doing by knowing’. Design problems, which are as well enriched by interdisciplinary studies as much as the autonomous realm of architecture, are particularly transformed into end products by means of discussion. It can be asserted that two well-known branches of design, fashion and architecture, are substantially integrated with each other. Both disciplines employ the ‘concept’ approach to regulate design, while their manufacturing approaches also run in parallel. Their fabrication techniques are established on the search of the relationship between material and detail. Thus, each material in design a process has the potential of adding new layers or changing the meaning of the design product. This study addresses the student Works as the final product of the Introduction to Design course and emphasizes the significance of these outcomes to demonstrate the effectiveness of the employed course methodology. Consequently, this study aims to create a collective awareness regarding Alzheimer’s through costume designs of architecture students on the theme ‘Missing Years’. A fashion parade and exhibition was performed in collaboration with Eskişehir Alzheimer Union, under the name “Awareness Parade/Exhibition” in the city center for Eskişehir’s inhabitants.

Culture in Education: Fairy-Tale Therapy and Other Forms of Art Therapy

Dorota BELTKIEWICZ

kontakt@dorotabeltkiewicz.pl

ABSTRACT

The present article presents an important role of culture, especially the spiritual one, in education as well as the ways of applying it through different forms of art therapy, in particular fairy-tale therapy, which is currently very attractive and popular. Workshops for pre- and lower-primary school children as well as research studies conducted by the author show that culture is most effectively and permanently acquired through personal experience. Taking an active part in sessions, based on art therapy, has a great impact on children's intuitive-emotional sphere. The most attractive and engaging form of classes is a mixed one – a workshop combining different forms of art, cultural tradition. It has a positive influence on the psychomotor development of the child (stimulation of sensory channels, memory, perception; emotional, social, linguistic development). In the era of the domination of practical knowledge and consumerism it is of particular importance to introduce spiritual culture (art, customs, beliefs) to the educational process, which can be achieved by means of art therapy. Such action passes cultural, linguistic and social models in a parallel and multidimensional way. It equips young recipients with key skills and competences, indispensable for a successful coping with life situations, independently of the chosen specialization.

INTRODUCTION

Culture, being defined in many ways, can be broadly viewed as all human products and encompasses both the **material and the spiritual sphere**. In education it is crucial to maintain the proportions between these two domains. **Material culture** is a collection of practical skills, technical products and - in broader terms - can be equated with (especially) exact science. **Spiritual culture** incorporates beliefs, tradition, but also all forms of art. Nowadays the tendency towards the domination of science can be observed, in the sense of knowledge and practical skills, over communing with art and tradition. Science corresponds with the intellectual sphere, while art with the intuitive-emotional one. This broad division is graphically presented by the diagram below.

Fig. 1. The division of culture into the material and the spiritual one, the localization of the two domains in psychological human spheres, and its relation to theoretical and emotional intelligence.

Both science and art constitute culture, which is based on human creation. According to Górniok-Naglik (2007: 20), "Analysing science and art as two types of creation is tantamount to classifying them under the same genre, and so perceiving their similarities rather than differences. The possibility of noticing the similarities

between science and art is not limited to the fact that both branches sprang up on the foundation of creative action – they are creation. The diagram presented above, depicting the division into material and spiritual culture, may be vague, but a few aspects enable this classification.

First of all, **the role of imagination** is essential in the two spheres presented. Górník-Naglik (2007: 20-21) emphasizes that “imagination in science is different than the one encountered in art. In art, its role is to lead to the creation of a complete production - an artwork. This type of imagination is closely related to sensation. There is, however, a difference in sensory experiences which accompany the contemplation of art and communing with science, because the sensations are formed on a different existential ground.” The author explains that in a piece of art imagination leads to the creation of a new object, a thing which expresses the mystery/the unknown, while in a scientific work imagination is to rationalize what seemed to be a mystery before. This relation can be transferred to the diagram presenting the division of culture.

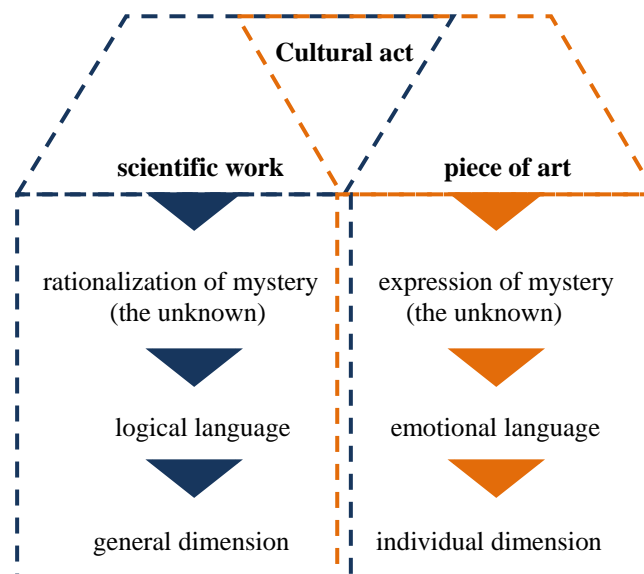

Fig. 2. The division of human artifacts into pieces of art and scientific work, the language related and the dimension of functioning in a person's life.

Another factor, which diversifies the two spheres, has been taken into account in the diagram, namely **the mean of expression of the cultural act – the language**. Art is linked to **emotional language**, which stems from the fact that the creator acts in the heat of emotions. A piece of art evokes in the recipients particular feelings. Science can also involve emotions. The subject of research or its findings can trigger positive as well as negative feelings, sometimes very strong ones, but the results of the creative act “have to be justified in logical terms and translated into a language devoid of emotions” (Górník-Naglik, 2007: 23). Since the early levels of education children should learn two basic forms of communication - logical and emotional, and how to use them in a given situation, context.

The next differentiating factor, which is connected with the previous ones – imagination and language, is **the level of functioning** of a piece of art and scientific work. Scientific work should be a universal medium enabling the understanding of (an unambiguous) theory by the general public, while an artwork is meant for individual perception and allows for multiple interpretations. The creation of scientific work gives the author a utilitarian fulfilment. The creator of art can get to know and express him-/herself (self-aggrandizement/self-expression).

The three aspects indicated explain why science has been classified under the intellectual human sphere, while art under the intuitive-emotional one. A parallel stimulation of both domains is indispensable. In this day and age specialization is important. Nevertheless, at the lower levels of education a person should be provided with the opportunity to get to know both areas in order to allow him to properly choose in the future. What is more, the intensification of the contact with art in the process of education can be expressed in many forms, among others in art therapy: music therapy, dance movement therapy, visual art therapy, as well as a very popular and

effective fairy-tale therapy. The intensification shapes the intuitive-emotional sphere of children (imagination, feeling). Communing with spiritual art has a positive influence on the development of emotional intelligence, conditioning life success independently of the chosen specialization.

Synthesis and symmetry are crucial in culture. They should be preserved (between the spiritual and material spheres) since the earliest levels of education due to the highest capacity and plasticity of the brain in childhood. As pointed out by Daniel Goleman, it is mainly the experiences in childhood that “shape” the human brain (Goleman, 2007).

Nowadays, when there is more focus placed on practical knowledge and skills, students lack the conditions for self-knowledge, the development of intuition as well as the expression of emotions and their verification, which shapes self-consciousness and self-control. Art is a plane which stimulates imagination and favours the emotional development. Daniel Goleman claims that “naturally, the development of each of the skills included in the **emotional intelligence** is determined by everything that happens in the period encompassing several childhood years. This period is the time when children can be helped to develop good emotional habits. If that opportunity is wasted, it is very difficult to fix it later.” A balanced stimulation of the child is thus an investment for its future success. “Therefore, it is the responsibility of educational institutions not only to educate, but also to bring up. Kindergarten groups or the groups of first graders are the first, next to family, social groups in which children are included” (Bełkiewicz, 2014).

Art therapy is an attractive, interesting form of stimulation which is easy to apply in kindergartens, schools and institutions. Skorny distinguishes the following forms of **art therapy**:

- **music therapy**;
- **choreotherapy**;
- **bibliotherapy**;
- **psychodrama**; and
- **graphotherapy** (Szulc 1994, following: Skorny, 1990).

Music therapy, which consists in having contact with music, can have a passive form – the perception, listening to music or songs, as well as an active form – playing musical instruments, singing (group or individual activity). Górniok-Naglik (2007: 126-127) notices that „a constant communing with music of a child, especially with singing, since the first days of life is a chance for teaching him/her to love music” and that “every communing with music is a school of imagination. Szulc (2011: 117-118) indicates that “four categories: the awareness of feelings, mobilization, belonging and meaning are based on the premise that there is a relations between music and identity. Analysing the four parameters of identity, namely personal space, social space, the space of place and time and transpersonal space, we can spot the strong relation taking place between music, identity and health”. Music therapy has a significant, long-term impact on the development of an individual as well as the current state and the quality of life.

Choreotherapy means influencing through dance. It can have the following forms: individual, ballroom, team. Its selection depends on the capabilities of the participants and the aim of the classes. Górniok-Naglik (2007: 129) observes that “children react to sounds and rhythm instinctively, but this reaction has to be developed since the early months of life.” The continuation of the stimulation is also indispensable in kindergarten and school, in particular in the form of a play. The author points out that “when the child dances, accompanying itself with clapping or singing, double sensory sensations support the formation and reinforcement of permanent kinaesthetic-auditory conceptions”.

Bibliotherapy is influencing on the recipient by means of a particular text/literary work, which is appropriately chosen for a given age, capabilities, life situation, aim of the class. A very popular and attractive form of bibliotherapy is **fairy-tale therapy**.

“It is based on applying specifically developed or selected texts presenting the problem similar to the experiences of the child. Such texts can be used simultaneously in all the above-mentioned child’s immediate living environments, and when this is not possible – in a compensatory way in the dominant environment” (Bełkiewicz, 2017).

Molicka indicated three basic functions of therapeutic stories:

- **psycho-educational**,
- **psycho-therapeutic**,
- **relaxation** (Molicka, 2011).

“Particularly important elements in the process of story-telling/reading are attractiveness and availability of this

genre for children, as well as the accompanying aspect of building bonds with the person, with the significant others” (Bautsz-Sontag, 2013: 20). The aims of fairy-tale therapy, among others, are: the reinforcement of proper

patterns of behaviour (presented by the main characters), the development of problem-solving thinking, redefinition of the ‘self’, boosting one’s self-esteem, linguistic development (stimulation of narration, enrichment of lexicon) (Bełtkiewicz, 2017).

“Patterns included in therapeutic stories may be related to **culture, social relationships, or language**. Of course, these domains form an inseparable triad; however, depending on the listener’s individual circumstances, therapeutic stories should be selected so as to display a specific type of a pattern” (Bełtkiewicz, 2017). Ostasz (2000) states that “it is commonly known that patterns are most effectively instilled during childhood. The most powerful child’s play is the one which contains certain patterns or role models. During play, such patterns become instilled without opposition and with pleasure, since, for a child, playing is both a necessity and a pleasure. At the same time, the following rule of development is respected: that which develops interiorizes and assimilates that with which it comes in contact”

Psychodrama is based on acting out, staging of a given topic, often using puppets/dolls. It is performed spontaneously, through improvisation or following a play script. Its goals are, inter alia, to: simulate the recognition and expression of emotions, increase empathy, prepare for a social dialogue, project potential situations (usually problematic ones) and their solutions (Bełtkiewicz, 2017).

Graphotherapy is about performing actions which accompany drawing and painting (with a brush or fingers). The main aims of this form of action are: stimulation of the visual analysis and synthesis, training of the eye-hand coordination, manual dexterity and visual perception, the feeling of agency/causing by the realization of one’s own idea, preparation to a multi-level work.

All the above listed forms of art therapy engage not only imagination, which was mentioned before, but also the senses. Appropriately planned multisensory classes can generate all kinds of stimuli, sensitizing children to their reception. Using different forms of art therapy simultaneously shapes also many skills and competences.

THE STUDY

The study conducted concentrated on the use of different forms of art therapy during workshops (additional classes) in educational and cultural institutions. Pre- and lower-primary school children (aged 3-6/7, 6/7-10) took part in the research, in groups of 15-20.

Zbigniew Skorny lists three main functions of art therapy:

- **recreational;**
- **educational;** and
- **corrective** (Szulc 1994, following: Skorny, 1990).

The leading function during the classes conducted was the **educational function**. The sessions were tailored to fulfil this function.

Different forms of art therapy concentrated on one, leading theme. The main message was passed at the beginning through fairy-tale therapy. The therapeutic story was presented in an engaging, interesting way, forming a bond. The subsequent forms of art therapy were of an individual, group or mixed character.

I model of workshops (for preschool children, aged 3-6/7)

Workshop „Ogród dobrych słów” (‘The garden of good words’)

- 1) bibliotherapy - fairy-tale therapy: the author’s therapeutic story (‘The garden of good words’ about positive emotions and words presented by kamishibai),
- 2) graphotherapy: painting - decorating paper butterflies - individual cards with children’s names (self-presentation) and a big, collective poster (cooperation),
- 3) choreotherapy: ‘dance of butterflies’ - dancing to calm music,
- 4) music therapy: listening to relaxing music with the sounds of nature.

Fig. 3. Hand-made children's name cards used for self-presentation and adaptation.

II model of workshops (for lower-primary school children, aged 6/7-10)

Workshop „Wielki atut” (‘The great asset’):

- 1) bibliotherapy - fairy-tale therapy: the author's therapeutic story ‘The great asset’ about acceptance presented by a multisensory book,
- 2) graphotherapy: painting/cutting - creating puppets - favourite (similar to children's traits) animals from the ZOO,
- 3) music therapy: singing a song about ZOO with ethnic instruments,
- 4) psychodrama: using created puppets, acting out the roles,
- 5) choreotherapy: ‘dance of animals’ - dancing and imitating animal movements,
- 6) music therapy: listening to relaxing music with the sounds of nature.

Fig. 4. Hand-made puppets for children's self-aggrandizement used in psychodrama.
The composition of classes assumed the following order of activities:

- 1) maximal concentration on the therapeutic story (imagination, emotions),
- 2) intensive creative activity (graphomotor, musical and/or psychodrama),
- 3) physical relaxation (physical activity, dancing),
- 4) psychological relaxation (relaxation listening to music).

When projecting the scenario, children's developmental capabilities and the aim of the classes were taken into consideration. The topic of the meeting and the level of difficulty of the tasks were appropriately adjusted to their age. Receptive (perception, communing with the child) and creative (creation/production) tasks were combined in a balanced way.

The plan of the classes took individual and team tasks for granted in order to meet the needs of the individual within the scope of self-aggrandizement, experiencing art, as well as to enable cooperation and socialization through creating artworks in a group.

FINDINGS

The action research, with a cyclical organization of classes with a given group, indicated:

- greater concentration of children during the reception and the creation of a piece of art,
- greater freedom in operating the means of expression (forms of fine arts, music, movement, acting), - development of imagination (children were able to create the projection of the future fate of the protagonist of the therapeutic story, realize an original visualization),
- development of empathy, self-awareness and emotional self-control,
- shaping of identity (local, national) through getting to know cultural works connected with the place of residence, background/descent (myths, legends, symbols).

The interviews/conversations with children after classes demonstrated that their **state of being** was very good, quoting: *"I felt comfortable"* (PL.: *"czulem się swobodnie"*), *"I could benefit from the forms which I didn't know before"* (PL.: *"mogłem skorzystać z form, których dotąd nie znałem"*), *"attractive art materials were available, which allowed latitude in creation"* (PL.: *"dostępne były atrakcyjne materiały plastyczne dające dowolność tworzenia"*), *the tale presented was nice and smart, and the good behaviour shown in it is worth-imitating"* (PL.: *"prezentowana bajka była ładna i mądra, a dobre zachowanie w niej pokazane warto naśladować"*), *"it was nice to create something pretty"* (PL.: *"miło było stworzyć coś ładnego"*), *"I could express what I really feel and what I cannot always talk about"* (PL.: *"mogłem wyrazić, co naprawdę czuję, a o czym nie zawsze mogę i chcę mówić"*). It can be concluded that the level of satisfaction of the participants was high as a result of the lack of artistic limitations, appropriately adapted material to children's age and needs.

Few statements with a negative tinge were: *"the classes lasted too short"* (PL.: *"zajęcia trwały za krótko"*), *"such workshops are organized too rarely"* (PL.: *"takie warsztaty są organizowane zbyt rzadko"*), *"it's a pity that we cannot repeat such classes at home"* (PL.: *"szkoda, że w domu nie możemy powtórzyć takich zajęć"*).

The statements are indicative of a great satisfaction with the classes as well as of art-deficiency at home and at school, in the educational process.

Górski (1986: 27) points out that "the child's needs, especially the psychosocial ones, are exceptionally strong", their partial fulfilment, as the studies conducted show, can be realized by contact with art, both individual and in a group.

The key conclusions are:

- beneficial impact of art-therapy classes on children's psychomotor development,
- the need to include such classes in the educational programme as a balance for theoretical lessons consisting only in assimilating knowledge and acquiring practical skills, the intensification of the creation and the reception of art by children (a bond with the teacher and peers),
- the need to include art in households in the process of upbringing in a natural way: a free creation of art reflecting emotions, visualizing experiences, a spontaneous interpretation of the pieces of art encountered (a bond with parents, siblings and other family members).

CONCLUSIONS

A natural human need is a balanced academic and artistic development, especially in the childhood period when the capacity and plasticity of the brain are the greatest and the experiences gained have an influence on future choices, the standard and the quality of life. Górniok-Naglik (2007: 33) states that "The advancing synthesis of art with other fields of science is a peculiar reflection of natural mechanisms of the functioning of the human brain, it calls for the necessity of treating its output equally with the scientific achievements both in everyday life

and education". The observed tendency, being stronger and stronger, to eliminate art from education "prevents the development of individual sensitivity and the ability of the student to intuitively sense and perceive the world". Childhood, in education the pre- and lower-primary period, allow for the shaping of skills and competences whose lack or a delayed acquisition often has a negative influence on the life success of the individual. In this period the need for the discovery of the world is particularly strong, but also for self-aggrandizement/self-expression, sense of identity, forming bonds (in the family and school environments), which is evident in the urge for understanding and acceptance. All these needs can be met by art included in the process of education and upbringing. As Goleman (2007: 69) points out, "that is the problem: theoretical intelligence, which is manifested in good grades at school, does not practically prepare to cope with adversity – or to use the opportunities which life's vicissitudes present us." Art strengthens internally, because it enables the highest form of cognition: the discovery of the 'self'.

Concentration on art as well as sensitizing to it since the youngest age will allow the future generation to resist the tendency towards the growing consumerism, pressure on a swift and spectacular success and the pressure of being well-educated and modernly utilitarian, which without emotional self-control and intuition is difficult to achieve at present for many young people and even children.

ABSTRACT

The Indonesian population consists of ethnic and cultural diversity, including tribes in the Remote Indigenous Community (KAT) category. KAT is synonymous with conditions of backwardness, backwardness, and poverty. They have the desire and the potential to learn and progress. This study aims to determine the curriculum model in Remote Indigenous Communities, especially the Baduy tribe in improving the quality of life and their welfare. The research used qualitative method against Baduy Luar and Baduy Dalam. Data were analyzed by descriptive approach. The results show that: 1) the purpose of the curriculum is to change the behavior to increase the added value of the potential they have in the aspects of agriculture, crafts, environment, and customs and culture. 2) Curriculum materials include: increasing value added on agricultural products, intensification of rice crops and crops, inculcating honest attitude in entrepreneurship, improving the quality of craft, arranging the environment and increasing human resources as a cultural tourism area, improving healthy and clean life, Marketing of the resulting product. 3) Learning method is done through Peer Tutor; 4) Assessment focuses on behavior change aspects that are real and beneficial to life.

Keywords: Baduy tribe, remote customary community, remote indigenous community curriculum model.

INTRODUCTION

The Republic of Indonesia has a population of about 258 million consisting of 1,128 tribes and spread over 17,508 islands. The number of these tribes, there are several tribes identified as isolated and remote tribes. They live in communities that tend to be closed and very obedient to run culture and local wisdom that is hereditary for generations. These isolated and remote populations are usually called Remote Indigenous Communities (KAT). The reality of this Remote Indigenous Communities lives not only in Indonesia or in Asia, but many are scattered almost in various countries.

Indigenous communities as part of Indonesian society are isolated community groups, both physically, geographically and socially (Adimihardja, 2007). Usually this community occupies a remote and difficult to reach area. Their social order generally rests on a very limited and homogeneous kinship. His daily life is still based on the traditional interactions of the biological nature of blood and the bonds of the marriage ropes. These communities are categorized as isolated Indigenous Communities, both externally (outside parties are difficult to provide access to basic social services) and internally (difficult access to basic social services) (Abdullah, 2004). This means that KAT is a group of people who still have limited access to basic social services (including education) because the adat community is closed or geographically difficult to reach.

Remote Indigenous Communities (KAT) is synonymous with backwardness, backwardness, and poverty. In general, the KAT lives in simplicity and poverty (Sihabudin, 2012). In the preamble of the Constitution of 1945, it was emphasized that development in Indonesia one of them aims to educate the life of the nation and realize the common prosperity for all citizens. The KAT community is an Indonesian citizen who has the same right to enjoy the results of development. Therefore, the government is obliged to improve the quality of life and welfare of the Remote Indigenous Community community.

The Remote Indigenous Community life is almost unaffected by the changing times, including advances in information and communication technologies. They live in various corners of the country. One of the KAT is still strong to maintain life with the culture and local wisdom of his ancestors is the tribe Baduy. Baduy tribe is interesting to be studied, because this tribe is located in the island of Java, which is in the Village District Leuwidamar Kanekes Lebak district of Banten province. Geographically relatively not far from the capital city of Jakarta as the capital of the state of Indonesia.

Baduy community is one ethnic that still holds tradition and tend to be closed. Baduy tribe consists of two namely Bady Luar and Baduy Dalam. According Sihabudin (2012) Outer Baduy is relatively willing to accept innovation and modernization from the outside while the Inner Baduy can not receive things that smell of technology and modernization. Despite this social and economic life, the Baduy Luar community is not much different from the Inner Baduy, which is far from prosperous.

Increasing the key welfare is to improve the quality of human resources, through education. Therefore, in accordance with the government's program, it seeks to guarantee all citizens, including Remote Indigenous Communities to obtain good educational services. However, education in KAT differs from the education done to the general public. Remote Indigenous Communities strongly uphold the customs and traditions of their ancestors. They are very careful and selective in accepting various forms of change that come from outside, including the process of education.

Anwas (2009) results in Baduy indicate that children aged 7 s.d. 15 years even generally Baduy tribe people have not followed formal education. Though their learning motivation is generally high, but the custom which still prohibits it as a form of concern to preserve the teachings of his ancestors. Education is taught by traditional leaders and their parents. Formal schools that are even close to their village are unable to change their perceptions of formal schools.

Baduy tribe actually do not reject to education from outside (Anwas, 2009). What is important is the approach that should be appropriate and appropriate to their local culture and wisdom. This is in line with the opinion of Rogers and Shoemaker (1971), Lippitt (1969), Sumardjo (2008), that the program changes planned (in this case education) is very important notice: the need, value system and culture, and involve them widely with the Handled holistically. Conversely, if education does not pay attention to these aspects, then there will be social and cultural resistance of the community.

Baduy people have a desire to learn, although limited by their custom (Anwas, 2009). On the other hand many potentials can be developed. Results of research Sihabudin et al. (2008), Baduy tribe has the potential of nature that can be developed, for example: aspects of agriculture, craft, forestry, culture, and also tourism. Therefore education and curriculum for advancement and welfare of Baduy society need to be specially designed and different from the general public.

The current reality is that there is no model of education / curriculum that suits their potential, needs, and culture. The problem is how is the curriculum model for Remote Indigenous Communities, in improving their quality of life

and well-being? Curriculum model is interesting to study, as an effort to improve the welfare of indigenous communities in remote communities either in Indonesia or in any country.

The process of education both in formal and non formal education, curriculum is required. This curriculum serves as a reference in implementing the education. In the National Education System Act of 2003 it was emphasized that the curriculum is a set of plans and arrangements concerning objectives, content and instructional materials and ways used as guidelines for the implementation of learning activities to achieve certain educational goals.

Referring to the definition of the curriculum, the curriculum has several important elements, namely objectives, content / lesson materials, and how or methods of implementation and penilainnya. According to Palupi (2016) the objectives in the curriculum are competencies that must be possessed by the students after receiving the learning, the content and the materials are the learning materials that must be conveyed by the teacher to the students so that they have the competence as set on the goal. The method used is a learning process used to deliver learning materials to students, the arrangement is an attempt to ensure the achievement of learning objectives through monitoring, measurement and control which are the functions of the assessment of learning. Therefore, in curriculum development, including the formal education curriculum needs to develop the curriculum elements.

This study aims to examine the curriculum model of improving the quality of life for Remote Indigenous Communities Baduy Tribe. This curriculum model focuses more on: 1) objectives that meet the needs and potentials, 2) necessary educational materials, 3) ways / methods of implementing education, and 4) assessment in measuring the success of the education. The curriculum model was developed to improve the quality of life, and prosperity that is in line with the potential, needs, and culture of Baduy people.

RESEARCH METHODS

This research uses qualitative approach. The research location is Remote Indigenous Community / Community (KAT) Baduy tribe, covering Baduy Luar and Baduy Dalam. Baduy tribe is located in Kanekes Village, Leuwidamar District, Lebak regency of Banten province. The number of villages in Baduy reaches 55 Baduy Luar villages and three villages of Baduy Dalam namely Cikeusik, Cibeo, and Cikartawana (Kanekes Village Office 2008).

Data collection is done through several methods, namely: literature study, observation (observation), indepth interview, and Focus Group Discussion (FGD). Literature studies are carried out in the review of the various writings, especially from relevant previous research results as well as the concepts / theories on curriculum development, and Education on Remote Indigenous Communities. Observation stage, conducted at research location, Remote Indigenous Community of Baduy tribe. This assessment is conducted primarily to obtain data related to the research objectives, for example: geographical conditions, natural conditions, social life of everyday society, culture and local wisdom, and other aspects. At this stage will also be done photo / video documentation in strengthening research data. This stage is also used as a preparation to determine prospective informants and respondents in conducting field interviews.

In-depth interview stage, conducted to informants from various backgrounds. In this stage the informant is persuasively asked to provide information relevant to the research objectives. The informants were mainly indigenous leaders: Jaro, Puun, to the village and Kanekes apparatus, baduy community figures, children and youth of Baduy tribe, parents of school-age children, farmers, traders, Baduy tribesmen, people around the Baduy tribe, And educational leaders around the Baduy tribe, and other parties.

The next stage is Focus Group Discussion (FGD). At this stage meetings and discussions with various stakeholders, including some experts in limited numbers. This stage is also done to perform data validation (via tri data angulation) with data source obtained through previous interview result. Data analysis is done through three stages:

data reduction, data presentation, and conclusion. Data reduction is the process of selecting, centralizing and simplifying data from the field. Data reduction includes sharpening, suppression, and selection of unnecessary data. Furthermore, the conclusion is based on the analysis of the data.

RESULTS AND DISCUSSION

Baduy tribe is one of the Remote Indigenous Communities in Indonesia. This tribe occupies the territory of Kanekes Village, Leuwidamar District, Lebak regency of Banten province. Baduy tribe is very strong to maintain customs and traditions, including in preserving nature and environment. They have consistently maintained nature conservation and natural spatial planning. The total area of Baduy has generally been divided into three zones ie residential zone, cultivated land zone or agricultural business area, and forest protection zone (forest deposit). The residential zone is where they live, consisting of several villages. The arable land zone is where they grow crops. Protection forest zone is an area in the hills that never worked. The area is considered sacred, no one dared to cut down the tree or open the land. This area is used as a means of water storage, erosion guard, and also as a place of pilgrimage of adat leaders.

This conservation order of nature they keep consistently and hereditary. Baduy tribal areas, although the region consists of hills, avoided from landslides. According to the people's confession, they never lack water even in long dry seasons. Clean water comes from protected forest zone flowing into various tributaries up to Ciujung River that flows into Rangkas bitung city up to the north coast of Java Sea. This means that the culture and local wisdom of Baduy tribe in the conservation of land can be enjoyed not only by Baduy residents but Baduy outsiders to Rangkasbitung city and part of North Serang to the north of Java Sea.

The main livelihoods of the Baduy tribe rely on agricultural products. They generally work on hilly fields by planting rice (huma), Banana, Ginger, and tubers such as cassava, Tales, Hui, and other types. They also plant fruit crops such as sugar palm trees, Durian trees, Jackfruit, Pete, Jengkol, Asem Kranci and others. Forest Baduy area especially forests of protection (forest titipan), produces forest honey. In the handicraft aspect, the Baduy tribe has been from generation to generation making a bag (Koja, unique bag of Baduy tribe). They are also the usual range of kitchenware, such as: Centong, Lumping Wood, Haseupan, and other types.

The culture and livelihood of the Baduy people have not brought their society prosperous, especially from the economic aspect. In general, the Baduy tribe is still classified as the poor. According to Suyono (2009), poverty alleviation, the key is to build the mind set, change the behavior to leave unfavorable habits changed into positive behavior.

If you consider the habits of the tribe Baduy, their agricultural products in addition to their own consumption, also partially sold to the tribe outside Baduy. They generally sell these produce in raw and unprocessed form. They sell Bananas, Ginger, tuber tubers, and unprocessed raw fruits. Likewise the craft that they have, need innovation and improvement of ualitas according to the demands of consumers. Excess of agricultural products of the Baduy tribe, they are taboo using chemical fertilizers. They plant a variety of plants using organic fertilizer. Public awareness, especially in urban consumption of agricultural products using organic fertilizer is higher. Therefore, the result of the earth produced by the Baduy tribe becomes a potential commodity and attracts the public interest of that class. The results of in-depth interviews with several parties and observations of researchers, that to improve the quality of life, especially on the earth products owned by the Baduy, is needed is to create added value to the produce they have produced. For example, produced bananas, can be processed into banana chips. For this we need increased knowledge and skills of the Baduy tribe to process raw banana into banana chips, or various other food preparations. They can sell bananas in the form of chips or other types of processed foods at a price much higher than selling raw bananas. Other commodities, such as Cassava, Tales, Hui, and other tuber types can be processed into various types of delicious, nutritious, and high economic value.

Baduy tribe actually have the ability in processing the crops. They already have the skills to process Palm Sugar. They also have been able to make health drinks from Ginger material produced from the garden, then mixed with Palm Sugar. This drink is good enough for health, especially nutritious to warm the body. Kelemahanya is in the packaging. They packed with dried banana leaves, making them less attractive and less durable. If processed drinks Ginger and Palm Sugar is packaged well and interesting, of course, will be sold at a higher price and can last longer. Forest area of Baduy especially forest protection (forest titipan) many inhabited by Wasp. Baduy people are accustomed to take Honey from the forest Wasps, then packed in bottles to be sold to people outside the Baduy tribe. Hornet honey is a honey that is very good quality, because it is produced from the multi-flower found in the trees in the forest. But Honey produced by the Baduy tribe is not sold in the market, because it is well known that the honey is not original. They are light with sugar water. This is a constraint, a mental attitude that needs to be nurtured.

In the handicraft aspect, the Baduy tribe has been from generation to generation making various kitchen tools, such as: Centong, Lumping Wood, Haseupan, and other types. Such household appliances are usually used only for their household use and are not traded. Though the tool is very unique and interesting so it can be used as souvenirs (handy craft) typical of the Baduy tribe.

Another type of handicraft is Making Bags (they call it Koja). This bag is very distinctive made from woven in various forms of traditional Bags. They have also made innovations to make this Koja to place bottles, mobile phones, and other requests. The disadvantage is, the innovation of the bag models tend to be static. If developed more dynamically according to the needs of the community, then these crafts can be an interesting and very distinctive souvenirs.

The people of Baduy tribe have been accustomed to doing business transactions with Baduy outsiders. Not a few of those who bring the produce and crafts are sold to big cities around the province of Banten, West Java, even to the capital city of Jakarta. Based on the observation of some outside Baduy community figures who often witnessed the sale transaction of Baduy crops, generally the sale is valued with relatively cheap value. Baduy tribe is often less understood with the market price of the products sold. Thus they tend to be disadvantaged in the sale and purchase transactions. The ability of competitiveness and marketing of Baduy is very low. Yet the results of the earth or craft that they produce has a superior potential. Therefore efforts to improve the welfare of the Baduy tribe, in addition to providing added value in crop processing and handicraft production, also improve the ability in the marketing aspect.

The habit of maintaining custom and culture has made many residents come from various regions even abroad to conduct tours and studies. This potential becomes a big capital for Baduy tribe to be developed as a better cultural tourism area. But the number of visitors who come, less optimized by the Baduy tribe to improve their welfare. Agricultural commodities that can be sold to migrants are still relatively low because they sell the produce in raw form. The result of handicrafts and some quality of crop processing are also still relatively low. Ironically, it is precisely the people outside the Baduy tribe who get a profit with the presence of tourists and foreign tourists. They provide a variety of purposes, including restaurants and lodging. This potential should be enjoyed by the Baduy tribe in improving the quality of life and welfare.

Based on the potential and needs of the Baduy tribe, efforts to improve the quality of life of Baduy tribe is by changing old habits with better behavior, through the education process. Education on Remote Indigenous Communities (KAT) is different from ordinary people. According Sihabudin (2012) educational mission is directed at community empowerment. This empowerment of its mission is to increase the dignity and value of KAT, improve the quality of life, strengthen the institutions within the social network, develop living and livelihood systems applicable to KAT, and enhance community participation and social responsibility in the process of empowerment of Remote Indigenous Communities.

Empowerment should be based on the needs, potential, and culture of local communities (Anwas, 2013). Education / curriculum on the Baduy tribe should be tailored to the needs, potential, and culture it has. In this community, curriculum development is based on their local needs. Needs in this case are needs that felt (felt needs) by them and converted into real needs (Asngari, 2007).

If considering the needs, potential, and culture of the Baduy people above, then the formulation of curriculum objectives in improving the quality of life especially from the economic aspect is to increase the added value of existing commodities, both agricultural products, handicrafts, environment, and customs and culture. Similarly, improvements in the ability of basic health and environmental hygiene need to get attention for improving their quality of life.

Curriculum materials are directed at improving knowledge, attitudes and skills that serve to improve the quality of life in accordance with its potential and needs. In detail the curriculum substance is directed as follows.

- A. Increasing the added value of the agricultural produce they produce through a variety of healthy and quality food processing. Types of knowledge and skills needed include: 1) Banana processing into various types of food, such as chips, fried bananas, bread, and other types; 2) Processing of Cassava, Tales, Hui, and other types of tubers can be processed into various types of foods that are delicious, nutritious, and have high economic value; 3) Making and simultaneously packing health drinks from Ginger and Palm Sugar are interesting and good quality.
- B. Intensification of Paddy and Palawija plants on dry land. The paddy field (huma) done by the community can be optimized with other crops after harvest rice is harvested.
- C. Processing, packaging, and marketing Honey. The honey produced by the Baduy tribe is highly qualified because it is produced by the wild Hornet which consumes various types of flowers. The problem is honesty in processing and packing Honey. Baduy tribe needs to be instilled mental attitude and honesty not to mix honey with anything, so the quality is maintained and consumers believe to buy the honey.
- D. Processing and packaging of Palm Sugar. The quality of Palm Sugar produced by Baduy is very good. Needed added value in processing and packaging so that the product can be more interesting, durable and quality.
- E. Improving the quality of typical Baduy handicrafts, especially the production and innovation skills that suit the demands of consumers.
- F. Structuring the environment and improving human resources Baduy tribe to become a cultural tourism area. Environment and culture need to be styled more attractively according to their culture and local wisdom. It is also necessary to improve the attitude and skill in providing services to the tourists who come with remain their customs and culture. Language skills, especially Indonesian and English, need to be mastered by them.
- G. Increasing daily habits in healthy and clean living, nutritious food processing, and maintaining environmental cleanliness, especially in mothers.
- H. Knowledge, attitude and skills in marketing for all products produced. They also need to be given the ability in processing, packaging and marketing various products produced.

Learning method on Baduy tribe can not be done formally.

Baduy tribe refused formal form of education, for fear of undermining their customs and culture. They are also very careful and selective in accepting various forms of change that come from outside the community. Anwas (2009) study results, actually Baduy tribe does not reject to education from outside. What is important is the approach that should be appropriate and appropriate to their local culture and wisdom. This is confirmed by Rogers and Shoemaker (1971), Lippitt (1969), Sumardjo (2008), that the program of change of plans (in this case education) is very important to pay attention to: needs, values and culture, and involving them as widely as possible Holistically. Conversely, if education does not pay attention to these aspects, then there will be social and cultural resistance of the community. Therefore the proper learning method for Baduy tribe through Tutor Sebaya done gradually and continuously.

To train and form tutors, the Baduy tribe included the customary mebaga and Jaro (the leader of the Baduy tribe) to Midwife Eros Rosita and her husband Pak Asep. Midwife Eros Rosita has long served to help the birth of the tribe

Baduy. Already many Baduy tribe who gave birth successfully ditolong field Eros. Thanks to the persistence of Midwife Eros, the Baduy have successfully formed Family Planning Conceptor (KB) not less than 1,700 people. Both people are familiar with interaction with the Baduy tribe. Baduy people believe in him. Therefore the method of education in this Baduy society can be through both figures, especially to form Tutor Sebaya in every village of Baduy tribe. Through this Tutor Sebaya, education messages are delivered in stages and continuously. The learning process emphasizes more on aspects of practice and mentoring.

Assessment of the success of the curriculum, focused on real behavior change aspects in their daily lives. This behavior leads to abandoning old bad habits leading to better behavior. The process of education, needs to be gradual and sustainable, dialogic especially with adat leaders, and with principles not in conflict with their customs and cultures.

CONCLUSIONS AND RECOMMENDATIONS

Conclusion

Curriculum development in improving the quality of life of Baduy tribe is formulated according to their potential, needs and culture. The objectives of the curriculum are to change the behavior to increase the added value of their potentials in the aspects of agriculture, crafts, environment, and customs and culture.

Curriculum materials include: increasing the added value of the agricultural produce they produce through various processing and packaging of healthy and quality agricultural produce; Intensification of Paddy and Palawija crops on dry land; Instilling mental attitude and honesty in entrepreneurship, improving the quality of unique Baduy handicraft, environmental arrangement and increasing Baduy human resource to become a cultural tourism area, increasing daily habit in healthy and clean life, and knowledge, attitude and skills in marketing for all Products produced.

The method of learning on the Baduy can be done through Tutor Sebaya done gradually and continuously. The learning process emphasizes more on aspects of practice and mentoring. Assessment of the success of the curriculum focuses on aspects of behavior change that are real and beneficial to their daily lives.

Suggestion

Improving the quality of life of the alienated tribes such as Baduy tribe is urgently needed. Participation mainly from the government is necessary. Similarly, the need for participation of various parties, especially companies through corporate social responsibility (CSR) program. To get a more operational curriculum model in improving the quality of life of Baduy tribe, more detailed research is needed by involving various related parties

ABSTRACT

The paper deals with a didactic experience through courses that are part of the first year of studies for the Schools of Architecture and Design of the Politecnico di Milano. One of the themes of these courses concerns geometric problems, in order to introduce students to 3D space. The peculiarity of the didactic method used is, first of all, to induce the student to observe the real object by identifying its geometric characteristics (symmetries, proportions, contours, and surfaces enveloping it). Subsequently, the goal is to teach how to translate the observed form into mathematical language and finally draw it on the computer.

The virtual reconstruction of the architectural form of the official symbol for EXPO2015 in Milan (Italy) is presented as an example of application of the method using dynamic surfaces.

The basic mathematical background for application in Computer Graphics is 3D parametric analytical geometry and matrix calculus, along with a basic approach to the SCILAB® library.

The most characteristic aspect of this teaching method is the sense of success achieved by students who can quickly manipulate and control complex lines and shapes by improving familiarity with geometry and stimulating creativity.

INTRODUCTION

Mathematics is usually considered a noble and abstract discipline, very close to philosophy. However, in applied sciences, such as physics, biology, chemistry, engineering, mathematics is recognized as a pillar for the simulation of natural phenomena. Even as regards geometry, essential tool for the work of Architects and Designers, it is generally seen as means of classifying curves and surfaces and describing their characteristics. Rarely mathematics is considered as an aesthetic and creative intellectual activity. This is the aspect of mathematics that is highlighted in this paper.

On the other hand new technologies, heavily computer based, like 3D printers, renew the designer figure, by imposing an effort on common design between designers, architects, mathematicians and engineers. This fusion of artistic, scientific and technological cultures brings with it a creative project based on a revised geometric sensitivity. In fact, the designer responds to this renewed cultural baggage by creating objects of geometrically innovative shape or, otherwise, using classical geometric forms in an innovative way (see Pottmann, 2007, for a very interesting formalization of this idea). The tendency is to design in a way apparently disordered, but in reality linked to geometric harmony.

In this direction the didactic experience, here presented, within the Schools of Architecture and Design is developed.

The first goal of this proposal is to learn, with the eye of the artist, to grasp, among the aesthetic aspects, in nature, in art, in buildings and in artifacts, the geometric component, which brings with it harmony, symmetry, dynamism and consequent beauty (see for example, Marchetti, 2012).

A second goal is to learn how to design, at any scale, by giving priority to harmony that is determined through geometric characteristics.

Another objective is to find the right tool. The painter has his brush, the writer the pen. What expressive tools does the mathematician wants to give to the designer? Obviously a mathematical tool that offers the ability to express and manipulate, taking into account all the geometric features, even complex forms, in a simple way. An expressive and creative mathematical tool, as well as rigorous, is 3D analytical geometry (Caliò, 2016). Here, lines, surfaces, classical

and more generic shapes can be represented not only with pencil, ruler and compass, but also with a few equations. This vision requires a sensibility that is certainly different from that of a painter or writer, but still can be defined as artistic. Another example of mathematical tool is the matrix calculus (Caliò, 2016). Thanks to this instrument we are able not only to virtually represent, deform and move objects in space, but also to create, define and construct them (Caliò, 1997).

Now the subsequent steps of the didactic method are described.

- The student observes the form of a real or ideal "object" (some images of architectural buildings or Design objects are presented) from an aesthetic point of view and comes to this consideration: each object designed, understood as a structure that defines a space, is delimited by surfaces.
- The student understands that, from the figurative point of view, besides the other factors - static, material, functional, social and so on - the object is characterized by the configuration of its surfaces.
- The student points out the peculiarities and the geometric nature of the surfaces.
- The student, using a suitable software provided with rigorous instructions, virtually represents the surface reconstructed or imagined.

In order to give a significant example of how the didactic experience develops, the attention is focused on particularly interesting surfaces, called dynamic surfaces: their epistemological nature is identified and the mathematical language is able to interpret their dynamism.

The dynamic surfaces are special surfaces obtained by continuous transformation of a planar or skew curve or by deformation of a given surface (Caliò, 2000, Marchetti, 2002, Caliò, 2012).

A curve that is subjected to a transformation is generatrix, a curve leading the transformation is directrix. A continuous transformation is rotation, translation or combination of them.

A surface acquires its physiognomy through the definition of the generatrix curve and through the law of movement.

The rotation surfaces (or revolution surfaces) are generated by a generatrix line rotating around an axis. Many examples of them are found in Design (for example the table lamp *Taccia* by *Castiglioni* and the *Bombo* tables by *Giovannoni*). More contemporary rotations can lead to very famous and strange surfaces : *Moebius* strip or *Klein* bottle (Caliò, 1997).

The translational surfaces are generated by the movement of a generatrix along a directrix and assume qualitatively different aspects, because they are strongly influenced by both curves (generatrix and directrix). The translation of generatrix curves along rectilinear lines creates indefinite cylinders of different nature (for example the roof of the *Theatre* in Lyon designed by *Nouvel*), whereas curved lines generate saddles and twisted tubes (for example the roof of the *Royal Theatre* in Torino designed by *Bertone*).

The combination of the two movements (rotation and translation) gives rise to forms that Architecture appreciates and adopts with enthusiasm (*Wright* in *Guggenheim Museum* is an example): helicoids of every type (dependent on generatrix, from the rotation axis and the directrix of translation).

Deformation of the simplest surfaces (plane and sphere) generates surfaces that acquire a remarkable significance from aesthetic point of view (*Isosaki Tower at City Life* in Milano gives example of architecture whose reading key can be the controlled deformation of plans).

This transform-oriented vision of reality is the principal subject here presented on which the didactic method is illustrated.

This idea has proven to be successful thanks to the fact that not only the searched target can be easily and pleasantly reached but also it can be somehow overridden. In fact it is intrinsic to this approach the capability of generating new unpredictable shapes whose aesthetic and validity can be verified a posteriori. It is a fantasy stimulating approach.

In the next Sections of the paper the generative process of the shape is described and an example of this procedure is illustrated. Final remarks will concern the skills of students acquired through this methodology.

GENERATIVE PROCESS:

What it is meant by 3D parametric geometry?

The 3D parametric analytical geometry is understood as the evolution of 3D analytical geometry, which in turn constitutes the evolution of the synthetic geometry language, superimposing the algebraic language to the geometric language. Precisely:

- given a Cartesian orthogonal reference system, a point P can be represented in 3D space through Cartesian coordinates;
- there is correspondence of point P as well as with an algebraic 3-component vector, as well as with a geometric vector, starting from the origin of the Cartesian system and terminating into the point P;
- a curve is expressed by means of an algebraic vector depending on a single parameter and it is geometrically described by the set of the terminating points of the geometric vector corresponding to the different values of the parameter;
- a surface is expressed by means of an algebraic vector depending on two parameters and is geometrically described by a set of generating curves related to each other through some given law;
- an affine geometric transformation (i.e. translation, rotation, reflection, scaling, ...) is obtained from the application of an appropriate matrix to a vector and by imposing a translation to the result. It is possible to compose some transformations. Each linear transformation is described by a generic matrix equation:

$$A\mathbf{v} + \mathbf{b} = \mathbf{w} \quad (1)$$

where A is the transformation matrix, \mathbf{b} the translation vector, \mathbf{v} the current vector that must be transformed and \mathbf{w} the transformed vector.

What it is meant by the generative process of a surface?

It is meant firstly the interpretation and secondly the representation of the genesis of surface shape.

Using the dynamic surface definition and the mathematical tools introduced, we can get to describe the generative process. Precisely:

- the shape is analyzed;
- a geometrical genesis (i. e. generation law) of the shape is determined;
- a basis curve is selected (generatrix curve) and parametrically expressed;
- an action is applied to the curve by means of an algebraic parametric transformation (one parameter is introduced in the matrix of transformation). Successive elementary transformations are composed if needed;
- the parametric equation (two parameters) of the surface is determined;
- finally the surface is graphically obtained.

LABORATORY EXPERIENCE: THE TREE OF LIFE

The didactic experience here presented is integrated by laboratory activities. The main purpose of the laboratory is to graphically implement and visualize the theoretical results obtained at the lessons. The open source software SCILAB® (<http://www.scilab.org/>) is used. The SCILAB® software allows very easy manipulations of one- and two- parameter equations and an immediate application of matrix calculus. Moreover it gives dynamic rendering of the image during the generation of forms. It can be used as an introductory tool to more professional and complex products.

The following example illustrates the laboratory activities.

The architecture object chosen is the symbol of EXPO 2015 (EXPO 2015, 2015): The Tree of Life [Figure 1]. This item is proposed for different reasons. Firstly it is, surely, attractive because it is a very recent work, a symbol of a popular event of very successful. Moreover its form, which gives us a concrete example of dynamism, is closely related to its meaning. The base, roots of the tree, and the terminal part, the tree's branches, take on the look of regular plot formed by basic elements that are close to the leaf and to the drop of water. The base and the top connect to each other in a vortex movement that seems to describe not the shape of the tree, but its growing, slow and regular. The surface of the object is realized by means of lines and voids that, for our benefit, highlight the forms to be grasped and reproduced.

Figure 1: The *Tree of Life*

Below the principal steps related to the virtual reconstruction in the 3D Cartesian space $Oxyz$ of the *Tree of Life* are described.

The first step of the algorithm is to generate the top and the basis of the tree.

In particular:

i) The projection on the horizontal plane of a singular arc forming the top and the basis of the tree is assumed as lemniscate arc (Caliò, 2000).

$$\Gamma_0 : \begin{cases} x = A(a,t) = -a + a \cos(t) \sqrt{\cos(2t)} \\ y = B(b,t) = b \sin(t) \sqrt{\cos(2t)} \\ z = 0 \end{cases} \quad t \in \left[-\frac{\pi}{4}, -\frac{\pi}{40}\right] \cup \left[\frac{\pi}{40}, \frac{\pi}{4}\right] \quad (2)$$

where the variation of the parameter t identifies the portion of the arc, and the coefficients a and b are related to the shape of the real curve.

The (2) in vectorial form is $\mathbf{v} = [A(a,t) \ B(b,t) \ 0]^T$.

ii) The complete basic plane form with 12 arcs is achieved by 11 rotations of Γ_0 around z -axis with angle of rotation $\alpha = \pi/6$. Applying to vector \mathbf{v} a suitable matrix of rotation according to (1) it follows:

$$\Gamma_1 : \begin{cases} x = C(a,b,c,t) = c(\cos(k\alpha)A(a,t) - \sin(k\alpha)B(b,t)) \\ y = D(a,b,c,t) = d(\sin(k\alpha)A(a,t) + \cos(k\alpha)B(b,t)) \\ z = 0 \end{cases} \quad \text{with } k = 0,1,\dots,11 \quad (3)$$

This basic form is inscribed in an ellipse with semi-axes c and d , suitable to the desired form.

The surface delimited by the ellipse can be considered formed by continuous rotations of Γ_0 around z -axis, but only 12 of them are selected in Γ_1 .

Thanks to this transformation, it is evident the relation between the basic forms and the decoration of the Campidoglio pavement (in Roma), one of the symbols of the Italian Renaissance [Figure 2].

Figure 2: Virtual image of Campidoglio pavement

iii) The top and the basis in 3D are obtained as projection of Γ_1 on a revolution logarithmic surface of equation:

$$S: \begin{cases} x = v \cos(u) \\ y = v \sin(u), v > 0, 0 \leq u < 2\pi \\ z = \log v \end{cases} \text{ that can be parameterized as } S: \begin{cases} x = u \\ y = v \\ z = \log(u^2 + v^2) \end{cases}, u \in R, v \in R.$$

Consequently projecting suitably Γ_1 on S :

$$\Gamma_2: \begin{cases} x = C(a, b, c, t) \\ y = D(a, b, d, t) \\ z = h \pm \ln((C(a, b, c, t))^2 + (D(a, b, d, t))^2) \end{cases} \quad (4)$$

In (4) the values of h and the choice \pm are related to construction the top or basis.

- 2) The trunk of the tree is obtained by the projection, on a trunk of cone, of two sets of twelve Archimedean spirals, symmetric with respect to a center. That is:

$$\Gamma_3: \begin{cases} x = (k_1 t + k_2)(\cos(k\alpha) \cos(t) \mp \sin(k\alpha) \sin(t)) \\ y = (k_1 t + k_2)(\sin(k\alpha) \cos(t) \pm \cos(k\alpha) \sin(t)), k = 0, 1, \dots, 11 \\ z = k_3 t + k_4 \end{cases}$$

The values of k_1, k_2, k_3, k_4 are chosen according to the shape of the trunk. In [Figure 3] the whole tree is represented in two perspectives.

Figure 3: Virtual reconstruction of the *Tree of Life*

FINAL REMARKS

The didactic method in teaching the geometric component of mathematics in Architecture and Design Schools exemplified in this work leads to interesting results, suitable to the audience to which it is addressed.

Firstly, it educates the student to thoroughly observe the object, to be described or to be designed, with an aesthetic eye, focusing on the geometric aspects of the surfaces that characterize the object.

Secondly, the student incorporates the possibility of creating complex forms with the modern and agile mathematical language of the parametric 3D geometry. As a result, students are sensitized to the potential of mathematical language itself, which will be an indispensable cultural basis for those who are oriented to virtual design.

Finally by the virtual reconstruction of the object, the student understands that he has in his hand a tool that allows to manipulate the object, for example to correct its dimensions and shape.

This latter consideration allows the student to grasp the aspect of less obvious and unusual mathematics: the creativity. In other words, following the particular path proposed in this paper, the knowledge and study of the genesis of the surface stimulates the designer to develop creative abilities, which allow him to go further the possibility to observe, understand and then communicate the already realized projects.

This method seeks to consolidate the deep and ancient bond between art and science, contributing to the collapse of the separation between scientific culture that it observes and it studies and the humanistic culture that it thinks and creates.

ABSTRACT

The article presents the results of a research survey, which was realized on a sample of gifted pupils (n = 208) from the Czech Republic, from the level of education ISCED2 (lower secondary), from classical schools and schools specialized in education of gifted pupils. The survey was conducted using the Social Coping Questionnaire, which includes factor called Denying Giftedness. The analysis focuses on this factor separately based on the previous exploratory factor analysis. The results show, that a third of gifted pupils declare certain tendencies to deny their giftedness. More than 80 % of the research sample attributes giftedness to other people and does not speak about their own giftedness publicly. The results do not differ significantly in terms of type of school or in the group of pupils with special educational needs. However, they differ in terms of gender where girls tend to deny their giftedness more than boys in all questionnaire items. Furthermore, it appears that with the growing school age, there is a growing percentage of pupils who do not tell people about their giftedness.

THEORETICAL BACKGROUND

The most commonly used definition of gifted is that provided by the U. S. Office of Education, which states: Gifted and talented children are those identified by professionally qualified persons who, by virtue of outstanding abilities, are capable of high performance. These are children who require differentiated educational programs in order to realize their contribution to self and society. Children capable of high performance include those with demonstrated achievement and/or potential ability in any of the following areas or in combination: General intellectual ability, specific academic aptitude, creative or productive thinking, leadership ability, visual or performing arts and psychomotor ability. (Marland, 1972, as cited in Gardynik & McDonald, 2005)

According to Porter (1999), these definitions of giftedness may become more specific in relation to their perspectives. These encompass, for example, liberal and conservative views (difference in quantity estimate of gifted people in population), one- and multi-dimensional (given by the number of criteria to identify gifted pupils), the definition of potential and the actual performance. Our view on giftedness is based on multi-dimensional liberal definitions and is focused on intellectual ability. In our view, a gifted pupil is a pupil who successfully passed complex diagnostics of intellectual talents at the pedagogical-psychological counselling centre.

In school environment, gifted pupils tend to demonstrate typical features. As far as cognitive features are concerned (Davis, Rimm & Sielge, 2011), let us mention, for example, intense curiosity, abstract thinking, ability to transfer knowledge, creativity, generating original ideas, excellent memory, interest in philosophical topics. As for social-emotional features described by T. L. Cross (2011), these are represented by asynchronous personality development (conflict between one's level of intelligence and aspects such as motoric, verbal and socio-emotional development), perfectionism, emotional sensibility, multipotenciality, intensity and profundity of experience. Because of these features, gifted pupils might feel very different from other children in class and might exclude themselves from (Coleman & Cross, 1988).

Social exclusion can be supported negatively by labelling of gifted pupils. The term of labelling tends to be defined in the scope of so-called labelling theory (Hudak, Kihn, 2001), which is concerned with labelling individuals by description of his or her abilities, skills and characteristics. After being labelled as such (“gifted”), the approach of one’s social environment as well as his or her own towards himself or herself, which leads to stigmatization. Labelling in relation to giftedness is mentioned by a lot of authors, for example Matthews and Foster (2005), Renzulli (2004), Freeman (1998), Heward (2013) and Clark (2013).

Research focused on giftedness, reflecting the above mentioned information and trying to prove it empirically, are realized not only in school environment, but also in family and peer environments, and they rely on quantitative research methods predominantly. If we focus on research from school environment (for example Gates, 2010; Renzulli, 2004; Moulton et al, 1998), the results point out to negative outcomes of labelling. These negative aspects are, for example, stereotypical evaluation of a gifted pupil’s personality, a gifted pupil’s fear of academic failure, pressure and higher expectations from teachers and parents which is not in accordance with his or her level of giftedness, social exclusion from class.

However, a human, as a social being, needs to belong among others and share his or her emotions and experiences with friends (Coleman & Cross, 1988). Researches on value preferences of children (Bocan, 2011) show that children from the age of 10 to 12 in the Czech Republic consider following things to be most important: 1. To have friends, 2. To be healthy, 3. To have a happy family. That is why it is logical that pupils might put all their effort to become fully-fledged part of the class. In the case of gifted people, this might mean that they will deny their giftedness, or chose other social strategy in order to fit in the class. Other research (Šramová & Hamranová, 2015), which used Portrait Value Questionnaire, showed that conformity, benevolence and success is currently going up in adolescents’ hierarchy of values. However, these are values which might be mutually conflicting (i.e. to be conforming and to experience success at the same time). The gifted pupils created a number of strategies in order to cope with consequences of labelling. We can refer to one of the most cited typologies of giftedness by Betts and Neihart (1988) which defined types of the gifted ones by using three criteria: expressions of behaviour, emotions and needs. As the authors themselves say, this approach enables us to understand the gifted ones in using social strategies used by them in order to make cognitive, emotional and social growth easier. From this theory, we select following types of gifted children and following social coping strategies:

Type 1: the successful gifted one. He or she is a conforming individual. He or she is submissive. On the outside, he or she does not seem to have any serious problems, achieves excellent study results. Teachers usually have no struggles with identification. 90% of pupils identified for school programmes focused on gifted pupils belong to this type. In the emotional sphere, this type of characteristic for the feeling of boredom, dependence and positive self-conception. In the behaviour sphere, it is perfectionism and high performance rate.

Type 2: the provoking gifted one. In this case, the authors emphasize creativity and the resulting problems in interpersonal relationships. The emotional sphere: feeling of boredom, frustration and low self-assessment. The behaviour sphere: correcting the teacher, asking questions about rules. Needs: the need to be with others, to learn social diplomacy and to gain self-esteem.

Type 3: the concealed gifted one. Most of the unidentified gifted children belong to this type. According to the authors, there are more girls than boys belonging to this type. The emotional sphere: insecurity, feelings of stress and pressure, embarrassment and feelings of guilt. The behaviour sphere: they hide their talent, refuse changes. Needs: the need to have a free choice (in both activities and friendships), the need to realize conflicts and emotions.

Type 4: the ignored gifted one. These gifted children did not meet with support and understanding of the others. That is why they often realize their interests and potentials outside of school. The emotional sphere: irritability, anger, depression. The behaviour sphere: unstable behaviour, tendency to keep tasks unfinished and engaging in activities outside of school. Needs: the need of individual approach and intensive support, the need for new opportunities.

Type 5: the independent gifted one. This type is characteristic for frequent expression of giftedness and ability to work effectively at school. He or she is respected by both children in class and adult authorities. The emotional sphere: confidence, self-acceptance and enthusiasm. The behaviour sphere: has solid social skills, works independently and is able to set his or her own goals.

Another analysis of social coping strategies was carried out by Swiatek (2002), using The Social Coping Questionnaire. The version of a questionnaire that we applied, the fields we covered were Denying giftedness, Social interaction, Humor, Conformity and Peer acceptance. In our research, we decided to map the usage of Denying giftedness strategy and find coherence between using this strategy and the school type, year of school

(age), gender and the information whether the pupil shows other special education needs (in the area of learning disabilities, behaviour problems, long-term diseases or their combinations) except for giftedness.

THE STUDY

The research is based on five-factor version of The Social Coping Questionnaire (Swiatek, 2002). Various versions of this questionnaire were tested in the past (Swiatek, 2002; Swiatek, Cross, 2011; Cross, Swiatek, 2009); however, the results were not satisfactory due to their inconsistency, both in terms of construct validity and reliability (Rudasill, Foust, & Callahan, 2007). Our goal is to test this questionnaire in Czech environment and to analyze and to compare gained results in the field of Denying giftedness.

208 ISCED2 pupils (in the Czech educational system, it means 6th to 9th year of elementary school) were included in the research. In terms of gender, there were 75 girls (36%) and 133 boys (64%) in the age from 10 to 16 years. The average age in the research sample is 13 years. The research sample is evenly spread in school years: 6th year is represented by 58 pupils (28 %), 7th year by 58 pupils (28 %), 8th year by 45 pupils (22 %) and 9th year by 47 pupils (22 %). 161 pupils (77 %) go to the type of schools oriented on education of gifted pupils (8-year grammar school, lyceum or elementary school oriented on education of gifted pupils) and 47 pupils (23 %) go to ordinary elementary school. Such a disproportion is usual in the Czech education system. Even though, there have been efforts to apply inclusive approaches, the education of diagnosed gifted pupils is realized as segregated in specialized schools. 50 pupils (24%) from the sample stated that they have one or more certificates on special educational needs to which we include learning disorders, behavior disorders, long-term illnesses, other disorders and their combinations.

Given the fact that we have only available selection of respondents, we treat work with the results only on the explorative descriptive level and they cannot be considered general. However, they indicate relationships which can be interesting for a comparison with other similarly oriented researches in the given field.

FINDINGS

The results of analysis are divided into three basic sections. Firstly, we will present exploratory factor analysis of eight questionnaire items falling under the factor of Denying Giftedness in the scope of The Social Coping Questionnaire, and also their overall reliability in the conception of Cronbach's alpha. Further, we present descriptive results for all items. In the conclusion, we focus on a comparison of results within the scope of selected groups of respondents.

The questionnaire was not applied in the Czech environment yet, which was why we were worried that its application together with the translation to different language will slightly change its factor structure. We investigated it with the usage of exploratory factor analysis (extraction method: Principal Component Analysis; KMO = 0,847; stat. signif. Bartlett's test of sphericity; MSA of all items \geq 0,807). Its results are shown in the table below.

Table 1: Component matrix of Denying giftedness

Items	Factor loadings
I28. I don't think that I am gifted.	0.812
I29. People think I am gifted, but they are mistaken.	0.753
I30. I am not gifted, I am just lucky in school.	0.729
I31. As I get older and academic work gets more difficult, people will stop seeing me as gifted.	0.708
I33. There are many people who are more gifted than I am.	0.667
I32. Most of the success I experience are due to luck.	0.666
I35. I don't tell people that I am gifted.	0.508
I34. I try not to be too successful at the things I do.	0.307

Note: Total variance explained = 43 %; Cronbach's alpha = 0,801.

Even though the questionnaire was applied in the new context and it had to be translated for such purposes, the selected factor seems to be relatively consistent and reliable from the view of construction validity in spite of the fact that in the scope of realization of exploratory factor analysis, it was possible to arrive at multi-factor solution.

The table above shows that there are 8 questionnaire items which were presented in full text. At the same time let us mention that the respondents could answer them by the scale of four levels (I strongly agree, I agree, I do not agree, I strongly disagree). For reasons of clarity, we focus only on the percentage of positive answers in the

scope of the analysis (i.e. I agree and I strongly agree). The following table sums up the descriptive results of the analysis.

Table 2: Descriptive analysis of individual items (affirmative answers)

Items	n	%
I34. I try not to be too successful at the things I do.	12	6%
I30. I am not gifted, I am just lucky in school.	39	19%
I32. Most of the success I experience are due to luck.	40	19%
I29. People think I am gifted, but they are mistaken.	57	27%
I28. I don't think that I am gifted.	68	33%
I31. As I get older and academic work gets more difficult, people will stop seeing me as gifted.	90	43%
I33. There are many people who are more gifted than I am.	168	81%
I35. I don't tell people that I am gifted.	174	84%

It is interesting that one third of the pupils shows tendencies to deny their giftedness in the half of all questionnaire items. They do not think they are gifted, they assume that people will stop labelling them as such at the higher and thus more demanding level of education, they identify other gifted people around them and they don't tell people that they are gifted themselves, even though in all these cases are pupils who were diagnosed and in most cases, they are enrolled to specialized education institutions. They show their giftedness by belonging to specialized education institutions, but at the same time they try to deny it and grant it to others, as if they tried to apologize for or play down their affiliation to the group of gifted pupils. Social position of these children is rather complicated because they need to cope with their difference strategically.

In the last part of the analysis, we present a comparison of results in selected groups. In comparison of the two types of education institutions, (traditional and specialized), there are no substantively significant differences found. More remarkable difference is only in the case of item number 31, which a higher percentage of pupils from specialized institutions agrees with. Another comparison focuses on the differences in the answers of the pupils who state that they have one or more special learning needs certified (learning disorders, behaviour disorders, long-term illness, and other or their combinations). In this case too are minimal differences from the factual perspective. Comparisons in which there are no significant differences are summed up in the table number 3.

Table 3: The results of comparisons in terms of education institution types and special learning needs of pupils

Items	Traditional education institution		Specialized education institution		Pupils without special learning needs		Pupils with special learning needs	
	n	%	n	%	n	%	n	%
I28	54	34%	14	30%	50	32%	18	36%
I29	44	27%	13	28%	42	27%	15	30%
I30	31	19%	8	17%	28	18%	11	22%
I31	65	40%	25	53%	66	42%	24	48%
I32	31	19%	9	19%	27	17%	13	26%
I33	133	83%	35	74%	129	82%	39	78%
I34	8	5%	4	9%	9	6%	3	6%
I35	135	84%	39	83%	131	83%	43	86%

As far as the results in terms of a school year (and, at the same time, age) are concerned, the results do not show that these variables remarkably determined pupils' answers in most of the items; that is why we do not present these in detail. Only number 35 shows (not presented in the tables) that the higher year of school (and age), the more likely pupils tend to keep quiet about their giftedness. In the 6th year, 78% of pupils do not inform other people about their giftedness, in the 7th year it is 83%, in the 8th it is 87% and in the 9th it is 89%.

In connection to gender of pupils, there are more remarkable differences. In case of all items, there is higher tendency to deny giftedness in the girls than in the boys (details in the Table 4). Our findings correspond to those of Swiatek (2002), who also mentions that the girls demonstrate higher tendency to hide their giftedness than the boys. Her findings are also supported by Kerr (2000) with reference to traditionally differentiated approach in bringing up girls who are expected to be passive, adaptable and moderate.

Table 4: The comparison of the results in relation to pupils' gender

Items	Girls		Boys	
	n	%	n	%
I28. I don't think that I am gifted.	30	40%	38	29%
I29. People think I am gifted, but they are mistaken.	27	36%	30	23%
I30. I am not gifted, I am just lucky in school.	19	25%	20	15%
I31. As I get older and academic work gets more difficult, people will stop seeing me as gifted.	37	49%	53	40%
I32. Most of the success I experience are due to luck.	18	24%	22	17%
I33. There are many people who are more gifted than I am.	66	88%	102	77%
I34. I try not to be too successful at the things I do.	6	8%	6	5%
I35. I don't tell people that I am gifted.	67	89%	107	80%

CONCLUSIONS

In the scope of this study, our goal was mainly to test The Social Coping Questionnaire, more concretely its dimension of Denying Giftedness, in the Czech context. It turned out that this dimension is relatively stable in Czech version too, which we based on results of exploratory factor analysis (there was no use in application of confirmation level of this analysis on the data we gathered). We also dealt with description and comparison of the results in this field. We found out that gifted pupils tend to have strong tendencies to deny their giftedness, which is more spread among the girls than the boys. In the case of hiding one's giftedness (I35), this strategy is more likely to be used with higher year of school. The denial of giftedness is explained in the context of labelling theory, according to which, there is a tendency to label gifted pupils, which can cause in their exclusion by their classmates and lead to stigmatization which is what these individuals try to naturally avoid, even though they are usually put in classes with other gifted individuals.

ACKNOWLEDGMENT

Thanks to Bc. Natálie Bártlová, student of FHS TBU in Zlín, for the participation on data collection. The publication has been produced with the support of the project IGA, No. IGA/FHS/2016/002.

ABSTRACT

This research study aimed to designing framework of Constructivist web-based learning environments to enhance Problem Solving on C Programming Language for Secondary School. The target group consisted of 3 expert reviewers for content, web-based learning and learning environment designing. Research methodology is developmental research; developmental research consisted of 3 processes: (1) designing process, (2) developing process, and (3) Evaluate the efficiency of the design framework. Research methods are document analysis. The procedures were as following steps: (1) to examine and analyze the principles and theories, (2) to synthesize theoretical framework as following that Contextual base, Psychological base, Technologies base, Problem Solving for programming base and Pedagogies base Model learning environments, (3) to synthesize designing framework. The result revealed that: 1) to synthesize theoretical design framework of 5 components as following that Contextual base, Psychological base, Technologies and media base, Problem Solving, Pedagogies base Model learning environments. 2) To synthesize theoretical design framework of Constructivist web-based learning environments to enhance Problem Solving of 7 components as following that. (1) Problem base (2) Resource (3) Collaboration (4) Problem Solving Center (5) Related Case (6) Scaffolding (7) Coaching. The efficiency of the Constructivist web-based learning environments to enhance Problem Solving are shown in following: learning content, web-based learning and learning environment designing.

INTRODUCTION

21st Century is the time when people around the world face change and develop quickly. Education is an important tool in the development of human and social resources. That is, education will develop people to have the features that society needs. To be a factor in social development)WANGSRIKOON , 2014(. Therefore, education must play a role in line with the changing world society that is entering the 21st century, with the necessary learning and innovation skills. Is a Problem Solving. Programming is a complex and complex science and is essential for enhancing students' 21st century skills and problem-solving skills)PHOLASA, 2016(. And the key theoretical principles that will help to encourage students to learn such skills are: Constructivism. Theory and characteristics of the media are used in the design, teaching, use of media, and the way of learning with the essential elements of the theory. Constructivist Combined with the principle of Problem Solving. web-based media enabled us to design instructions that responded to learners' requirements at all places and time)SAMAT, 2015(. For this reason, we have adopted theoretical problem solving to support programming, and to enhance the problem solving needed for 21st century learners to improve their problem solving skills in computer programming. Thus, this research was aimed at designing framework of Constructivist web-based learning environments to enhance Problem Solving from analysis of theoretical framework and learning environment. In order to obtain the basis for constructing the appropriate and efficient learning environment for the learners.

METHODOLOGY

This study was aimed to synthesize theoretical framework and design of Constructivist web-based learning environment to enhance problem solving. Research methodology is developmental research consisted of 3 process; (1) Designing process and (2) Developing process research methods are document analysis, (3) Evaluate the efficiency of the design framework The procedures were as following : (1) To examine and analyze the principles and theories. (2) To synthesize theoretical framework. (3) To synthesize designing framework. (4) To evaluate the efficiency of the learning environments.

Target Group in the design and development process consisted of 3 expert reviewers. (1) Experts in content validity. (2) Experts in web-based media. (3) Experts in learning environment design.

The instruments in this study as following details : (1) The document examination and analysis recoding form to synthesize a theoretical framework. (2) The recoding form for synthesis of the design framework to learning

environment to enhance problem solving. (3)The evaluation form for synthesize theoretical framework and designing of Constructivist web-based learning environments to enhance Problem Solving.

The researchers collected the data as follows: (1)Synthesis of theoretical framework and Components of the learning environment. The data were collected by analyzing principles, theories, related research of the constructivism theory, cognitive theory, media and technology theory, pedagogy and contextual study, (2) Synthesis of Designing framework of the learning environment: The above synthesized theoretical framework was taken into this process. The underlined theories base such, Contextual base, Psychological base, Technologies and media base, Problem Solving for programing base, and Pedagogies base Model learning environments. (3) Designing and develop of the learning environment based on foundation of creating designing framework was adopted. (4)Evaluate of the learning environment by experts. The analytical description, summarization and interpretation were used to analyze data

RESEARCH RESULTS

The designing and development of the learning environment that promote student's problem solving are follows:

A. SYNTHESIS OF THEORETICAL FRAMEWORK

The results show that the theoretical framework as following that (1) Contextual base are follows: basic education curriculum core in Thailand, Content of course. (2) Psychological base are follows : Constructivist, cognitive, social constructivist theory and cognitive theory, Information processing theory.(3) Technologies and media base are follows: Web-based learning, The system of media. (4) Problem Solving for programing base are follows: (1) Problem-Solving Phase, Analysis and Specification. (2) Implementation Phase, Concretesolution, Test. (3) Maintenance Phase, Use, Maintain. (5) Pedagogies base Model learning environments are follows: OLEs Model, CLEs Model, Situated learning, Cognitive apprenticeship. From the synthesis of principles and theories. Theoretical frameworks can be synthesized as follows in figure 1.

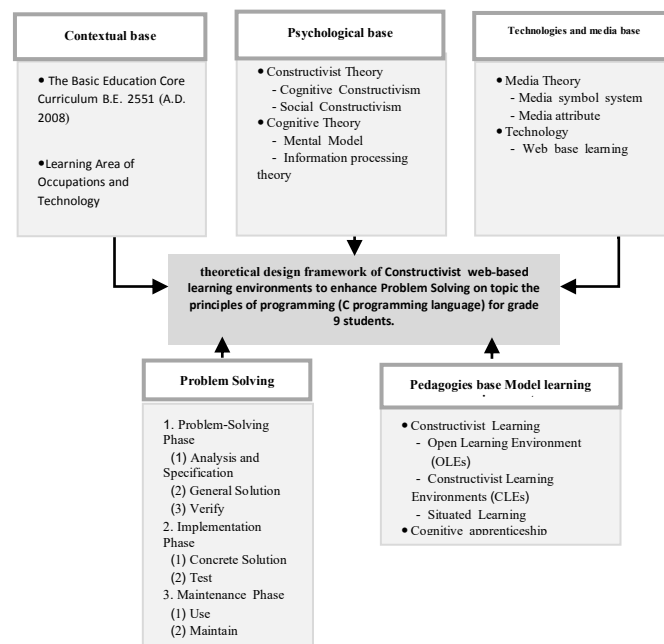

Figure.1 : Theoretical framework of the learning environment for enhance creative problem solving.

B. SYNTHESIS OF DESINING FRANEWORK

According to this study, the findings of synthesis of the theoretical framework which was used as foundation in synthesizing the designing framework of the learning environments to enhance Problem Solving which include following details;

Activating cognitive Structure, Problem Solving.It is illustrated the relationship between the underlined theories and the component as follows: cognitive constructivism, situated learning (Brown, Collins, and Duguid,1989), Problem Solving (Dale et al., 2007). Designing of the component of which is called Problem situation. It focuses on authentic design, contextualize problem. This help to activate cognitive structure of the students.

Supporting cognitive equilibrium. It is illustrated the relationship between the underlined theories and the component as follows: cognitive theories, Information processing theory (Klausmeier, 1985), Mental model theory, OLEs (Hannafin, 1999). Designing of the component of which is called (1) Resources. It focuses on how the students process the information effectively. This can help the students understand easily. (2) Related case, this component used CLEs model (Jonassen, 1999). It focuses on Understanding each problem stimulates the experience of the problem and create a conceptual model of the problem in the case of a less experienced student.

Enhancing knowledge construction and Problem Solving. It is illustrated the relationship between the underlined theories and the component as follows: Problem Solving (Dale et al., 2007). Designing of the component of which is called (1). Problem Solving Center, the learners showed problem solving ability of Problem-Solving Phase that analysis and specification. Implementation Phase, the learner can create solution and test solution. Maintenance Phase ;Use ; Maintain. (2) Collaboration, this component used social constructivism (Vygotsky, 1962) that help the learner collaboration within a group of participants and shared decision making.

Supporting enhancement for construction knowledge. It is illustrated the relationship between the underlined theories and the component as follows respectively ; Social constructivist (Vygotsky, 1962), focuses on the Zone of proximal development to support the student as scaffolding . CLEs model (Jonassen, 2004), the component as follows: (1) Scaffolding include Metacognitive Scaffolding, Strategic Scaffolding, Conceptual Scaffolding and Procedural Scaffolding. (2) Coaching, relies on theory Cognitive apprenticeship focus to monitor, analyze, and regulate the learners' development of important skills (Jonassen, 1999; Charuni Samat&Sumalee Chaijaroen, 2009). The relationship between the underlined theories and component are shown in Figure 2.

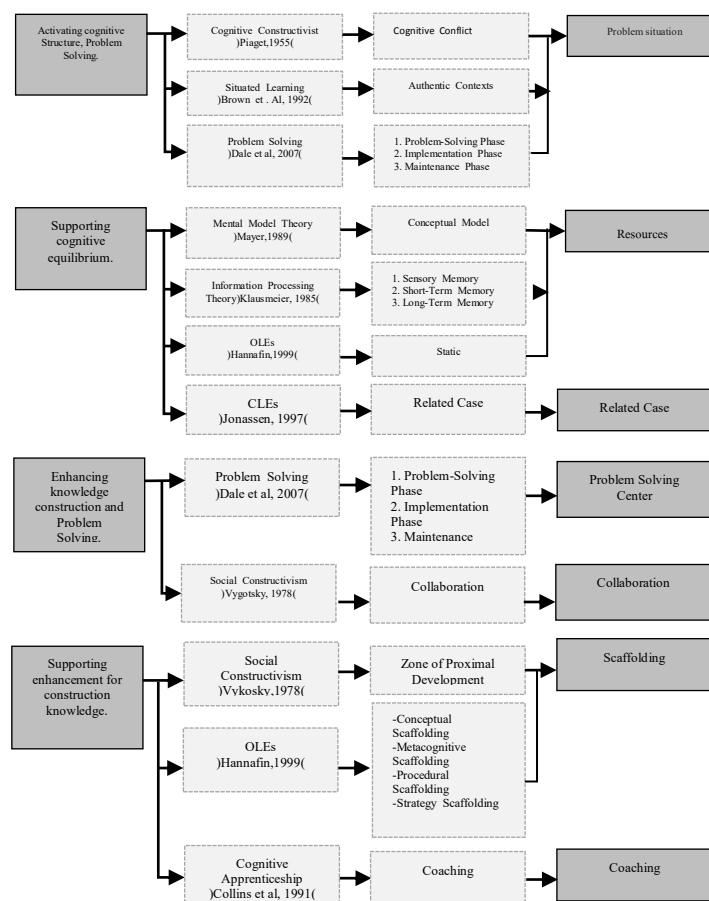

Figure2 : Designing framework of learning environment to enhance problem solving.

C. EVALUATE THE EFFICIENCY OF THE LEARNING ENVIRONMENTS

The results of the expert assessment on learning content, theoretical framework, and design framework, a way to check the quality of the specialists Content Design and Constructivist web-based learning environment Design to learn from the evaluate form. The learning environment is designed according to the principles of the theory

as a basis for the design. Overall fitness and help promote the creation of knowledge-based theory constructivist Whistler undertakings augment reality is a new technology that promotes analytical thinking as well. The results of the expert synthesis desing were show in table 1.

Table 1: The results of the expert Synthesis design learning environment. Evaluation, synthesis, design learning environment.

According to Table 1, the results of the assessment of the experts on the learning content, Synthesis of theoretical framework and the Constructivist web-based learning environment Design, as follows :

Learning Content : It was found that the content was appropriate for the learners. Accounted for 78 percent.

Synthesis of theoretical framework : Based on the study of related research theories. Synthesizes 5 fundamental theories: Contextual base, Psychological base, Technologies and media base, Problem Solving, Pedagogies base Model learning environments. Found that theoretical basis from the synthesis. It is appropriate to design a web-based learning environment that promotes student problem solving. Accounted for 78 percent.

Web-based learning environments components : To synthesize theoretical design framework of Constructivist web-based learning environments to enhance Problem Solving of 7 components as following that. (1) Problem base, (2) Resource, (3) Collaboration, (4) Problem Solving Center, (5) Related Case, (6) Scaffolding, (7) Coaching. Each components is derived from the application of theoretical principles that are appropriate. And it is necessary to help the learner to be able to solve the problem. Which is 79.2 percent.

The results of the expert Synthesis design learning environment. Evaluation, synthesis, design learning environment, found that the synthesized; Consistent design principles along constructivist that promotes problem solving was 78.9 percent.

CONCLUSIONS AND CONCLUSION

The study of the design framework of Constructivist web-based learning environments to enhance Problem Solving on C Programing Language for Secondary School. The 7 important components i.e., (1) Problem base (2) Resource (3) Collaboration (4) Problem Solving Center (5) Related Case (6) Scaffolding (7) Coaching.

ABSTRACT

The purpose of this research was to synthesize theoretical framework and designing framework of constructivist web-based learning environment to enhance Creative thinking for college students. Documentary research was employ in this study. The procedures were as following: 1) to examine and analyze the principles theories review relevant research.2) to explore the relevant context concerning 3) to synthesize theoretical framework and designing framework of constructivist web-based learning environment to enhance Creative thinking. Using the framework of Creative thinking as following:1)Fluency2)Flexibility 3)Originality 4) Elaboration. The result revealed that: 1) Theoretical framework comprise of 5 components as following: (1) Psychological base (2) Pedagogical (3) Context base (4) Technology base (5) Creativity base. 2) Constructivist web-based learning environment to enhance Creative thinking comprise of 5 step as following: 1) Activating cognitive Structure and promoting Creative thinking 2) Supporting for adjusting into equilibrium 3) Supporting and enlarge for constructing knowledge 4)Fostering the creativity 5) Support and assisting the knowledge and construct of 6 components as following: 1) Problem base 2) Learning Resource 3) Collaboration 4) Creativity Center 5) Scaffolding and 6) Coaching

INTRODUCTION

training that makes students learn and develop their knowledge from learning in a classroom from their teachers. Students must learn a lot of information, plus the information changes all the time because the knowledge of information technology changes all the time; changes into the economic society of knowledge and technology as well as epistemology with the quote that knowledge is not stable, it changes all the time. Therefore, how to know is to create knowledge. Learning management must be changed rapidly that can respond to knowledge-based economic society with the characteristics of an all-the-time knowledge seeker and a creator of new knowledge to use in living, and the theory that is used to design and compatible with the aforementioned characteristics is the constructivist theory emphasizing creating students' knowledge via information interaction from various sources through the cognitive process and social interaction that makes comprehension to enhance learning and emphasize students to start doing it by their own thought processes connecting the old knowledge to the new one and expanding the intellectual structure. Teachers can help students improve the intellectual structure by managing learning environment that enhances the students' knowledge creation process combined with the principle, theory and characteristic of compatible technology media (Chaijaroen, S. , 2008).

In addition to the constructivist theory, another key principle enhancing students to be able to learn effectively is the creative principle consisting of 4 elements: 1) skillful thought, 2) creative thought, 3) flexible thought and 4) careful thought [3]. Learning management by the web-based learning environment is to lay the floor to support knowledge creation with efficiency and expand students' ideas; thereby, it is proper to self-learning and compatible with learning process. The web-based learning environment is to design learning management between media and methods that significantly emphasizes students. The constructivist theory is used as the basic in designing with media characteristic and symbolic system of media that support students' knowledge creation consisting of the problem situation, assistant base, learning source, coaching, learning exchange and promoting

center of creative thinking. Students can control what to learn themselves, plus it supports students to learn with awareness, have the opportunity to start doing something themselves and can connect to many information sources; that is to say, it is convenient to search for information as well as students and teachers can interact to each other via the web-base system.

THE PURPOSE THE STUDY

To synthesize the theoretical framework and the framework in designing the environmental model of constructivist web-based learning enhancing creative thinking.

RESEARCH DESIGN

Document analysis and survey research were employed in this study.

TARGET GROUP

The target groups of this study consisted of two experts to assess the designing framework of the constructivist web-based learning environment model to enhance Creative thinking for college students.

RESEARCH INSTRUMENT

The instrument in this study consisted of 4 instruments as following:

- 1) Record of synthesizing the theoretical framework is a record used to create the theoretical framework, used to record, examine and analyze the document, the principle, theory and related research of web-based learning environment as well as how to apply the record of synthesizing the theoretical framework to the basic in designing web-based learning environment developed under the constructivist idea.
- 2) Record of synthesizing the framework in designing the learning environmental model that enhances creative thinking.
- 3) Evaluation form for an expert of evaluating the framework of designing the learning environmental model that enhances creative thinking.

DATA COLLECTING AND ANALYSIS

- 1) Literature review is to study and analyze the principle, theory and related research of designing the web-based learning environmental model under the constructivist idea enhancing creative thinking for bachelor's students by studying the principle and theory of related learning theory that consists of the intellectual theory that is the theory that evaluating information and the related theory of creating knowledge under the constructivist idea as well as the characteristic and symbolic system of multi-media to apply as the learning basic and record in the record of documentary examination.
- 2) The researchers study the context condition of students' creative thinking and the context of learning management to study the basic of students' previous creative thinking and considers the aforementioned result to be the basic in designing the web-based learning environment under the constructivist idea enhancing creative thinking for bachelor's students.
- 3) The researchers synthesize the theoretical framework of web-based learning environmental model with reviewing the idea, principle, theory, research and literature related to the theoretical framework and the framework in designing and element of web-based learning environmental model under the constructivist idea enhancing creative thinking for bachelor's students to make the result from studying and analyzing the constructivist theory, creative thinking and research related to the web-based learning environment under the constructivist idea as well as studying the context condition about students' creative thinking as the basic in synthesizing the theoretical framework in designing and element of web-based learning environmental model under the constructivist idea enhancing creative thinking for bachelor's students. Summarization, Interpretation and analytical description were used to analyze the data.
- 4) The researchers synthesize the designing framework counting on the basic from the theoretical framework with underlining the process of creativity.
- 5) The researchers synthesize the element of web-based learning environmental model under the constructivist idea enhancing creative thinking for bachelor's students counting on the basic from the theoretical framework with underlining the process of creativity.
- 6) The researchers offer the framework in designing and element of web-based learning environmental model

under the constructivist idea enhancing creative thinking for bachelor's students to an expert to examine the compatibility between the framework in designing and element of web-based learning environmental model enhancing creative thinking and the principle and theory used as the basic as well as the designing framework to criticize and evaluate and make a proposal for improvement and amendment.

RESEARCH RESULTS

1. According to the result of synthesis framework of constructivist web-based learning environment model to enhance the creative thinking for college students, the researcher studied the principles, theories, and related studies about creative thinking for college students as well as designed the web-based learning environment including (1) principles of designing web-based learning environment, (2) Constructivism theory, (3) Multiple Intelligence theory (Klausmeier, H. J. 1985), 4) creative thinking[3]. Then, the researcher synthesized the theoretical framework of the constructivist web-based learning to enhance the creative thinking. The synthesized theoretical framework is showed in the Figure 1 below.

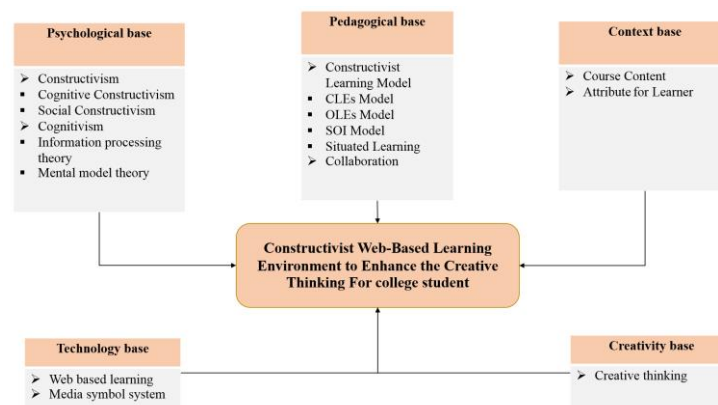

Figure 1 Theoretical Framework of Constructivist Web-based Learning to Enhance Creative Thinking

2. According to the theoretical framework of constructivist web-based learning to enhance creative thinking for college students in Figure 1, the researcher the framework of constructivist web-based learning to enhance creative thinking as follows:

2.1 Activating cognitive Structure and promoting Creative thinking , which are:

1) Problem Base Due to the Piaget's cognitive constructivism theory, the learners are activated by the situational problems leading to the conflict of cognitive process or intellectual disequilibrium. These theories were transformed into practice as problem situation in order to induce the learner into discovery learning process.

2) Learning task to enhance creative thinking or questioning to activate learners to use creative thinking. As for 4 abilities of creative thinking (Guilford, J.P., 1967) as follow: Fluency, Flexibility, Originality, Elaboration were transformed into practices as learning task in order to promote Creative Thinking. This may help activating cognitive structure and Creative Thinking of the college student.

2.2 Supporting for adjusting into equilibrium, when the learners are encountering with the situational problems or the learning task to enhance the creative thinking, they need to employ the resource. The resource stores the information to solve the problem by using SOI Model[6]. The principle of SOI Model includes 3 processes of Constructivist learning process. In SOI Model, S means selecting, O means organizing, and I mean integrating respectively. Cognitive process encourages learners to construct the cognitive knowledge due to the Constructivist theory, which based on how to activate the cognitive process of learners while learning with adding picture captions for the information processing theory. The information processing theory focuses on thinking process, staging of evaluating information, and retrieving to use long-term memory effectively. By using bold and italic alphabet in web-based learning environment, learners are interested and able to process the information effectively. These theories were transformed into practice as learning resources in order to provide information for the learners to construct the knowledge. This may help learner Creative Thinking

2.3 Supporting and enlarge for constructing knowledge. In terms of collaboration, learners are supported to exchange their experiences in order to expand their own vision. Moreover, learners are supported by the teachers or the experts to show their opinion about themselves to the others. While constructing the knowledge, it was important to learners to change and defend the misunderstanding, which could be occurred while learning,

including expanding the concept (Klausmeier, H. J. 1985).

2.4 Fostering the creativity, learners to have creative thinking by (Guilford,J.P ,1967) including 1) fluency, 2) flexibility, 3) originality, and 4) elaboration.

2.5 Supporting and assisting the knowledge construct based on the framework, the theory was applied to the principle to practice in scaffolding. According to the Social Constructivism theory by Vygotsky, if the learners go beyond the Zone of Proximal Development, they are not able to learn. Therefore, they need to be scaffolding in order to support the learners to solve the problem while learning in case they cannot complete the mission by themselves. The researcher adapts the principle of Open Learning Environment (OLEs) which developed by (Hannafin, M. J. ,1999). to scaffold the learners. The principle of Open Learning Environment (OLEs) includes: (1) Conceptual Scaffolding Base is to help learners to design and guide learners what information is related to the problems. In other words, knowledge classification is the main concept to solve the problem, as it was designed to illustrate the link between the titles and information, and then summarizing the main idea into the concept map.

(2) Procedural Scaffolding Base is to recommend learners to use the resources and the instruments in the system. In this designing, the researcher describes the elements of the instruments in the web-based learning environment by coaching which based on Situated Cognition and Situated. From the principles which based on the Constructivist theory, the role of teachers was changed from transferring the knowledge to “coaching” or assisting the learners.

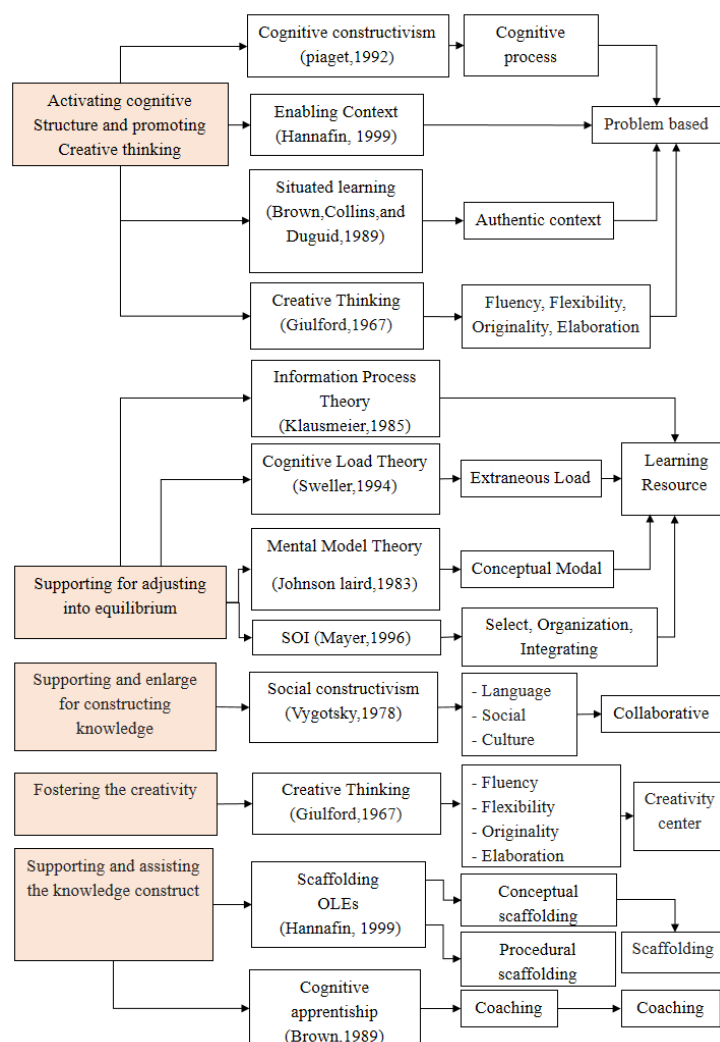

Figure 2 Designing Framework of Constructivist Web-based Learning Environment to Enhance Creative Thinking

From the synthesis of the conceptual framework. Based on a theoretical framework, important element. 1) Problem base 2) Learning resource 3) Collaborative 4) Creativity Center 5) Scaffolding and 6) Coaching

Table 1 element describe the element of the Constructivist Learning Environment model

Element describe the element	describe the designing element of the Constructivist Learning Environment model
Problem base	Problem base was designed framework to activate cognitive structure into disequilibrium by using enabling contexts: Externally Induced (Hannafin,1999) as open problem situation in order to induce the learners into discovery learning process. And 4 abilities of Creative Thinking (Guilford,1967): Fluency, Flexibility Originality, Elaboration were used to design learning task for promoting Creative Thinking.
Learning Resources	Resources was designed to support for adjusting cognitive disequilibrium by using essential principles and theories as following: information processing theory (Klausmeier,1985), SOI model (Mayer, 1996) Mental model theory (), Schema theory, and Cognitive load theory. (sweller,1994), media attribution, symbol system of multimedia, These theories were applied to design the learning resources for providing information for the learners to construct the knowledge. This may help the learners processing information effectively.
Collaboration	Social Collaboration Center was designed to support for enlarging cognitive structure and promoting Creative Thinking.Social constructivism (Vygotsky,1962 was used to design the Social Collaboration Center. It may help support the learners for sharing experiences, multiple perspectives, and adjust misconception.
Creative Thinking	Creative Thinking Center was designed to foster Creative Thinking. Guilford (1967). 4 abilities of Creative thinking theory: Fluency, Flexibility Originality, Elaboration were used to design the Creative Thinking Center. It may help the learners to foster creative thinking.
Scaffolding	Scaffolding center was designed to support and encourage knowledge construction of the learners. 4 scaffolding (Hannafin,1999): Conceptual Scaffolding, Metacognitive Scaffolding, Procedural Scaffolding, Strategic Scaffolding were used to design Scaffolding Center. It may help the learners to guide and support learning efforts in their knowledge construction process.
Coaching	Coaching Center was designed to support for providing hints and helps when needed, monitor learners' performance and help learners reflect on their performance. Cognitive apprenticeship (Collins, Brown and Newman,1989) used to design Coaching Center. It may help the learners to conduct their performance effectively and prevent misconception of the learners.

CONCLUSION

Due to the result of synthesis framework of constructivist web-based learning environment to enhance the creative thinking for college students, there were 5 process which are 1) Activating cognitive structure and promoting Creative thinking, 2) Supporting for adjusting into equilibrium, 3) Supporting and enlarge for constructing knowledge, 4) Fostering the creativity and 5) Supporting and assisting the knowledge construct. The main theories which were adapted to use in this study include Constructivist theory including Cognitive Constructivist and Social Constructivist, and Intellectualism theory including information processing with creative thinking framework shown in Figure 1 and Figure 2. In this study, the researcher focuses on reviewing and analyzing the theories and the related contexts, and then synthesized the theoretical framework which is the main concept to reach the objectives in designing the framework. Moreover, knowledge construction and creative thinking which are consistent to the principles and theories were able to be supported by researching documents. The results of this study are consistent with Jarunee Samat and Sumalee Chaijaroen (2009) Design and development Constructivist Web-Based Learning Environment the Creative Thinking. With the analysis of all related theories and synthesized framework, the theory led to practice, which links to the principles and theory into the basic of designing and the elements of web-based learning environment to enhance creative thinking for college students. This study aims to synthesize the theoretical framework, which is the first factor that is significant to design the process and develop Constructivist web-based learning to enhance creative

thinking for collect students more effectively. Besides, the researcher obviously operates researching based on the theoretical framework as well as to design and develop by using research procedure as a basic approach.

ACKNOWLEDGEMENT

This research was supported by Ph.D. Program in Educational Technology, Faculty of Education, Research Group for Innovation and Cognitive Technology, Khon Kaen, University, and Research and Technology Transfer Affairs Division, Khon Kaen University which hereby giving the thankfulness all through this.

ABSTRACT

The purpose of this research was to synthesize theoretical framework and designing framework of Constructivist multimedia learning environment Model using BYOD to enhance Creative Thinking for higher education students. Document analysis was employed in this study. The procedures were as follows: 1) to examine and analyze the principles, theories and related researches, 2) to study the context teaching and learning 3) to synthesize the theoretical framework and the designing framework of Constructivist multimedia learning environment Model using BYOD. The results revealed that the theoretical framework consists of 5 bases were as follows: 1) Psychological base, 2) Pedagogical base, 3) Technological and Media theory base, 4) Contextual base and 5) Creative Thinking base. The designing framework of Constructivist multimedia learning environment using BYOD consisted of 5 stages and 8 elements. 5 stages of the designing framework as following: 1) Activating cognitive structures and promote Creative Thinking 2) Supporting for adjusting cognitive equilibrium 3) Supporting for enlarge cognitive equilibrium 4) Fostering for Creative Thinking 5) Supporting and enhancing knowledge construction. For 8 components were as following: 1) Problem base and learning task 2) Resources 3) Collaboration 4) Cognitive Tool 5) Center for enhancing Creative Thinking 6) Scaffolding, and 7) Coaching.

Keywords: (BYOD) Learning Environment Model, constructivist theory, Creative Thinking

INTRODUCTION

Today's society all over the world is making progress in the science, technology. This affects the society has changed rapidly and constantly. This change brings humanity to the full digital society, knowledge – based society and information society. Therefore, human being need to learn throughout their life or life- long learning. In addition, the 21 century learning that focus on learning and innovation skills which required creative thinking (Vicharn, panich. 2012). However, at present teaching management in higher education focus on lectures, still lacking of promoting creative thinking as well as seeking skills and construct the knowledge using digital technology. For above mentioned reason, it is necessary to adjust instructional management design to meet the above crucial characteristics such as creative thinking, seeking skills and knowledge construction by using digital technology. In particular, digital technology used in a learning environment that allows learners to learn by themselves, anywhere, anytime by bringing their own devices (BYOD). Instructional design theory (ID Theory) is required to use in the design. Theories used as foundation are Constructivist theories: Social Constructivist and Cognitive Constructivist, Cognitive theory: Information Processing and Creative thinking. These theories may help the knowledge construction and creative thinking of the learners. In addition, the media attribute and symbols system of web base comprises of hypertext, hyperlink, and hypermedia. my support knowledge construction and creative thinking. (Sumalee Chaijaroen. 2559). Moreover. the BYOD concept that focus on bringing your own devices for promoting knowledge construction in anywhere, anytime.

Therefore, the researchers recognize the of importance of synthesizing the theoretical framework and designing framework of the Constructivist Multimedia learning environment Model using BYOD, as a guide line for developing

creative thinking for higher education student. This framework may help to confirm the validity in design the Constructivist Multimedia learning environment Model using BYOD.

THE PURPOSE OF THIS STUDY

To synthesize theoretical framework of Constructivist Multimedia learning environment Model using (BYOD) to Enhance Creative Thinking for Higher education students.

To synthesize Designing framework of Constructivist Multimedia learning environment Model using (BYOD) to Enhance Creative Thinking for Higher education students.

Research design

Model Research design is documentary research. consisted of to examine and analyze the principle, theories and related researches, to study the context teaching and learning. to synthesize the theoretical framework and the designing framework of Constructivist Multimedia learning environment Model using (BYOD) to Enhancing Creative Thinking for Higher education students.

Target Group

The target groups of this study consisted of 3 experts to assess the Designing framework of the Constructivist Multimedia learning environment Model using (BYOD) to Enhancing Creative Thinking.

Research instruments

The instrument in this study consisted of instrument as following:

- 1)The expert review recording form for checking the quality of the designing framework.
- 2)The recording form for synthesis of the theatrical framework of the Constructivist Multimedia learning environment Model using (BYOD) to Enhancing Creative Thinking.
- 3)The recording form for synthesis of the designing framework of the Constructivist Multimedia learning environment Model using (BYOD) to Enhancing Creative Thinking.

Data collecting and analysis

The procedure of gathering and analysis data ware as follows:

- 1)Synthesis of the theoretical framework of the Constructivist Multimedia learning environment Model using (BYOD) to Enhancing Creative Thinking. The data were collected by using the recording form for synthesis of the theoretical framework. Summarization, interpretation and analytical description were used to analyze the data.
- 2)Synthesis of designing framework of the Constructivist Multimedia learning environment Model using (BYOD) to Enhancing Creative Thinking. The data were collected by using the recording form for synthesis of the designing framework. Summarization, interpretation and analytical description were used to analyze the data.

RESEARCH RESULTS

Theoretical framework

Designing theoretical of Constructivist Multimedia learning environment Model using (BYOD) to Enhance Creative Thinking for Higher education students. Researcher is documentary analyze. about principle, theories and related researches. study the context teaching and learning, synthesize the theoretical framework and the designing framework of Constructivist Multimedia learning environment Model using (BYOD) to Enhancing Creative Thinking for Higher education students. Then synthesize theoretical framework: 1) Theoretical framework of Constructivist Multimedia learning environment Model using (BYOD) to Enhance Creative Thinking The result revealed that the theoretical framework consists of 5 bases were as follows: 1) Psychological base, the basic design has led to a major. Constraint theory to promote self-knowledge and cognitive theory to help promote creativity. 2) Pedagogical base, Study of principles, theories and teaching methods. to provide a basis for designing a learning environment model that promotes creativity. The basis of pedagogy to be the basis of this design is. (1) OLEs, (2) CLEs, (3) SOI model (4) Intellectual training 3) Contextual base, The researcher studied the context of teaching and learning management. And learning management that promotes creativity and knowledge creation. 4) Technological Media theory base, this is a web-based learning and cloud system that can be learned anywhere, anytime. and 5) Creative Thinking base. Education related to cognitive processes. This study will be used as a measurement tool. and

assess the effect on cognitive processes, which are creative. consists of 4 bases were as follows: Fluency, Flexibility, Originality, Elaboration. as show in figure 1 individual's ability to think in a multitude of directions. Also known as divergent thinking. By expression of thought or action resulting from learning and Hyper linking prior knowledge with new experiences together. And create a new work or outcome. Including the discovery of a solution to the problem. Creativity consists of four different thinking abilities: 1) original 2) Fluency 3) Flexibility 4) Elaboration. as show in figure 1.

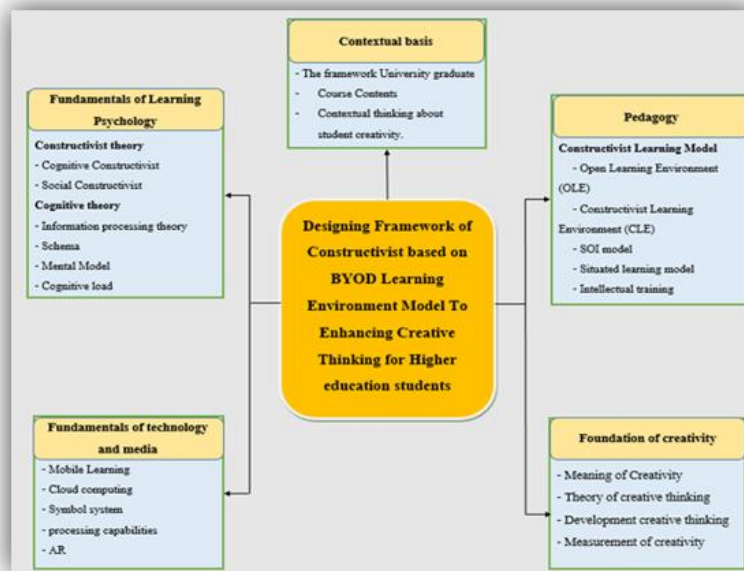

Figure 1. The Theoretical framework: Activating cognitive structure and promoting Creative Thinking.

The Designing framework

According to this study. The findings of syntesis of the designing framework of the learning environment model to promote Creative Thinking found 5 crucial bases as the following details:

1 . Activating cognitive structure and Creative Thinking The first crucial bases of the designing framework was Activating cognitive Structure, creative thinking, Thinking, it illustrated the underlined theories used in design the component called “Problem bases” of the learning environment to for promote Creative thinking. The underlined theories used for activating cognitive structure were as follows: Cognitive constructivist (Piaget,1992): cognitive conflict, Enabling contexts OLE (Hanafin,1999): Externally induced, individually induced. OLEs (Hanafin,1999). These theories were transformed into practice as problem situation in order to induce the learners into discovery learning process. Ac for 4 abilities of Creative thinking (Guilford, 1967) as following: Fluency, Flexibility, Originality, Elaboration were transformed into practice as learning task in order to promote Creative thinking. This may help activating cognitive structure and Creative thinking of the student as show in figure 2.

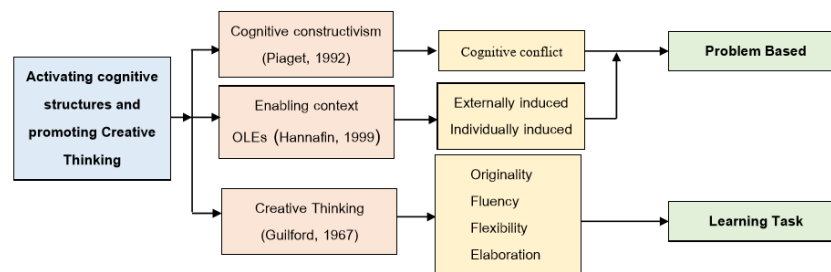

Figure 2. The designing framework: Activating cognitive structure and promoting Creative Thinking.

2. Supporting for adjusting of cognitive disequilibrium

Supporting for adjusting of cognitive disequilibrium. The second crucial bases of the designing framework was Supporting for adjusting of cognitive disequilibrium, it illustrated the underlined theories used in design the

component called “Resources” of the learning environments to for promote Creative Thinking. The underlined theories used for Supporting for adjusting of cognitive disequilibrium were as follows: information processing theory (Klausmeier, 1985): sensory register, short-term memory, long-term memory); Cognitive load theory (sweller,1994): Chunking, Hierarchical network and media attribute symbol system of Multimedia; still picture, motion picture, text, sound Schema theory: Schema as memory structure, Schema as context, Schema as network; SOI model (Mayer, 1996): selection, organizing, integrating, Mental model theory (Johnsonlaid, 1983): Conceptual model. These theories were transformed into practice as learning resources in order to provide information for the learners to construct the knowledge. This may help learner processing information effectively and understand easily as shown Figure 3.

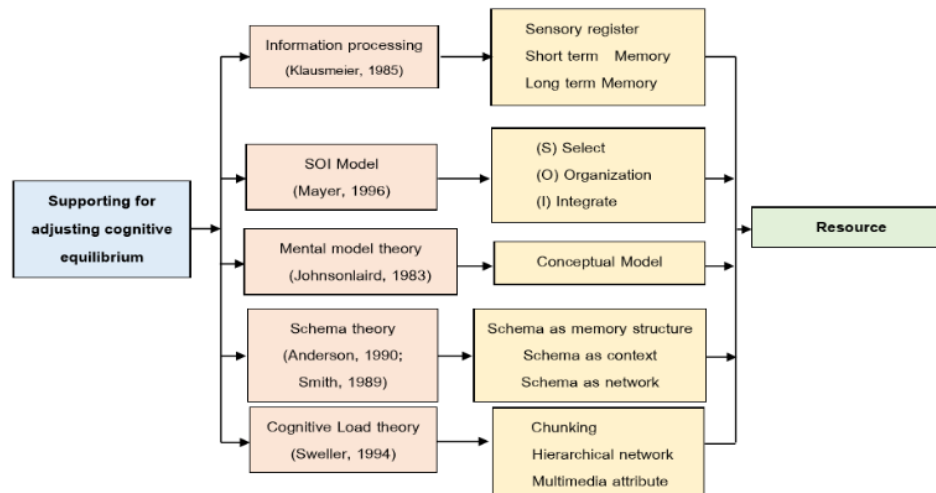

Figure 3. The designing framework: Supporting for adjusting of cognitive disequilibrium.

3. Supporting for enlarging cognitive structure

Supporting for enlarging cognitive structure. The third crucial bases of the designing framework was Supporting for enlarging cognitive structure. it illustrated the underlined theories used in design the component called “Collaboration base” of the learning environments to for promote Creative Thinking. The underlined theories used for Supporting for enlarging cognitive structure were as follows: Social constructivist (Vygotsky, 1978): Collaboration, social, Language, Culture. These theories were transformed into practice as learning Collaboration in order to provide the learners sharing experiences, multiple perspectives, adjust misconception, and collaboration problem solving.

Ac for 5 Cognitive Tool (OLEs, Hannafin, 1999): Seeking tool, collecting tool, generating tool, organizing tool, Integrating tool. These theories were transformed into practice as cognitive tools base in order to provide the learners knowledge contracture. as shown Figure 4.

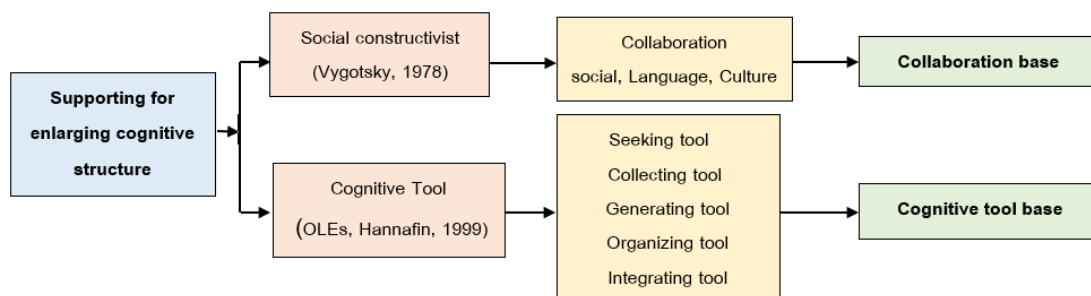

Figure 4. The designing framework: Supporting for enlarging cognitive structure.

4. Fostering for Creative Thinking

Fostering for Creative Thinking. The fourth crucial bases of the designing framework was Supporting for Fostering for Creative Thinking. it illustrated the underlined theories used in design the component called “Creative thinking

base” of the learning environments to for promote Creative Thinking. The underlined theories used for Fostering for Creative Thinking were as follows: Creative Thinking (Guilford, 1967): Fluency, Flexibility, Originality, Elaboration. These theories were transformed into practice as Creative thinking base in order to promote Creative thinking. This may help Fostering for Creative thinking of the student as show in figure 5.

Figure 5. The designing framework: Fostering for Creative Thinking.

5. Fostering and assist Knowledge construction

Fostering and assist Knowledge construction. The fifth crucial bases of the designing framework was Supporting for Fostering for Creative Thinking. it illustrated the underlined theories used in design the component called “Scaffolding” of the learning environments to for promote Creative Thinking. The underlined theories used for Fostering for Creative Thinking were as follows: Social constructivist (Vygotsky, 1978): Zone of proximal development, Scaffolding (Hannafin, 1999): Conceptual Scaffolding, Strategic Scaffolding, Metacognition Scaffolding, Procedural Scaffolding. These theories were transformed into practice as Scaffolding base in order to provide help with learning and adjusting of cognitive disequilibrium.

Ac for Cognitive apprenticeship (Brown, 1989): Coaching. Elaboration were transformed into practice as Coach base in order to provide the learners enlarging knowledge construct. as shown Figure 6.

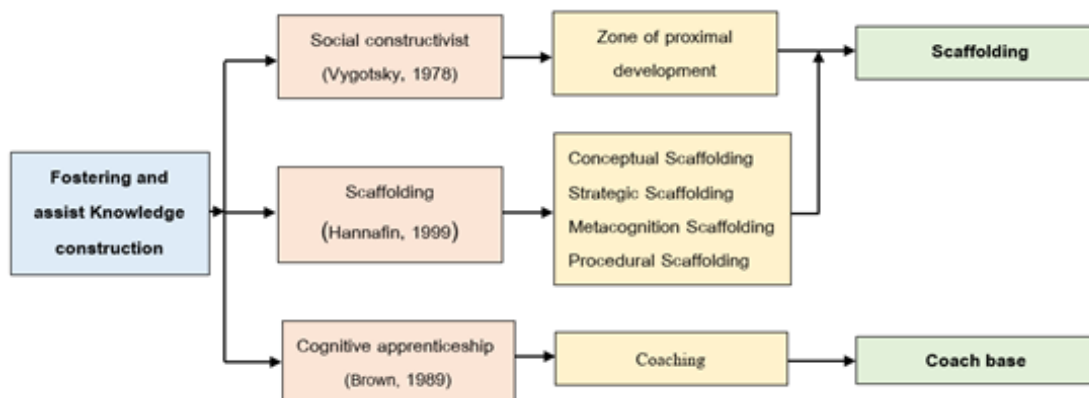

Figure 6. The designing framework: Fostering and assist Knowledge construction.

A. The Designing Framework: Thinking Constructivist learning environment to promote Creative thinking comprised of 8 components as follows:

Element Describe the elements Example of design Shot	Describe the designing elements of the Constructivist Learning Environment model
Problem Base	Problem base was designed frame work to activate cognitive structure into disequilibrium by using enabling contexts: Externally Induced (Hannafin, 1999) as open problem situation in order to induce the learners into discovery learning process. and 4 abilities of Creative Thinking (Guilford,1967): Fluency, Flexibility Originality, Elaboration were used to design learning task for promoting Creative Thinking.
Learning Task	Learning task was designed to promote Creative thinking. This may help activating cognitive structure and Creative thinking of the student.

Resources	Resources was designed to support for adjusting cognitive disequilibrium by using essential principles and theories as following: information processing theory (Klausmeier,1985), SOI model (Mayer, 1996), Mental model theory (Johnsonlaid, 1983), Schema theory (Anderson, 1990; Smith, 1989), and Cognitive load theory. (sweller,1994), media attribution, symbol system of multimedia, These theories were applied to design the learning resources for providing information for the learners to construct the knowledge. This may help the learners processing information effectively and understand easily.
Collaboration base	Social Collaboration base was designed to support for enlarging cognitive structure and promoting Creative Thinking. Social constructivism (Vygotsky,1962) was used to design the Social Collaboration base. It may help support the learners for sharing experiences, multiple perspectives, adjust misconception, and collaboration problem solving.
Cognitive Tool base	Cognitive Tool base was designed to support the learners to enable and facilitate the cognitive processing tasks associated with open-ended learning. Cognitive Tool (OLE, hannaafin,1999) was used to design the Cognitive Tool base. This may help the learners to enlarge their cognitive structure (Hannaafin,1999)
Creative Thinking base	Creative Thinking base was designed to foster Creative Thinking. Guilford (1967). 4 abilities of Creative thinking theory: Fluency, Flexibility, Originality, Elaboration were used to design the Creative Thinking base. It may help the learners to foster creative thinking.
Scaffolding	Scaffolding was designed to support and encourage knowledge construction of the learners. 4 scaffolding (Hannaafin, 1999): Conceptual Scaffolding, Metacognitive Scaffolding, Procedural Scaffolding, Strategic Scaffolding were used to design Scaffolding. It may help the learners to guide and support learning efforts in their knowledge construction process.
Coaching base	Coaching base was designed to support for providing hints and helps when needed, monitor learners, performance and help learners reflect on their performance. Cognitive apprenticeship (Collins, Brown and Newman,1989) used to design Coaching Center. It may help the learners to conduct their performance effectively and prevent misconception of the learners.

B. Assessment of the designing framework of the Constructivist Multimedia learning environment Model using (BYOD) to enhance Creative thinking by experts found the congruence between the underlined theories and the design.

CONCLUSION

The designing framework of the Constructivist Multimedia learning environment Model using (BYOD) comprised of crucial bases as following: 1) Activating cognitive structure and promoting Creative Thinking, 2) Supporting for adjusting of cognitive disequilibrium, 3) Supporting for enlarging cognitive structure, 4) Fostering for Creative Thinking and 5) Fostering and assist Knowledge construction. According to above 5 bases of the designing framework were transformed into practice as 8 elements the Constructivist based on (BYOD) Learning Environment Model to enhance Creative thinking as following: 1) Problem base, 2) Learning Resource, 3) Social Collaboration Center, 4) Cognitive Tool Center, 5) Creative Thinking Center, 6) Scaffolding center 7) Coaching Center. This finding was consistent with Chaijareon, S., Samat, C., Kanjug, I., (2012); Techapornpong, O., Chaijareon, S., (2017) These previous research found that the students showed their creative thinking and the framework of Constructivist Multimedia learning environment Model using (BYOD) used creative thinking as foundation of the design. As for this research finding may be the result of Instructional design Theory (ID Theory) that used underlined theories especially the creative Thinking theory (Guilford,1967): Fluency, Flexibility Originality, Elaboration as the foundation of the design. This was shown in the designing framework of the of Constructivist Multimedia learning environment Model using (BYOD) to enhance Creative thinking. This may help learners to foster creative thinking. In addition, the theoretical validity of the designing framework of Constructivist Multimedia learning environment Model using (BYOD) was found from assessment by experts. As mentioned findings can be supported the designing framework of the of Constructivist Multimedia learning environment Model using (BYOD) to enhance Creative thinking.

ACKNOWLEDGEMENT

This research was supported by Ph.D. Program in Educational Technology, Faculty of Education, Research Group for Innovation and Cognitive Technology, Khon Kaen, University, and Research and Technology Transfer Affairs Division, Khon Kaen University which hereby giving the thankfulness all through this.

ABSTRACT

This research aimed to synthesize theoretical framework and develop the AR-Book learning environment to enhance analytical thinking on computer components' subject for grade 4 students. Research methodology is developmental research; developmental research consisted of 3 processes which were designing process, developing process, and evaluating process. The procedures were as following:)1(to examine the principles and theories, 2(to synthesize designing framework,)3(to design and develop the AR-Book learning environment according to above mentioned designing framework, and)4(to evaluate the efficiency of the AR-Book learning environment. And survey. The procedures were as following:)1(designing process and)2(developing process research methods are document analysis, and survey. The procedures were as following:)1(to examine and analyze the principles and theories)2(to synthesize theoretical framework (3(to synthesize designing framework.1(to synthesize theoretical framework comprise of 6 components as following that. Contextual base, Psychological base, Technologies base, Analytical base and Pedagogies base Model learning environments .2(to synthesize theoretical design framework of constructivist augmented reality web-based learning environments to enhance Analytical of 6 components as following that.)1(Problem base)2(Resource)3(Analytical thinking Center)4(Collaboration)5(Coaching)6(Scaffolding. The efficiency of this learning environment was evaluated by expert review. It was found that the learning environment is appropriate on 3 aspects: content, Text-based learning and learning environment.

Keywords: AR-Book, Augmented Reality, Learning Environment, Analytical Thinking

INTRODUCTION

Nowadays, society transforms fast to period which is believed knowledge is information which develops from thinking and technology stimulates to create new knowledge ability for learners so technology ability is equipment to learn fast for new generation by encourage learners apply thinking to solve problems which set learner's preparation for complicated real life. Therefore, education will be prepared with society transfer to 21st century. Analytical thinking is an important feature of the educational development of children that should be developed continuously at every school level. According to analytical thinking which is deep thinking. The theories used to serve the above mentioned learning is rooted in the theory of Piaget)Piaget(called Cognitive Constructivist. The theory indicates that if the students encounter with the problem that cause them have cognitive conflicts and they should try to adjust their cognitive structure into equilibrium state by integration between prior knowledge and new information until they can understand. That is they can construct the knowledge. For above mentioned reason, this study intent to synthesize the Theoretical framework and the Designing framework of cognitive innovation to enhance the knowledge construction This may help to clarify the internal process of the learners that can be lead to effective learning.

METHODOLOGY

The researchers collected the data as follows: 1(Synthesis of theoretical framework and Components of the learning environment. The data were collected by analyzing principles, theories, related research of the constructivism theory, cognitive theory, media and technology theory, pedagogy and contextual study. 2(Synthesis of Designing framework of the learning environment: The above synthesized theoretical framework was taken into this process and related literature regarding design and development, context of school base, constructivist base, pedagogical base, analytical thinking base, and technology and media base)AR technology and media symbol system(for the synthesis of the theoretical framework of the learning environment. 3(Design and develop of the learning environment based on foundation of creating designing framework was adopted. 4(Evaluate of the learning environment by experts. The analytical description, summarization and interpretation were used to analyze data

A.Target Groups of this study

Target Group in the design and development process consisted of 3 expert reviewers.)1(Experts in content validity.)2(Experts in Text-based learning design.)3(Experts in learning environment design.

B.Research Instruments

The instruments in this study as following details:)1(The document examination and analysis recoding form to synthesize a theoretical framework,)2(The recoding form for synthesis of the design framework to learning environment to enhance analytical thinking, and)3(The evaluation form for synthesize theoretical framework and designing of constructivist augmented reality text-based learning environments to enhance creative thinking.

RESEARCHDESIGN

This research methodology was documentary research and survey research comprised of 1(the synthesis of theory concept, 2(the synthesis of the constructivist learning environment design concept through augment reality to promote the analytical thinking, 3(development of the constructivist augment reality learning environment, and 4(evaluation of the learning environment

RESEARCH RESULTS

The design and development of the learning environment that promote students' analytical thinking are follows:

A. SYNTHESIS OF THEORETICAL FRAMEWORK

The results show that the theoretical framework of text based learning environment with augmented reality to enhance learner's analytical thinking comprised of five basic theories:)1(Context of school base are follows: Policies, Targets, Present situation, Processes, and Performances,)2(Analytical thinking base are follows: Identify the elements, Identify the relationships reason, Classification of things)Sumalee, 2007(The above synthesized theoretical framework was taken into this process)3(Constructivist base are follows: Constructivist cognitive)Piaget, 1992(and social constructivist)Vygotsky, 1992(theory and cognitivism; and Information processing theory)Klausmeier,1985(,)4(Pedagogical base are follows: OLEs Model)Hannafin,1999(, SOI Model)Mayer,1996(, Situated learning)Brown, Collins, and Dugoid, 1989(, Cognitive apprenticeship)Brown and Collins, 1991(,)5(Media theory and technology base are follows: Web-based learning)Khan, 1998(, Augmented Reality)Donald Douglas McMahon, 2014(, The system of media)Chaijaroen, 2009(The technology used in this study is multimedia. This study focuses on media attribution and symbol system which help.

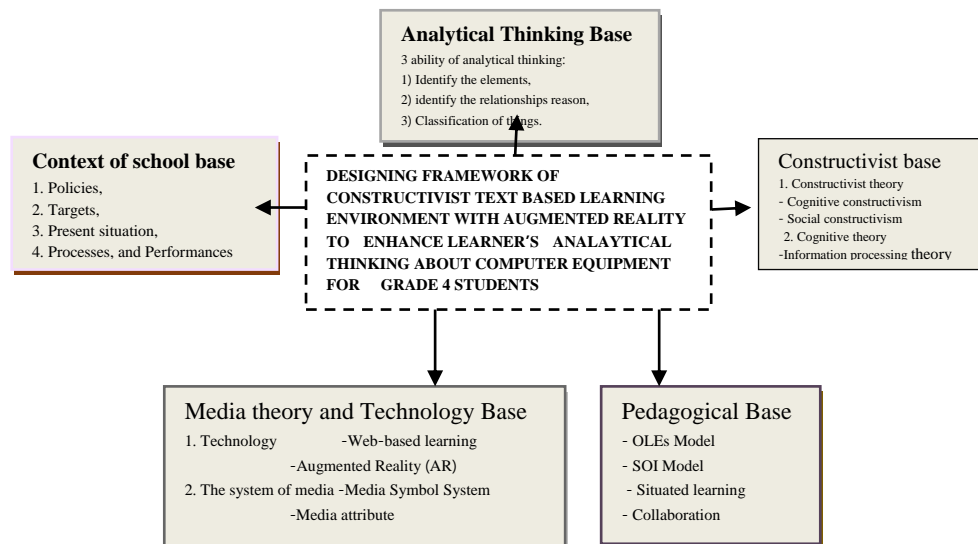

Figure.1. Theoretical framework for text based learning environment with augmented reality to enhance learner's analytical thinking about Computer Equipment for grade 4 students.

B. SYNTHESIS OF DESIGNING FRAMEWORK

Synthesize theoretical framework comprise of 6 components as following that. Contextual base, Psychological base, Technologies base, Analytical base and Pedagogies base Model learning environments.

Synthesize theoretical design framework of constructivist augmented reality web-based learning environments to enhance Analytical of 6 components as following that. 1) (Problem base) 2) (Resource) 3) (Analytical thinking Center) 4) (Collaboration) 5) (Coaching) 6) (Scaffolding)

According to this study, the findings of synthesis of the theoretical framework which was used as foundation in synthesizing the designing framework of cognitive innovation to enhance knowledge construction and memory process found that

a) *Encouraging learners to balance intellectual and promote Analytical thinking. process:* It is illustrated the relationship between the underlined theories as follows: cognitive constructivism, OLEs model (Hannafin, 1999), Authentic context, Analytical Thinking (Sumalee Chaijaroen, 2007) as follows of 3 ability: Identify the elements, Identify the relationships reason, Classification of things, Augmented Reality (AR) and the components of innovation which it's called Problem base. Fig 2 showed theoretical framework designing problem base.

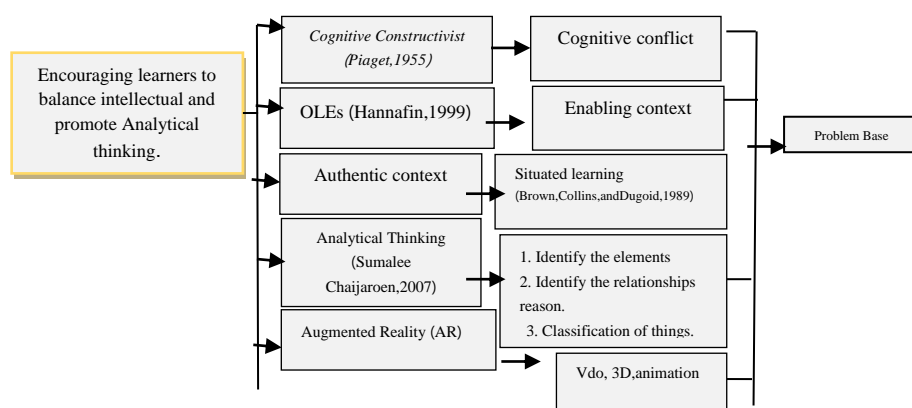

Figure2. Theoretical framework designing problem base.

Problem Base Cognitive constructivism has its roots in cognitive psychology and biology and an approach to education that lays emphasis on how the individual learner "maker of meanings" and the ways knowledge is created in order to adapt to the world in which the mechanisms of accommodation and assimilation are key to this processing. In the design, Augmented Reality)AR(,visual, text, audio, and animation are provided to stimulate the students to have recognition and attention by using externally impose for helping student to associate with their own experience.

b(Supporting Cognitive Equilibrium thinking . process: It is illustrated the relationship between the underlined theories as follows: information processing theory)Klausmeier, 1985(; sensory register, short-term memory, long-term memory, analytical thinking)Sumalee, 2007(; conceptual model, SOI model)Mayer, 1996(; selection, organizing, integrating, OLEs)Hannafin,199(; Resource, Seeking tool, Organization tool, Collecting tool, Social constructivism Vygotsky,1992(;Collaboration ,Augmented Reality)AR(and the components of innovation which it's called Resources. Fig 3 showed Theoretical framework designing resources.

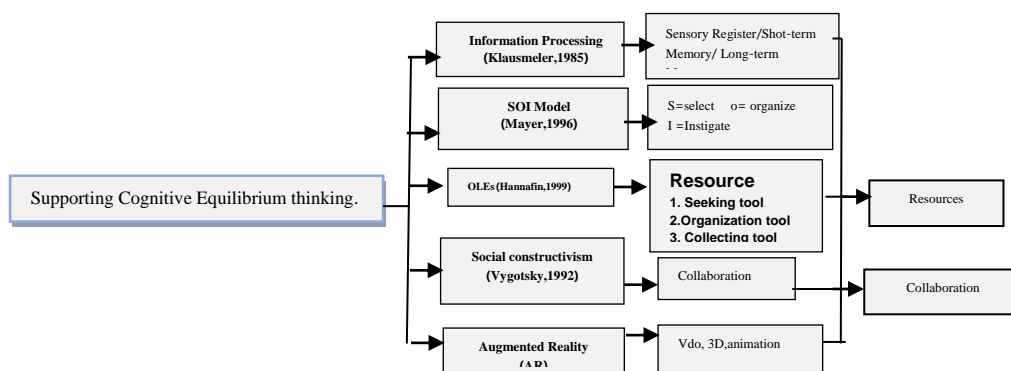

Figure 3 showed Theoretical framework designing resources.

Resource is the collecting information that should be provided for students in the problem solving process. They use it to discovery learning through various information technologies. SOI model)Mayer, 1996(Techniques for encouraging student to selecting, organizing and integrating information

- 1(To help the learner select relevant information, highlight the important information, use instructional objectives and/or adjunct questions, provide a summary and eliminate irrelevant information
- 2(Organize information for the learner using text structure, outlines, headings, pointer words, and graphic representations;

- 3(Integrate information using advance organizers, illustrations, animation, worked-out examples, and elaborative questions

Collaboration The students collaborated problem solving. The students will exchange multiple perspectives to solve the problem and designed to collaborate in problem solving through Facebook, google classroom, web-board, e-mail which make the students could express their opinion.

c(Enhancing Knowledge Construction and Analytical Thinking. process: It is illustrated the relationship between the underlined theories as follows: Analytical Thinking)Sumalee Chaijaroen,2007(as follows of 3 ability: Identify the elements, Identify the relationships reason, Classification of things, CLEs)Jonassen,1999(;Cognitive tools)Manipulation tool(Augmented Reality)AR(and the components of innovation which it's called Analytical Thinking Center. Fig 4 showed Theoretical framework designing analytical thinking center and collaboration

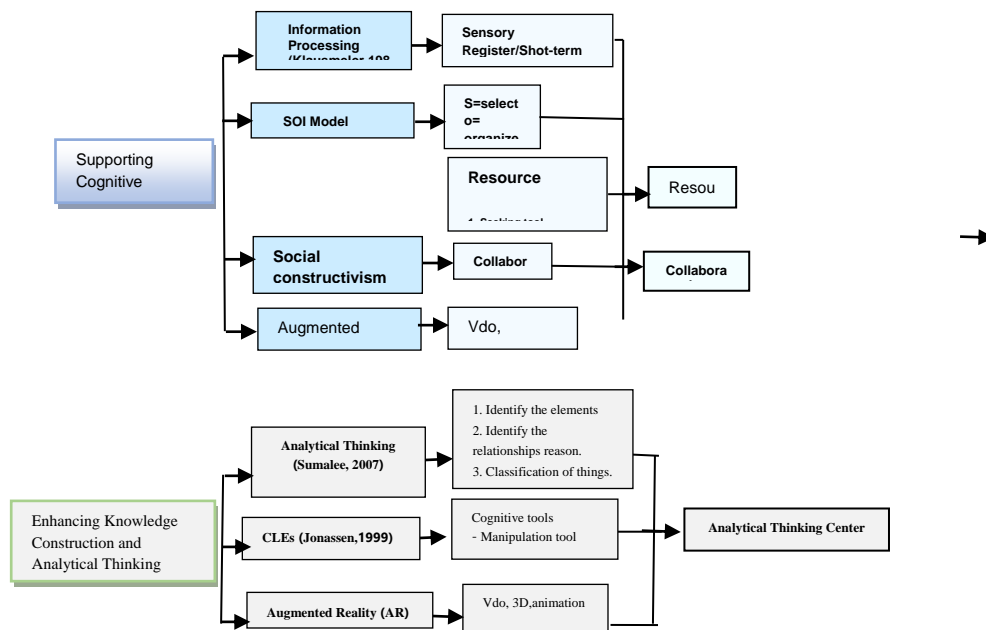

Figure 4 Theoretical framework designing analytical thinking center and collaboration

Analytical Thinking is a critical component of visual thinking that gives one the ability to solve problems quickly and effectively. It involves a methodical step-by-step approach to thinking that allows you to break down complex problems into single and manageable components. This type of thinking also requires you to compare sets of data from different sources; identify possible cause and effect patterns, and draw appropriate conclusions from these datasets in order to arrive at appropriate solutions.

d(Supporting and Enhancement for Constructing Knowledge process: It is illustrated the relationship between the underlined theories as follows: social constructivism)Vygotsky,1962(; zone of proximal development, OLEs)Hannafin,1999(; Scaffolding, 1.Conceptual Scaffolding Metacognition 2.Scaffolding Procedural scaffolding 3.Strategic Scaffolding ,Cognitive Apprenticeship)Brow and Collins,1991(; Coaching, Augmented Reality)AR(and the components of innovation which it's called scaffolding. Fig 5 showed Theoretical framework designing scaffolding.

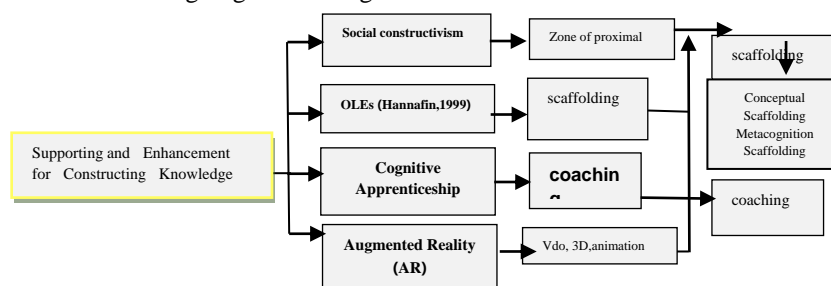

Figure 5 showed Theoretical framework designing scaffolding and coaching

Scaffolding the concept of Social Constructivism of Vygotsky believed that if the student is under the Zone of Proximal Development can not learn on their own. Need to be rescued called Scaffolding, of assistance to support learners to solve problems or learning in not being able to complete the mission itself. Will support the creation of knowledge of the students

Coaching A good coach motivates learners, analyzes their performance, provides feedback and advice on the performance and how to learn about how to perform, and provokes reflection and articulation of what was learned. Evaluate the efficiency of the learning environments.

The results of the expert assessment on learning content, theoretical framework, and design framework, a way to check the quality of the specialists Content Design and Constructivist Text-based learning environment Design to learn from the evaluate form. The results of the expert synthesis design were show in table 1

No.	Lists of preconception towards the Constructivist Text-based learning environments	results of the expert)Percentage(

Table 1. The results of an expert on learning content, the expert assessment. Theoretical framework synthesis and design framework.

In Table 1, the results of the assessment of the experts on consists of on the learning content, Synthesis of theoretical framework and the Constructivist Text-based learning environment Design, found that Learning Content ; Appropriate learning content 88 percent, Synthesis of theoretical framework ; Contextual base. 87 percent., Psychological base 89 percent Technologies and media base 88 percent , Analytical Thinking.

89 percent, Pedagogies base Model learning environments 88 percent, Text-based learning environments components; Problem base 86 percent, Resource 85 percent, Collaboration 87 percent, Analytical Thinking Center 89 percent, Scaffolding 89 percent , Coaching 87 percent , Total results of the expert 87.6 percent.

V. Conclusions and Future Work.

This study designed the augmented reality learning environment to promote analytical thinking about computer equipment for grade 4 students. Should take into account that both of theoretical framework and designing framework of the augment learning environment to promote analytical thinking. The synthesis of designing framework confirmed the 6 important components)1(problem base,)2(resources,)3(collaboration,)4(problem solving center,)5(scaffolding, and)6(coaching. However, to enhance students' analytical thinking ability, we are going to study about the effect of augmented reality learning environment to promote analytical thinking learning with mobile technology on students analytical thinking. It is consistent with Oakkarawong Preeyanan , Samat, Charuni)2016(which has Designing Framework of Augmented Reality Learning Environment to Promote Analytical Thinking for Grade 8 Student.

ABSTRACT

This study aimed to synthesize theoretical and designing framework of Constructivist Web-based Learning Environment Model to enhance Problem Solving and Transfer of Practical Skills for Industrial Engineering Student. Document analysis and survey research were employed in this study. The procedures were as follows: (1) to examine and analyze the principles, theories and related researches, (2) to study instructional context, (3) to synthesize the theoretical framework, and (4) to synthesize the designing framework. The results revealed that: 1) The theoretical Framework comprised of 6 bases were as follows: (1) Learning theory base, (2) pedagogical base, (3) Media theory base, (4) neurological base, (5) Technological base, and (6) Context of instructional base 2) The designing framework consisted of 5 stages and 9 elements, were as follows: (1) Activate cognitive structure and promote problem solving and transfer (2) Support for adjusting cognitive structure (3) Support for enlarge cognitive structures (4) Foster for problem solving and transfer Practical Skills (5) promote and assist knowledge construction and 9 components as following: (1) Problem base (2) Resources (3) Cognitive tool (4) Collaboration for problem solving (5) Center for enhancing problem solving (6) Center for transfer of Practice Skills (7) Related cases (8) Scaffoldings, and (9) Coaching.

Keywords: Web-based learning environment; Problem solving; Transfer of Practical Skills; Constructivist

INTRODUCTION

The advancement of technology has influenced in increasing of information in knowledge based and digital society. At the same time, the current problems are increasing more serious and complicated. Therefore, necessary skill for learners is problem-solving especially for practical work of engineering student. However, the current instructional management focus on transmit the information from teacher to learners. This results in lacking of seeking skills, knowledge construction, especially problem solving of the learners. Thus, it need to adjust the instructional management to foster the learners to construct knowledge on their own, problem solving and transfer the knowledge to solve problems in other situations.

1. To synthesize the Theoretical framework of Constructivist Web-Base Learning Environment Model to Enhance Problem Solving for Transfer of Practical Skills for Industrial Engineering Student.
2. To synthesize the Designing framework of Constructivist Web-Base Learning Environment Model to Enhance Problem Solving and Transfer of Practical Skills for Industrial Engineering Student.

RESEARCH DESIGN

Document analysis and survey research were employed in this study.

TARGET GROUP

The target groups of this study consisted of 2 experts to assess the designing framework of Constructivist Web-Base Learning Environment Model to Enhance Problem Solving and Transfer of Practical Skills for Industrial Engineering Student.

RESEARCH INSTRUMENT

The instruments in this student consisted of 3 instruments as following:

1. The expert review recording form for checking the quality of the designing framework.
2. The recording from for synthesis of the theoretical framework of Constructivist Web-Base Learning Environment Model to Enhance Problem Solving and Transfer of Practical Skills for Industrial Engineering Student.
3. The recording from for synthesis of the designing framework of Constructivist Web-Base Learning Environment Model to Enhance Problem Solving and Transfer of Practical Skills for Industrial Engineering Student.

DATA COLLECTING AND ANALYSIS

The procedure of gathering and analysis data were as follows:

1. Synthesis of The theoretical framework of Constructivist Web-Base Learning Environments Model to Enhance Problem Solving and Transfer of Practical Skills for Industrial Engineering Student. The data were collected by using the recording form for synthesis of the theoretical framework. Summarization, interpretation and analytical description were used to analyze the data.
2. Synthesis of designing framework of Constructivist Web-Base Learning Environment Model to Enhance Problem Solving and Transfer of Practical Skills for Industrial Engineering Student. The data were collected by using the recording form for synthesis of the designing framework. Summarization, interpretation and analytical description were used to analyze the data.

RESEARCH RESULT

1. The theoretical framework

It is found that the theoretical framework of Constructivist Web-Base Learning Environment Model to Enhance Problem Solving for Transfer of Practical Skills for Industrial Engineering Student consist of 6 crucial bases which compose of: 1 Learning theory base: Several learning theories used are Constructivist theory and Cognitive theory2) Pedagogical base: The pedagogies which underlined this framework are Situated learning, Collaborative learning, and Constructivist learning model 3) Media theory base : The media theory used in this study is media symbol system and capability process 4) neurological base; Electroencephalography (EEG). 5) Technological base: The technology used in this study is multimedia 6) Context of instructional: The technology used in this study is Desirable graduate features, The concept of learning management, Industrial Education, Main Course in Electrical EngineeringThis study focuses on media attribution and symbol system which help to enhance knowledge construction and memory process.

After review literature, these all of 6 bases are analyzed, and synthesized the relationship between each of them as below illustration in Figure 1.

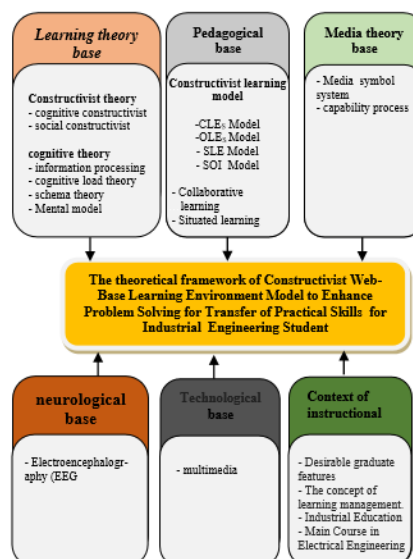

Figure 1: Theoretical Framework of Constructivist Web-Base Learning Environment Model to Enhance Problem Solving and Transfer of Practical Skills for Industrial Engineering Student.

2. Designing Framework of Constructivist Web-Base Learning Environment Model to Enhance Problem Solving and Transfer of Practical Skills for Industrial Engineering Student.

According to this study, the findings of synthesis of the theoretical framework which was used as foundation in synthesizing the designing framework of Constructivist Web-Base Learning Environment Model to Enhance Problem Solving and Transfer of Practical Skills for Industrial Engineering Student. found that 5 crucial bases for enhance Problem Solving and Transfer of Practical Skills for Industrial Engineering Student. which are:

2.1 The activation activating cognitive structure, problem solving, and transfer.

The first crucial base of designing framework was activating cognitive structure, problem solving, transfer ,it illustrated the underline theories used in design the component called “problem base” of the learning environments to for promote problem solving. The underlined theories used for activating cognitive structure were as follows:

Cognitive constructivism(piaget,1992); cognitive conflict, situated learning(Brown, Collins & Duguid, 1989); Authentic context. These theories were transformed into practice as problem situation in order to induce the learners into discovery learning process.

As for 7 step of problem solving (Jonassen,1987) as following: Step 1: Learners Articulate Problem Space and Contextual Constraints Step 2: Identify and Clarify Alternative Opinions, Positions, and Perspectives of Stakeholders Step 3: Generate Possible Problem Solutions

Step 4: Assess the Viability of Alternative Solutions by Constructing Arguments and Articulating Personal Beliefs

Step 5: Monitor the Problem Space and Solution Option

Step 6: Implement and Monitor the Solution Step 7: Adapt the Solution were transformed into practice as learning task in order to promote problem solving. This may help activating cognitive structure and problem solving of the student as show in figure 2.

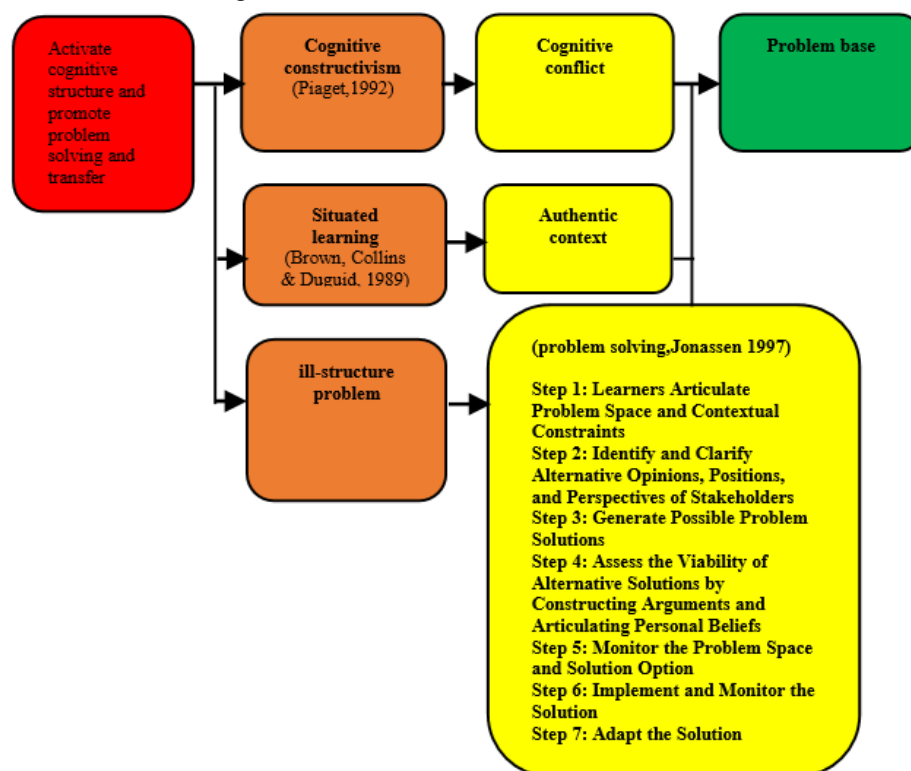

Figure 2: The designing framework: Activate cognitive structure and promote problem solving and transfer
(1) Support for adjusting cognitive structure

The second crucial base of designing framework was Support for adjusting cognitive structure, it illustrated the underline theories used in design the component called “Resources” of the learning environments to for promote problem solving and transfer . The underlined theories used for Supporting for adjusting of cognitive structure were as follows: information processing theory (Klausmeier, 1985): sensory register, working-memory, long-term memory): Cognitive load theory (sweller,1994): Chunking, Hierarchical network and media attribute symbol. These theories were transformed into practice as learning resources in order to provide information for

the learners to construct the knowledge. This may help learner processing information effectively and understand easily as shown Figure 3.

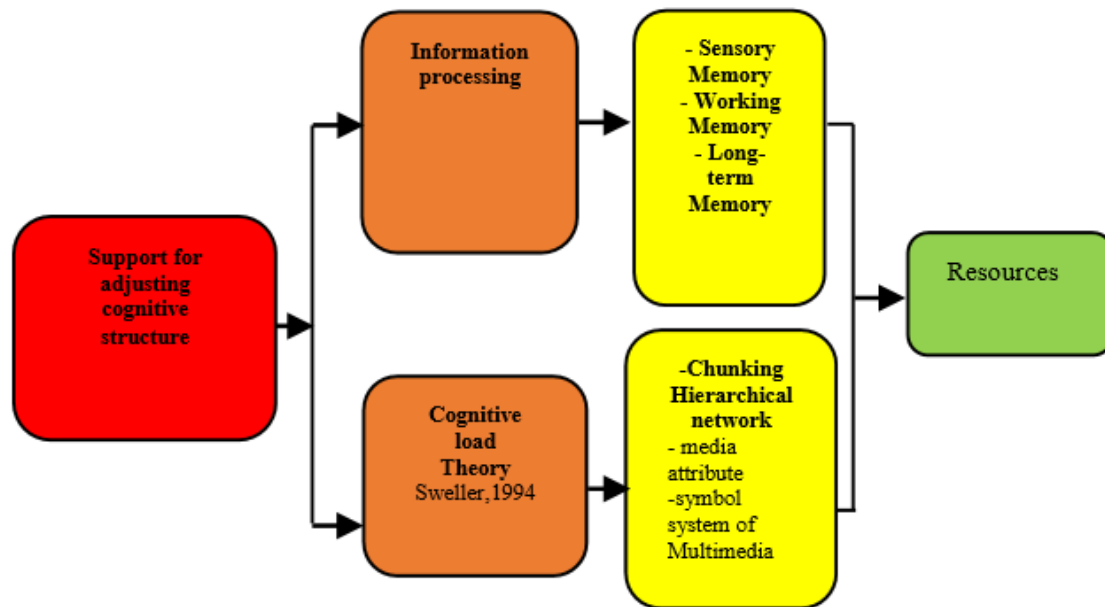

Figure 3: The designing framework: Support for adjusting cognitive structure
(2) Support for enlarge cognitive equilibrium

The third crucial base of designing framework was Support enlarge cognitive equilibrium, it illustrated the underline theories used in design the component called “Collaboration for problem solving” and “Cognitive tool”. The underlined theories used for Support for enlarge cognitive equilibrium were as follows: Social constructivist theory (Piaget,1992): Collaborative Activity Cognitive tool(OLEs,Hanafin,1999): Seeking tool, Collecting tool, Generating tool, Organizing tool, Integrating tool. These theories were transformed into practice as learning resources in order to provide information for the learners to construct the knowledge. This may help learner for enlarge cognitive equilibrium as shown Figure 4.

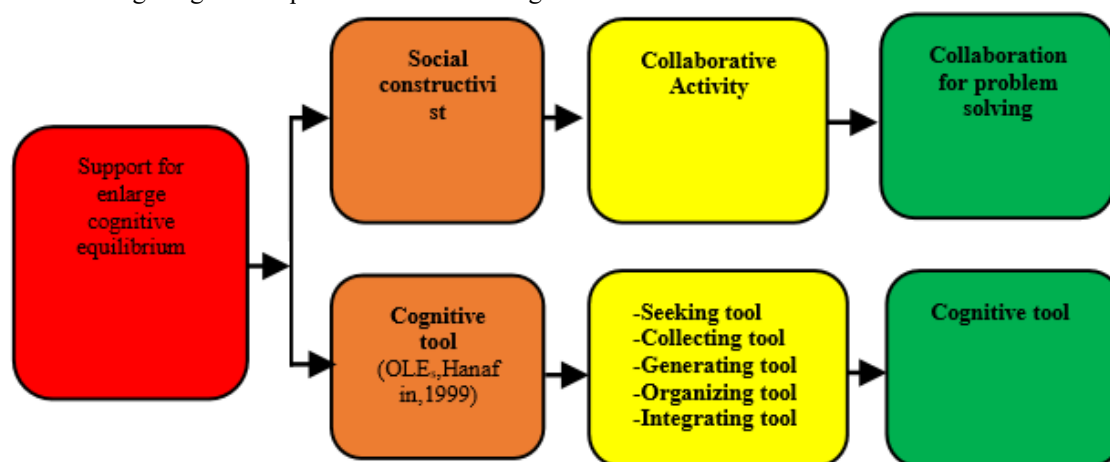

Figure 4: The designing framework: Support for enlarge cognitive equilibrium
(3) Foster for problem solving and transfer Practical Skills

The fourth crucial base of designing framework was Support for Foster for problem solving and transfer Practical Skills , it illustrated the underline theories used in design the component called “Center for enhancing problem solving ”and “Center for transfer of Practice Skills” of the learning environments to for promote problem solving and transfer . The underlined theories used for Supporting for Foster for problem solving and transfer Practical Skills were as follows: ill-structure Problem (Jonassen,1997): Step 1) Learners Articulate Problem Space and Contextual Constraints Step 2) Identify and Clarify Alternative Opinions, Positions, and Perspectives of Stakeholders Step 3) Generate Possible Problem Solutions Step 4) Assess the Viability of Alternative Solutions by Constructing Arguments and Articulating Personal Beliefs Step 5) Monitor the Problem

Space and Solution Option Step 6) Implement and Monitor the Solution Step 7) Adapt the Solution were transformed into practice as learning task in order to promote problem solving. Analogical transfer (Gentner, Holyoak & Kokinov): retrieving a prior knowledge structure, mapping, mapping Practical skill : Training Practical skill. These theories were transformed into practice as learning resources in order to provide information for the learners to construct problem solving and transfer Practical Skills shown Figure 5.

Figure 5: The designing framework: Foster for problem solving and transfer Practical Skills
(4) Promote and assist knowledge construction

The fifth crucial base of designing framework was Support for promote and assist knowledge construction, it illustrated the underline theories used in design the component called “Scaffoldings” and “Coaching” of the learning environments to for promote and assist knowledge construction. The underlined theories used for promote and assist knowledge construction were as follows: Scaffolding (Hanafin,1999): Conceptual Scaffolding, Strategic Scaffolding, Metacognition Scaffolding Cognitive apprenticeship (Brown,1989): Coaching. These theories were transformed into practice as learning resources in order to provide information for the learners to construct the knowledge. This may help promote and assist learner as shown Figure 6.

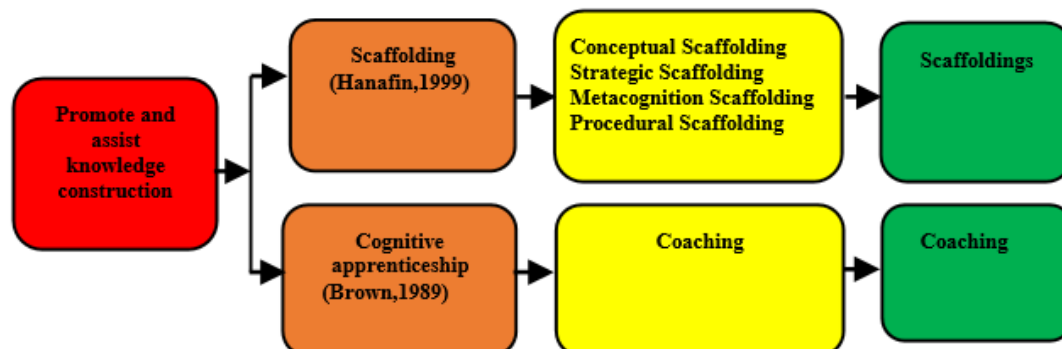

Figure 6: Promote and assist knowledge construction
The element of the designing framework

The designing framework of Constructivist Web-Base Learning Environment Model to Enhance Problem Solving for Transfer of Practical Skills for Industrial Engineering Student showed 9 elements as following details:

Element Describe the elements Example of design Shot	Element Describe the elements Example of design Shot
Problem base	Problem base was designed framework to activate cognitive structure into disequilibrium by using situated learning (Brown, Collins & Duguid, 1989): Authentic context as simulate the real world in order to induce the learners into discovery learning process. And 7 step of problem solving (Jonassen,1987): Step 1 Learners Articulate Problem Space and Contextual Constraints Step 2: Identify and Clarify Alternative Opinions, Positions, and Perspectives of Stakeholders Step 3: Generate Possible Problem Solutions Step 4: Assess the Viability of Alternative Solutions by Constructing Arguments and Articulating Personal Beliefs Step 5: Monitor the Problem Space and Solution Option Step 6: Implement and Monitor the Solution Step

Element Describe the elements Example of design Shot	Element Describe the elements Example of design Shot
Problem base	Problem base was designed framework to activate cognitive structure into disequilibrium by using situated learning (Brown, Collins & Duguid, 1989): Authentic context as simulate the real world in order to induce the learners into discovery learning process. And 7 step of problem solving (Jonassen,1987): Step 1 Learners Articulate Problem Space and Contextual Constraints Step 2: Identify and Clarify Alternative Opinions, Positions, and Perspectives of Stakeholders Step 3: Generate Possible Problem Solutions Step 4: Assess the Viability of Alternative Solutions by Constructing Arguments and Articulating Personal Beliefs Step 5: Monitor the Problem Space and Solution Option Step 6: Implement and Monitor the Solution Step Step 7: Adapt the Solution were transformed into practice as learning task in order to promote problem solving were used to design learning task for promoting Problem solving and transfer .
Resources	Resources was designed to support for adjusting cognitive disequilibrium by using essential principles and theories as following: information processing theory (Klausmeier,1985), and Cognitive load theory. (sweller,1994), media attribution, symbol system of multimedia, These theories were applied to design the learning resources for providing information for the learners to construct the knowledge. This may help the learners processing information effectively.

Cognitive tool	Cognitive Tool Center was designed to support the learners to enable and facilitate the cognitive processing tasks associated with open-ended learning. Cognitive Tool (OLE, hannafin,1999) was used to design the Cognitive Tool Center. This may help the learners to enlarge their cognitive structure (Hannafin,1999)
Collaboration for problem solving	Collaboration for problem solving Center was designed to support for collaborate solve problem. Social constructivism (Vygotsky,1962) was used to design the Social Collaboration Center. It may help support the learners for sharing experiences, multiple perspectives, and adjust misconception.
Center for enhancing problem solving	Center for enhancing problem solving was designed to learner's drill for solve problem with authentic context . problem solving (Jonassen,1987) used to design center for enhancing problem solving . It may help the learners to solve ill-structure problem .
Center for transfer of Practice Skills	Center for transfer of Practice Skills was designed to support for transfer of learner's Practice Skills. Analogical transfer(Gentner ,Holyoak &Kokinov,2001) used to design center for enhancing transfer of Practice Skills. It may help the learner's transfer of Practice Skills from one context to each.
Related cases	Related cases was designed to present related cases for learner in order to solve problem and help learners meaningful learning. Analogical transfer(Gentner ,Holyoak &Kokinov,2001) used to design Related cases. It may help the learners to transfer knowledge for solve problem
Scaffoldings	Scaffolding center was designed to support and encourage knowledge construction of the learners. 4 scaffolding (Hannafin, 1999): Conceptual Scaffolding, Metacognitive Scaffolding, Procedural Scaffolding, Strategic Scaffolding were used to design Scaffolding Center. It help the learners to learning or practical when them can not with themselves.
Coaching	Coaching Center was designed to support for providing hints and helps when needed, monitor learners' performance and help learners reflect on their performance. Cognitive apprenticeship (Collins, Brown and Newman,1989) used to design Coaching Center. It may help from novice learners to expert learner and prevent misconception of the learners.

CONCLUSION AND DISCUSSION

The designing framework of Constructivist Web-based Learning Environment Model to enhance Problem Solving and Transfer of Practical Skills for Industrial Engineering Student bases as following: (1) Activate cognitive structure and promote problem solving and transfer (2) Support for adjusting cognitive structure (3) Support for enlarge cognitive structures (4) Foster for problem solving and transfer Practical Skills (5) promote and assist knowledge construction. According to above 6 bases of the designing framework were transformed into practice as 9 elements the Constructivist Web-based Learning Environment Model to enhance Problem Solving and Transfer of Practical Skills for Industrial Engineering Student as following: (1) Problem base (2) Resources (3) Cognitive tool (4) Collaboration for problem solving (5) Center for enhancing problem solving (6) Center for transfer of Practice Skills (7) Related cases (8) Scaffoldings, and (9) Coaching.

This finding was consistent with Chaijareon, S., Charuni S (2016); Suchat, W., Charisa,P., (2010) These previous research found that the students showed their problem solving and transfer and the framework of constructivist web-based learning environment model used problem solving and transfer foundation of the design. As for this research finding may be the result of Instructional design Theory (ID Theory) that used underlined theories especially the problem solving theory (Jonassen,1997) and transfer theory (Gentner ,Holyoak &Kokinov,2001) as the foundation of the design. This was shown in the designing framework of the Constructivist web-based learning environments model to enhance problem solving and transfer of practical skills . This may help learners to foster problem solving and transfer of practical skills . In addition, the

theoretical validity of the designing framework of the Constructivist web-based learning environment model was found from assessment by experts. As mentioned findings can be supported the designing framework of the Constructivist Web-based Learning Environment Model to enhance Problem Solving and Transfer of Practical Skills for Industrial Engineering Student

ACKNOWLEDGEMENT

This research was supported by Ph.D. Program in Educational Technology, Faculty of Education, Research Group for Innovation and Cognitive Technology, Khon Kaen, University, and Research and Technology Transfer Affairs Division, KhonKaen University which hereby giving the thankfulness all through this.

ABSTRACT

The purpose of this research was to synthesize theoretical framework and designing framework of constructivist web-based learning environment to enhance Creative thinking for Junior high school. The procedures were as follow: 1.) study of principles involved in creating a conceptual framework. 2) Synthetic frame theoretical framework in the learning environment on web base. The results revealed that 1) The theoretical framework of 6 base were as follows: (1) Psychological base (2) Pedagogical base (3) Technological base (4) Media theory base (5) Creative thinking base and (6) Learning and Teaching Contextual base. 2) Synthesis of theoretical and conceptual framework to design a model learning environment on the network Consists of 4 steps and 7 elements include: 1) Activate Cognitive to structure that promotes creativity. 2) Support to accommodation of intellectual 3) Supporting and enlarge for constructing knowledge creativity 4) Supporting and enlarge for constructing knowledge 5) Promote the creation of knowledge and creativity. 5) Assist and support the creation of knowledge and creativity. And 7 elements as following: 1) Problem base 2) Resource 3) Collaboration 4) Cognitive tools 5) Creative thinking Center 6) Scaffolding and 7) Coaching

INTRODUCTION

At present, Thai society is a rapidly changing society. And there are new problems all the time. Therefore, quality development is the most important. To prepare people for change. And to a new era firmly. And know the world the key development mechanism is people. Education by education must develop people to quality. Think of and there is a way to think logically. As can be seen from the National Education Act, 1999. Section 22 Education must be based on the principle that all learners have the ability to learn and develop themselves and that the learner is the most important. The educational process must encourage learners to develop. Natural and full of potential " Based on this principle, the focus is on students to act. And can be learned all over the place and at all times is consistent with web-based learning. This is an educational innovation with features that respond to knowledge creation. And promote creativity. It is evident that network learning is a media attribution. And the symbolic system of media (Symbol systems) in the form of hypermedia, presented both animated graphics, text, voice (Salomon, 1977; Hannanfin, 1999. Jonassen and Henning, 1999; Jordan, 2003; Sumalee Chaijaroen, 2008)

Thailand has made education reform a learning-oriented learning, the brain can develop their potential to cause to learn maximum and a solid foundation to your well-being. Valuable and creative (Sansani and Usa, 2544:11). Country of Thailand, critical to the development of creative thinking that is the important thing that is needed to support our students. Constantly because creativity affect developing countries in future by taken. Targeted to education, as defined in the Education Act 2542 (1999) Chapter 4 section 24 national 2 and 3 text messages saying "give school the Grand thought processes to manage the situation and knowledge application, tight encounter used to protect vehicles and fix the problem by arranging activities to students Learn from the real experience of training practices, do, think as a love of reading and knowledge continually "(Commission of national Education, 2002:13). Creativity is the process of the human brain that are important to humans. To make a human being born to discover new ways to solve problems can be invented, invention demonstrations including the discovery concept theory is very useful to be able to improve. Change in the living conditions and the environment in a manner that creative people can live in a society in today's world of comfort and joy. Creativity is an important one, in which there is in every human being and has the ability to generate ideas. Imagination can correct the situation or environment changed quickly. Creativity is therefore critical thinking power. If it has been encouraging and promoting development. Systematic and applied appropriately, it will be beneficial for themselves and the nation, and particularly if there are people in society who have a creative high, it will be driven to develop and progress rapidly. Creative person, there is a need of society. The development of a creative person, so it is a particularly important goal of societies and Nations (Sompon , 1999:1)

(Office of the National Education Committee , 2545:13) , creativity is a feature that is in every person at different levels and can promote and further promote this feature. (1997: Miler, 12) by Torrance (Torrance, 1965:8), said that creativity can be developed with teaching. Training and practice that is how. Based on the creative framework of Guilford (1967), it consists of originality thinking, fluent thinking, flexibility thinking, and Elaboration thinking.

For this reason, the researcher is aware of the importance. And memory to design some theoretical frameworks based on constructivist learning environments that promote creativity among junior high school students. Using a learner-centered instructional process is critical to designing a learning environment on the network. Can be used as a lane in the development of thinking. To use as a guideline in learning management aimed at students to learn the content along with creative development. The findings will lead to the development of the quality of students with the modern world. To be useful in bringing knowledge to self-development. It also leads to development in the promotion of creativity.

The purpose of this study

To synthesize theoretical framework and designing framework of constructivist web-based learning environment to enhance Creative thinking for Junior high school.

Target Group

The target groups of this study consisted of two experts to assess the designing framework of the constructivist web-based learning environment model to enhance creative thinking.

Research instrument

the instrument in the study consisted of 4 instrument as following.

1. The expert review recoding form checking the quality of the designing framework.
2. The Recoding form for synthesis of the theoretical framework web-based learning environment model to enhance learner's creative thinking.
3. The Recoding form for synthesis of the Designing framework web-based learning environment model to enhance learner's creative thinking.

Data collection and analysis

The procedure of gathering and analysis data were as follows:

1. The synthesis of a theoretical framework of the Constructivist web-based learning environment model to enhance creative thinking. The data were collected by using the recoding for synthesis of the theoretical framework. Summarization, interpretation and analytical description were use analyze data.
2. The synthesis of designing framework of the Constructivist web-based learning environment model to enhance creative thinking. The data were collected by using the recoding for synthesis of the theoretical framework. Summarization, interpretation and analytical description were use analyze data.

Research result

1. Theoretical framework

Theoretical framework of creative learning environment based on constructive network. For junior high school students of 6 base were as follows: (1 Psychological base (2 Pedagogical base (3 Technological base (4 Media theory base (5Creative thinking base and (6Learning and Teaching Contextual base.

Figure 1. Theoretical framework of creative learning environment based on constructive network. For junior high school students

Psychological base (Instructional design) this is an important area where theories of learning are used as the basis for teaching design. To promote knowledge building among learners. And internal development (Cognitive process) Meaningful learning is more than just information acquisition. Therefore, the creative learning environment model based on constructive networks. Of junior high school students the basic psychology of learning is based on the two main theoretical concepts. Constructivist Theory and cognitive theory.

Pedagogical base Constructivism is the design of instructional design. The researcher has taken as a basis for the study. Includes OLEs model CLEs model SOI model Situated learning and Collaborations model.

Technology Basics It is a web based learning design. It provides a learning environment that mixes design and teaching. (Instructional design) And the application of Internet resources. To promote effective learning. Learning on the network consists of 2 major components. 1) web base learning And 2) media symbol system.

Media theory base the theory of media using the media symbol system. That explains the effect of media on learning. Each type of media has a different symbol system. This is the basis of design. It shows the characteristics of each type of media. The design does not take into account only media type or category.

Creative thinking base Foundation of creativity by introducing Guilford's Creative Theory (1967) it is an individual's ability to think in a multitude of directions. Also known as divergent thinking. By expression of thought or action resulting from learning And Hyper linking prior knowledge with new experiences together. And create a new work or outcome. Including the discovery of a solution to the problem. Creativity consists of four different thinking abilities: 1) original 2) Fluency 3) Flexibility 4) Elaboration

2. The Designing framework

According to this study, the findings of synthesis of the designing framework of the learning environments model to promote Creative Thinking found 5 crucial bases as the following details:

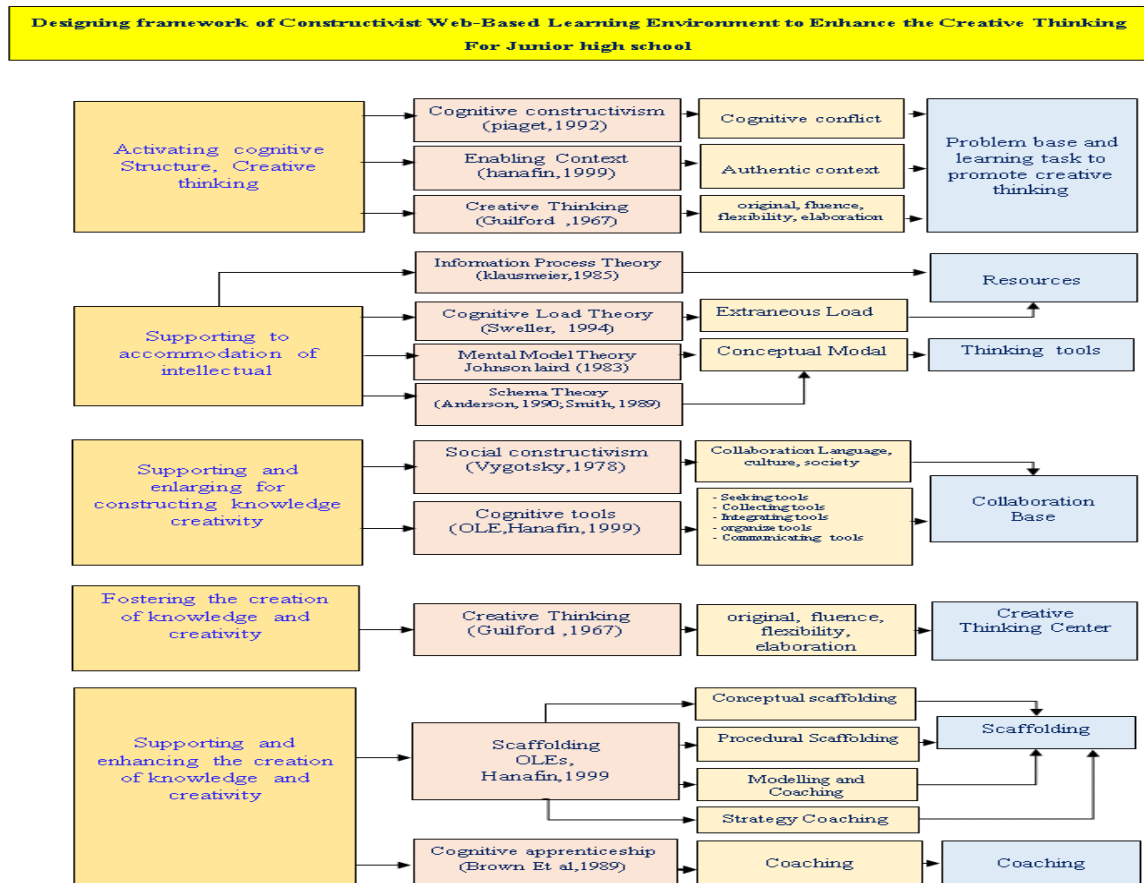

Figure 2. Designing framework of creative learning environment based on constructive network. For junior high school students

1. Activating cognitive structure and Creative Thinking

Figure 3 Activating cognitive structure and Creative Thinking

The first crucial bases of the designing framework was Activating cognitive Structure, creative Thinking, it illustrated the underlined theories used in design the component called “Problem bases” of the learning environments to for promote Creative Thinking. The underlined theories used for activating cognitive structure were as follows: Cognitive constructivism (Piaget, 1992); cognitive conflict, Enabling contexts OLE (Hannafin, 1999); Externally Induced, OLEs (Hannafin, 1999). These theories were transformed

Ac for 4 abilities of Creative thinking (Guilford, 1967) as following: Fluency, Flexibility, Originality, Elaboration were transformed into practice as learning task in order to promote Creative thinking. This may help activating cognitive structure and Creative thinking of the student as show in figure 3

2. Supporting to accommodation of intellectual

Figure 4. Supporting to accommodation of intellectual

Supporting to accommodation of intellectual. The second crucial bases of the designing framework was Supporting for adjusting of cognitive disequilibrium, it illustrated the underlined theories used in design the component called “Resources” and “thinking tools” of the learning environments to for promote Creative Thinking. The underlined theories used for Supporting for adjusting of cognitive disequilibrium were as follows: information processing theory (Klausmeier, 1985): sensory register, short-term memory, long-term memory): Cognitive load theory (sweller, 1994): Chunking, Hierarchical network and media attribute symbol system of Multimedia; still picture, motion picture, text, sound Schema theory: Schema as memory structure, Schema as context, Schema as network; SOI model (Johnson-Larid, 1983) Knowledge is stored in the mental model. With the linkage of information. The information inside the mental model can be re-created. (Restruction) with experience. (Learning) and the pattern of the problem. (Anderson, 1990; Smith, 1989) "What create Instead of an object or event within a "mental representation" and “script”. These theories were transformed into practice as learning resources and thinking tools in order to provide information for the learners to construct the knowledge. This may help learner processing information effectively and understand easily as shown Figure 4.

3. Supporting and enlarging for constructing knowledge creativity

Figure 5. Supporting and enlarging for constructing knowledge creativity

Supporting and enlarging for constructing knowledge creativity. The third crucial bases of the designing framework was Supporting for enlarging cognitive structure. it illustrated the underlined theories used in design the component called “Collaboration base” of the learning environments to for promote Creative Thinking. The underlined theories used for Supporting for enlarging cognitive structure were as follows: Social constructivist (Vygotsky, 1978); Collaboration, social, Language, Culture. These theories were transformed into practice as learning Collaboration in order to provide the learners collaboration problem solving and enlarging knowledge construct. Ac for 5 abilities Cognitive Tool (OLEs, Hannafin, 1999): Seeking tool, collecting tool, generating tool, organizing tool, integrating tool. Elaboration were transformed into practice as cognitive tools base in order to provide the learners enlarging knowledge construct. As shown Figure 5.

4. Fostering the creation of knowledge and creativity.

Figure 6. Fostering the creation of knowledge and creativity

Fostering the creation of knowledge and creativity. The fourth crucial bases of the designing framework was Supporting for Fostering for Creative Thinking. it illustrated the underlined theories used in design the component called “creative thinking center” of the learning environments to for promote Creative Thinking. The underlined theories used for Fostering for Creative Thinking were as follows: Creative Thinking (Guilford, 1967): Fluency,

Flexibility, Originality, Elaboration were transformed into practice as Intelligent thinking base in order to promote Creative thinking. This may help Fostering for Creative thinking of the student as show in figure 6

5. Supporting and enhancing the creation of knowledge and creativity

Figure 7. Supporting and enhancing the creation of knowledge and creativity

Supporting and enhancing the creation of knowledge and creativity. The fifth crucial bases of the designing framework was Supporting for enhancing for Creative Thinking. it illustrated the underlined theories used in design the component called “Scaffolding” and “Coaching” of the learning environments to for promote Creative Thinking. The underlined theories used for enhancing for Creative Thinking were as follows: Social constructivist Scaffolding (Hannafin, 1999): Conceptual Scaffolding, Strategic Scaffolding, Metacognition Scaffolding, and Procedural Scaffolding. These theories were transformed into practice as Scaffolding base in order to provide help with learning and adjusting of cognitive disequilibrium. Ac for Cognitive apprenticeship (Brown, 1989): Coaching. Elaboration were transformed into practice as Coach Base in order to provide the learners enlarging knowledge construct. As shown Figure 7.

The designing framework: Thinking Constructivist learning environment to promote Creative thinking comprised of 7 components as follows:

Element Describe the elements Example of design Shot	Element Describe the elements Example of design Shot
Problem base and learning task to promote creative thinking	Problem base and learning task to promote creative thinking was designed framework to activate cognitive structure into disequilibrium by using enabling contexts: Externally Induced (Hannafin, 1999) as open problem situation in order to induce the learners into discovery learning process. And 4 abilities of Creative Thinking (Guilford, 1967): Fluency, Flexibility Originality, and Elaboration were used to design learning task for promoting Creative Thinking.
Resources	Resources was designed to support for adjusting cognitive disequilibrium by using essential principles and theories as following: information processing theory (Klausmeier,1985), SOI model (Mayer, 1996) Mental model theory 0, Schema theory, and Cognitive load theory. (sweller,1994), media attribution, symbol system of multimedia, these theories were applied to design the learning resources for providing information for the learners to construct the knowledge. This may help the learners processing information effectively.
Thinking Tools	Thinking tools was designed to support the learners to enable and facilitate the cognitive processing tasks associated with open-ended learning. Cognitive Tool (OLE, hannafin, 1999) was used to design the Cognitive Tool Center. This may help the learners to enlarge their cognitive structure (Hannafin, 1999)

Collaboration base	Collaboration Base was designed to support for enlarging cognitive structure and promoting Creative Thinking. Social constructivism (Vygotsky, 1962) was used to design the Social Collaboration Center. It may help support the learners for sharing experiences, multiple perspectives, and adjust misconception.
--------------------	---

Element	Describe the elements	Example of design	Shot
Cognitive Tool base			enlarge their cognitive structure (Hannafin, 1999)
Creative Thinking Center			Creative Thinking Center was designed to foster Creative Thinking. Guilford (1967). 4 abilities of Creative thinking theory: Fluency, Flexibility Originality, Elaboration were used to design the Creative Thinking Center. It may help the learners to foster creative thinking.
Scaffolding			Scaffolding center was designed to support and encourage knowledge construction of the learners. 4 scaffolding (Hannafin, 1999): Conceptual Scaffolding, Metacognitive Scaffolding, Procedural Scaffolding, Strategic Scaffolding were used to design Scaffolding Center. It may help the learners to guide and support learning efforts in their knowledge construction process.
Coaching			Coaching Center was designed to support for providing hints and helps when needed, monitor learners' performance and help learners reflect on their performance. Cognitive apprenticeship (Collins, Brown and Newman, 1989) used to design Coaching Center. It may help the learners to conduct their performance effectively and prevent misconception of the learners.

SUMMARY AND DISCUSSION RESULTS

The result of the design of the learning environment on the network along the construction of Martin wit to promote creativity. For junior high school students found that theoretical framework comprises 6 Basic were as follows: (1) Psychological base (2) Pedagogical base (3) Technological base (4) Media theory base (5) Creative thinking base and (6) Learning and Teaching Contextual base. And Designing framework of the learning environments model to promote Creative Thinking found 5 crucial bases as the following details: 1) Activating cognitive structure and Creative Thinking 2) Supporting to accommodation of intellectual 3) Supporting and enlarging for constructing knowledge creativity 4) Fostering the creation of knowledge and creativity 5) Supporting and enhancing the creation of knowledge and creativity And 7 elements as following: 1) Problem base 2) Resource 3) Collaboration 4) Cognitive tools 5) Creative thinking Center 6) Scaffolding and 7) Coaching.

This study focuses on theoretical synthesis of theoretical framework. It is the first factor that is critical to the design and development of a learning environment based on a Constructivist learning environment. To promote creativity for junior high school students. The next effective, It also allows designers to perform clearly based on theoretical frameworks. As well as the use of research processes as a basis for design and development.

ABSTRACT

The purpose of this research was to synthesize theoretical and designing framework of constructivist web-based learning environment model to enhance creative thinking. Document analysis and survey research were employed in this study. The procedures were as follows: 1. to examine and analyze principles, theories and related researches, 2. to study instructional context 3. to synthesize the theoretical and the designing framework. The result revealed that: 1) The theoretical framework consisted of 5 bases were as follows: (1) pedagogical base, (2) psychological base, (3) Technological and media theory base, (4) Contextual base and (5) Neuroscience base 2) The designing framework consisted of 5 stages and 7 elements, were as follows: (1) Activating cognitive structure and promoting Creative Thinking (2) Supporting for adjusting of cognitive equilibrium (3) Supporting for enlarging cognitive structure (4) Fostering creative thinking (5) Supporting and encouraging knowledge construction and 7 element as following: (1) Problem Bases, (2) Learning Resources, (3) Social Collaboration Center (4) Cognitive Tools (5) Creative Thinking Center (6) Scaffolding center (7) Coaching Center

Keywords— Web-based learning environment, Constructivist theory, Creative thinking

INTRODUCTION

The changing of world society and advancement of technology is influenced society in globalization. This change affects human being need to learn all their life or life- long learning, especially 21 century learning focuses on learning and creative skills. However, at present instructional management focuses on transmitting and memorizing information. This results in lacking of creativity and information seeking skills of the learners.

Above mentioned reasons, it is necessary to adapt the learning strategies to meet the 21 century learners' characteristics. Therefore, the instruction design must be changed in order to foster creative thinking and information seeking skills and knowledge construction rather than passively receive the knowledge. Instructional Design Theory (ID Theory) was used in this design. Crucial theories used as foundation were Constructivist theories: Social Constructivism and Cognitive Constructivism, Cognitive theories: Information processing and the Creative thinking. These theories may help the knowledge construction and creative thinking of the learners, especially in the course Multimedia Production and Presentation for Education. Moreover, the media attribute and symbols system of web base comprises of hypertext, hyperlink, and hyperlink media may support the knowledge construction and creative thinking.

For the above reasons, researchers realize the importance of synthesizing the designing framework of the Constructivist web based learning model to enhance creative thinking. This framework may help designer to effectively design the Constructivist web based learning environment model. In addition, it will help to confirm the credibility and provide beneficial guideline for the designer to design the Constructivist web based learning environment model.

THE PURPOSE OF THIS STUDY

To synthesize the designing framework of constructivist web-based learning environment model to enhance creative thinking.

Research design

Document analysis and survey research were employed in this study

Target Group

The target groups of this study consisted of 3 experts to assess the designing framework of the Constructivist web-based learning environment model to enhance Creative thinking.

Research instruments

The instruments in this study consisted of 2 instruments as following:

- 1) The expert review record form for checking the quality of the designing framework.
- 2) The synthesis of the designing framework record form for record the data for synthesis of the designing framework of the web-based learning environments model to enhance the learner's creative thinking.

Data collecting and analysis

The procedure of gathering and analysis data were as follows:

- 1) Synthesis of theoretical framework of the constructivist web-based learning environment model to enhance creative thinking. The data were collected by using the recording form for synthesis of the theoretical framework. Summarization, interpretation and analytical description were used to analyze the data.
- 2) Synthesis of designing framework of cognitive web-based learning environment model to enhance Creative thinking. The data were collected by using the recording form for synthesis of the designing framework. Summarization, interpretation and analytical description were used to analyze the data.

Research Results

1. The stage of the designing framework

According to this study, the findings of synthesis of the designing framework of the constructivist learning environments model to promote Creative Thinking showed 5 stages were as follows: (1) Activating cognitive structure and promoting Creative Thinking (2) Supporting for adjusting of cognitive equilibrium (3) Supporting for enlarging cognitive structure (4) Fostering creative thinking (5) Supporting and encouraging knowledge construction. The details of these 5 stages as the following:

1. Activating cognitive structure and promoting Creative Thinking

The first crucial bases of the designing framework was activating cognitive structure and promoting creative thinking. It illustrated underlined theories used to design the component called “Problem Base” of the learning environments to promote creative thinking. The underlined theories used for activating cognitive structure were as follows: cognitive constructivism (Piaget, 1964); cognitive conflict, enabling contexts OLE (Hanafin,1999); externally induced, OLEs (Hannafin,1999); these theories were transformed into design problem situation in order to induce the learners into discovery learning process. As for 4 abilities of creative thinking (Guilford, 1967); fluency, flexibility originality, elaboration were transformed into practice as learning task in order to promote creative thinking. This may help activating cognitive structure and creative thinking of the learners as shown in figure 1

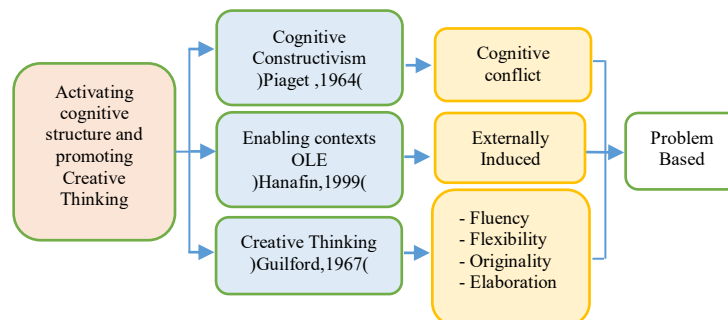

Figure 1. The designing framework: Activating cognitive structure and promoting Creative Thinking

2. Supporting for adjusting of cognitive equilibrium

The second crucial bases of the designing framework was supporting for adjusting of cognitive equilibrium, it illustrated the underlined theories used to design the component called “Learning Resources” of the learning environments to promote creative thinking. The underlined theories used for supporting for adjusting of cognitive equilibrium were as follows: information processing theory (Klausmeier, 1985); sensory register, short-term memory, long-term memory; cognitive load theory (sweller,1994); chunking, hierarchical network and media attribute symbol system of multimedia; still pictures, motion pictures, text, sound: schema theory; schema as context, schema as network: SOI model (Mayer, 1996) selecting, organizing, integrating; mental model theory; conceptual model. These theories were transformed into practice as learning resources in order to provide information for the learners to construct the knowledge. This may help the learners processing information effectively and understand easily as shown in Figure 2

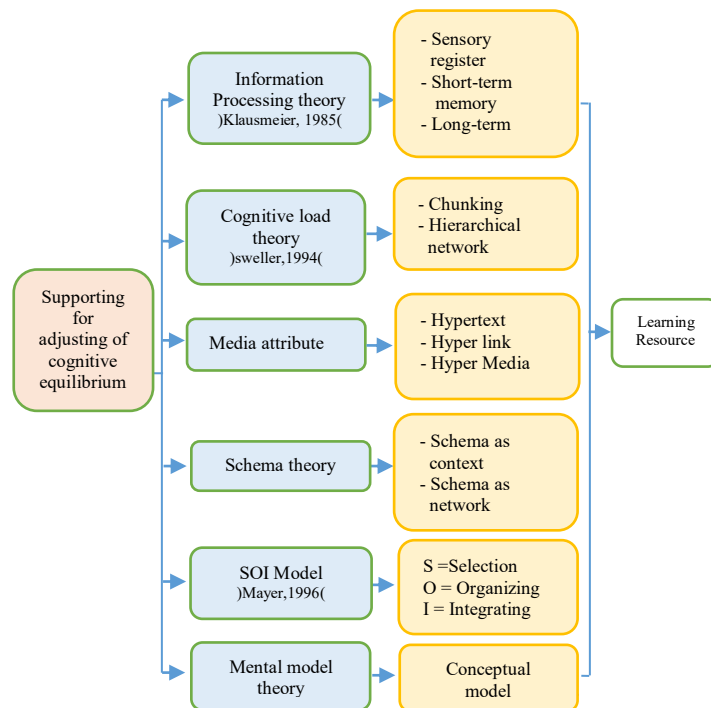

Figure 2. The designing framework supporting for adjusting of cognitive equilibrium

3. Supporting for enlarging cognitive structure

The third crucial bases of the designing framework was supporting for enlarging cognitive structure, it illustrated the underlined theories used to design the component called “Social Collaboration Center” of the learning environments to promote Creative Thinking. The underlined theories used for supporting for enlarge cognitive structure were as follows: Social constructivism (Vygotsky, 1962); language, culture and society. These help support learners to share experiences, multiple perspectives, and adjust misconceptions. Cognitive tools (Hannafin, 1999) comprise of Seeking Tool, Collecting Tool, Organization Tool, Integrating Tool, Generation Tool. These 5 tools help support learners to enable and facilitate the cognitive processing associated with open-ended learning. This may help learners supporting for enlarging cognitive structure as shown in figure 3.

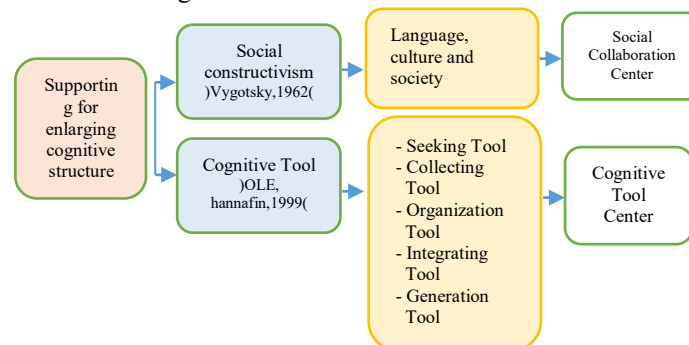

Figure 3. The designing framework supporting for enlarging cognitive structure

4. Fostering creative thinking

The fourth crucial bases of the designing framework was fostering creative thinking it illustrated the underlined theories used to design the component called “Creative Thinking Center” of the learning environments to promote creative thinking. The underlined theories used for fostering creative thinking: fluency, flexibility originality, elaboration Guilford (1967). This may help learners to foster creative thinking as shown in Figure 4

Figure 4. The designing framework fostering creative thinking

5. Supporting and encouraging knowledge construction

The fifth crucial bases of the designing framework was supporting and encouraging knowledge construction, it illustrated the underlined theories used to design the component called “Scaffolding center” of the learning environments to promote creative thinking. The underlined theories used for supporting and encouraging knowledge construction were as follows: Social Constructivism (Vygotsky, 1978): Zone of Proximal Development; 4 scaffolding (Hannafin, 1999): conceptual scaffolding, metacognitive scaffolding, procedural scaffolding, strategic scaffolding, and cognitive apprenticeship; coaching. These theories were transformed into practice as scaffolding center in order to guide and support learning efforts of learners. This may support and encourage the learners to construction knowledge. As shown in Figure 5

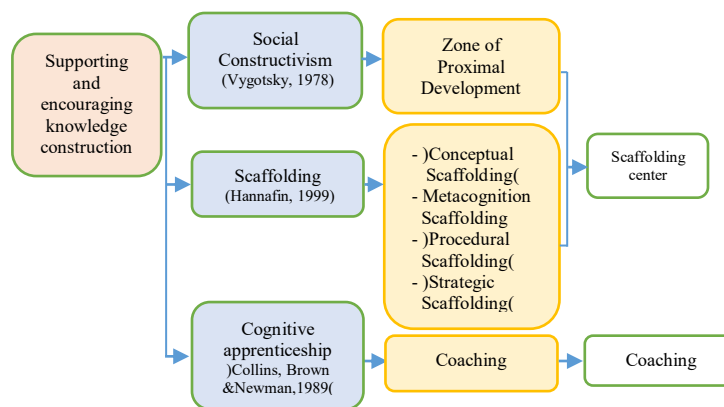

Figure 5. The designing framework supporting and encouraging knowledge construction

2. The elements of the designing framework

The designing framework of the constructivist learning environments models to promote creative thinking showed 7 elements as following details:

Element Describe the elements	Describe the designing elements of the Constructivist Learning Environment model
Problem Base	Problem base was designed to activate the cognitive structure into disequilibrium by using enabling contexts: Externally Induced (Hannafin, 1999) as open problem situation in order to induce the learners into discovery learning process. And 4 abilities of Creative Thinking (Guilford, 1967): Fluency, Flexibility Originality, Elaboration were used to design learning task for promoting Creative Thinking.
Learning Resources	Learning Resources was designed to support for adjusting cognitive equilibrium by using essential principles and theories as following: information processing theory (Klausmeier, 1985), Cognitive load theory (sweller, 1994), media attribution, symbol system of multimedia, Schema theory, SOI model (Mayer, 1996) and Mental model. Theory. These theories were applied to design the learning resources for providing information for the learners to construct the knowledge. This may help the learners processing information effectively.
Social Collaboration Center	Social Collaboration Center was designed to support for enlarging cognitive structure and promoting Creative Thinking. Social constructivism (Vygotsky, 1962) was used to design the Social Collaboration Center. It may help support the learners for sharing experiences, multiple perspectives, and adjust misconception.
Cognitive Tool Center	Cognitive Tool Center was designed to support the learners to enable and facilitate the cognitive processing tasks associated with open-ended learning. Cognitive Tool (OLE, hannafin, 1999) was used to design the Cognitive Tool Center. This may help the learners to enlarge their cognitive structure (Hannafin, 1999)
Creative Thinking Center	Creative Thinking Center was designed to foster Creative Thinking. Guilford (1967). 4 abilities of Creative thinking theory: Fluency, Flexibility Originality, Elaboration were used to design the Creative Thinking Center. It may help the learners to foster creative thinking.
Scaffolding Center	Scaffolding center was designed to support and encourage knowledge construction of the learners. 4 scaffolding (Hannafin, 1999): Conceptual Scaffolding, Metacognitive Scaffolding, Procedural Scaffolding, Strategic Scaffolding were used to design Scaffolding Center. It may help the learners to guide and support learning efforts in their knowledge construction process.
Coaching Center	Coaching Center was designed to support for providing hints and helps while learners needed, monitor learners' performance and help learners to reflect on their performance. Cognitive apprenticeship (Collins, Brown and Newman, 1989) used to design Coaching Center. It may help the learners to conduct their performance effectively and prevent misconception of the learners.

3. Assessment of the designing framework of the Constructivist web-based learning environment model to enhance Creative thinking by experts. It showed the congruence between the underlined theories and the design of all 7 elements.

CONCLUSION

The designing framework of the Constructivist web-based learning environments model comprised of 5 stage as following: 1) Activating cognitive structure and promoting Creative Thinking, 2) Supporting for adjusting of cognitive equilibrium, 3) Supporting for enlarging cognitive structure, 4) Fostering Creative Thinking and 5) Supporting and encouraging knowledge construction. According to above 5 stages of the designing framework were transformed into practice as 7 elements the Constructivist web-based learning environments model to enhance Creative thinking as following: 1) Problem base, 2) Learning Resource, 3) Social Collaboration Center, 4) Cognitive Tool Center, 5) Creative Thinking Center, 6) Scaffolding center 7) Coaching Center.

This finding was consistent with Chaijareon, S., Samat, C., Kanjug, I., (2012); Techapornpong, O., Chaijareon, S., (2017) These previous research found that the students showed their creative thinking and the framework of constructivist web-based learning environment models. As for this research finding may be the result of Instructional design Theory (ID Theory) that used underlined theories especially the creative Thinking theory (Guilford, 1967): Fluency, Flexibility Originality, Elaboration as the foundation of the design. This was shown in the designing framework of the Constructivist web-based learning environments model to enhance Creative thinking. This may help learners to foster creative thinking. In addition, the theoretical validity of the designing framework of the Constructivist web-based learning environment model was found by experts reviewed. As mentioned findings can be supported the designing framework of the Constructivist web-based learning environment model to enhance Creative thinking. The designing framework of the Constructivist web-based learning environments model was recognized as the important one. Since it can support and help the designers to design effectively and clearly. If lacking of this framework how can the designer perform it effectively.

ABSTRACT

The purpose of this research was to synthesize designing framework of constructivist web-based learning environment model to enhance information processing. Document analysis and survey research were employed in this study. The procedures were as follows: 1. To examine and analyze the principles, theories and related researches, 2. To study instructional context 3. To synthesize the theoretical framework, and 4. To synthesize the designing framework. The results revealed that: 1) The theoretical framework consists of 5 crucial bases were as follows: (1) Psychological base, (2) Pedagogical base, (3) Technological base, (4) Context base, and (5) Neuroscience base 2) The designing framework consisted of 5 stages and 7 element as following: 1) Activating cognitive structure and promoting information processing 2) Supporting for adjusting of cognitive equilibrium 3) Supporting for enlarge cognitive structure, 4) fostering information processing, and 5) supporting and encouraging knowledge construction and 7 element as following: (1) Problem Base, (2) Learning Center (3) cognitive tool Center, (4) Social Collaboration Center, (5) Information Processing Center, (6) Scaffolding Center and (7) Coaching Center.

INTRODUCTION

Due to the changes of society in the world and technological changed has influenced on the knowledge based and digital society. This change affect learning skill of the learners especially information processing. In addition, the teaching and learning management also focused on the transmission and memorization. It results in lacking of seeking skill, information processing and knowledge construction.

Therefore, it is necessary to adapt the learning strategies to keep pace with above mentioned change. Therefore, the instruction design must be changed in order to foster information processing and information seeking skills and knowledge construction rather than passively receive the knowledge.

Instructional Design Theory (ID Theory) need to use in this design. Theory used as foundation were Constructivist theory: Social constructivism and cognitive constructivism, Cognitive theory: Information Processing. These theories may help the knowledge construction and information processing of the learners, especially on English vocabulary. Moreover, the media attribute and symbol system of web baes comprises of hypertext, hyperlink, and hyperlink media may support the knowledge construction and information processing. For the above reasons. researchers recognize the importance of synthesizing the designing framework of the Constructivist web based learning model to enhance information processing. This framework may help designer to effectively design the Constructivist web based learning environment model. In addition, it will help to confirm the credibility and provide obvious guideline for the designer to design the Constructivist web based learning environment model to enhance information processing.

THE PURPOSE OF THIS STUDY

To synthesize the designing framework of the constructivist learning environment to enhance information processing.

Research design

Document analysis and survey research were employed in this study.

Target Group

The target groups of this study consisted of 3 experts to assess the Designing framework of the Constructivist web-based learning environment model to enhance information processing.

Research instruments

The instruments in this study consisted of 2 instruments as following:

- 1) The expert review recording form for checking the quality of the designing framework.
- 2) The recording form for synthesis of the designing framework of the constructivist learning environment to enhance information processing.

Data collecting and analysis

The procedure of gathering and analysis data were as follows:

- 1) Synthesis of the theoretical framework of the constructivist learning environment to enhance information processing. The data were collected by using the recording form for synthesis of the theoretical framework. Summarization, interpretation and analytical description were used to analyze the data.
- 2) Synthesis of the designing framework of the constructivist learning environment to enhance information processing. The data were collected by using the recording form for synthesis of the designing framework. Summarization, interpretation and analytical description were used to analyze the data.

Research Results

1. The designing framework

According to this study, the finding of synthesis of the designing framework of the constructivist learning environment to enhance information processing. found 5 crucial bases as the following details:

1. Activating cognitive structure and promoting information processing

The first crucial bases of the designing framework was activating cognitive structure and promoting information processing. It illustrated the underlined theories used in design the component called “Problem Based” of the constructivist learning environment to promote information processing the underlined theories used for activating cognitive structure as following: cognitive constructivism (Piaget, 1964): cognitive conflict, situated learning (Brown et al., 1989): authentic context. These theories were transformed into practices as problem situations in order to induce the learners into discovery learning process. As for 4 abilities of information processing (Klausmeier, 1985) as following: sensory memory, short term memory, and long term memory. Elaboration were transformed into practices as learning task in order to promote information processing. This may help activating cognitive structure and information processing of the learners as shown in **Figure 1**.

Figure 1. The designing framework: Activating cognitive structure and promoting information processing

2. Supporting for adjusting of cognitive disequilibrium

The second crucial bases of the designing framework was supporting for adjusting of cognitive disequilibrium, it illustrated the underlined theories used in design the component called “Resources Center” of the constructivist learning environment to promote information processing. The underlined theories used for supporting for adjusting of cognitive disequilibrium were as follows: information processing theory (Klausmeier, 1985): sensory register, short-term memory, long-term memory, Cognitive Load theory (sweller,1994): chunking, hierarchical network and media attribute symbol system of multimedia; still picture, motion picture, text, sound, and SOI model (Mayer, 1996); selection, organizing, integrating, These theories were transformed into practice

as resources center in order to provide information for the learners to construct the knowledge. This may help learner processing information effectively and understand easily as shown in **Figure 2**.

Figure 2. The designing framework: Activating cognitive structure and promoting information processing

3. Supporting for adjusting of cognitive disequilibrium

The second crucial bases of the designing framework was supporting for adjusting of cognitive disequilibrium, it illustrated the underlined theories used in design the component called “Resources Center” of the constructivist learning environment to promote information processing. The underlined theories used for supporting for adjusting of cognitive disequilibrium were as follows: information processing theory (Klausmeier, 1985): sensory register, short-term memory, long-term memory, Cognitive Load theory (sweller,1994): chunking, hierarchical network and media attribute symbol system of multimedia; still picture, motion picture, text, sound, and SOI model (Mayer, 1996); selection, organizing, integrating, These theories were transformed into practice as resources center in order to provide information for the learners to construct the knowledge. This may help learner processing information effectively and understand easily as shown in **Figure 3**.

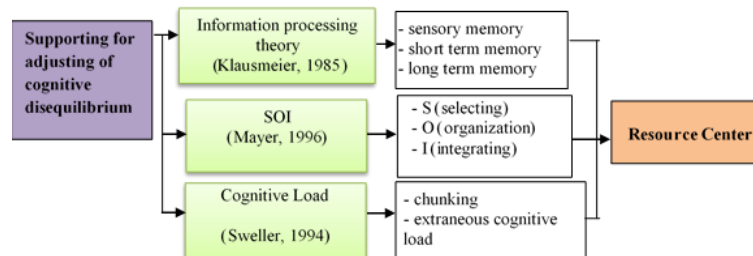

Figure 3. The designing framework: Supporting for adjusting of cognitive disequilibrium.

4. Supporting for enlarging cognitive structure

The third crucial bases of the designing framework was supporting for enlarging cognitive structure, It illustrated the underlined theories used in design the component called “Social Collaboration Center” of the constructivist learning environment to promote information processing. The underlined theories used for supporting for enlarging cognitive structure as following: Social constructivism (Vygotsky, 1978); language, culture, and society. These help support learners to share experiences, multiple perspectives, and adjust misconception. Cognitive tools (Hannafin, 1999) comprise of seeking tool, collecting tool, generating tool, organizing tool, and integrating tool. These 5 tools help support learners to enable and facilitate the cognitive processing tasks associated with learning. This may help learners supporting for enlarging cognitive structure as shown in **Figure 4**.

Figure 4. The designing framework: supporting for enlarge cognitive structure

5. Fostering information processing

The fourth crucial bases of the designing framework was fostering Information Processing, it illustrated the underlined theories used in design the component called “Information Processing Center” of the constructivist learning environment to promote information processing. The underlined theories used for information processing theory (Klausmeier, 1985): sensory memory, short term memory, and long term memory. This may help learner to foster information processing as shown in **Figure 5**.

Figure 5. The designing framework: Fostering of information processing

6. Supporting and encouraging knowledge construction

The fifth crucial bases of the designing framework was supporting and encouraging knowledge construction, it illustrated the underlined theories used in design the component called “Scaffolding Center” of the constructivist learning environment to promote information processing. The underlined theories used for supporting and encouraging knowledge construction were as follows: social constructivism (Vygotsky, 1978): zone of proximal development, 4 scaffolding (Hannafin, 1999): conceptual scaffolding, strategic scaffolding, metacognitive scaffolding, and procedural Scaffolding, and cognitive apprenticeship (Brown et al., 1989). These theories were transformed into practice as Coaching Center in order to guide and support learning efforts of learners. This may support and encourage the learners to knowledge construction as shown in **Figure 6**.

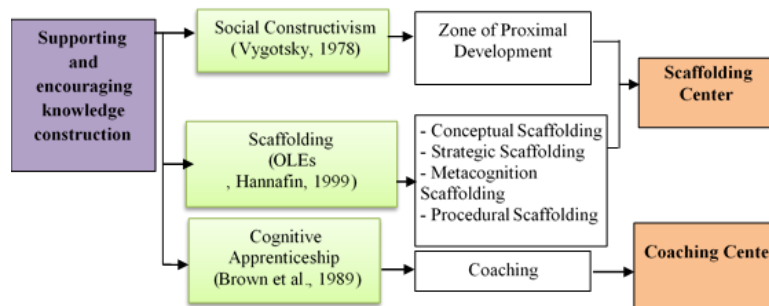

Figure 6. The designing framework: Supporting and encouraging knowledge construction

2. The constructivist learning environment to promote information processing.

The constructivist learning environment to promote information processing designing framework comprised of 7 components as follows:

Element	Describe the elements
Problem base	Problem base is designed to activating cognitive structure into disequilibrium by using Cognitive constructivism (Piaget, 1964) and Situated learning: authentic context (Brown et al., 1989) as problem situation in order to induce the learners into discovery learning process. And 3 abilities of Information processing theory (Klausmeier, 1985): sensory memory, short term memory, long term memory were used to design learning task for promoting Information processing.
Resources Center	Resources Center was designed to support for adjusting cognitive equilibrium by using essential principles and theories as following: information processing theory (Klausmeier, 1985), Cognitive Load theory (sweller, 1994), media attribution, symbol system of multimedia, and SOI model (Mayer, 1996). These theories were applied to design the Resources Center for providing information for the learners to construct the knowledge. This may help the learners processing information effectively.
Social Collaboration Center	Social Collaboration Center was designed to support for enlarging cognitive structure and promoting Information Processing. Social constructivism (Vygotsky, 1962) was used to design the Social Collaboration Center. It may help support the learners for sharing experiences, multiple perspectives, and adjust misconception.
Cognitive Tool Center	Cognitive Tool Center was designed to support the learners to enable and facilitate the cognitive processing tasks associated with learning. Cognitive tools (OLE, Hannafin, 1999) was used to design the Cognitive Tool Center.
Element	Describe the elements
	This may help the learners to enlarge their cognitive structure (Hannafin, 1999).
Information Processing Center	Information Processing Center was designed to foster Information Processing. (Klausmeier, 1985). 3 abilities of Information Processing theory: sensory memory, short term memory, and long term memory were used to design the Information Processing Center. It may help the learners to foster information processing.
Scaffolding Center	Scaffolding Center was designed to support and encourage knowledge construction of the learners. 4 scaffolding (Hannafin, 1999): conceptual scaffolding, metacognitive scaffolding, procedural scaffolding, strategic scaffolding were used to design Scaffolding Center. It may help the learners to guide and support learning efforts in their knowledge construction process.
Coaching Center	Coaching Center was designed to support for providing hints and helps when needed, monitor learners' performance and help learners reflect on their performance. Cognitive Apprenticeship (Brown et al., 1989) used to design Coaching Center. It may help the learners to conduct their performance effectively and prevent misconception of the learners.

3.=Assessment of the designing framework of the Constructivist web-based learning environment model to enhance Information Processing by experts found the congruence between the underlined theories and the design.

CONCLUSION

The designing framework of the Constructivist web-based learning environments model comprised of crucial bases as following: 1) activating cognitive structure and promoting information processing 2) supporting for adjusting of cognitive equilibrium 3) supporting for enlarge cognitive structure, 4) fostering information processing, and 5) supporting and encouraging knowledge construction. According to above 5 bases of the designing framework were transformed into practice as 7 elements the Constructivist web-based learning environments model to enhance Information Processing as following: (1) Problem Base, (2) Learning Center (3) cognitive tool Center, (4) Social Collaboration Center, (5) Information Processing Center, (6) Scaffolding Center and (7) Coaching Center.

This finding was consistent with Kwangmuang, P., Chaijareon, S., Samat, C., Kanjug, I., (2012); Ployphan, N., Chaijareon, S., Phonimdaeng, Ch., (2006); Paisarn, J., Chaijareon, S., Phonimdaeng, Ch., (2006) These previous research found that the students showed their information processing and the framework for development of cognitive innovation to enhance knowledge construction and memory process as foundation of the design. As for this research finding may be the result of Instructional design theory (ID Theory) that used underlined theories especially the Information Processing theory (Klausmeier, 1985): sensory memory, short term memory, long term memory as the foundation of the design. This was shown in the designing framework of the Constructivist web-based learning environments model to enhance information processing. This may help learners to foster information processing. In addition, the theoretical validity of the designing framework of the Constructivist web-based learning environment model was found from assessment by experts. As mentioned findings can be supported the designing framework of the Constructivist web-based learning environment model to enhance information processing.

ABSTRACT

The purpose of this research was to synthesize theoretical framework and designing framework of constructivist web-based learning environment to enhance Problem Solving. The procedures were as follow: 1.) To study and analyze principles, theories and related researches. 2.) To synthesize the theoretical framework 3.) To survey instructional context 3) To synthesize the designing framework. The results revealed that 1) The theoretical framework consisted of 6 bases as following: (1) Psychological base (2) Pedagogical base (3) Technological base (4) Media theory base (5) Problem Solving base and (6) Learning and Teaching Contextual base. 2) The designing framework consisted of 4 steps and 7 elements included: 1) To activate Cognitive structure and promotes problem solving. 2) To support for adjusting cognitive equilibrium 3) To support for enlarging cognitive structure 4) To promote the knowledge construction and problem solving. 5) To support and enhance knowledge construction and Problem Solving. And 7 elements of the constructivist web-based learning environment as following: 1) Problem base 2) Resource 3) Collaboration 4) Cognitive tools 5) Problem Solving Center 6) Scaffolding and 7) Coaching.

Key words: Learning environment, Problem Solving

INTRODUCTION

The important and the need of the recent Education. The learners should be given a high- Higher-Order Thinking Skills such: Critical thinking, Analysis thinking, problem solving, and information transfer which focus on the use of methods. Simulation, discovery, problem solving and collaboration. Learners were receive the authentic experience, it can be congruent with the real life. Therefore, the instruction design must be changed in order to foster Problem Solving and information seeking skills and knowledge construction rather than passively receive the knowledge.

Instructional Design Theory (ID Theory) was used in this design. Essential theories used as foundation were as follows: Constructivist Theories, problem solving, transfer knowledge theories and media attribute, symbol system of web-base comprises of hyperlink hypertext , and hyperlink media my support the knowledge construction and problem solving.

THE PURPOSE OF THIS STUDY

To synthesize the designing framework of constructivist web-based learning environment model to enhance Problem Solving.

Research design

Document analysis and survey research were employed in this study

Target Group

The target groups of this study consisted of 3 experts to assess the designing framework of the Constructivist web-based learning environment model to enhance Problem Solving.

Research instruments

The instruments in this study consisted of 2 instruments as following:

- 1) The expert review record form for checking the quality of the designing framework.
- 2) The synthesis of the designing framework record form for record the data for synthesis of the designing framework of the web-based learning environments model to enhance the learner's Problem Solving.

Data collecting and analysis

The procedure of gathering and analysis data were as follows: 1) Synthesis of theoretical framework of the constructivist web-based learning environment model to enhance Problem Solving. The data were collected by using the recording from for synthesis of the theoretical framework. Summarization, interpretation and analytical description were used to analyze the data. 2) Synthesis of designing framework of cognitive web-based learning environment model to enhance Problem Solving. The data were collected by using the recording

from for synthesis of the designing framework. Summarization, interpretation and analytical description were used to analyze the data.

Research Results

1. The stage of the designing framework According to this study, the findings of synthesis of the designing framework of the constructivist learning environments model to promote problem solving. showed 5 stages were as follows: (1) Activating cognitive structure and promoting problem solving (2) Supporting for adjusting of cognitive equilibrium (3) Supporting for enlarging cognitive structure (4) Promoting the knowledge construction and problem solving (5) Supporting and enhance knowledge construction and problem solving. The details of these 5 stages as the following:

Activating cognitive structure and promoting Problem Solving

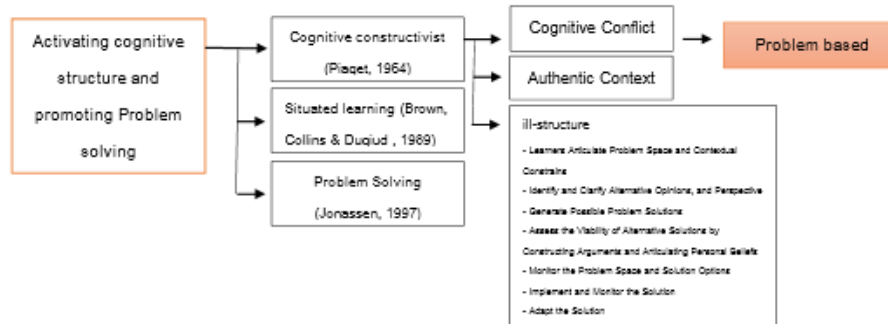

Figure 1. The designing framework: Activating cognitive structure and promoting Problem Solving

2. Supporting for adjusting of cognitive equilibrium

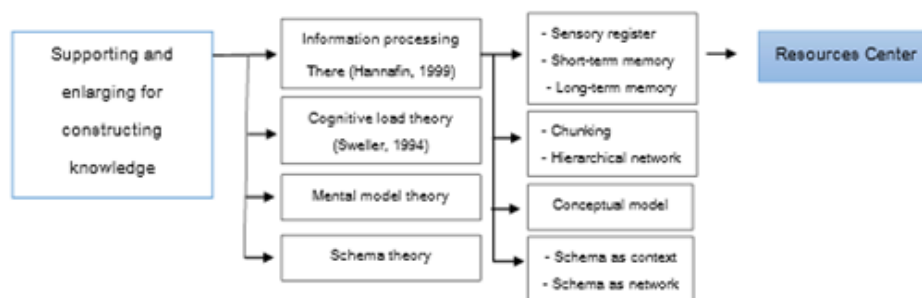

Figure 2. The designing framework supporting for adjusting of cognitive equilibrium

3. Supporting for enlarging cognitive structure

Figure 3. The designing framework supporting for enlarging cognitive structure

4. Promoting the knowledge construction and problem solving

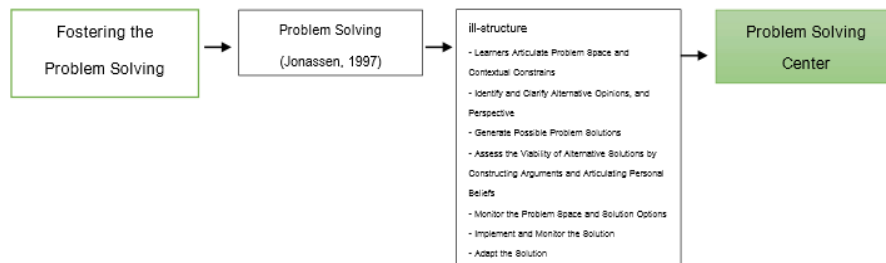

Figure 4. The designing framework Promoting the knowledge construction and problem solving

5. Supporting and enhance knowledge construction and problem solving

Figure 5. The designing framework supporting and enhance knowledge construction and problem solving

2. The elements of the designing framework

The designing framework of the constructivist learning environments models to promote problem solving showed 7 elements as following details:

Problem Base	Problem base was designed frame work to activate cognitive structure into disequilibrium by using enabling contexts: Externally Induced and Individually Induced (Hannafin, 1999) as open problem situation in order to induce the learners into discovery learning process and 4 abilities of Creative Thinking (Guilford, 1967): Fluency, Flexibility Originality, Elaboration were used to design learning task for promoting Problem Base.
Resources	Resources was designed to support for adjusting cognitive disequilibrium by using essential principles and theories as following: information processing theory (Klausmeier, 1985), SOI model (Mayer, 1996), Mental model theory (Johnsonlaid, 1983), Schema theory (Anderson, 1990; Smith, 1989), and Cognitive load theory. (sweller, 1994), media attribution, symbol system of multimedia, These theories were applied to design the learning resources for providing information for the learners to construct the knowledge. This may help the learners processing information effectively and understand easily.
Collaboration	Social Collaboration base was designed to support for enlarging cognitive structure and promoting Problem Solving . Social constructivism(Vygotsky, 1962) was used to design the Social Collaboration base. It may help support the learners for sharing experiences, multiple perspectives, adjust misconception, and collaboration problem solving.
Cognitive Tool	Cognitive Tool base was designed to support the learners to enable and facilitate the cognitive processing tasks associated with open-ended learning. Cognitive Tool (OLE, hannafin, 1999) was used to design the Cognitive Tool base. This may help the learners to enlarge their cognitive structure (Hannafin, 1999)
Problem Solving Center	Problem situation in order to induce the learners into discovery learning process. And 7 abilities of Problem Solving (Jonassen, 1997) as following: ill-structure 1) Learners Articulate Problem Space and Contextual Constrains 2) Identify and Clarify Alternative Opinions, and Perspective 3) Generate Possible Problem Solutions 4) Assess the Viability of Alternative Solutions by Constructing Arguments and Articulating Personal Beliefs 5) Monitor the Problem Space and Solution Options 6) Implement and Monitor the Solution 7) Adapt the Solution were used to design learning task for promoting Problem Solving.
Scaffolding	Scaffolding was designed to support and encourage knowledge construction of the learners. 4 scaffolding (Hannafin, 1999): Conceptual Scaffolding, Metacognitive Scaffolding, Procedural Scaffolding, Strategic Scaffolding were used to design Scaffolding. It may help the learners to guide and support learning efforts in their knowledge construction process.
Coaching	Coaching base was designed to support for providing hints and helps when needed, monitor learners, performance and help learners reflect on their performance. Cognitive apprentice (Collins, Brown and Newman, 1989) used to design Coaching Center. It may help the learners to conduct their performance effectively and prevent misconception of the learners.

3. Assessment of the designing framework of the Constructivist web-based learning environment model to enhance Problem Solving by experts. It showed the congruence between the underlined theories and the design of all 7 elements.

CONCLUSION

The designing framework of the constructivist web-based learning environment to enhance Problem Solving. The procedures were as follow: 1.) To study and analyze principles, theories and related researches. 2.) To synthesize the theoretical framework 3.) To survey instructional context 3) To synthesize the designing framework. The results revealed that 1) The theoretical framework consisted of 6 bases as following: (1) Psychological base (2) Pedagogical base (3) Technological base (4) Media theory base (5) Problem Solving base and (6) Learning and Teaching Contextual base. 2) The designing framework consisted of 4 steps and 7 elements included: 1) To activate Cognitive structure and promotes problem solving. 2) To support for adjusting cognitive equilibrium 3) To support for enlarging cognitive structure 4) To promote the knowledge construction and problem solving. 5) To support and enhance knowledge construction and Problem Solving. And 7 elements of the constructivist web-based learning environment as following: 1) Problem base 2) Resource 3) Collaboration 4) Cognitive tools 5) Problem Solving Center 6) Scaffolding and 7) Coaching This finding was consistent with Chaijareon, S., Samat, C., Kanjug, I., (2012); Techapornpong, O., Chaijareon, S., (2017) These previous research found that the students showed their Problem Solving and the framework of constructivist web-based learning environment models. As for this research finding may be the result of Instructional design Theory (ID Theory) . This was shown in the designing framework of the Constructivist web-based learning environments model to enhance Problem Solving. The designing framework of the Constructivist web-based learning environments model was recognized as the important one. Since it can support and help the designers to design effectively and clearly. If lacking of this framework how can the designer perform it effectively. This study focuses on theoretical synthesis of theoretical framework. It is the first factor that is critical to the design and development of a learning environment based on a Constructivist learning environment. To Enhance the Problem Solving. The next effective, It also allows designers to perform clearly based on theoretical frameworks. As well as the use of research processes as a basis for design and development.

ABSTRACT

The purpose of this research was to synthesize a theoretical framework and design framework of supervision models integrating technological competency and participatory supervision. Using the model of research (Model research) (Richey and Klein, 2007) in this study is Phase I research. 1) Theories and related research 2) Synthesis of theoretical frameworks. 3) Synthesis of designing frameworks for supervision models Integrating technological competency of Thailand 4.0 with participatory supervision. The results revealed that: 1) The theoretical framework of 8 base were as follows: (1) Supervision base (2) Learning and Teaching Contextual base (3) Psychological base (4) Pedagogical base (5) Technological base (6) Media theory base (7) Professional Learning Community base and (8) Competency teacher base. Consists of 5 steps and 8 elements include : (1) awareness (2) create knowledge (3) enhance experience (4) reflect on the development and (5) praise. The 8 elements are as follows: (1) knowledge & realize (2) workshop (3) web-based training with the environment constructivist learning (4) deceptive supervision (5) online supervision (6) learn & share (7) community learning and (8) showcase innovations.

Keywords: Participatory Supervision, technological competency of Thailand 4.0, constructivist

INTRODUCTION

The changing world society and the advancement of technology, society is influenced by globalization. Human beings need lifelong learning and 21st century learning that focuses on critical thinking skills and problem solving. In addition, the teaching-oriented teaching of relativity has resulted in the lack of critical thinking and problem solving. Knowledge building and lifelong learning which is necessary to respond to changing conditions. For the above reasons. Therefore, it is necessary to adjust the teaching methodology in response to the learners' characteristics. The teaching and learning management should change the knowledge transfer in the course. Come to promote encourage students to learn by themselves for life. Through the practice of learning skills. based on the current 21st century teaching concept. By focusing on students to act. Learn from the real experience. More than lectures Therefore, the learning design. It needs to be transformed to focus on learners as a means of seeking knowledge and critical thinking and problem solving based on a theoretical teaching design, Constructivist Theory supports self-knowledge, Critical thinking and problem solving Theory. It encourages students to be ready for the world of increasingly sophisticated work today. It is the basis for the design of teaching and learning individuals who play an important role in student development and teaching process are teachers. By stimulating attention and engaging classroom participation with technology advanced thinking skills development to promote learning both in and out of the classroom. Include the use of various measurement and evaluation of learning and focus on assessment to develop learners. Teachers were the most important role; including the concept of teacher development and new educational personnel, focusing on the development of teachers and educational personnel. It must bring about changes in the students that conjunction with

the concept of educational supervision, it is a work process that can be used in teacher professional development. Because it is a process that has helped and encourage elevation and improve the quality of education with the goal of student quality. The supervisors an important role in helping to improve teachers' teaching behaviors in with changing global environment.

For the above reasons researchers are aware of the importance of designing and developing models for integration in collaborative work with the introduction of concepts related to teacher professional development, educational supervision, and information and communication technology by integrating and working principles together to achieve a holistic, holistic work each element can harmonize with each other. It creates a balance that is holistic, as well as based on contextual studies. The education is based on the development of theoretical framework that study of relevant documents and research to develop an integrated supervision of innovation and information technology education with participatory supervision. As a guideline for the design and development of supervisory models to promote quality teachers that preparing to study in Thailand 4.0

THE PURPOSE OF THIS STUDY

To synthesize the theoretical framework and the designing framework of supervision models integrating technological competency and participatory.

Target Group

The target groups of this study consisted of three experts to assess the designing framework of supervision models integrating technological competency and participatory.

Research methodology

The research methodology of this study is the documentary research consisting of the documentary research, the principle and theory, related research, context condition about thinking and analyzing as well as synthesizing the theoretical framework in designing framework of supervision models Integrating technological competency and participatory supervision and the survey research used to collect the qualitative data.

Research instrument

The instrument in this study consisted of 4 instruments as following:

1. The expert review recording form for checking the quality of the designing framework.
2. The recording form for synthesis of the theoretical framework.
3. The recording form for synthesis of the designing framework.
4. The teacher's opinion on context of teaching and learning.

Data Collection and Data Analysis

The procedure of gathering and analysis data were as follows:

1. Synthesis of the theoretical framework of supervision models integrating technological competency and participatory.

The data were collected by using the recording form synthesis of the theoretical framework. Summarization, interpretation and analytical description were used to analyze the data.

2. Synthesis of the designing framework of supervision models Integrating technological competency and participatory.

The data were collected by using the recording form synthesis of the designing framework. Summarization, interpretation and analytical description were used to analyze the data.

Research Results

1. Theoretical framework

The theoretical framework of 8 base were as follows :)1(Supervision base)2(Learning and Teaching Contextual base

(3) Psychological base (4) Pedagogical base (5) Technological base (6) Media theory base (7) Knowledge management base and (8) Competency teacher base as shown in Figure 1

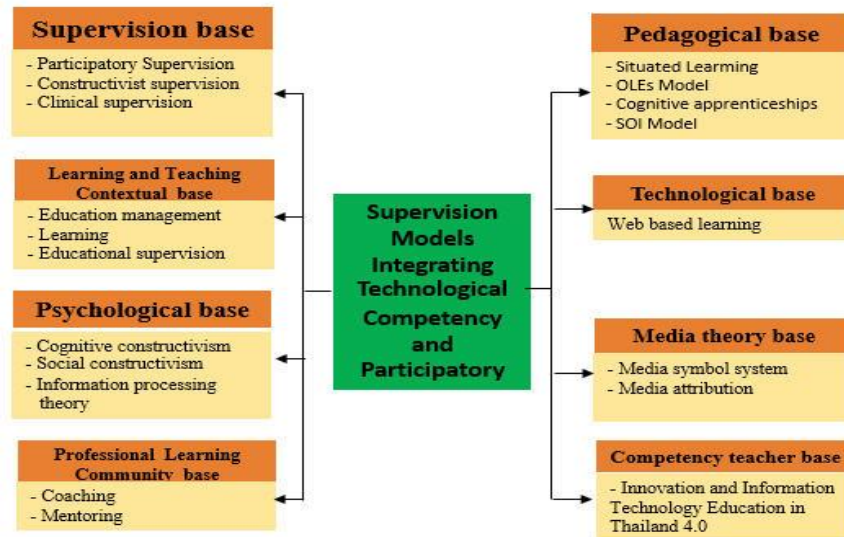

Figure 1: The theoretical framework of supervision models integrating technological and participatory.

2. The Designing framework

According to this study, the findings of synthesis of the designing framework for supervision models Integrating technological competency in Thailand 4.0 with participatory supervision found 5 crucial base as the following details :

1) Awareness

Is a conceptual framework for designing that enhance teacher knowledge, based on Smith's (2004) conceptual involvement and knowledge and competencies related to teacher performance (Teachers Council, 2005). Based on the theory, the researcher designed the element called **Know and realize** as shown in Figure 2

Figure 2: Awareness

2) Create knowledge

Is a designing framework that encourages teachers to develop competencies by allowing teachers to practice and build their own knowledge through cognitive processes based on previous experiences or knowledge, linked to new experiences to build teacher competencies. The design relied on Piaget's cognitive constructivism concept, along with Smith's concept of participation and teacher development, which were professionally standardized and standardized knowledge that includes knowledge and performance related to the work (Teachers Council, 2005) researcher have designed two elements ;

2.1 Workshop

2.2 Web-based training ; with a learning environment on a network based on Constructivist. This is a learning medium designed based on the conceptual basis of the constructivist theory, technological theory, media theory as shown in Figure 3

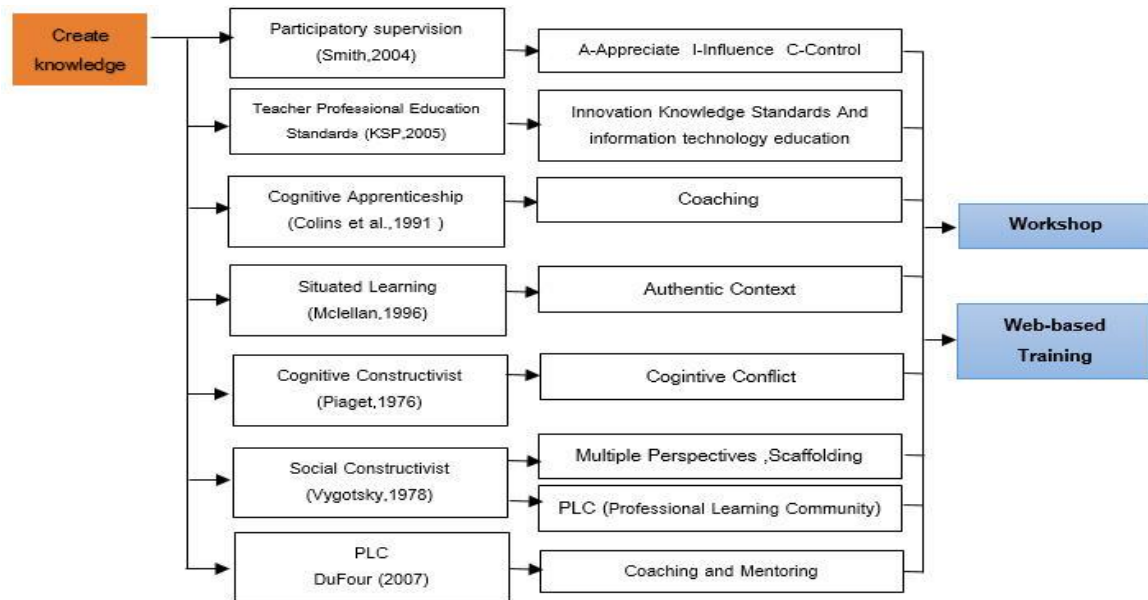

Figure 3 : Create knowledge

The designing framework: Web-based training; with a learning environment on a network based on Constructivist comprised of 7 components as follows as shown in Figure 4

Figure 4 : The designing framework : Web-based training with a learning environment

3) Enhance experience.

Introduce the Zepeda (2000) Constructivist conceptual basis with Smith's (2004) conceptual involvement and the Clinical supervision concepts of Goldhammer (1993) and the knowledge-based approach knowledge and competencies related to the performance of the teachers council (2005)

Researcher rely on the principles mentioned above. The basic design features are: 1) **Deceptive supervision** and 2) **Online supervision** as shown in figure 5

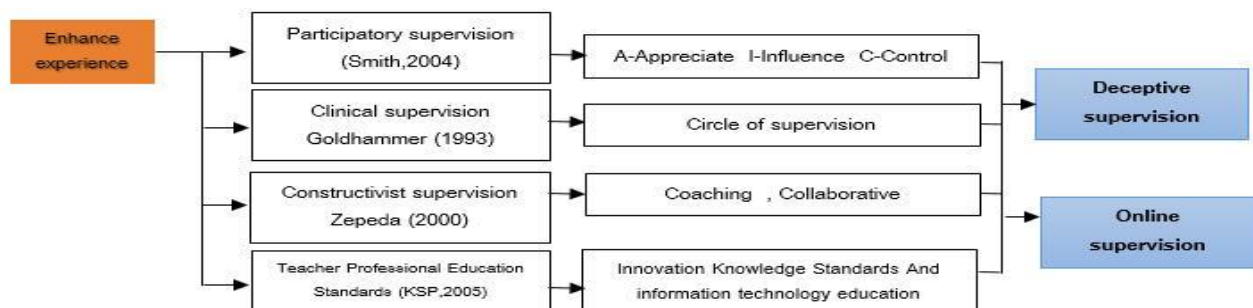

Figure 5: Enhance experience

4) Reflect on the development.

A designing framework that enhance the professional of teachers based on Professional Learning Community: PLC (Dufour,2007) Researcher rely on the principle as mentioned above, the basic design element is the 1) **Learn & Share** and 2) **Community Learning**. The researcher design was in the form of activities to support work and learning management by teachers or supervisors. Experienced by spending time together in various forms such and learning management by teachers or supervisors. Experienced by spending time together in various forms such as coaching, mentoring training between teachers as shown in figure 6

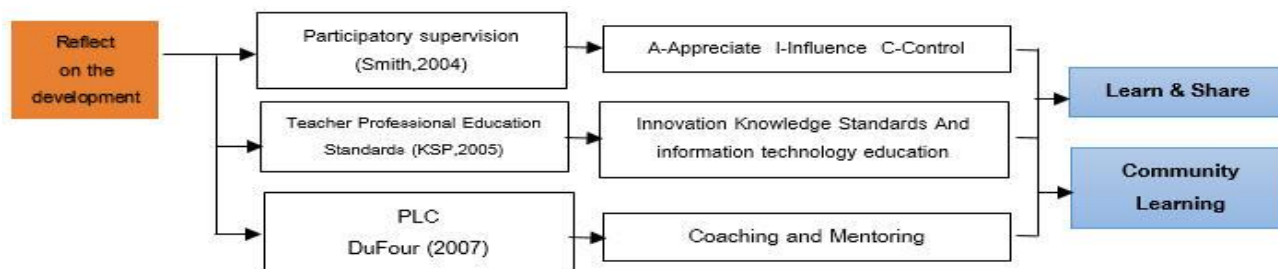

Figure 6 : Reflect on the development

5) Praise

Designing framework that enhance teacher performance on the basis of performance management (preservation and utilization) in accordance with the principles of the Office of Civil Service Commission (CSC) performance management for performance. Agencies should retain employees or take full advantage of their work. With continuous follow-up assignments. Improve employee capabilities evaluate performance and reward with good performance.

Researcher rely on the above principles as the basis for design elements called **Showcase Innovation** It is designed in a way that is assigned to the teacher create, design and develop learning innovations. And continuous follow up by the supervisor As well as the development of teachers' abilities through training and evaluate the performance to reward good performance so teachers have the ability to create and develop innovative learning and create a sustainable learning network as shown in figure 7

Figure 7 : Praise

CONCLUSION

The synthesis of the design of supervision models Integrating technological competency and participatory . by synthesis of the results of document research. The study of theoretical principles as the basis for theoretical frameworks found that:

1. Theoretical frameworks of 8 base were as follows: 1) (Supervision base) 2) (Learning and Teaching Contextual base) 3) Psychological base (4) Pedagogical base (5) Technological base (6) Media theory base (7) Professional Learning Community base and (8) Competency teacher base

2. The designing framework of supervision models integrating technological competency and participatory consists of 5 elements: 1) awareness ; is a framework in design that helps enhance teachers' knowledge based on Smith's (2004) participation concept and the knowledge and competencies involved in the implementation of teacher (Teachers Council, 2005) Researcher have designed an element called Know and realize, 2) create of knowledge ; It is a designing framework that focuses on encouraging teachers to build competency by allowing teachers to practice and build their own knowledge thought processes. The experience or knowledge to create new experiences linked to the performance of teachers. The design relied on Piaget's cognitive constructivism, along with Smith's concept of participation and teacher development, which were professionally standardized and standardized knowledge consists of knowledge and performance related to the work (Teachers Council, 2005). The researcher has designed two elements: (1) workshop and (2) web-based training with environment learning developed by the constructivist. This is a learning designed based on the conceptual basis of the constructivist theory. Technological theory, media theory, 3) Enhance experience ; applying Zepeda's (2000) Constructivist theory, participatory based on Smith's (2004) and the Clinical supervision concepts of Goldhammer (1993), the researcher has designed two elements are: (1) Deceptive supervision; (2) Online supervision; 4) Reflection on the development based on the Professional Learning Community: PLC (Dufour, 2007). Researcher design element called learn & share and Community learning 5) Praise it is a presentation of a best practice (Smart teacher) and to develop community learning which corresponds to the research of Nutchrat Prasitsinchai (2012), who studied of the integrating teacher's competency and participative supervision model which professional competency and the opinions of teachers who learned by integrating models between teacher professional development and participatory supervision, the model was appropriate and enhances professional competencies for teachers.

Determinants of Effectiveness of e-learning for College Students in South Korea

Kang-Sik KIM

School of Business

Korea Aerospace University

South Korea

kskim@kau.ac.kr

ABSTRACT

This paper focused on certain factors influencing the effectiveness of e-learning for college students in South Korea. For the study, a questionnaire was developed to measure the determinants of the effectiveness of e-learning and their effects on the effectiveness for students at Korean universities. A sample of randomly selected five hundred students from eight universities participated in the study. In order to find the answer to the question of effects of selected factors on the effectiveness of e-learning for college students, regression analysis of the collected data was made. It was found that all the selected factors were positively correlated with effectiveness of e-learning. Individual characteristics of students, such as motivation and experience of student, proved as strongest determinant followed by system characteristics as interaction and practice with significant predictive powers. Moreover, environmental factors, such as support and resources, moderated the relationship between both individual and system characteristics and the effectiveness of e-learning.

Key Words: E-learning, effectiveness, college students

INTRODUCTION

The development of e-learning system and the increased supply of e-learning opportunities are the most rapidly growing areas among all educational and training services. Effective e-learning is considered to have a potential to enhance the quality of learning, the access to education and training, and the cost-efficiency of education (Alexander, 2001). By reason of such advantages of e-learning, many on-campus colleges have adopted the use of on-line course delivery besides traditional class-room learning. However, despite such initiatives, e-learning adoption does not show in every case high level of effectiveness from the perspective of students' responses. Research has attempted to identify particular individual characteristics or other factors that can be used to predict the effectiveness of e-learning for students (Bouhnik & Marcus, 2006). Individual characteristics and other circumstances like system characteristics and environmental factors identified in previous studies, including clarity of design, interaction with instructors, and active discussion in the context of the course (Swan, 2001), will enhance the effectiveness of e-learning. Understanding individual and system characteristics of e-learning is a critical issue for improving the effectiveness of e-learning. Furthermore, a systematic understanding is required on internal and external environment of e-learning. This paper specifically focuses on the effectiveness of e-learning and the related precedent variables. So, this study reports the results of an analysis of factors that influence the effectiveness of e-learning.

LITERATURE REVIEW AND HYPOTHESIS

E-learning is learning utilizing electronic technologies to access educational curriculum outside of a traditional classroom. In most cases, it refers to a course, program or degree delivered completely online. There are many terms used to describe learning that is delivered online, via the internet, ranging from Distance Education, to computerized electronic learning, online learning, internet learning and many others. In this study, e-learning is defined as courses that are specifically delivered via the internet to somewhere other than the classroom where the instructor is teaching. Although e-learning has advantages over traditional classroom education (Piccoli et al., 2001), concerns include time, technology, support and resources involved in running e-learning environments. The high failure rate of e-learning implementations discussed by Arbaugh and Duray (2002) deserves attention from management and system designers.

Important variables concerning e-learning have been identified in previous studies. Liaw (2008) identified six critical dimensions that affect the effectiveness of e-learning: learner, instructor, course, technology, design, and environmental dimension. Liaw and Huang (2007) suggested that four elements should be considered when developing e-learning environments: learners' characteristics, learning activities, environmental characteristics, and environmental satisfaction. In e-learning environments, learning activities give learners and instructors a great chance to share their experience and knowledge. Additionally, environmental characteristics, such as synchronous or asynchronous interaction, will create a high-level communicative environment that allows learners not only to share information, but also to determine how to retrieve useful information. Moreover, environmental satisfaction will improve learners' perceptions of technology that might raise their participation in the learning processes. Basically, when users feel less self-confident toward information technology, they also

show less positive feelings toward the technology. According to existing research on the effectiveness of e-learning, there are several characteristics of e-learning systems that determine the level of the effectiveness of e-learning. For designing effective e-learning systems, Noesgaard and Oregreen (2015) suggested three considerations: individual factors, contextual factors, and e-learning solution and process. In developing e-learning system, it is necessary to understand the targeted population. Learner characteristics, such as motivation, learner preference, and previous e-learning experience need to be identified. Contextual factors refer to learning environment, support, technological resources available to user, and time available to learn. E-learning solution and process include interaction, practice, technological constraints, and usability.

Hypothesis

Individual characteristics and e-learning effectiveness

With regards to individual factors, the papers generally agree that effectiveness of e-learning varies according to individual differences (e.g. Armatas et al, 2003; Aydoğdu Karaaslan, 2013). Some papers refer to learner characteristics broadly and others discuss particular issues relevant to their study. The individual factors largely fit into two categories related to learner characteristics: experience and motivation. It is not surprising that the experience of learners, in terms of previous relevant work experience and online experiences, affects the effectiveness of e-learning. This factor seemed to determine the kind of attitude that learners ‘go into the learning process with’; previous experience can be beneficial, if the previous work and online experiences related the e-learning (Bennison and Goos, 2010; Haverila, 2010). Motivation to learn and engage with the e-learning is a key to the effectiveness of e-learning, especially when effectiveness is defined as the time spent using the product: ‘Results suggest the importance of motivation to learn and workload in determining aggregate time spent in e-learning courses’ (Brown, 2005: 465).

H1a. Experience of learner relates positively to the effectiveness of e-learning.

H1b. Motivation of learner relates positively to the effectiveness of e-learning.

System characteristics and e-learning effectiveness

For the e-learning solution and process, interaction and practice belong to the key factors (Noesgaard and Orngreen, 2015). The importance of these factors was determined as a result of the coding of the factors that influence effectiveness as well as the codes including the reasons that e-learning was or was not effective. Interaction is combined into interrelated factors, such as ‘instructional scaffolding’, ‘modeling’ and ‘support’. Though e-learning is often considered to be equally or more effective than classroom learning, interaction is generally considered very important for the effectiveness of e-learning. Practice is a recurring factor contributing to e-learning effectiveness. The learner is given the opportunity or is required to practice the educational material presented via the e-learning solution in case studies, simulations or actual work situations. This type of education is very valuable to equip students with a minimum of technical and non-technical skills before they use them in practice settings’ (Alinier et al, 2006).

H2a. Interaction relates positively to the effectiveness of e-learning.

H2b. Practice relates positively to the effectiveness of e-learning.

Environmental characteristics and e-learning effectiveness

In general, concerning the contextual factors, the key factors are quite clearly ‘resources’ (time, technology) and ‘support’ (from managers, IT personnel or peers) in the learning environment (Noesgaard and Orngreen, 2015). These factors are essential for using e-learning initiatives to improve performance and change behaviours. Technological resources market influences the effectiveness of e-learning. Especially, when there are not enough technological resources, learner has difficulties in attaining learning goal efficiently. Moreover, effectiveness of e-learning may be lower when there is not enough support from manager, IT personal or peers. Therefore, the following hypotheses are proposed:

H3a: Support moderates positively the relationship between experience and the effectiveness of e-learning.

H3b: Support moderates positively the relationship between motivation and the effectiveness of e-learning.

H3c: Resources moderate positively the relationship between experience and the effectiveness of e-learning.

H3d: Resources moderate positively the relationship between motivation and the effectiveness of e-learning.

DATA AND METHODS

The sample data were collected by mailing out questionnaires; 500 questionnaires were mailed to students at South Korean Universities. The duration of the study was three weeks and 349 effective questionnaires were returned, resulting in a valid response rate of 69.8%. The non-respondent bias was checked by observing the gender, age, and major of the targeted students. It was found that the non-responding students were not

statistically different in these dimensions from those that responded, suggesting that the sample represented the target population.

The questionnaires were designed by evaluating the related literature to determine the scales that demonstrate favorable reliability and validity before modifying the scales according to the study environment. In order to develop constructs for the study, seven-point Likert-type scales were used. Measurement scales had with reliable psychometric properties, validated in previous empirical studies. Reliability for each scale was determined using Cronbach's alpha. The reliability score is a measure of the internal consistency of the construct (Nunnally, 1978), and alpha values over 0.70 indicates sound reliable measures. Construct validity was assessed in using factor analysis described by Deshpande (1982). Principal component factor analysis provided factor loadings in order to assess construct validity. The factor loadings of the operationalized measurement scales provided indication of convergent and discriminant validity of the constructs. Although the researcher has discretion to determine the cut-off point for assessment of validity, many studies proposed that convergent validity is attained when factor loadings are ≥ 0.70 (Bagozzi, 1981; Nunnally, 1967) and the average variance extracted for each factor component is $\geq 50\%$ (Anderson and Gerbing, 1988).

The effectiveness of e-learning is operationalized by three indicators: learning efficiency, learning performance and learning motivation (Liaw, 2007). These indicators were measured using a Likert-type seven-point scale. Learner characteristics measured in this study made use of the subjective measurement of the experience and motivation. Experience and motivation have been used as proxy learner characteristics in previous studies. The variables were measured using a seven-point ordinal scale. Experience involved three items: previous online experience, computer competency, and prior knowledge about online course. Motivation was operationalized by three items: attitude toward learning, attitude toward self-development and attitude toward achievement. System characteristics in this study consisted of two dimensions: interaction and practice. Interaction dimension was operationalized by three indicators: interaction with instructor, interaction with peers, and interaction with materials. Practice dimension was made up of three items: practice the education material in case studies, simulations, and actual work situations. For environmental dimensions, we asked to evaluate the learner perceived support and resources available to user. Each variable was measured on a seven-point ordinal scale. The support concept consisted of three items: support from peers, manager and IT personnel. The resources concept involved three items: technological resources, time available to learn and usability. As control variables, two variables were used: gender and age of the respondent. Gender was classified as male (coded as one) and female (coded as zero). The age was defined by the number of years.

Table 1 presents a summary of the measurement scales, sample item used for the constructs, and the reliability of the constructs.

Table 1: Sample items, source and reliability of the constructs

Scale (Cronbach)	# of items	Sample items	Prior research
Experience (Cronbach Alpha=0.76)	3	previous online experience computer competency	(Noesgaard and Orngreen, 2015)
Motivation (Cronbach Alpha=0.79)	3	attitude toward learning attitude toward achievement	Sun et al. (2006)
Interaction (Cronbach Alpha=0.75)	3	interaction with instructor interaction with peers	(Noesgaard and Orngreen, 2015)
Practice (Cronbach Alpha=0.73)	3	practice the material in case studies practice the material in simulations	(Noesgaard and Orngreen, 2015)
Support (Cronbach Alpha=0.81)	3	support from peers support from IT personnel	Liaw (2007)
Resources (Cronbach Alpha=0.83)	3	technological resources time available to learn	Sun et al. (2006)
Effectiveness (Cronbach Alpha=0.82)	3	learning efficiency learning performance	Liaw (2007)

RESULTS

The analysis examined the correlations of the variables used in the study. Table 2 shows the correlation matrix of the variables. None of the correlations appeared to be large enough to warrant concern about the issue of multicollinearity (Hair et al., 1998).

Table 2: Correlation matrix

Variables	1	2	3	4	5	6	7	8	9
1. Effectiveness	1								
2. Experience	0.24 ^b	1							
3. Motivation	0.20 ^b	0.18 ^b	1						
4. Interaction	0.18 ^b	0.14 ^a	0.45 ^b	1					
5. Practice	0.15 ^b	0.27 ^b	0.08	0.12 ^a	1				
6. Support	0.02	0.04	0.05	0.04	0.07	1			
7. Resources	0.04	0.05	0.04	0.10	0.06	0.03	1		
8. Gender	0.05	0.09	-0.14 ^a	-0.20 ^b	0.19 ^a	0.05	0.06	1	
9. Age	0.03	0.04	0.04	0.07	0.07	0.05	0.04	0.06	1

^a $p < 0.05$, ^b $p < 0.01$

Table 3 shows the estimation results of the predictor for the effectiveness of e-learning. As can be seen from Table 3, the percent of cases classified is 81%, indicating the fact that the independent variable is a good predictor of the effectiveness of e-learning variable. As shown in Table 3, the results provide support for H1, which confirms that learner characteristics are positively related to the effectiveness of e-learning, i.e. both individual experience (H1a: $\beta = 0.58$; $p < 0.05$) and motivation of learner (H1b: $\beta = 0.47$; $p < 0.01$) were significant. Also interaction (H2a: $\beta = 0.27$, $p < 0.01$) and practice (H2b: $\beta = 0.33$, $p < 0.01$) were significant; thus confirming that system characteristics of e-learning were positively related to the effectiveness of e-learning, confirming hypotheses H2.

As shown in Table 3, the coefficient of the moderator variables were not significant (support: $\beta = 0.06$, $p < 0.30$; resources: $\beta = 0.04$, $p < 0.30$); however, the coefficient of the multiplicative interaction term was in some interactions significant, confirming hypothesis H3. Specifically, support between learners' characteristics and the effectiveness of e-learning ($\beta = 0.37$, $p < 0.01$), between the system characteristics and the effectiveness of e-learning ($\beta = 0.21$, $p < 0.01$), confirming H3a and H3b.

This result implies that the moderator variable support modified the relationship between experience and the effectiveness of e-learning (H3a: $\beta = 0.42$, $p < 0.01$) as well as motivation and the effectiveness of e-learning (H3b: $\beta = 0.48$, $p < 0.01$). However, by the moderator resources, the interaction terms related to experience and the effectiveness of e-learning was not statistically significant ($\beta = 0.11$, $p < 0.30$), thus hypothesis H3c was not supported. The same applies to the interaction terms related to motivation and the effectiveness of e-learning ($\beta = 0.06$, $p < 0.30$), thus hypothesis H3d was also not supported.

Table 3: Logistic regression results

Variables	Parameter Estimates
Experience	0.58 ^a
Motivation	0.47 ^b
Interaction	0.27 ^b
Practice	0.33 ^b
Support	0.06
Resources	0.04
Moderator	
Support x Experience	0.42 ^b
Support x Motivation	0.48 ^b
Resources x Experience	0.11
Resources x Motivation	0.06
Control variables	
Gender	0.21 ^a
Age	0.16 ^a

Note: Percent of case: correctly classified = 81%, Chi-Square = 32.88, -2 log likelihood = 89.42

^a $p < 0.05$, ^b $p < 0.01$

CONCLUSIONS

The result implies that e-learning system at university should be prepared to consider the student's individual characteristics such as learning motivation and experience as well as system characteristics such as interaction and practice. And more systematically aggressive support and resources are needed to prepare an effective e-learning system to students.

According to the study, motivation and experience of learner influenced the effectiveness of e-learning significantly. Helping students build their confidence in using computers will make e-learning more effective. A fundamental computer course could be a prerequisite to better prepare students. The study found that students of e-learning assume dual roles: learners and computer users. For this reason, the level of familiarity with computer and internet technology plays an important role. New technologies emerge and the technological skills and functional expectations of users evolve. Thus, new information systems and new designs can and should be combined to continuously improve user friendliness of e-learning interfaces and the functionality that help learner learn the technology conveniently and easily. Technology education to improve overall familiarity of the learner will also contribute to the expansion of the learner pull who would take e-learning courses and to the improvement of the effectiveness of e-learning (Sun et al., 2006).

Not surprisingly, support and resources were found to be an important variable. The level of support and resources affects the effectiveness of e-learning. Students seem to be sensitive to the influence, opinion, and pressure of their peer group and instructor. Educators and the managers of e-learning should keep paying attention to both the general response of the students and social networks among students to help them use the new e-learning facility more efficiently and effectively. This study found that instructors' attitudes toward e-learning positively influence the effectiveness of e-learning. When instructors are committed to e-learning and exhibit active and positive attitudes, their enthusiasm will be perceived and further motivate students. Thus, college administration must be very careful in selecting instructors for e-learning courses. Certain instructor training might be very helpful.

Although this study represents a systemic effort to investigate the determinants of the effectiveness of e-learning for students, it is not without limitations. First, the study proposes an integrated model covering important factors influencing the effectiveness of e-learning; it might not be comprehensive because of the limitations of resources and time. Second, this study focuses on metrics from a specific digital learning system. The variance in different systems is not further investigated. Third, the dependent variable of this study is a single indicator, perceived effectiveness of e-learning. Some studies suggest that student scores and learning performance could also be considered as dependent variables (Piccoli et al., 2001; Vogel, Davison, & Shroff, 2001). Future research might include more variables and analyze variance across different e-learning systems.

ABSTRACT

A growing body of research has dealt with the role of teachers' internal factors facilitating information and communication technology (ICT) in classroom. Previous findings have shown a series of external and internal obstacles which hinder the successful integration of ICT into the learning environment. The present study aimed at examining the direct and indirect effects of those internal factors (e.g., socio-cognitive-motivational factors) that could ensure the efficient integration of technology into educational settings. A sample of 198 teachers ($F = 85.9\%$, $M_{\text{age}} = 49.86$, $DS = 7.00$) was selected to respond to a questionnaire composed by a socio-demographic section and four scales (teachers' constructivist belief scale, attitudes toward computer, motivational factors and ITC classroom use). Causal analyses were applied to data. Path modeling was used to explore the direct and indirect effects of the teacher-related variables on the ICT classroom integration. Results confirmed the hypothesized relationships showing the mediating role of attitudes toward computer and motivational factors in predicting the linkage between constructivist belief and integration of technology into teaching practices. Findings suggested some useful practical implications to plan a successful ITC integration in education.

Key words: ICT integration, Constructivist beliefs, Attitudes toward computer, Motivation

INTRODUCTION

Over the last decades, the rapid spread of information and communication technology (ICT), i.e., computers and related technologies, in schools has become one of the most important topics discussed by educational researchers due to the capability of these tools in providing a proactive teaching and learning environment. Their mere presence in educational institutions, however, does not automatically promote the benefits for teaching and learning (Gülbahar & Güven, 2008; Shaunessy, 2007), which can only be attained if teachers know how to use the technology well and appreciate the significance of the *information revolution*. As a matter of fact, classrooms must be organized differently, teachers require considerable shifts in their pre-existing competencies, skills, and behaviors, and need to accept that some pupils may know more about computers and software than they do. A series of external and internal obstacles have been recorded, hindering the successful integration of ICT into the learning environment. At the end of the 1990s Ertmer (1999) individualized two types of barriers that would preclude technology integration in education and that can still be valid (Konstantinos, Andreas, & Karakiza, 2013; Pyle & Esslinger, 2014; Villalba & González-Rivera, 2016; Villalba, González-Rivera, & Díaz-Pulido, 2017): external (first-order) barriers and internal (second-order) barriers. The first-order barriers include some factors extrinsic to teachers, such as lack of adequate access, lack of time (Legrain, Grillet, Gernigon, & Lafreniere, 2015), bandwidth, training and institutional support (e.g., Galanouli, Murphy, & Gardner, 2004). The underlying assumption is that these obstacles can be removed via governmental policies. The second-order

barriers, which are more intrinsic to teachers, comprise teachers' pedagogical and technology beliefs, and their willingness to change (e.g., Inan & Lowther, 2010; Koehler & Mishra, 2008; Könings, Brand-Gruwel, & van Merriënboer, 2007; Lane & Lyle, 2011; Liu & Szabo, 2009). However, as Ertmer himself documented, even though the external barriers are removed, "teachers do not automatically use technology to achieve advocated meaningful outcomes" (Ertmer, 1999, p. 51).

A growing body of research has also dealt with the role of teachers as actors of new curricula in the classroom, thus facilitating technology integration that is most likely to achieve when (1) teachers are informed how to implement the innovation (how to use technologies and how the innovation might support their teaching practice); (2) when the distance between innovative and existing teacher practices are small; and (3) when teachers could take small steps during the implementation of technology (Cviko, McKenney, & Voogt, 2012; Ertmer, 2005; Grossman & Thompson, 2008; Zhao, Pugh, Sheldon, & Byers, 2002).

Researchers' attention has been also addressed to those personal factors influencing the integration of technology into teaching practices. To this purpose, two general categories of professional computer use have been identified (Hogarty, Lang, & Kromrey, 2003; van Braak, Tondeur, & Valcke, 2004). The first, supportive computer use, refers to the use of computers for pro-active and administrative tasks, such as student administration and evaluation, preparing worksheets and keeping track of pupils' learning progress. The second, class use of computers, refers to the use of computers to support and/or enhance the teaching or learning process, such as demonstration, drill and practice, instruction, and differentiation.

A growing body of research has also dealt with the role of teachers as enactors of new curricula in the classroom, thus facilitating technology integration that is most likely to achieve when: (a) teachers are informed how to implement the innovation (how to use technologies and how the innovation might support their teaching practice); (b) when the distance between innovative and existing teacher practices are small; and (c) when teachers could take small steps during the implementation of technology (Cviko, McKenney, & Voogt, 2012; Ertmer, 2005; Grossman & Thompson, 2008; Zhao et al., 2002).

In this context, if the influence of teachers' perceptions on the technology design and implementation processes has been enough investigated (e.g., Wang et al., 2012), less emphasis has been placed on the evaluation of the direct and indirect effects of teachers' psychological characteristics, such as motivation, teacher self-efficacy, computer self-efficacy, computer attitudes, gender, teaching constructivist beliefs, etc. (Holden & Rada, 2011; Sang, Valcke, van Braak, & Tondeur, 2010; Sang, Valcke, van Braak, & Tondeur, 2011).

However, in the 1980s Davis (1989) and Davis, Bagozzi, and Warshaw (1989) theorized one of the well-known models in helping to predict user behavior of information technology, i.e., the Technology Acceptance Model (TAM) (King & He, 2006; Legris, Ingham, & Collette, 2003; McCoy, Galletta, & King, 2007). Its origins came from Ajzen and Fishbein's (1980) Theory of Reasoned Action (TRA), according to which beliefs and attitudes should be related to individuals' intentions to perform: attitude toward a behavior is determined by behavioral beliefs about the consequences of the behavior and evaluation of those consequences on the part of the individual. Beliefs were defined as the individual's estimated probability that performing a given behavior will result in a given consequence. With regard to Davis' model (1989), two specific constructs, perceived usefulness and perceived ease of use, were hypothesized to be beliefs that lead to favorable attitudes and intentions to accept and use technology. In 2008 the theory of motivational self-determination, that foresaw a dichotomy between intrinsic and extrinsic motivation (Deci & Ryan, 1985), was included into the model, therefore defined Integrated Model of Technology Acceptance (IMTA; Fagan, Neill, & Wooldridge, 2008). Adopting this model, recent research (Mueller, Wood, Willoughby, Ross, & Specht, 2008; Teo, Lee, Chai, & Wong, 2009) has clearly shown how a holistic perspective, i.e., the interaction of various variables such as perceived usefulness, perceived ease of use, attitude towards computer use, comfort with computers, teaching efficacy, etc., could better define teachers' behavioral intention.

On these premises, the present study aimed at identifying the social-cognitive factors that could ensure the efficient, effective, and satisfactory use of technology in educational settings. In particular, along with the constructs of the TAM, constructivist beliefs and attitude towards computer were taken into account.

Constructivist belief has been generally considered a key construct in teaching, since it affects teachers' decision-making processes about the types of learning objectives and contents, organisational issues, the selection of media, the choice of instructional strategies, and the adoption of approaches towards assessment and evaluation. As constructivist perspective foresees that learning occurs when learners are the makers of meaning and knowledge, in contrast to traditional learners who receive passively information, past research has demonstrated that teachers' constructivist beliefs are strong predictors of class use of computers (Higgins & Moseley, 2001; Tondeur, Van Keer, van Braak, & Valcke, 2008), while traditional teaching seems to have a negative impact on the integrated ITC use (Hermans, Tondeur, van Braak, & Valcke, 2008).

Attitude towards computer is another important construct given its influence on the acceptance of computer technology: a negative or low attitude towards technology would not allow an effective integration of computer technology into teaching, even when sophisticated ICT infrastructures are provided (Selwyn, 1997; Sang et al., 2010; Teo et al., 2009; Huang & Liaw, 2005; van Braak, Tondeur, & Valcke, 2004). Consequently, a path model with direct and indirect effects was hypothesized. Inspired by Sang and colleagues' (2011) model, constructivist beliefs were expected to predict directly attitudes toward computers and motivational components (intrinsic motivation, perceived usefulness, and perceived ease of use), and indirectly ITC use in classroom. Moreover, attitudes towards computers were expected to influence directly ITC use in classroom and indirectly via motivational components.

METHODOLOGY

Participants

The target population for this study consisted of 198 teachers from primary and secondary schools in Southern Italy. The schools were selected on the basis of their convenience and/or accessibility. The teachers attended a training course in innovative technology. The mean age was 49.86 years ($SD = 7.00$) and the majority was female (85.9%, $n = 170$).

Procedure

The respondents completed the battery of tests in Autumn 2016. They were told the participation was voluntary and were assured their data would remain anonymous. The questionnaires were completed under the supervision of two experienced researchers. The time taken for the completion of the battery was approximately 20 minutes. The scales were translated into Italian by three authors of our group expert in English and was back translated into English by a native English-speaker.

Instruments

1. The *socio-anagraphic section*, including gender, age, and school category (primary, middle, and high school);
2. The *Teacher's Beliefs Scale – Constructivist Teaching* (TBS-CT; Woolley, Benjamin, & Woolley, 2004) assesses teachers' beliefs related to the student-centred pedagogical perspective which fosters computer use in education (Higgins & Moseley, 2001; Niederhauser & Stoddart, 2001; Sang et al., 2010; Tondeur et al., 2008). It contains 7 items (e.g., "I involve students in evaluating their own work and setting their own goals"; "I make it a priority in my classroom to give students time to work together when I am not directing them"). The instrument obtained a sufficient level of reliability (Cronbach's $\alpha = .64$);
3. The *Attitudes toward Computers in Education Scale* (ACES; van Braak, 2001) assesses teachers' attitudes (perceived usefulness, computer confidence, anxiety, liking, etc.) towards the effects of computer adoption in the classroom (Abedalaziz, Jamaluddin, & Hai Leng, 2013; Garland & Noyes, 2005). It is composed of 12 items (e.g., "The computer provides opportunity for improving the learning performance"; "The use of computer helps students to achieve better text writing"). The internal consistency level was high (Cronbach's $\alpha = .90$);
4. The *Intrinsic Motivation-Computer Enjoyment Scale* (Fagan, Neill, & Wooldridge, 2008) assesses the extent to which the activity of using the computer is perceived to be enjoyable. The scale is composed of 3 items (e.g., "I find using a computer to be enjoyable"). The internal consistency level was high (Cronbach's $\alpha = .93$);

5. The *Perceived Ease of Use Scale* (Fagan, Neill, & Wooldridge, 2008) is composed of 5 items and measures the degree to which a person believes that using technology would be free of difficulty or effort (e.g., “My interaction with a computer is clear and understandable”). The internal consistency was good (Cronbach’s $\alpha = .85$);
6. The *Behavioural Intention to Use Computer Scale* (Fagan, Neill, & Wooldridge, 2008) is composed of 3 items (e.g., “Assuming I had access to a computer, I intend to use it”). The internal consistency level was good (Cronbach’s $\alpha = .87$).
7. The *ICT Class Use Scale* (ICT-class; van Braak et al., 2004) measures the frequency (from never to daily) of the didactic use of computer in classroom. It consists of six items (e.g., “I use ICT for independent work/ individual learning”). The internal consistency level was good (Cronbach’s $\alpha = .86$).

All of the above described scales are rated on a 5-point Likert scale (from 1 = *strongly disagree* to 5 = *strongly agree*). As for the motivational component, a total score was calculated by adding the scores of the *Intrinsic Motivation-Computer Enjoyment Scale*, the *Perceived Ease of Use Scale*, and the *Behavioural Intention to Use Computer Scale*.

Analysis strategies

Descriptive and causal analyses were carried out. As for the descriptive analyses, frequencies, means, and standard deviations were calculated. Means differences between males and females and among teachers belonging to the three levels of education (primary, middle, and high schools) were analyzed by using independent samples t-test and one-way ANOVA. The bivariate Pearson correlations were also calculated to analyse the associations between the variables of interest. With regard to causal analyses, a path model was performed to test direct and indirect effects of beliefs, attitudes, and motivational factors on the didactic use of computer. Data analyses were conducted by means of the statistical software SPSS 20.0 and Mplus 7.0.

RESULTS

The results of the descriptive analyses are reported in Tables 1.

- elf-Efficacy
- (6 items), Outcome Expectations (9 items), Interest (6 items), and Behav-
- ioral Intentions (4 items). Subjects indicated their level of agreement with
- each statement on a five-point Likert scale: strongly disagree (1), disagree
- (2), neither agree nor disagree (3), agree (4), and strongly agree (5)

Table 1. Descriptive statistics: Mean and standard deviation for each variable

	N	Min – Max	Mean	S D.
Age	198	31 – 62	49.86	7.00
TBS-CT	198	17 – 34	26.16	3.16
ACES	198	39 – 60	51.29	5.61
Motivational factors	198	21 – 55	43.83	6.11
ICT integration	198	22 – 40	33.52	3.72

No gender effects emerged in the scores of constructivist belief, $t(196) = .224, p = .823$, attitudes toward computer, $t(196) = .391, p = .696$, acceptance technology, $t(196) = 1.732, p = .085$, and classroom use of technology, $t(196) = .031, p = .975$. Moreover, there were not significant effects of schools levels on teachers’ beliefs [$F(2, 195) = 2.59, p = .077$], on computer-related attitudes [$F(2, 195) = 1.67, p = .019$], on motivational constructs [$F(2, 195) = 0.895, p = .410$] and on ICT integration [$F(2, 195) = 0.119, p = .888$] at the $p < .05$ level for the three conditions.

Correlations

Findings from bivariate correlations showed a first picture of the interrelationships among the constructs: all associations with the classroom use of technology were strong and positive. Moreover, teachers' constructivist beliefs were strongly related to attitudes toward computer and motivational factors, and attitudes toward computer were positively related to motivational factors.

Table 3. Bivariate correlations among the variables.

	TBS-CT	ACES	ICT integration
ACES	.423**	-	
Motivational factors	.455**	.634**	-
ICT integration	.487**	.687**	.627**

** $p < .01$

Path model

A path model was used to test the hypothesized links. Direct and indirect effects on the dependent variable were calculated as standardized beta-weight (path coefficients or β 's). Fit indices showed good values, $\chi^2 = 10.647$, $df = 1$, $p > .001$; CFI = .97; RMSEA = .221, 90% C.I. = .115 - .349. The model explained 53% of the variance of ICT classroom use, 44.4% of the variance of motivational aspects, and 17.9% of the variance of attitudes toward computer. The final path diagram with the standardized estimates is shown in Figure 1. ICT classroom use was directly predicted by attitudes toward computer ($\beta = .484$, $p < .001$) and by motivational constructs ($\beta = .320$, $p < .001$). These variables also played an indirect role, since ICT classroom was positively predicted by constructivist beliefs via attitudes toward computer and motivational aspects and by attitudes toward computer via motivational aspects. Table 4 shows indirect effects.

Figure 1. Path diagram

Table 4. Indirect effects. Standardized estimates

	Estimate	P-Value
Effects from TBS-CT to ITC-class		
Total indirect	.350	.001
Specific indirect		
TBS-CT on ITC-class via ACES	.205	.001
TBS-CT on ITC-class via MOT	.073	.002
TBS-CT on ITC-class via ACES and MOT	.073	.001
Effects from ACES to ITC-class		
Total	.656	.000
Total indirect	.172	.000
Specific indirect		
ACES on ITC-class via MOT	.172	.000
Specific direct		
ACES on ITC-class	.484	.000

DISCUSSION

The current study aimed at analyzing the role of internal teacher variables in explaining ICT integration by testing a path model that interlinks constructivist beliefs, attitudes towards computer, and motivational components. Overall, findings supported the hypothesized direct and indirect effects of teacher-related variables on ICT classroom use and provided further empirical evidence to the results reported in Sang and colleagues' research (2011).

In particular, the indirect relationship between constructivist beliefs and ICT integration via attitudes towards computer was confirmed in accordance with previous studies (Chai, Hong, & Teo, 2009; Ertmer, 2005; van Braak, 2001; van Braak, Tondeur, & Valcke, 2004): teachers with a student-centered approach to teaching adopt favorable attitudes towards ICT in education and, consequently, they seem to be more eager to integrate technologies into teaching. From a theoretical point of view, this relationship could be explained by the Theory of Reasoned Action (Ajzen & Fishbein, 1980), according to which attitudes represent strong determinants of a person's behavior toward a certain target. Similarly, Hew and Brush (2007) argued that, even though attitudes and beliefs are two separate, but intertwined constructs, beliefs are actually determinant precursors of attitudes. Along with attitudes toward computer, the motivational components of computer use analyzed in the current research mediated the relation between constructivist beliefs and ICT integration. Stated in a different way, the beliefs related to the constructivist approach in teaching affect directly the extent to which teachers perceive the use of computer as enjoyable and free of effort, thus determining the classroom use of ICT. This is in line with the assumption that internal motivation should be considered as a state of beliefs influencing individuals' decision-making (Czubaj, 1996). A multiple mediation was also observed with attitudes towards computer impacting teachers' motivation. This effect was higher than the effect of constructivist beliefs on motivation. The indirect relationship between attitudes toward computer and ITC integration via motivational factors was also found, this consistently with Abdullah and colleagues' (2006) research.

Some limitations should be stressed. First, the sample size was too small to reflect the Italian teacher population in a representative way, thus affecting the generalizability of the current findings. Second, this research did not analyzed variables related to school (i.e., leadership, school culture, etc.), to social background (economic status, social culture, etc.), and to national school-policies. Third, as the data were obtained only via self-report measures excluding classroom observations and interviews with teachers, they could be affected by some respondents' bias.

Despite these limitations, practical implications could be inferred. For instance, to achieve a successful ITC integration, teachers' motivation should be enhanced by involving them in school policies. Moreover, the degree of computer use in educational process should be affected by both teachers and students' individual differences in terms of cognitive styles (Di Bitonto, Roselli, Rossano, Monacis, & Sinatra, 2010; de Palo et al., 2012). Consequently, future research is important to better ascertain the influence of individual factors on technology acceptance.

Dr.Metin ÇENGEL

cengel@sakarya.edu.tr

ABSTRACT

Rapid changes and developments in technology can bring positive results as well as negative consequences. One of them is a cyber victimization. In this study; To study the cases of cyber victimization of gifted students. The working group of the study is gifted students in Sakarya in the academic year 2016/2017. In addition to the demographic information of the students, data collected with "Ciber Victimization" scale were analyzed by SPSS program. Frequency, percentage, Mann Whitney U,Kruskal Wallis H, Kay-Kare test and statistical techniques were used in the analysis of collected data. The results of the research; To determine the cyber victimization that students are exposed to and to take necessary measures in this regard, It is thought to contribute to the related literature.

Key words: gifted, talented, cyber victimization

INTRODUCTION

Rapid development and widespread use in the field of technology has led to the realization of bullying using technology. Serin (2012) notes that the abusive use of information and communication technologies has led to the emergence of bullying, known as cyber bullying, among the types of bullying that occur among students in schools. Arıcak (2011) defined cybercrime as the whole of technical or relational damaging behaviors against persons, private or legal persons, using information and communication technologies. The rapid spread of mobile communication tools along with evolving technology and the ease of social sharing brought by Web 2.0 technologies are leading people to tend to share their personal knowledge and thoughts. Especially the use of social networks which spread rapidly among the adolescents and spreading the personal information in an uncontrolled manner increases the negative behavior of the adolescents (Arıcak et al., 2012). Çetinkaya (2010) states that the virtual environments that emerged with the development of technology have become indispensable parts of human life, that individuals can hide their identities and that they are in harmful behavior. Çetin et al. (2012) in electronic vehicles to reach unlimited number of people It is more difficult to control the cyber bullying because of the presence of the witness and many people witnessed that the suffering experienced by the victim increases. Hidden numbered calls, spam e-mails sent with confidential identification, voice, images and texts spread by e-mail or text messages to smear a person or group with insults and threats, virus e-mails, the images to send to other people, to remove rumors about other people, gossiping, threatening, insulting, all this has led to the definition under cyberbullying of harmful actions (Arıcak 2009, Peker, 2013). Arıcak et al. (2013) describe the three different groups of victims (victims), cyber bullies (bullies) and potential victims exposed to cyber bullying. Private (2013) states that individuals exposed to cyber bullying behaviors are considered cyber victims. Arıcak, Tanrıku and Kınay (2012) are also exposed to cyber victimization, information and communication technologies through an individual or a group, a private or legal person, a technical or relational way of harmful behavior, it is defined as a state.

Purpose of the research:

The purpose of this study is to identify the views of gifted and talented students regarding the cases of victimization of cyber and to contribute to other work to be done in this regard.

METHOD

In this section, information about the researcher's model, study group, data collection tool, data collection and analysis will be given.

Model of Research

Survey screening model was applied. The main purpose of screening research is to describe the situation as it exists. Everything that is subject to research is tried to be defined as if it is within its own conditions (Karasar, 2005). The students' demographic information constitutes the screening section for the views on the cases of cyber victimization.

Working Group

The study group of the study is composed of outstanding gifted students in Sakarya. The socio-demographic information of the students in the study group is shown in Table1.

Table 1: Socio-Demographic Information of Students in the Study Group

		Frequency	%
Gender	Female	14	21,2
	Male	52	78,8
	Total	66	100
Age	7 years	14	21,2
	8 years	20	30,3
	9 years	9	25
	10 years	10	7
	Total	66	100
Which device do you mostly prefer to use the Internet?	Computer	32	48,5
	Telephone	7	10,6
	Tablet	27	40,9
	Other	-	-
	Total	66	100
What is your average weekly use of the Internet?	Less than 5 hours	58	87,9
	5-10 hours	8	12,1
	11-20 hours	-	-
	21 hours and over	-	-
	Total	66	100
How often do you hide your identity on Internet events (such as Facebook, chat, games) Or are you involved with a different identity than your actual identity?	Never	34	51,5
	Rarely	6	9,1
	Sometimes	6	9,1
	Mostly	20	30,3
	Total	66	100
How often do you use social networks (Facebook, Twitter, Instagram, etc.)?	Never	53	80,3
	Rarely	-	-
	Sometimes	7	10,6
	Mostly	6	9,1
	Total	66	100
Cyber-bullying came to me in my life.	Never	53	80,3
	Once	7	10,6
	Once or twice	-	-
	Many times	-	-
	Too many times	6	9,1
	Total	66	100
I've been bullied to others.	Never	60	90,9
	Once	-	-
	Once or twice	-	-
	Many times	6	9,1
	Too many times	-	-
	Total	66	100

According to Table 1, 21.2% of the respondents were female and 78.8% were male students. 21.2% of the students are 7 years old, 30.3% are 8 years old, 25% are 9 years old and 7% are 10 years old. When the devices preferred by the students participating in the research are examined, it is seen that 48.5% of them are using computers, 10.6% are telephones and 40.9% are tablets. 87.9% of the students stated that they use the internet less than 5 hours a week and 12.1% 5-10 hours a week.

51.5% of the students who participated in the study never, 9.1% rarely, 9.1% occasionally, 30.3% mostly stated that they hid their identities on internet or use a different identity. 80.3% of the students stated that they never used social networks (facebook, twitter, instagram etc.), 10.6% occasionally use 9.1% mostly. 80.3% of the students stated that they never had cyber bullying, and 10.6% stated that they were exposed once. 90.9% stated that they never made cyber bullying, and 9.1% stated that they did it many times.

Data Collection Tool

In order to collect data in the survey, "Ciber Victimization Scale" developed by Arıcak, Tanrikulu and Kinay (2012) was applied in order to determine the students' victim status. The scale consists of 24 items and is answered on a scale of 2 (No, Yes). "No" is evaluated as one point, and "Yes" response is evaluated as two points. Thus, the lowest score that can be taken from the scale is 24 and the highest score is 48. The increase in the scores indicates the high level of being victimization. In order to obtain the demographic information of the students in the study group participated in the research, the information form developed by the researchers was used.

Data Collection and Analysis

The data obtained by means of quantitative data collection in the study were analyzed using SPSS 16.0 (Statistical Package for Social Sciences) statistical program and the significance level was accepted as 0.05 in all the analyzes made in the research. The frequency, percentage, Mann Whitney U, Kruskal Wallis H, Kay-Square test and statistical techniques were used in the examination of the quantitative data.

RESULTS

Table 2. Descriptive Statistics of the Cyber Victimization Scale

Scale	Item number	Min \ Max Score to be taken	\bar{X}
Cyber Victimization Scale	24	24-48	24,56

The average score of the Siberian victimization scale was measured as 24.56. The lowest score that can be taken from the scale is 24 and the highest score is 48. It can be said that those who participated in the study had a "very low" level of cyber victimization points.

Table 3. Comparison by Gender of Cyber Victimization Level

Gender	N	\bar{X}	U	p
Female	14	27,21	276,00	,09
Male	52	35,19		

*p<0,05

When the results of Mann Whitney U test are examined in Table 3, the average of male students is 35,19 and the average of female students is 27,21. There was no significant difference between male and female students (U = 276.00; p> 0.05).

Table 4. Age Variable comparison with Cyber Victimization Level

Age	N	Average Rank	sd	X ²	p
7 years	14	29,32	3	26,81	,00
8 years	20	27,42			
9 years	25	32,74			
10 years	7	61,93			

*p<0,05

When the results of the Kruskal Wallis H test are examined in Table 4, the mean scores of the cyber victimization scale of the participants were significantly different according to age ($X^2 = 26,81$; $p < 0,05$). While the students who are in the age group of 10 and 9 are higher than the other age groups, the students who are in the age group of 10 have the highest level of cyber victimization.

Table 5. Cyber Victimization in Internet use with Level Preferred Device Comparison

	N	Average Rank	sd	X ²	p
Computer	32	40,05	2	10,72	,00
Telephone	7	27,21			
Tablet	27	27,37			
Other	-	-			

*p<0,05

When the results of the Kruskal Wallis H test were examined in Table 5, it was found that the mean scores of the cyber victimization scales of the participants were significantly different ($X^2 = 10,72$; $p < 0,05$) compared to the device used in internet use. It can be said that the students who use computers have the highest levels of cyber victimization followed by those who use tablets.

Table 6. Comparison of Cyber Victimization Level with Weekly Average Internet Usage Time

	N	Average Rank	sd	X ²	p
Less than 5 hours	58	33,93	1	,358	,54
5-10 hours	-	-			
11-20 hours	-	-			
21 hours and over	8	30,38			

*p<0,05

When the results of Kruskal Wallis H test are examined in Table 6, it was found that there was no significant difference ($X^2 = ,358$; $p > 0,05$) in relation to the relationship between cyber victimization scale scores and internet use time of the participants.

Table 7. Results of Kay-Square Test Regarding Identity Hiding Situations in the Internet Environment (Facebook, Chat, Game, etc.) by Gender of Students

Gender	Identity Hiding Situations in the Internet Environment (such as Facebook, chat, gaming)			
	Never	Rarely	Sometimes	Mostly
Male	7 %50	-	-	7 %50
Female	27 %51,9	6 %11,5	6 %11,5	13 %25

$X^2=5,51$ sd=3 P=,138

According to Table 7, when the results of the Kay-Square test regarding the hiding of the identities of the students in the internet environment (such as facebook, chat, game) are examined according to gender ($p > .005$), it can be said that there is no significant difference.

Table 8. Results of the Kay-Square Test Regarding the Use of Students' Gender-Based Social Networks (Facebook, Twitter, Instagram, etc.)

Gender	Social Networks (Facebook, Twitter, Instagram, etc.) Usage Situations			
	Never	Rarely	Sometimes	Mostly
Female	14 %100	-	-	-
Male	39 %75	7 %13,5	6 %9,1	

$$X^2=4,35 \quad sd=2 \quad P=,113$$

According to Table 8; It can be said that there is no meaningful difference when the results of Kay-Square test regarding the use of social networks (facebook, twitter, instagram etc.) of the students according to their genders are examined ($p > .005$).

Table 9. Regarding cyber victimization status of students by gender Chi-Square Test Results

Gender	Cyber Victimization Status				
	Never	Once	Once twice	or Many times	Too many times
Female	14 %100	-	-	-	-
Male	39 %75	7 %13,5	-	-	6 %9,1

$$X^2=4,35 \quad sd=2 \quad P=,113$$

According to Table 9, when the results of Kay-Square test on the status of victims of cyber in relation to the gender of the students are examined ($p > .005$), it can be said that there is no significant difference.

Table 10. Results of Kay-Square Test Regarding Cyber Bullying Situations of Others According to Their Gender

Gender	Cyber Bullying Situations				
	Never	Once	Once twice	or Many times	Too many times
Female	14 %100	-	-	-	-
Male	46 %88,5	-	-	6 %11,5	-

$$X^2=1,77 \quad sd=1 \quad P=,183$$

According to Table 10; It can be said that there is not a significant difference when the results of Kay-Square test ($p > .005$) regarding the cases of students cyber bullying others according to their genders are examined.

CONCLUSIONS

In this study, the cases of cyber victimization of gifted / talented students were examined. A total of 66 students, 14 female and 52 male, participated in the research. 14 of the students are 7 years old, 20 are 8 years old, 9 are 9 years old and 10 are 10 years old. It is observed that most students prefer to use the computer and the tablet after

entering the internet. When the average weekly internet use period was examined, they stated that they entered less than 5 hours. In this case, it can be said that students use internet in a controlled way.

Most of the students stated that they do not hide their identities in internet events (such as facebook, chat, play). Most of the gifted / talented students stated that they did not use social networks (facebook, twitter, instagram etc.). In addition, most of the students stated that they did not live cyber bullying and they did not do cyber bullying.

According to the obtained data, it can be said that gifted/talented students do not have cyber bullying and cyber victimization because their internet usage time is low and they use limited social networks. According to the average of the data obtained by the cyber victimization scale, it can be said that the most gifted / gifted students participating in the study are at a very low level of the cyber victimization status. It is seen that Dalmaz (2014) has a very low level of victimization of cyber in the last study with university students.

There was no difference between male and female students as a result of sex comparison of cyber victimization level. There are researches that show that there are no differences between male and female students as well as research on girls being exposed to cyber victimization (Dilmaç, 2009; Akbulut vd., 2010; Peker vd., 2012; Özel, 2013; Dalmaz, 2014; Alkan vd., 2016). As a result of comparing the level of cyber victimization with age variation, it can be said that the age of cyber victimization increases as the age increases. The cyber victimization status is at most 10 years old, then 9 years old and it is 8 and 7 years old. Compared to the cyber victimization level and the devices that are preferred for internet use, it is seen that most computers use the tablet afterwards.

Students also not a significant difference compared to the average weekly duration of use Internet with cyber victimization levels seen less than 5 hours per week they use the internet. There was no significant difference regarding the use of social networks (facebook, twitter, instagram, etc.) according to the gender of the students, as there was no meaningful difference regarding the status of students hiding their identities on internet based events (such as facebook, chat, game). It can also be said that there is no meaningful difference between the sexes of the students regarding the cases of cyber victimization and there is no significant difference regarding the cases of cyber bullying according to their sex.

RECOMMENDATIONS

- Students, families and teachers can be informed about cyber victimization and cyber bullying.
- Students may be informed that they should not be able to hide from the teachers and their parents the situation of victimization of the cybercrime they may encounter.
- Teachers and parents can be told that victims of cybercrime can affect the social life, academic achievement and psychology of students.
- Siberia can be brought to a more deterrent situation with bullying laws.

ABSTRACT

Nowadays a lot of organizations try to gain more maturity for their development in process. A large percentage of these organizations tend to the expansion model. People resource capability model is one of these models which concentrate on expanding organization human skills. People capability maturity model is a process-driven framework which carries out people resources step by step in an organization .The motive of this model is to guide the organizations in improving their people resources .This model contains five maturity levels and twenty two process area. Each of these maturity levels has different qualities from one another. In fact, each of these levels a unique way in changing the organizations culture by equipping it with more effective actions for attracting expansion organizing, provocation and keep in its human resources. The present research has been performed with propose of studding process areas connected to each of maturity levels in human resources maturity model that determines the maturity in Islamic Azad University of Bushehr. Methodology research design is a non-experimental and from description-collection, that researcher with the Cochran community statistical formula to determine the statistical sample size 410 people that the result was 199, and researcher distributed Carnegie Mellon questionnaire about 210 pcs between Islamic Azad University of blusher's staffs, and identified the first and second levels of maturity requirements on base of PCMM model in 2016. The objectives of the research with using SPSS software were analysed and with use descriptive statistics according to the research questions. Results from this study showed that Processes of: The recruiter, Communication and Coordination, Workplace, Training and Development, Compensation system, Analysis of competency, Workforce Planning System, Rising of competency system was more attention from the society of the Islamic Azad University of Bushehr, however, this organization not completely covered the level 2 of mature PCMM model.

INTRODUCTION

In the 1980s the use of performance measurement systems primarily focused on economy and efficiency because cost saving and operational control purposes was unable to support organizational objectives (Pollitt, 1986; Ghobadian and Ashworth, 1994; Guthrie and English, 1997) and this infirmity was the main reason of BSC appearance. The BSC was developed by Robert Kaplan and David Norton after an extensive research project in 1990 and their first refereed paper published in 1992 (Kaplan and Norton, 1992). Kaplan and Norton's (1992)

Balanced Scorecard (BSC) has become a widely used framework for performance measurement, although the authors originally intended the framework to be used as a tool for communicating strategy (Meyer, 2005). In general, at least three different explanations of the stages of the evolution of BSC exist in the literature (Morisawa, 2002; Miyake, 2002; Lawrie and Cobbold, 2004; Speckbacher et al., 2003) which are called as generations of BSC. All authors agree that the first generation of BSC combines financial and non-financial Indicators with the four perspectives (financial, customer, internal business process and learning and growth). At this stage, measurement systems without cause-and-effect logic may also qualify as Balanced Scorecards (Malmi, 2001, p.216).

In fact, this generation of BSC was a set of indicators arranged by perspectives derived from mission and vision of organization. Speckbacher et al. (2003) and Lawrie and Cobbold (2004) argue that the second generation BSC emphasized the cause-and-effect relationships between measures and strategic objectives. It became a strategic management tool, usually utilizing a strategy map to illustrate the linkage between measures and strategies. In contrast there is a view in the literature (Morisawa, 2002; Miyake, 2002) that the key contribution of second generation BSC was the formal linkage of strategic management with performance management.

Concept of the strategy-focused organization (Kaplan and Norton, 2001) reflected the third-generation application of the BSC. Two basic concepts in all generations of BSC are perspectives and indicators. Kaplan and Norton (2001) have argued that organizations should develop the best set of perspectives that reflect their strategy. The earliest BSC papers (Kaplan and Norton, 1992) advocated the use of the four perspectives – financial, customer, internal business process and learning and growth. Although only four perspectives defined in original BSC, but Kaplan and Norton (1996) describes where it's required, organization can add other perspectives to own scorecard.

Another basic concept of BSC is indicator (or measure). One goal of balanced scorecard is to identify a core set of indicators that can be used to summarize an organization's performance (Chan and Ho, 2000) and also to provide a clear set of metrics to evaluate the organization's strategy (Kaplan and Norton, 2001). Therefore, the aim of a well-structured BSC is to establish a balanced set of indicators, which consist of both financial and non-financial measures that control all activities and operations of organization.

LITERATURE REVIEW

Meenchanavan (2009) has done a research entitled "BSC, new challenge" the researcher has concluded that this model, as a culture change and development to accept new suggestions and members, is a suitable model.

Deem (2009) also has done a research entitled "studying the relationship of organizational culture and BSC effectiveness". The results of this research have shown that each of the four organizational features, partnership, solidarity, adaptability and mission have significant and positive- relationship with BSC effectiveness.

Another research has been done by Soleimani (2011) and entitled "studying the relationship of organizational culture and BSC effectiveness". By analyzing the questionnaire with Pierson correlation method and regression analysis, a direct relationship between organizational culture and each of its components, partnership, sohдарity, adaptability, assignment and BSC effectiveness, was concluded.

In addition, Asaadi has done a research entitled "performance appraisal of Yazd province public hospital using a combination of BSC, data envelope analysis. The researcher concluded that mean relative efficiency of the hospital was 0.945, 9 out of 13 were on the efficiency frontier and the efficiency of 4 hospitals was less than one.

RESEARCH HYPOTHESIS

The following research Hypothesis is established based on the above literature review. The research hypotheses are:

1. Using the Balance Scorecard, improve the performance of managers in keeping financial indicators of organization.
2. Using the Balance Scorecard, improve the performance of managers in customer retention.
3. Using the Balance Scorecard, improve the performance of managers in processes within the organization.
4. Using the Balance Scorecard, improve the performance of managers in growth of the organization learning process.

PARTICIPANTS AND PROCEDURE

The population of this study consists university presidents and heads of departments in three higher education institutes in Bushehr. Since the population was small (136 people), sampling is not done and all members are chosen as samples.

This research is descriptive – survey and library resource and internet are used for the research literature.

MEASURE

The questionnaire data collection tools are researcher-made which the reliability of it is confirmed by the supervisor professor. To calculate the validity of questionnaire, Cronbach's Alfa is used. (Alfa=0.88). Questionnaire consists of 20 questions: 4 questions for the financial indicators variable, 3 questions for the customer retention variable, 7 questions for the processes within the organization variable and 5 questions for the growth process and organization learning variable. Likert 5 point scale is used in this questionnaire and to analyze the research hypothesis, the average test is used.

FINDINGS

Table 1. The result of comparison between hypotheses mean

Dependent Variable	Statistic Value t	Significan t Level (sig)	Degree of freedom (df)	Confidence Interval		Result
				High limit	Low limit	
The performance of managers in keeping financial indicators	6.227	0.000	114	0.3926	0.2031	Accept
The performance of managers in customer retentio	5.481	0.000	114	0.4972	0.2332	Accept
The performance of managers in processes within the organization	3.204	0.002	114	0.2171	0.0512	Accept
The performance of managers in growth of the organization learning process	0.764	0.429	114	0.1543	-0.0661	Failed

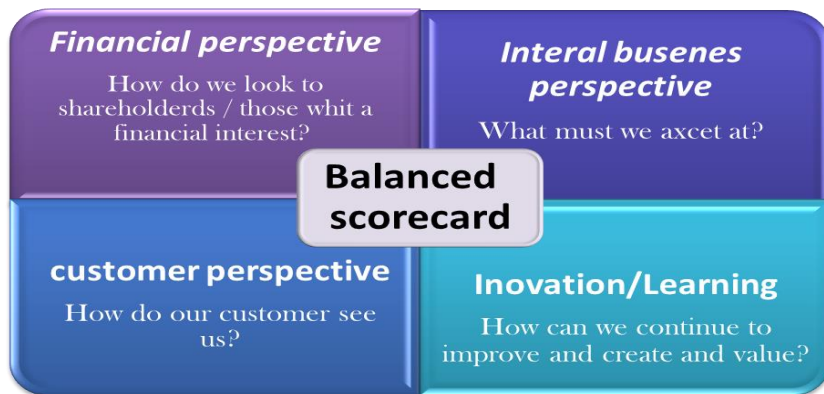

Figure 1. Balanced scorecard's perspective

CONCLUSION

The purpose of this research is studying the role of BSC in appraisal of higher education institutes performance. According to the results of test and test results interpretation table, using BSC, in population's opinion, leads up to development of managers' performance in keeping financial indicators of organization, customer retention and within the organization processes, which were similar to Chen (2008), Umashankar& Dutta (2007), and Gullen (2003), researches. However it doesn't lead up learning process growth in organization, which differs from result of Amaratunga&BaldAry (2000) and Einstein (2006) researches.

ABSTRACT

This study examined 86 high school (Year 11) students' basic proficiencies in Mathematics were examined, and the connections between language proficiency, gender, family socio-economic background and family factors to their performances were also identified. A 'proficiency test' paper was developed to investigate students' proficiency in Mathematics, and semi-structured interviews were utilized to gather data regarding parental involvement in students' academic activities. Several different statistical tests were employed for the data analyse. Although the findings revealed a positive correlation between students' proficiency test score and their yearly Mathematics achievements, the relationship between students' basic proficiency in Mathematics and their gender were not found to be significant. The students' English language literacy was significantly related to their achievements in Mathematics. And the students' basic proficiency in Mathematics and parents' income was significantly correlated, but the students' proficiency and parents' education was not significantly correlated. Students' English language proficiency and parental involvement in terms of emotional or financial support (such as attending private tuition class) were also determined to be the contributing factors in the students' achievement in Mathematics.

Keywords: Mathematics Basic Proficiency, Performance and Achievements, Family Socio-Economic Background, Gender

INTRODUCTION

Fundamental skills comprised of basic or elementary abilities in an idea or a system. Every field of life has their own definition of fundamental skills. When fundamental skills are not taught properly, the least privileged in our society are those affected most, and thus also added that mastering fundamental skills were necessary to advance in mathematics (Loveless, 2003).

The Ministry of Education of Brunei Darussalam is committed in providing quality education. It is believed that quality education will provide a firm foundation for the country to become a peaceful and developed nation (Ministry of Education, 2012). In 2008, Brunei introduced an education system that brought about massive changes (Ministry of Education, 2013). The onset of *Sistem Pendidikan Negara Abad ke-21* (SPN21), which translated in the English language as the National Education System for the 21st Century curriculum sets out to provide a holistic education, and it is worth noting that solid foundation in Mathematics needs to be established at the primary school level (Ministry of Education, 2013). Previous studies showed that error patterns of students in public examination in Brunei are caused by exposure to the drilling of application of rules and formulae, at the expense of Mathematical understanding (Veloo & Lopez-Real, 1994; Wong & Veloo, 1996; Shahrill, 2009; Veloo, 2012; Sarwadi & Shahrill, 2014; Botty et al., 2015; Othman et al., 2016; Yunus et al., 2016; Mahanin et al., 2017).

This present study investigates the relationship between students' basic proficiencies and achievements in

Mathematics as well as identifying the factors influencing it. The initial focus explored the relation between students' basic mathematical skills and their achievements, by monitoring the students' Mathematics results throughout their school years. These findings will help determine the factors that contribute to their poor performance. Next, the students' family socio-economic backgrounds were also investigated. In addition, the students' English language proficiencies were also examined.

The following research questions were developed as guidance for this study:

1. Is the students' yearly achievements in Mathematics influenced by the students' basic Mathematical proficiency?
2. Does the students' gender affect their basic proficiency?
3. Can we detect any significant correlations between the students' English language proficiency and their achievement in Mathematics?
4. Can we detect any significant correlations between the students' proficiency in Mathematics and their families' socio-economic background?
5. To what extent does the family's socioeconomic background impact on students' basic proficiency and achievement in Mathematics?

Referring to the above-guided questions, the following null hypotheses (H) were identified;

H₀₁: Significant correlation was not detected between the students' Mathematics basic proficiency and their gender.

H₀₂: Significant correlation was not detected between the students' English language literacy and their Mathematics performance.

H₀₃: Significant correlation was not detected between the students' proficiency in mathematics and their family background.

One limitation of this study is that only students from one high school were chosen. Moreover, the number of student-participation is only 86. Another limitation is that only Year 9 to Year 11 students' yearly performances were considered due to unavoidable circumstance.

REVIEW OF THE LITERATURE

Family Socio-Economic Background

According to Reardon (2011), one of the greatest predicting factors of the child's academic achievement is the Socio-Economic Status (SES) of his or her parents. Furthermore, the cognitive abilities and educational achievements of a child are deeply affected by parental SES (Jednoróg et al., 2012). And it is well established that there is a gap in academic achievements between students from the high and low socio-economic family backgrounds (Frederickson et al., 2008). Children with better SES backgrounds are more likely to excel in Mathematics (Coley, 2002). Interestingly, the rate of college completion by students with families from the high-income background has increased in comparison to the students' completion rate from low-income families (Bailey & Dynarski, 2011). Income also has significant impact on the students' education and IQ from the low-income category (Løken et al., 2012). However, Dahl and Lochner (2012) found that these effects decreased significantly for the higher-income families. Previous studies have reported that educated parents are more efficient teachers at home (Alexander et al., 1994; Davis-Kean, 2005). Moreover, Zakaria et al. (2013) found that the parents who are involved in their children's schoolwork can contribute positively towards their children's academic achievement. Knowing the type of home environment the children come from will be useful in order to assist educators in assessing and providing the best support strategy in schools. Milne and Plourde (2006) believed that if given sufficient support to the families, then there could be success for the children.

Gender Differences

Several researchers have regarded Mathematics as a subject dominated by the male gender (Burton, 2001; Blömeke et al., 2011). Which led to the question, why do boys performed better in mathematics than girls? Findings from Beilock et al.'s study indicated that girls tend to worry more, thus eroding the mental resources needed for problem-solving. Hyde and colleagues (2008) found that there was little or no difference in Mathematics performance between girls and boys in ten of the states in the United States. In some states, girls performed fractionally better than boys. They also asserted that gender differences did not exist anymore in math performance. The issue of 'gender gap' in achievement between boys and girls remained the focus of attention and the gaps appeared to be growing rather than receding. In the context of Brunei, female students outperform male students academically (Yong, 2010; Metussin, 2015, 2016).

Language Literacy

For English Language Learners (ELL), the language factors could have an effect on assessments (Abedi, 2002; Abedi et al., 2003). Furthermore, Abedi et al. (2004) found that the language background of a student has a strong connection to their performance in tests. Walter and Taskinen (2007) stated that differences in language are a major concern as it may impede academic achievement. Students who learn using their second language have been found to perform significantly worst in comparison to those learning using their first language (Yushau & Omar, 2015). Meanwhile, Khalid and Tengah (2007) reiterated that pupils in Brunei with limited English language proficiency usually encounter difficulty in learning Mathematics. As a result, teachers often translate certain problems using the Malay language. On the contrary, Pungut and Shahrill (2014) discovered only weak relationship between the English language competency and the students' ability to solve mathematics word problems. Alternative strategies for second language learners, such as graphics organizers and journal writing have shown to be useful tools when learning mathematics (Khoo et al., 2016; Suhaimi et al., 2016, 2017). Meanwhile, disadvantaged and language-diverse learners have an important characteristic in common, as both have difficulty expressing their difficulties to students. This could produce a classroom of many silent learners (Nieto & Bode, 2012).

METHODOLOGY

This study employed a mixed method combination of quantitative and qualitative research strategies. This study adapted Hammersley (1996) classification of approaches to mixed methods research. Hammersley proposed the use of mixed method for *triangulation* approach. The target population for this study consisted only of one high school in one of the four districts in Brunei. The participants comprised of 86 high school students (47 male students and 39 female students) from four selected Year 11 classes, with their ages ranging from 15 – 19 years old (mean age of 16.87 years and standard deviation of 0.72). Data on students' background and academic information was accessed, with prior permission from the school Registration Department and Academic and Examination Department. The data extracted includes students' socio-demographic factors that focused on age, gender and students' family background including parents' income and education, as well as the students' examination results.

In this study, a 'proficiency test' paper was developed to investigate students' proficiency in Mathematics. The test paper consisted of five content strands that complied with the content areas used in the Trends in International Mathematics and Science Study (TIMSS) for the Mathematics curriculum. This comprised of Number, Measurement Algebra, Geometry and Data. There were 38 items altogether within the five components; Number (21 items), Measurement (2 items), Algebra (4 items), Geometry (4 items), and Data (6 items).

To determine the reliability of the instrument, a pilot study was conducted on 24 students from the general science classes of Years 9 and 10 who were not part of the study sample. This small sample size is deemed sufficient for cases involving pilot studies. However statistical significance is unlikely to be obtained with this sample size (Hill, 1998). Therefore a typical scale reliability measure will be based on the Cronbach alpha (Field, 2009). And for this pilot study, the reliability coefficient showed a reading of 0.832 and can be considered as 'great'. Meanwhile, semi structured interviews were conducted on selected students based on their basic proficiency test score results. According to Thomas (2010), this method of interview has features of both structured and unstructured interviews and therefore uses both closed and open questions. As a result, it has the advantage of both methods of interview. In order to be consistent, pre-planned core questions were set for guidance so that the same areas were covered with each interviewee. The questions were based on family context and parental involvement.

Data Collection Procedure

The paper and pencil test was conducted on 86 participants. The Mathematics teachers of the selected classes assisted in administering the participants to complete the standardized tests within 60 minutes. Data collection was done immediately upon completion. The reliability coefficient of the test items yielded a score of 0.889 on the Cronbach's alpha. The mean score for the entire five content strands are shown in Table 1. It shows that most students managed to answer questions on *Algebra* with a mean score of 0.433 compared to *Measurement* that only yielded a mean score of 0.128.

Table 1: The mean score of the five content strands

Content Strands	N	Mean	Std. Deviation
Numbers	21	0.389	0.443
Measurement	2	0.128	0.332
Algebra	5	0.433	0.488
Geometry	4	0.430	0.430
Data	6	0.384	0.390

Description of Variables

The different variables were subsequently identified, and the students' basic proficiency test score was labelled as proficiency score, and the students' yearly performance in Mathematics which were collected from the Year 9 and 10 end of year examination, Year 11 preliminary assessment and Year 11 qualifying examination marks were labelled as ME9, ME10, MP11 and MQ11 respectively. Meanwhile, the students' English language qualifying examination marks was labelled as language literacy. All of the scores were then transformed into grades, which was adapted from the school's grading system and given as; A (90 – 100), B (80 – 89), C (70 – 79), D (60 – 69), E (50 – 59), and U (40 – 49). Whereas, the variables for family socio-economic background was labelled as 'Parent Income' which is represented by the highest income gainer in the family and categorised as (1) Less than \$1000, (2) \$1000 – \$2000, and (3) \$2000 and above. As for the variable 'Parent Education', it represents the parents' highest qualifications with the categorizations: (1) Below high school, (2) High school, (3) Certificate, (4) Diploma or Technical, and (5) Degree or Professionals.

Data Analysis

The data obtained were inputted in Microsoft Office Excel for Windows 8, and further analysed using SPSS version 21.0 (IBM Corp., 2012). Thus different statistical tests were employed as follows:

- The reliability of the test items were analyzed using reliability tests scale for Cronbach's alpha.
- The descriptive statistics was utilized in deducing mean, standard deviations, frequency and percentages for the content strand, proficiency tests, parents' income and education level, as well as English language qualifying marks.
- The independent (two-sample) *t*-tests were used to determine the significant effect between gender and proficiency tests.
- A set of Pearson product-moment correlation coefficient tests were also used in examining the linear relationships between:
 - Students' proficiency tests as well as their yearly performance in Mathematics.
 - Students' achievement in Mathematics and family socioeconomic background (parents' income and education level)
- The chi square analysis with cross-tabulation were used to examine the correlations between
 - Gender differences and students' proficiency in Mathematics.
 - Students' achievement and their English language literacy.

RESULTS AND DISCUSSIONS

Based on the results of the proficiency tests score shown in Table 2, 64% scored below 50 marks thus indicating they have weak basic foundations in Mathematics, with 33.7% having a moderate basic Mathematical foundation and only 9.3% was considered as having strong basic foundations in Mathematics.

Table 2: Proficiency tests score according to grade

Coding	Value	Frequency	Percent (%)
1	A (90 – 100)	0	0.0
2	B (80 – 89)	2	2.3
3	C (70 – 79)	6	7.0
4	D (60 – 69)	7	8.1
5	E (50 – 59)	16	18.6
6	U (0 – 49)	55	64.0

Table 3 reveals the sample population of students with their parents' income level. It seems that a significant proportion of students are from low-income family.

Table 3: Proficiency tests score categorized into parents' income level

Coding	Value	Frequency	Percent (%)
1	Less than \$1000	38	44.2
2	\$1000 – \$2000	25	29.1
3	More than \$2000	23	26.7

Table 4 shows the students population according to parents' level of education. And for Table 5, the students' English language qualifying examinations results were shown according to grades, and 18.6% of the population failed their qualifying examinations.

Table 4: Level of education for the parents

Coding	Value	Frequency	Percent (%)
1	Below High School	11	12.8
2	High School	54	62.8
3	Certificate	7	8.1
4	Diploma or Technical	6	7.0
5	Degree or Professional	8	9.3

Table 5: English language qualifying results according to grade

Coding	Value	Frequency	Percent (%)
1	A (90 – 100)	0	0.0
2	B (80 – 89)	5	5.8
3	C (70 – 79)	12	14.0
4	D (60 – 69)	24	27.9
5	E (50 – 59)	29	33.7
6	U (0 – 49)	16	18.6

Is the students' yearly achievements in Mathematics influenced by the students' basic mathematical proficiency?
A Pearson correlation analysis was utilized in exploring the connection between the students' proficiency test and their Mathematics yearly achievements. The results are summarized in Table 6. The analysis of these correlations shows that all the variables are moderately to strongly-related. We also observed that the students' basic proficiency is positively and significantly related to students' yearly achievement in Mathematics.

Table 6: Correlations matrix between proficiency test score and students yearly achievement

	Proficiency	MQ11	MP11	ME10	ME9
Proficiency	1				
MQ11	0.587**	1			
MP11	0.628**	0.874**	1		
ME10	0.411**	0.302**	0.434**	1	
ME9	0.592**	0.761**	0.812**	0.583**	1

**, Correlation is significant at 0.01 level (2-tailed)

To validate the results obtained above, the variables were then tested. We compared the means to examine the relationship between two variables. This procedure is often accompanied by the test of association between variables called *eta*. The level for the *eta* for the data in Table 7 shows a strong relationship between proficiency test scores and the variables. The test for linear regression shows a 43.2% variation among the variables with the F value of 15.421 (R^2 changed (df1 =4, df2 = 41) = 0.432, $p = 0.000$). As shown in Figure 1, the scatterplot indicated a positive correlation between the proficiency test and students' yearly achievements. As mentioned by Harrington (2007), doing a basic skills review is worthwhile as it allowed students to refresh their memory.

Table 7: Measures of association

	Eta	df	Sig.
Proficiency * MQ11	0.885	55	0.024*
Proficiency * MP11	0.848	44	0.003**
Proficiency * ME10	0.823	47	0.047*
Proficiency * ME9	0.772	39	0.036*

Note: * $p < 0.05$, ** $p < 0.01$

Figure 1: The scatterplot between proficiency and regression studentized residual on ME9, ME10, MP11 and MQ11

Does the students' gender affect their basic proficiency?

Before performing the t-tests, the data were checked to verify the assumptions of normality and equality of variances. Since the preliminary Levene's test for equality of variances implied that the two groups' variances were significantly different, a two-sample t-test, which does not assume equal variances, was then performed (Elliot & Woodward, 2006). The proficiency test score has a mean score of 37.06 (SD = 22.53) for males and 40.10 (SD = 18.87) for females. This indicated that females have a slightly better Mathematical foundation than males. However, this difference is not statistically significant based on the results of the t-test ($t(86) = -0.681$, $P = 0.498 > 0.05$) by taking the reading of "equal variances not assumed".

The correlation is then checked with a cross-tabulation table (see Table 8), and chi-square test for associations between variables (see Table 9 and Table 10). One obvious explanation is that there are more males compared to female participants. From Table 10, there is no relation between gender and their proficiency tests where, $X^2(df = 4) = 0.524$, $p = 0.971$ and $\phi = 0.578$, $p = 0.324$. Therefore, the relationship for gender differences and proficiency tests cannot be established. And, we accept the null hypothesis (H_0), and this coincided with Lindberg et al.'s (2010) findings.

Table 8: Gender and proficiency test score cross-tabulation

		Proficiency Grade					Total
		B (80 – 89)	C (70 – 79)	D (60 – 69)	E (50 – 59)	U (0 – 49)	
Gender	Male	1	4	4	8	30	47
	Female	1	2	3	8	25	39
	Total	2	6	7	16	55	86

Table 9: The chi-square test (gender and proficiency)

	Value	df	Asymp. Sig. (2-sided)

Can we detect any significant correlations between the students' English language proficiency and their achievements in Mathematics?

We performed a Pearson chi-square test to determine the relationship between the two nominal variables (the students' English language qualifying results and the students' Mathematics qualifying results). In order to conduct this test, it was best to determine the critical value of the chi-square, which is 21.0261, before the relationship can be confirmed. As depicted in Table 11, the chi square (X^2) value of 21.684 exceeds the critical value of 21.0261 and the p -value of 0.041 is less than the Cronbach alpha of 0.05. The ϕ coefficient was 0.502 with p -value of 0.041 (see Table 12). Therefore, the alternative hypothesis is accepted. The results indicated a

weak correlation between the students' English language literacy and their achievements in Mathematics (which supported the findings by Blömeke et al., 2011).

Table 11: The chi-square tests (English language and Mathematics)

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	21.684 ^a	12	0.041

Can we detect any significant correlations between the students' proficiency in Mathematics and their families' socio-economic background (i.e. parents' education and income)?

A Pearson's moment correlation coefficient test was done to examine the relationship between students' basic proficiency in Mathematics and family's socio-economic background. From Table 13, the results of the analysis show a weak correlation between proficiency and the parents' income ($r = 0.227$, $p = 0.036 < 0.05$), and no correlation between proficiency and the parents' education ($r = 0.084$, $p = 0.444 > 0.05$). However, we observed a strong correlation between the parents' income and education ($r = 0.590$, $p = 0.000 < 0.001$). And this finding is consistent with study made by Dahl and Lochner (2012).

Table 13: Correlations between proficiency test score and family background (income and education)

		Proficiency	Parent Income	Parent Education
Proficiency	Pearson Correlation	1		
	Sig. (2-tailed)			
Parent Income	Pearson Correlation	0.227*	1	
	Sig. (2-tailed)	0.036		
Parent Education	Pearson Correlation	0.084	0.590**	1
	Sig. (2-tailed)	0.444	0.000	

*. Correlation is significant at the 0.05 level (2-tailed).

**. Correlation is significant at the 0.01 level (2-tailed).

To what extent does the family's socioeconomic background has an impact on students' basic proficiency and achievement in mathematics?

Semi-structured interview sessions were conducted to seven participants based on their proficiency tests score. The interview feedbacks are divided into three sub groups above average, average and below average. Further insights on the students' interviews are summarized below.

Above average

All three students in this category had scores between 80 and 82. There was only one male participant in this group. They had a few things in common which were not common to the rest, such as speaking English language at home most of the time, their parents always enquired about their school work, and they also attended tuition classes. They answered the basic Maths proficiency test questions very well, and they also wished to attend university.

Average

This student managed to score 50 marks on the proficiency tests. She sometimes practiced speaking English language at home and claimed that her parents showed concern about her schoolwork. She did not attend any tuition classes, and she looked forward to furthering her studies in one of the engineering colleges in Brunei.

Below Average

All the three students in this group are male and aged between 16 and 17 years old. They scored between 3 and 11 marks in the test. None of them spoke English language at home and their parents generally showed no concern towards their schoolwork. They did not attend any tuition classes, and they had problems answering the basic Mathematics proficiency test questions. They also showed interest in going to a vocational school.

To conclude, the main factor affecting students' Mathematics proficiency is their English language literacy. English as a second language applied to most of these students in this study. In addition, parental involvement also contributed to students' achievement in schools. These findings support the findings from Zakaria et al. (2013) as well as Milne and Plourde (2006). There is also considerable evidence suggesting that students with parents on the higher income bracket tend to do well possibly because their parents can afford to send them to tuition classes.

CONCLUSIONS AND RECOMMENDATIONS

The findings of this present study reveal that a relationship exists between the students' basic proficiency and their Mathematics achievements. English language literacy also has a significant impact on students' achievement in Mathematics. In contrast, gender and parents' level of education does not affect the students' basic proficiency in Mathematics. We also deduced that parents' income has a significant effect on the students' basic proficiency and their achievements in Mathematics.

Moreover, the students' basic mathematical proficiency is highly correlated to their achievements in Mathematics. A stronger basic foundation will allow the students to handle higher-level Mathematics more readily. In addition, monitoring students' achievement in Mathematics will allow teachers to alter their lessons to suit the students' needs. If the teachers are aware of their students' progress, then the teachers will be in a better position to identify the problems faced by their students. Similarly, monitoring their performance in Mathematics will allow students to observe their own progress throughout the school year. This might help them identify their own weaknesses and motivate themselves to improve further.

As the sample is quite small and limited, a bigger sample is required from a more diverse source for future research. In addition, we recommend future study in investigating why attending private tuition class has positive effects on achievement test scores. One suggestion is for the school to provide one period of lesson every week just to review student basic Mathematical skills. Borich (2014) suggested that teachers should include parents in the planning and implementation of important changes in instructional techniques and assessment aimed at eliminating the differences in the performance among learners. Teachers also need to learn and experiment with different instructional techniques as learners have a quite diverse background (Golijani-Moghadam et al., 2012; Shahrill, 2017). In short, a good rapport between teachers and parents is crucial as it might produce a better educational system. Teachers also need to be robust in their teaching style to cater for diverse group of students.

ABSTRACT

The aim is to teach students to gauge the wounding potential of shooting weapon and ammunition. Part of Forensic Science course is dedicated to shooting weapons. These lessons deal with finding the wounding potential of shooting weapons. For this educational purpose, weapons of category D are used. In the Czech Republic, these weapons are freely sold from 18 years. The principles of controlling some weapons of category D (e.g. expansion weapon, Flobert rifle, airsoft pistol) which provide lower projectile speeds, are the same as for other firearms. Before measuring, students characterize the used alternative material. Then, they measure the speed of projectiles and the depth of incomplete penetration in this material. The students process results and prepare a report on the measurement including the measurement errors. Finally, the students correlate the velocity of projectiles (momentum), the weight and dimensions of the ammunition, and the depth of incomplete penetration, which was measured earlier. Obtained data are compared with those from previous measurements.

INTRODUCTION

Forensic sciences are an integral part of all investigations and evidence in criminal or civil proceedings in front of state authorities. These are the procedures leading to the proof of the identity of the persons, the authenticity of the documents etc. One part of forensic science is forensic ballistics or forensic medicine.

Forensic ballistics try to identify a shooting weapon mainly by using a projectile stop. After passing off the projectile from the barrel of shooting weapon, identification markers remain on the projectile. From these markers, it is possible with a certain probability to determine the shooting weapon from which the projectile was shot according to the reference sample. The following scientific publications have concerned with the identification of the projectiles according to the marks created after the shot (Martínek et al.).

On the contrary, forensic medicine determines the time and the cause of death or damage. From our point of view, it is the determination of the lethal effect that arises in a gunshot wound. The wounded effect is determined on living tissues (e.g. the human body, determined by doctors or forensics doctors); however, the wounded potential is determined on the alternative material. The wounding potential is researched by scientists and experts, who determine the wounding potential of the ammunition or test a new type of ammunition. This can be seen in the following scientific publications e.g. (Gracila, Chocholatý, and Malánik 2017; Hanna et al. 2015; Humphrey and Kumaratilake 2016; Juříček, Plíhal, and Komenda 2003; Martínek et al.; Mattijssen et al. 2016; Mikuličová et al. 2017; Werner et al. 2017). The wounded effect can be estimated from the wounding potential. This is aided by the experience of forensic doctors who deal directly with forensic medicine. Based on their experience and measured values on the alternative material, it is possible to determine the wounded effect.

Forensic ballistics is taught in the subject of forensic science at the Faculty of Applied Informatics at Tomas Bata University in Zlin. The students get acquainted with the shooting weapon, which they then test and attempt to estimate its wounding potential. Weapons of category D are used for testing. In the Czech Republic, these weapons are freely sold since the age of 18 without the need for a gun license. These shooting weapons, that provide lower velocities, can be traced to their effect. Most commonly, air gun (air guns or airsoft weapons on CO₂), but also firearms (Flobert) or other shooting weapons are used.

THE STUDY

Based on the assignment of a laboratory task (Determination of the velocity of the projectiles and determination of the depth of incomplete penetration to the alternative material), the student obtain a firearm and ammunition intended for the tested shooting weapon. The student become acquainted with the theoretical basis of the laboratory task and with the basics of the safe handling of shooting weapon. Then, he follows the instructions to prepare the necessary equipment, aids, the shooting weapon and tested ammunition. For each tested ammunition, the student determines dimensions and weight.

Equipment

For this experiment, an air gun (air pistol) and four types of ammunition (diabolo pellets) were selected.

Air pistol – TEX 086

Figure 1. Air pistol model TEX 086

Table 1. Parameters of air pistol model TEX 086

Parameters	Value
Type	Pistol
Length of pistol	346 mm
Length of barrel	185 mm
Caliber	4.5 mm (.177)
Groove number	12
Groove step	450 mm
Aiming line	292 mm
Mass of pistol	1.22 kg
Speed of projectile	90 m/s (diabolo pellets)
Trigger pull adjustable	Max. 3.72 N
Cocking strength	Max. 11.77 N

This pistol (Figure 1) is a spring-piston air gun made in Czechoslovakia. Other parameters can be found in Table 1. The production was discontinued in the 80s.

Diabolo pellets

For the comparison of momentum, dimensions and the depth of incomplete penetration of the different types of projectiles, four types of diabolo pellets (Figure 2) were selected.

Figure 2. Microscopic photos of selected diabolo pellets

The digital caliper with the accuracy of 0.01 mm was used to measure the dimensions. To determine the exact weight, the students used the laboratory scale PLT 2000-3DM from company KERN. Measurement of dimensions and weight was done with each type of diabolo pellets and 30 samples. The results are shown in the Table 2.

Table 2. Parameters of diabolo pellets

	Hunter Impact	Red Fire Enenergy	Lethal	Diabolo LUX
Producer	GAMO	GAMO	GAMO	Kovohute Pribram
Caliber	4.5 mm (.177)	4.5 mm (.177)	4.5 mm (.177)	4.5 mm (.177)
Weight	0.49 g	0.51 g	0.36 g	0.55 g
Weight	7.56 gr	7.87 gr	5.56 gr	8.49 gr
Measured length	6.408 ± 0.048 mm	8.656 ± 0.065 mm	8.774 ± 0.078 mm	5.635 ± 0.049 mm
Measured width	4.648 ± 0.084 mm	4.630 ± 0.053 mm	3.466 ± 0.005 mm	4.624 ± 0.073 mm
Measured weight	0.485 ± 0.004 g	0.506 ± 0.002 g	0.356 ± 0.002 g	0.559 ± 0.008 g

For measuring velocity of projectiles, the electronic gates (Figure 3) Caldwell Chronograph Premium Kit with IR light were used. These gates measure velocity in m/s, but also in ft/s. They can measure velocities from 1.5 to 3,000 m/s and their equivalent in ft/s. Speed is displayed directly on the display or can be connected to your mobile phone or PC.

Figure 3. Ballistic chronograph used to measure velocity of diabolo pellets

Then, the student measures the density of alternative material, that serve to stop the projectile, and he determine the depth of incomplete penetration in the alternative material. In this case, it was a modeling material (plastic alternative material). In the end, these results are correlated with a ballistic gel that was measured in another laboratory task.

Measurement of the density of the modeling mass was carried out using a pycnometer and distilled water at 20 °C. The measurement was carried out by considering the weight of the alternative material, followed by the weight of the distilled water in the pycnometer, and finally, the weight of the distilled water with the alternative material in the pycnometer.

According to mathematical relations:

$$M = m_1 + m_2 - m_3 \quad (1)$$

$$M = 1,129 + 76,816 - 77,298 \quad (2)$$

$$M = 0,647 \text{ g} \quad (3)$$

Where:

M - the total weight of the spilled water

m_1 - weight of alternative material

m_2 - mass of the pycnometer with distilled water

m_3 - mass of pycnometer with distilled water and alternative material

$$V = \frac{M}{\rho_{\text{spilled water}}} \quad (4)$$

$$V = \frac{0,647}{0,998} \quad (5)$$

$$V = 0,648 \quad (6)$$

Where:

V - volume of alternative material

$\rho_{\text{spilled water}}$ - density of distilled water at 20 °C (0.998 g/cm³)

$$\rho_{\text{alternative material}} = \frac{m_1}{V} \quad (7)$$

$$\rho = \frac{1,129}{0,648} \quad (8)$$

$$\rho = 1,742 \text{ g/cm}^3 \quad (9)$$

Once the student defines the used shooting weapon, diabolo pellets, and alternative material, he can proceed to the experiment itself. He creates a workplace (Figure 4) in which a shooting stand is used to maintain the same distance between the tested shooting weapon, the electronic gates, and the alternative material. At a distance of 1 meter from the muzzle of the tested shooting weapon, the electronic gates are placed to measure projectiles velocity. At a distance of 2 meters from the muzzle of shooting weapon, the alternative material is located. The student shoots 10 times into alternative material and determines the values of the velocity and depth of incomplete penetration of diabolo pellets. Then, he calculates the momentum of the individual diabolo pellets and records the minimum, maximum, average and standard deviations of the individual kinds of diabolo pellets to the tables.

Figure 4. Experimental setup of measurement chain

FINDINGS

The measurement was carried out at a constant temperature of 26.9 °C. The velocity measurement of diabolo pellets were measured at each shot. From the results obtained, the average velocities and the standard deviation of the measurements were determined. Additionally, the individual depths of incomplete penetration and their mean values and the standard deviation of the measurements were determined. From the measurement, the student creates a measurement report. Then he correlates its measured results with the results that have been measured earlier.

The findings are divided up into two parts (Table 3). The first part focuses on the velocity measurements (momentum) of each type of diabolo pellets.

Table 3. Findings for velocity and momentum

		Hunter Impact	Red Fire Energy	Lethal	Diabolo Lux
Velocity	Min	105 m/s	74 m/s	88 m/s	86 m/s
	Max	112 m/s	91 m/s	106 m/s	92 m/s
	Average	107.8 m/s	81.4 m/s	93.0 m/s	89.4 m/s
	Standard deviation	2.95 m/s	6.47 m/s	7.35 m/s	2.41 m/s
Momentum	Min	51.45*10 ⁻³ kg.m/s	37.74*10 ⁻³ kg.m/s	31.68*10 ⁻³ kg.m/s	47.3*10 ⁻³ kg.m/s
	Max	54.88*10 ⁻³ kg.m/s	46.41*10 ⁻³ kg.m/s	38.16*10 ⁻³ kg.m/s	50.6*10 ⁻³ kg.m/s
	Average	52.82*10 ⁻³ kg.m/s	41.51*10 ⁻³ kg.m/s	33.48*10 ⁻³ kg.m/s	49.17*10 ⁻³ kg.m/s
	Standard deviation	1.45*10 ⁻³ kg.m/s	3.30*10 ⁻³ kg.m/s	2.65*10 ⁻³ kg.m/s	1.32*10 ⁻³ kg.m/s

The weights and dimensions of the used ammunition are the same as those used in the previous measurement. Velocities and momentums differ in average values, except diabolo Hunter Impact. This is due to a higher temperature in the laboratory during the experiment.

Depth of incomplete penetration

Table 4. Results of Depth of incomplete penetration

	Hunter Impact	Red Fire Energy	Lethal	Diabolo Lux
Min	21.61 mm	9.83 mm	7.97 mm	18.41 mm
Max	30.89 mm	14.29 mm	10.93 mm	22.16 mm
Average	25.70 mm	12.01 mm	9.89 mm	20.30 mm
Standard deviation	3.53 mm	2.00 mm	1.20 mm	1.33 mm

The depth of incomplete penetration in the alternative plastic material (modelling mass) with a density of $1,742 \text{ kg/m}^3$ (Table 4) behaved differently than in the second alternative material (ballistic gel), which had a density of $1,055 \text{ kg/m}^3$ and was cooled to 7°C . This ballistic gel was not blended with a standard concentration of 10% or 20% but had a concentration of 16.78 % to bring the soft tissues of the human body as close as possible. The soft tissue of the human body corresponds to a density of approximately $1,100 \text{ kg/m}^3$ (Juricek, Matenko and Vojtechovska). Alternative plastic material (modelling mass) corresponds rather to density of bones in the human body. Human bones have a density of about $1,650 \text{ kg/m}^3$. During the experiment of the depth of incomplete penetration into the alternative plastic material, the temperature of 26.9°C in the laboratory had an important role because it passed a part of its temperature to an alternative plastic material. Due to this, the modeling mass became more plastic and diabolo pellets went deeper into this alternative material.

Correlating the results from the previous measurement on the ballistic gel, the results are shown in graphs for better clarity.

Graph 1. Correlation of average projectile velocity

As can be seen in graph (Graph 1), the diabolo Hunter Impact had the same speed in the previous measurement as in this. For other diabolo pellets, the average velocity values were more or less different. This is due to the fact that all diabolo pellets do not have the exact value and they move within certain tolerances.

Correlation of the average momentums of the diabolo pellets

Graph 2. Correlation of the average momentums of the diabolo pellets

The following graph (Graph 2) builds on the previous one, where the momentum is derived from the velocity of the individual diabolo pellets and their weights. Although the diabolo Lethal is similar in velocity to the diabolo Red Fire Energy, its momentum is much smaller because it is lighter. On the other hand, the diabolo Lux has the highest weight and therefore it can cope with its momentum to the diabolo Hunter Impact.

Correlation of average depth of incomplete penetration of diabolo pellets

Graph 3. Correlation of average depth of incomplete penetration of diabolo pellets

The final correlation graph (Graph 3) shows the difference of used alternative materials. The first was an alternative plastic material - plasticine and the second was a ballistic gel. As was previously mentioned, the density

of plasticine corresponds more to the density of human bones; therefore, the depth of incomplete penetration to this alternative material is small. On the contrary, the ballistic gel is very close to human tissue. Because of this, the depth of incomplete penetration is so great.

CONCLUSIONS

Within the course of forensic science at the Faculty of Applied Informatics at Tomas Bata University in Zlín, students get acquainted with shooting weapons. Used shooting weapons are safe at manipulation. These are weapons of category D which are, according to Czech law 119/2002 Coll., freely sold from 18 years of age in the Czech Republic. The weapons of category D do not have the same penetration as weapons of category A, B or C; even though, they have enough power to cause relatively serious gunshot injuries. Laboratory task in forensic science is fun to students because it is practical thing that students test and see practical results. Then, they realize that no shooting weapon is a toy and must be treated safely. The same applies to the other means that do not appear to be weapons at first sight, but serve to prepare lunches (knives, scissors) or as the means of transport (cars). Once things are used according to security rules, these things are useful and not dangerous. Due to the knowledge gained from the results of the laboratory task, the students are able to compare and to investigate the differences between the individual alternative materials and to apply them independently.

ACKNOWLEDGMENT

This work was supported by Internal Grant Agency of Tomas Bata University in Zlin under the project No. IGA/FAI/2017/010.

ABSTRACT

A growing education systems and increased competition amongst countries resulting from globalisation create enormous pressure amongst higher education institutions. It is critical for the administrators of higher education institutions to understand factors influencing students' perceptions since it is acknowledged in the literature that the reputation of the countries affects students' choice of higher education institutions. Therefore, the aim of this study is to understand the factors affecting the choice of students studying in North Cyprus universities and to develop a scale to measure Country Reputation for Higher Education. 11 focus groups were conducted with 71 students and a twenty item "Country Reputation for Higher Education measurement scale for higher education" is developed to be tested in a further research. Our findings can be used both by the educational institutions and the government officials to understand the factors important on the choice of students studying in North Cyprus and to make necessary improvements according to the findings of this research.

Keywords: Higher Education, Education Administration, Country Reputation for Higher Education Measurement.

INTRODUCTION

Increased competition between countries (Kerr, 2006) especially due to globalisation, has given extra importance to education. In 2007, there were over 2.8 million international students (UNESCO, 2009) and this figure is expected to increase to 25 million by 2025 (Bohm *et al.*, 2002). These figures indicate a growing education market which creates fierce competition within the international education industry (Lawley and Perry, 1998; Kemp, 2005).

Higher education within the goods-service continuum is at the pure service end (Harvey and Busher, 1996; Patterson *et al.*, 1998; Srikatanyoo and Gnoth, 2002) which makes it difficult for a clear pre-purchase evaluation especially for the overseas students. The reputation of the provider therefore plays an important role in the decision-making process of the service purchaser (Bourke, 2000). Studies suggest that students opting to study overseas tend to choose a country first and then select an institution second (Bourke, 2000; Mazzarol and Soutar, 2002; Srikatanyoo and Gnoth, 2002). Moreover, both in Bourke's (2000) and in Srikatanyoo and Gnoth's, (2002) studies, it is found that countries' good reputation for higher education have a positive effect on prospective students' perception of their higher education institutions. Toros (2017) also found in her recent research that despite of many similarities, a measurement tool comprising aspects of country reputation for higher education is important to be used instead of a general country reputation measurement to understand the perceptions of students towards the higher education provided in a country.

On the other hand, push and pull theory (McMahon, 1992) is one of the most popular theory in the discussions of understanding the reasons international students choose to study overseas rather than their home country (Sanghyeop *et al.*, 2017)

North Cyprus is the Turkish part of a divided island which is recognised by only Turkey and this internationally unrecognized country is exposed to much negative publicity. The main source of this negative exposure is the Republic of Cyprus with which it has had a ceasefire since 1974. Since then, the main political objective of the Greek Cypriot authorities has been to prevent any normalisation of the regime in the north. Especially since the establishment of the Turkish Republic of Northern Cyprus (TRNC) state in 1983, aggressive measures have

assiduously been applied by the Greek Cypriot authorities to block Turkish Cypriots from participating any international events.

These efforts have been effective in the international arena, spreading negative perceptions to other countries leading to the rejection of any official existence of the TRNC. However, despite of all these discouraging engagements, North Cyprus currently has 15 universities and 93,292 students, 85% of whom are non-Cypriots (State Planning Organisation of the TRNC, 2017). Moreover, further growth is expected in the number of universities in North Cyprus.

Higher education therefore can be said that is one of the most predominant businesses on the island and it has a priority in North Cyprus' economy. Hence, it is crucial for both the government and institution authorities to understand how to manage the reputation of higher education in the TRNC. In order to manage reputation, it is necessary to measure it, which is why it is very important to know how to do so. Given the facts above, the purpose of this research is twofold. Firstly, it aims to understand the factors which affect the decisions of students' choice to study in North Cyprus. It is important for the university managers and country officials to know if there are some country specific factors being effective on the choice of students studying in North Cyprus to make necessary adjustments both in their policies and resources. Secondly, the purpose of this study is to develop a measurement scale for the country reputation in the context of higher education in North Cyprus which is essential in managing the reputation of higher education of North Cyprus.

As indicated earlier, higher education within the goods-service continuum is at the pure service end (Harvey and Busher, 1996; Patterson *et al.*, 1998; Srikatanyoo and Gnoth, 2002), since many of its key quality aspects are intangible such as the way materials are covered, the instructors' teaching methods, and communication with students. Therefore, the quality of higher education can vary according to the students, lecturer, class, and year (Owlia and Spinwall, 1996; Patterson *et al.*, 1998; Cubillo *et al.*, 2006). As Cubillo *et al.* (2006) points out, much of the education marketing literature focuses on institutions (Qureshi, 1995; Lin, 1997; Mazzarol, 1998; Ivy, 2001; Soutar and Turner, 2002; Price *et al.*, 2003) and ignores other factors like the influence of the country itself on the choice of students. For this reason, some research indicates the reputation of the institution as the key factor swaying the student's decision (Pimpa, 2003; Chen, 2007). However, there are some other research findings which point to the reputation of a country as the most important factor (Bourke, 2000; Mazzarol and Soutar, 2002), and one which is frequently used to signal quality (Sapir and Winter, 1994). In either case, the reputation of higher education – whatever the education marketing literature focuses on – is an important aspect in the international trade of services and it is affected by the reputation of countries (Bourke, 2000; Srikatanyoo and Gnoth, 2002).

Many researchers directed their research on exploring the reasons international students choose to study overseas rather than their home country. McMahon (1992) was the first scholar who proposed the push and pull theory to explain the flow of students from eighteen developing countries to the world and to the United States during the 1960s and 1970s. In a later study similar to McMahon, Altbach (1998) used pushed and pull theory and he indicated that some students were pushed by the existence of unpleasant conditions in their home countries, while others were pulled by other opportunities, such as scholarships provided by their host countries' governments. As pointed out by Li and Bray (2007) student mobility in higher education is now viewed "less as aid and more as trade" since many students are now looking for their higher education outside their countries without the sponsorship of their governments. This, in turn, has changed the role of governments from direct sponsors of students into regulators and facilitators.

The factors of a country which draw international students, considered as "pull factors" of a country, are mainly explained by the host country's economic wealth. Moreover, other factors attracting international students are the cultural and economic links between the host and home country (McMahon, 1992); the international recognition / reputation of the host country; ease of immigration procedures and university entrance for foreign students (Binsardi and Ekwulugo, 2003; Maringe and Carter, 2007), advanced research facilities; congenial socio-economic and political environments and the internationality of the classmates (Li and Bray, 2007), improve employment prospects; experience different culture; improve English; quality of education; reputation of university; quality and content of programme and rankings (Wilkins and Huisman, 2011a).

The unfavourable factors of a country which drive students out of their own countries are called “push factors”. The slow economic growth of the home country (Lee and Tan, 1984; Agarwal and Winkler, 1985; McMahon, 1992) which limits the opportunities in students’ home countries (Wilkins et al., 2012), limited science or technology base programmes, perception of the poorer quality of higher education in the home country are some of the most common push factors mentioned in the literature. For such students, constrained by circumstance to search elsewhere for higher education, the commonality of the language and geographic proximity of the host country (Mazzarol and Soutar, 2002) are important factors in encouraging students to study away from their home countries. It is important to note that the push factors of a country create a generalised desire and interest in overseas education, but do not give a specific direction to students. On the other hand, pull factors are specific to potential host countries and institutions (Davis, 1995). For that reason, it can be concluded that reputation of a country as much as that of the institutions themselves can play a key role in students’ decision making in relation to the choice of their host country for higher education.

METHODOLOGY

This section includes the model of research, working group, data collection and explanations on the data analysis.

METHOD

Focus groups are decided to be used in this qualitative research to gain a comprehensive view on two issues. Firstly, it was done to understand the reasons behind the students’ choice of a country for higher education to find out which push and pull factors are effective on their decision to study in North Cyprus and secondly, it aimed to clarify the meaning of solid country reputation for education, so that reputation measurement tool could be developed for North Cyprus’ higher education reputation.

WORKING GROUP

This study is limited with the universities in North Cyprus includes Turkish, Turkish Cypriot and international students, the original plan was to conduct two groups in the most populated six universities; one with Turkish and Turkish Cypriot students and the other with international students. 11 focus groups were conducted with 71 students and a twenty item “reputation measurement scale for higher education” is developed to be tested in a further research. The former group discussions were held in Turkish and the latter were held in English. This was the case for all the universities except the North Cyprus Campus of the Middle East Technical University. As the number of international students was very limited in this university there was only one focus group organised with Turkish students only. Many students were unwilling to spend valuable time participating in any research, and for this reason, convenience sampling was used. However, a compilation of differing profiles of students from each university was completed (see Table 1) which was important for the collection of diversified ideas. The main target for the focus groups was to gather a minimum of 6 and a maximum of 8 students, as the recommended number in a group would seem to be 6-8 people in general (MacIntosh, 1993).

DATA COLLECTION TOOL

In the qualitative research approach, in order to collect data generally the depth interview (face to face interview), direct observation and document analysis technics are used (Legard , Keegan and Ward, 2003). The data of this research has been gathered through “face to face interview technique” which is generally preferred in qualitative research approach providing the possibility of deeply understanding the views of the participants about the matter and which cannot be observed directly by other data collection tools. The depth or face to face interviews have some major advantages like having a high response rate, providing flexibility on the order of questions, ensuring control possibility on the environment and giving deep information about the subject that is researched (Yıldırım and Şimşek, 2011). This method is a source of many dimensions such as the reasons forming the basis of response of the participants, emotions, thoughts and beliefs (Legard, Keegan and Ward, 2003).

Table 1. Demographics of the Focus Groups

University	Gender	Age	Nationality for International Students / Cities for Turkish Students	Major
EMU (international Group)	2 Female 4 Male	23, 31, 27, 22, 23, 29	Azerbaijan, 2 from Iran, 2 from Nigeria, Tajikistan	MS student in Economics, 3 PhD students in Economics, 2 Master students in Banking and Finance
EMU (Turkish Group)	2 Female 6 Male	23, 22, 24, 23, 19,19, 22,25	Ankara, İstanbul, Uşak, Mersin, Denizli, İzmir, Konya, Famagusta	3 BS students in PR, 1 BS students in Journalism, 1 BS student in Business Administration, 1 BS student in Political Science, 1 MS student in Architecture, 1 BS student in International Relations
CIU (International Group)	2 Female 4 Male	23, 23, 23, 24,14,24	3 students from Nigeria, 1 Pakistan, 1 Zimbawe, 1 Iran	All BA Tourism and Hospitality Management students
CIU (Turkish Group)	1 Female 5 Male	21, 21, 24, 24, 25, 26	Elazığ, Ankara, İstanbul, Samsun, Mersin, Tekirdağ, Famagusta	All BA Tourism and Hospitality Management students
EUL (International Group)	2 Female 4 Male	23, 29, 24,25,21,25	3 from Nigeria, 3 from Pakistan	3 BS students in PR, 3 BS students in Civil Engineering,
EUL (Turkish Group)	3 Female 3 Male	22,22, 23, 24, 25, 25,	İstanbul, Diyarbakır, Ağrı, Giresun, Zonguldak, Rize	3 BS students in Architecture, 3 BS students in PR

The first two questions were designed to clarify the initial objective of the research, which was to understand the reasons why students chose to study abroad. The last question was prepared to design reputation scale for the country reputation for higher of North Cyprus.

The first question, “why study abroad?” was asked to understand why students chose to study abroad. This was an important question to understand the push factors which aimed to identify any unfavourable factors in the students’ home countries which were driving them abroad.

The second question, “once you had decided to go abroad, how you chose which country” was designed to understand the pull factors; thus, the rationale behind the students’ choice of country which mainly highlighted the attractive factors in the host country.

The third question “what are the important factors to establish a solid country reputation for education?” was to elucidate the factors in a solid country reputation for higher education.

DATA ANALYSIS

The answers given for each question according to the views of the interviewed participants were categorized separately and put in the tables. After this first categorization, data was examined again by the researcher and the basic themes and categories were formed. The themes and categories that are determined have been observed again by taking into consideration the related literature and the categories having similar patterns have been unified and the different ones were coded by being gathered in another category. After the interview form was applied in the research, the data obtained from the answers of the questions in interview form were resolved by content analysis (Yıldırım et al., 2011).

FINDINGS

In this section, the data collected through data collection tools are analysed and the results are interpreted accordingly.

1. Push and Pull Factors

In all the Turkish groups, the challenge of the university entrance examination (OSS) in Turkey was indicated as their main reason for studying in North Cyprus. OSS is the University Entrance Examination in Turkey administered by OSYM (Student Selection and Placement Centre). This examination is the only way to obtain a place in a university within the Turkish education system. North Cyprus universities are a part of this system, but they require lower OSS scores for acceptance as do many other private universities in Turkey. Consequently, many Turkish students studying currently in North Cyprus are there not because they want to study abroad but because of their exam results, with the exception of students studying at the North Cyprus Campus of the Middle East Technical University. These students could have studied in relatively good universities in Turkey; however, they wanted to have a degree from a well-known university which was the main reason for their choice of North Cyprus.

Some students from Nigeria and Iran also pointed out that the challenging university entrance exams in their own countries were their main reason for choosing to study abroad.

Many of the international student groups emphasised the importance of being exposed to different cultures and having the opportunity to develop international perspectives. This parallels the findings for the pull factors in the literature. Another very common reason for studying abroad amongst international students was the push factors within their home countries. Limited university facilities, being unable to take their courses in the English language, disruption in education due to political instability, were the main reasons raised for not choosing an education in their home countries. A few of both international and Turkish students pointed out the lack of a democratic environment as the main factor for looking at higher education opportunities abroad.

Another very popular reason for international students to study abroad was the respect given to foreign education by their home countries. Some emphasised the fact that foreign education enhances their career opportunities. However, since most of the Turkish students did not consider Cyprus as a foreign country, the intention to study abroad did not really exist for most of them. Thus, the responses of the international students were of a greater variety than those of the Turkish students. Yet many Turkish students indicated that North Cyprus universities did not have a positive image in Turkey.

Four Turkish Cypriot students participated in three of the Turkish focus groups (see Table 2) to explain why they preferred to study in their home country rather than abroad. The main reasons were found to be twofold: firstly, Turkish Cypriot students did not need to take an entrance examination at some Cypriot universities and secondly, some students were reluctant to study abroad and live by themselves.

The last topic to be discussed was what factors a country needed to have a solid reputation for higher education. The most emphatic answers among focus groups were a high standard of education, together with the opportunity it provides for its graduates. Parallel to a high standard of education, the second most frequently given answer was the quality of the education especially in universities, which accorded with the literature.

Some students needed to be reminded that the question was specific to a country rather than universities since some of them started to divert the conversation toward the universities in which they studied. “Quality of educators”, “democracy of the country”, “and the number of successful graduates” and “the use of high technology” were other frequently given answers. “Social life provided for students”, “the level of government investment in education” and “flexibility in giving permission to students to work while they study” were responses that were given in three groups. Two of the focus groups mentioned “safety”, “literacy rate”, “accommodation”, “provision of good facilities” and “reasonableness of fees”. In only one group, was leadership of the country associated with a strong higher education reputation of a country (see Table 2).

Table 2. Summary of the Focus Group Results

Why study abroad (push factors)	How country choice is given (pull factors)	Factors for solid country reputation for education
Challenging university entrance exams in the home country (7) - OSS exam in Turkey - Nigeria entrance exam - Iran entrance exam Desire to be exposed to different cultures / develop international perspective(4) Push factors of home country (4) - Limited facilities - No English education - Interruption in education due t political instability - No democratic environment More respected to get a degree abroad (3) - Indicated by students from Nigeria and Sudan -Easier to find a job Develop language (2) Hesitation to be exposed to a totally new culture (2)	Tuition fees (6) Other alternatives’ living expenditures are higher (5) Visa requirement (5) - Students from Iran and Nigeria indicated that it is harder to get visa for UK, USA and Australia Similarity of the culture (4) Teaching language being in English (4) Accredited by YOK (3) Safe environment (3) Scholarship (2) Offered programs (2) A friend or family member studying in N. Cyprus (2)	Provides worldwide opportunities to graduates (9) High standard of education in the country (9) - Balance of standard among universities - High standards in every level of education - Offering contemporary education - Real-life teaching - Guiding students towards their skills - Stable politics on education - Accredited by other countries Quality of education offered in universities (7) - Ranking of the universities - Accreditations of the universities Quality of the educators (4) Democratic country (4) Successful graduates / alumni (4) High technology (4) Social life of students (3) Investment in education (3) Gives permission to work while study (3) Safe (2) Literacy rate of the country (2) Accomodation (2) Good facilities provided to students (2) Reasonable fees (2) Leadership of the country (1)

Note: Numbers on the side of the focus group findings indicate total number of responses

2. Scale Development for Country Reputation for Higher Education

The results of the focus groups revealed similarities with the modified RQ known as the Country Reputation Index (CRI) of Passow *et al.* (2005) and the country reputation scale of Yang *et al.* (2008).

Since there was no indication of either social or emotional appeal in the focus groups, these two facets were omitted from the scale (see Table 4). On the other hand, all the components in the physical and cultural appeals were maintained. Only one component of the leadership appeal (has charismatic leaders) was kept in the new scale since this was similar to the findings in both the literature and the focus groups, and one component of the political appeal (is a democratic country) was included and combined under the facet name of “management appeal” since both these factors are related to the management of a country. Financial appeal as a heading was kept, but the components were modified according to the financial aspects of higher education based on the findings in the focus groups and the literature review. A new facet, the quality of higher education appeal, was added which was the main facet in the scale directly related to higher education (see Table 3).

The results obtained from the focus groups were coded together with one marketing academician. Since there was more than one researcher coding the results of the focus groups, inter-coder reliability was applied by using percent agreement. Inter-coder reliability is an important step to ensure the reliability of the research and it measures “*the extent to which different judges tend to assign the same rating to each object*” (Tinsley and Weiss, 2000). Percent agreement method, “*is the percentage of all coding decisions made by pairs of coders on which the coders agree*” (Lombard *et al.*, 2002) and it is an easy way to calculate the coder reliability. A high inter-coder reliability of 0.90 was obtained and later two PhD students along with one marketing academic were asked to assess the readability of the items.

Table 3. Comparison of the Focus Group Findings of the Country Reputation for Higher Education Scale with the Adapted Country Reputation Scales and the Literature

Adapted Instrument of RQ Fombrun-RI Country Reputation Index (Passow <i>et al.</i> , 2005)	Adapted Instrument of CRI (Yang <i>et al.</i> , 2008)	Developed Country Reputation for Higher Education Facets	Focus Groups Findings	Literature Findings on Country Choice of International Students
N/A	N/A	Quality of Higher Education	<p>High standard of education in the country (9)</p> <p>Balance of standard among universities</p> <p>High standards in every level of education</p> <p>Offering contemporary education</p> <p>Real-life teaching</p> <p>Guiding students towards their skills</p> <p>Stable politics on education</p> <p>Accredited by other countries</p> <p>Quality of education offered in universities (7)</p> <p>Ranking of the universities</p> <p>Accreditations of the universities</p> <p>Quality of the educators (4)</p> <p>Successful graduates / alumni (4)</p>	<p>Education standards of the country (Binsardi and Ekwulugo, 2003)</p> <p>Recognition of host's qualifications in the home country (Mazzarol, 1996; Mazzarol <i>et al.</i>, 1997; Cubillo <i>et al.</i>, 2006)</p> <p>Staff expertise (Lin, 1997; Mazzarol, 1988; Soutar and Turner, 2002)</p> <p>Safety (Lawley and Perry, 1998)</p>
Physical Appeal (Country) is a beautiful place (Country) has well-educated residents (Country) has a good infrastructure of roads, housing, services, health care, and communications	Physical Appeal (Country) is a beautiful place (Country) has a good infrastructure of roads, housing, services, health care, and communications (Country) is a safe place	Physical Appeal	<p>Safety of the place (2)</p> <p>Literacy rate of the country (2)</p> <p>Good facilities provided to students (2)</p> <p>Accommodation (2)</p>	

Adapted Instrument of RQ Fombrun-RI Country Reputation Index (Passow <i>et al.</i> , 2005)	Adapted Instrument of CRI (Yang <i>et al.</i> , 2008)	Developed Country Reputation for Higher Education Facets	Focus Groups Findings	Literature Findings on Country Choice of International Students
Financial Appeal (Country) is an inviting place to do business (Country) has a well-developed industrial sector (Country) is a low tax country (Country) is a safe place in which to invest	Financial Appeal (Country) is an inviting place to do business (Country) has a well-developed industrial sector (Country) maintains a stable economic environment	Financial Appeal	Provides worldwide opportunities to graduates (Job opportunities it possesses) (5) Gives permission to work while study (4) Reasonable fees (2)	Ease of finding employment (Cant, 2004)
Leadership Appeal (Country) has charismatic leaders (Country) communicates an appealing vision of the country (Country) is well-managed (Country) upholds international laws	Leadership Appeal (Country) has charismatic leaders (Country) communicates an appealing vision of the country		Leadership of the country (1)	N/A
	Political Appeal (Country) maintains good international relations (Country) is a democratic country (Country) maintains a stable political environment	Management Appeal	Democratic country (4)	N/A

Adapted Instrument of RQ Fombrun-RI Country Reputation Index (Passow <i>et al.</i> , 2005)	Adapted Instrument of CRI (Yang <i>et al.</i> , 2008)	Developed Country Reputation for Higher Education Facets	Focus Groups Findings	Literature Findings on Country Choice of International Students
Cultural Appeal (Country) is socially and culturally diverse (Country) has a rich historical past (Country) offers enjoyable entertainment activities	Cultural Appeal (Country) has a rich historical past (Country) has distinct culture (Country) has an appealing culture	Cultural Appeal	Social life of students (3) Internationality (2) Historical attractions (1)	Culture (McMahon, 1992; Binsardi and Ekwulugo, 2003; Cubillo <i>et al.</i> , 2006)
Social Appeal (Country) supports good causes (Country) is a responsible member of the global community (Country) supports responsible environmental policies	Global Appeal (Country) supports good causes (Country) is a responsible member of the global community (Country) supports responsible environmental policies	N/A	N/A	N/A
Emotional Appeal I respect (country) I like (country) I trust (country)	Emotional Appeal I like (country) I trust (country)	N/A	N/A	N/A

As can be seen from Table 4, the country reputation for higher education scale is developed with five different appeals.

Table 4. Scale Developed for the Country Reputation for Higher Education

Physical Appeal

North Cyprus has well-educated residents

North Cyprus has a good infrastructure of roads, housing, services, health care and communications

North Cyprus is a safe place

North Cyprus provides satisfactory accommodation facilities for students

Financial Appeal

North Cyprus provides worldwide opportunities for graduates

North Cyprus universities have reasonable fees

North Cyprus gives permission to work while studying

Management Appeal

North Cyprus is a democratic country

North Cyprus has charismatic leaders

Cultural Appeal

North Cyprus is socially and culturally diverse

North Cyprus has a rich historical past

North Cyprus offers enjoyable entertainment activities

Quality of Higher Education Appeal

North Cyprus universities have high rankings

North Cyprus universities have recognised qualifications

North Cyprus universities have qualified educators

North Cyprus universities have a balance of standards among universities

North Cyprus has high educational standards

North Cyprus offers contemporary education

North Cyprus has a clear policy on education

North Cyprus has successful graduates / alumni

CONCLUSION

In summation, it appears that there are some North Cyprus specific factors being effective on the decision making of overseas students. One of the main pull factors which is North Cyprus specific is the university entrance examination. Turkish students need to take the University Entrance Examination in Turkey administered by OSYM. Since this examination is the only way to obtain a place in a university within the Turkish education system and North Cyprus universities are a part of this system, those Turkish students who scores lower points choose to study in North Cyprus instead of re-taking the entrance exam for acceptance. Hence, the main reason of choosing North Cyprus is not the quality of the education or the reputation of the country's higher education but Turkish students' need for a placement to a university. Of course this is not a sustainable reason to attract students especially after the significant increase in the number of private universities in Turkey. On the other hand, overseas students who are not Turkish stated the cost of living and easier visa procedures for favouring North Cyprus over other destinations. Again, increasing number of private universities in Turkey is a big threat for North Cyprus since they started to accept more international students. Moreover, work opportunities after graduation is superior in Turkey which can be effective in international students' choice of place for university since many of them indicated high intentions not to go back to their home countries.

It is very important for the officials to focus on the pull factors indicated by overseas students which can provide competitive advantages over other countries. One of the most important one is the tuition fee policy of the universities which is significantly lower than Turkish private universities and the other important factor is the teaching language of the universities which is mainly English.

It is important to acknowledge that focus group findings on the solid reputation for country reputation for higher education are in accordance with the literature findings of country choice of international students. A high standard of education, together with the opportunity provided for graduates are the main associations for the higher education reputation.

The scale developed for higher education reputation has shown that quality for higher education is the primary facet in this scale. Therefore, it is strategically very crucial for the policy makers to ensure that high standard of education is provided by the universities in order to increase the country reputation of the country in higher education. This is the only way to sustain its potential within the growing regional and international competition.

As a last note, the developed scale needs to be tested to see if it can be a generic tool to be used in the evaluation of a country's reputation for Higher Education.

ABSTRACT

In Kajang Women's Prison in Malaysia, there are some inmates who have children, those who were either born while their mothers were in detention or were still small and lactating when their mothers were detained. These children are allowed to stay with their mothers in the prison until they reach the age of 3 years. After the age of 3, they will be sent to their families to be raised if their mothers are still serving the remaining sentence. Preliminary studies regarding children's upbringing while in prison found that the prison authorities would merely use the general module for children supplied by the Social Welfare Department. There is no specific module designed for children's education in prison. Due to this void, a draft module (10 sub-modules and 42 sessions) has been developed based on 'A Study on Requirement & Development of Guidance Module for the Children of Inmates at Kajang Women's Prison' and the module was tested on study 'Validation and Implementation of Guidance Module for Children of Inmates'. The objectives of these two studies are to develop a specific module for the guidance of children in prison, and to test the validity and suitability of the module for implementation by taking into account the appropriate circumstances and situations in the prison. It is developed based on interviews with child guidance experts, prison officers, and round-table discussions attended by health experts and those related to children's guidance in general. It also involves the use of questionnaires. This module was examined to gauge its validity and suitability, and tested on twenty-one (21) inmates who had children, either living with them in prison or outside. The module is found to be suitable and is acknowledged as appropriate for use by the respondents since the mean score of their understanding was increased exceeding 4 at the end of the study. This module is able to fulfill the need to provide specific guidance to inmates who have children, living inside or outside of prison.

INTRODUCTION

In Kajang Women's Prison, there are some prisoners with children, who were born in prison or were still small or lactating when their mothers were detained. These children are allowed to stay in prison with their mothers,

from birth until the age of three years. After age three, they will be raised by their families if their mothers are still serving sentence. However, mothers may appeal to the Prison Department of Malaysia for permission to keep their children with them in prison until age four years. There are only between 5-10 children in Kajang Women's Prison at any one time (depending on the mothers' sentence duration). The children are placed in a daytime special childcare unit, and will spend nighttime with their mothers in the detention cells. In the daytime, the mothers will attend skill workshops available in the prison. The children will be looked after by other prisoners supervised by a nursery teacher/governess from among female prison wardens trained from time to time. In addition, many children of women prisoners are raised outside the prison by their families. Some of them also have their fathers serving time in prison or rehabilitation centres. Psychologically, these children may be susceptible to emotional or mood disorders due to imprisonment of their parents or mothers.

Research on the Guidance Module for Children of Women Prisoners is based on reading and improvements on past studies conducted. Rachel Taylor (2004) in *Women in Prison and Children of Imprisoned Mothers* discussed babies and children who are brought to live with their mothers in prison. She emphasized on issues such as adequate facilities to ensure that babies thrive physically, mentally and emotionally as well as to socialize with other children. Even though childcare centres (nursery) are available in prisons, the number is still small and not very practical. Furthermore, there is also question of how long or up to which age the children should be allowed to stay in prison. When the children reach the age which requires them to leave the prison, how will the mother and child cope with the situation and what is the effect to their well-being. Marlene Alejos (2005) in her study, *Babies and Small Children Residing in Prisons*, found that children were affected when their mothers lost their freedom because they were also in detention with their mothers. A few number of children were born when their mothers were in detention. In addition to that, Oliver Robertson (2007) explained in *The Impact of Parental Imprisonment on Children*, that children were affected by their parents' imprisonment, before, during and after incarceration. The effects may be perceived in terms of behaviour, health, relations, emotions, education and so on. His study also found that children of incarcerated parents has a tendency to be involved in future delinquency/criminal activities in future. Other studies conducted by Laurel Townhead's (2006) known as *Women in Prison & Children of Imprisoned Mothers*, discussed the status and rights of a prisoner's child within and outside the prison. This study stated that the child should be entitled to his rights. Patrick Yeagle (2010) in his study *Kids in Prison* held the opinion that children got involved in crime due to exposure to violence and the absence of a good role model. Thus, in order to change their mindset and make them productive, they need protection and a healthy environment to grow. A study by Lefkowitz et al. (1977) found that unawareness of parents to their children and lack of proper discipline are associated with juvenile delinquency such as theft, running away from home and fighting. Erroneous patterns of communication may trigger in-house problems and as a consequence it built the tendency for children to make bad behaviour. In addition, Prison Advice & Care Trust (2011) in research of *Protecting the Welfare of Children when a Parent is Imprisoned*, explained that about 17,700 childrens were separated from their imprisoned mothers annually. Further, only 5% of the children remain in their own homes after their mothers were detained and 9% were raised by their fathers throughout their mothers' absence. However, 40% of them were raised by their grandparents or relatives. At least a third (1/3) of women prisoners are single mothers. Jaana Wikgren (2011) in his study, *An Infant or a Small Child in Prison with a Parent- could a prison be a good place to raise a child?*, examined how far the facilities in prison provide a comfortable environment to children of prisoners. From the research found that such action of bringing a child into prison is the best alternative to teach and create awareness of inmates on how real life goes on.

In Malaysia, past studies conducted found that the prison authority used the general module for children provided by the Social Welfare Department or Jabatan Kebajikan Masyarakat (JKM). There was no specific educational module used for children in prison (Jawiah Dakir et al. 2011 – 2012). Thus, in order to realised it, a group of researchers drafted a module in Study on the Requirement and Development of Guidance Module for Children of Inmates at Kajang Women's Prison, (*Kajian Keperluan & Pembinaan Modul Bimbingan Untuk Anak-anak Banduan Penjara Wanita Kajang* with the code: KOMUNITI-2011-033) and Validation and Implementation of Guidance Module for Children of Inmates (*Menguji Kesahan dan Mengimplementasi Modul Bimbingan Anak-anak Banduan Penjara* with the code: KOMUNITI 2-2014-001). Research conducted by Jawiah Dakir et al. (2011-2012) resulted in a Guidance Module for Children in Kajang Women's Prison. This module contains 10 sub-modules/chapters and 42 sessions. The main purpose of the research is to develop a suitable module to be implemented in prison. The research was conducted over a period of two years. On completion of the module, another study was required to verify its validity before it can be implement officially in Women's Prison in Malaysia. Thus, the second important study is for validation of the module (Jawiah Dakir et al. 2005-2017). The main purpose of this study is to test the validity of the module, implement it and improve it.

THE STUDY

Development of Module: The module was developed using quantitative and qualitative methods (mixed method). The survey method was the main method as well as round-table discussions among education experts. A total of 93 respondents from five prisons, that is, Kajang Prison, Sungai Udang Prison, Pokok Sena Prison,

Kluang Prison and Bentong Prison were involved. The main purpose is to determine their satisfaction from different angles while in prison.

Testing Validity of Module: A study to test the validity of the module developed were conducted for three (3) months beginning January until March 2017. A total of 21 inmates were drawn as sample in this study comprising of Malays, Chinese and Indians. This study were using pupossible sampling method. A small sample size was taken as it only involved Malaysian inmates who were pregnant or who have ever been pregnant and have child inside or outside the prison. This is to ensure that the sample tested is relevant to the purpose of developing the module. The constraints in getting the sample size is because only 30% of the inmates in Kajang Women's Prison were Malaysians while 70% were non-citizens. According to the prison officers involved, only 3 out of 11 children in the nursery are Malaysian citizenship. During the process of testing the module, other constraints involved were lack of understanding of some inmates because of the difference in mother-tongue language used by the facilitator as well as illiteracy causing inability to fill up the evaluation forms. The method used is conducting guidance class to pregnant inmates or those who have children in or outside the prison. Classes were held two (2) to three (3) times weekly. The approach used in each class consisted of lectures, discussions, video presentations, simulations, problem-solving and question and answer. In addition, inmates were given evaluation forms before and after the module. There were twelve question asked to evaluate the inmates before going through the module and two more items were added in the evaluation after completion of the module. The items were evaluated according to Likert Scale, SDA = Strongly Disagree, DA = DisAgree, Ave = Average, A = Agree and SA =Strongly Agree.

RESEARCH RESULTS

Module construction: This module provides guidance to inmates who are pregnant or who have children in and outside of prison. Inmates need guidance because a child's personality is shaped from the time it is still in the womb. In fact from the Islamic perspectives it should starts from the selection of life partner itself. Meanwhile, this module focuses guidance during the time of pregnancy and after birth until the age of three years. The module developed was named *Guidance Module for Children of Inmates in Prison*. It is emphasize on early exposure to pregnant inmates or those who have children, whether with them or raised by relatives outside the prison. The main purpose of developing the module is to expose the inmates to the importance of knowledge relating to pregnancy and various aspects of childcare. It starts from early, during and after pregnancy. In addition to that, the module also focused on personal care of the mother and baby/child.

Module Content and Method of Implementation: The Guidance Module constructed consists of 10 chapters /sub-modules and 42 sessions, as follows: i) Education for unborn child ii) Preparation for delivery iii) Mother's responsibility for self and child healthcare iv) Lactation/breast-feeding v) Baby's security in prison vi) Mother's security in prison vii) Newborn baby care and development (0–6 months) viii) Baby care and development (6-12 months) ix) Toddler care and development (1-2 years) x) Toddler care and development (2-3 years). It is suggested that the implementation of each session lasts 2 hours, and the total time of 100 hours for all modules and sessions. It is to be implemented in prison premises according to time scheduled proposed by the prison authority. The prison officer should be informed beforehand of any changes in activity, time, teaching aid etc. in order to comply with the objectives assigned for each session. There should be a flexible approach in implementing suggested activities and teaching aids uses which may be diversified. I can be depending on the creativity of the facilitator to make the session interesting and in compliance with prison regulations. The suggested time period of 2 hours may be divided according to suitability, without affecting the module contents. This likely modification is based on the time situation of inmates, who are constantly changing from time to time, as well as the current situation of the prison which has tight and controlled regulations.

Testing Validity of Module and Respondent's Perception: This module was tested for its validity for 3 months from January until March 2017. A number of 21 inmates selected by the prison authority. The respondents were selected among inmates who were pregnant or had children/babies who live inside or outside, or raised by family members outside the prison; who were not involved with serious crime; and were among Malay, Chinese and Indian inmates who showed motherly and loving characteristics towards their offspring. At the beginning and end of the validation test, evaluation forms were distributed to inmates to test their understanding of module contents. The process of testing was done in the form of class instruction and guidance by the researcher/fassilitator, once to thrice weekly. At the same time, the researcher played the role as guide, adviser and motivator to the inmates. Based on evaluation before implementing the module validity test, the mean score of respondents understanding was below 3.048 as shown in Table 1. It shows that respondents' understanding was low before attending the guidance module class on self and child healthcare before and during pregnancy as well as methods of nurturing and educating a child. However, for items S1, S2 dan S3, the percentage score for inmates for the scale Strongly DisAgree (SDA) is high, exceeding 50%. This score is appropriate as the question posed evaluates the respondents' understanding of the module content, objective and

methods of implementation before they attended the guidance module class. Thus the percentage score is very high, meaning the respondents did not understand the module contents, objectives and methods of implementation intended at the initial stage.

Table 1 Inmates' Understanding before Undergoing Guidance Module

Item	Frequency (%)					Mean
	SDA	DA	Ave	A	SA	
S1	15 (71.43%)	3 (14.29%)	1 (4.76%)	0	2 (9.52%)	1.619
S2	12 (57.14%)	3 (14.29%)	4 (19.05%)	0	2 (9.52%)	1.905
S3	12 (57.14%)	3 (14.29%)	5 (23.81%)	1 (4.76%)	0	1.762
S4	6 (28.57%)	2 (9.52%)	7 (33.33%)	2 (9.52%)	4 (19.05%)	2.810
S5	5 (23.81%)	2 (9.52%)	7 (33.33%)	3 (14.29%)	4 (19.05%)	2.952
S6	4 (19.05%)	2 (9.52%)	7 (33.33%)	5 (23.81%)	3 (14.29%)	3.048
S7	4 (19.05%)	1 (4.76%)	8 (38.10%)	7 (33.33%)	1 (4.76%)	3.000
S8	5 (23.81%)	4 (19.05%)	8 (38.10%)	2 (9.52%)	2 (9.52%)	2.619
S9	2 (9.52%)	2 (9.52%)	13 (61.90%)	4 (19.05%)	0	2.905
S10	5 (23.81%)	2 (9.52%)	5 (23.81%)	8 (38.10%)	1 (4.76%)	2.905
S11	4 (19.05%)	2 (9.52%)	7 (33.33%)	6 (28.57%)	2 (9.52%)	3.000
S12	4 (19.05%)	1 (4.76%)	7 (33.33%)	8 (38.10%)	1 (4.76%)	3.048

Further, upon completion of the entire Guidance Module, the results shows an increase of mean score exceeding 4 for each item evaluated as presented in Table 2. Two additional questions were inserted compared to twelve questions at the onset before the validation test. These items evaluated inmates' knowledge and understanding in managing her ownself and baby/child after undergoing the guidance module class. The increased mean score clearly shows that their understanding of self-management and baby/child care was improved after completing the module. Although the number of 21 inmates who underwent the module decreased to 15 at the end of the sessions, there was notably one inmate who became interested to follow the guidance class after she was invited by her fellow inmate. The decrease in number of attendees was due to transfer to other jails by the order of the prison authority. In addition, for item S12 which evaluates the importance of religious/spiritual values during pregnant and after delivery, there remain only one inmate whose understanding remained at average level (5.88%).

Table 2 Inmates' Understanding After Undergoing Guidance Module

Item	Frequency (%)					Mean
	SDA	DA	Ave	A	SA	
S1	0	0	0	5 (29.41%)	12 (70.59%)	4.706
S2	0	0	0	8 (47.06%)	9 (52.94%)	4.529
S3	0	0	1 (5.88%)	6 (35.29%)	10 (58.82%)	4.529
S4	0	0	0	3 (17.64%)	14 (82.35%)	4.824
S5	0	0	0	4 (23.53%)	13 (76.47%)	4.765
S6	0	0	0	2 (11.76%)	15 (88.24%)	4.882
S7	0	0	0	3 (17.64%)	14 (82.35%)	4.824
S8	0	0	0	3 (17.64%)	14 (82.35%)	4.824
S9	0	0	0	3 (17.64%)	14 (82.35%)	4.824
S10	0	0	0	3 (17.64%)	14 (82.35%)	4.824
S11	0	0	0	5 (29.41%)	12 (70.59%)	4.706
S12	0	0	1 (5.88%)	2 (11.76%)	14 (82.35%)	4.765
S13	0	0	0	3 (17.64%)	14 (82.35%)	4.824
S14	0	0	0	3 (17.64%)	14 (82.35%)	4.824

CONCLUSION

On the whole, the purpose of developing this module is to guide and impart knowledge to inmates on nurturing and educating their children while in prison. Additionally, its purpose is also to ensure that inmates may nurture or bring up their children properly, maintaining the bonding with their children and ensure that both mother and child get their rights to education in the form of systematic instruction, while serving time in detention.

All the above stated objectives may be achieved through perceiving the reaction and feedback of each inmate in every guidance class conducted. The majority of inmates show a good response toward module content when they were given the opportunity to share their personal experiences. Interestingly, one of the inmates succeeded in attracting her fellow inmate to join in the guidance class although initially the latter was not one of the respondents in the research sample. In the meantime, the two-way interactive approach used by the facilitator was helpful in making it easier for the inmates to understand the module content conveyed. Thus, the purpose of imparting knowledge to inmates so that they understand each aspect of baby/child care and development was easily implemented.

The use of a simulation approach, that is, requesting inmates to think and reflect for a moment regarding the situations, which they previously experienced and react to their mother and baby/child, was found to affect their emotions. This approach is good because as an impact from their previous negative behaviour towards mother and baby/child, it raised positive consciousness. Consequently, this effect could broaden their views in order to behave properly and with good manner to their mother and offspring. The module is found to be suitable and is acknowledged as appropriate for use by the respondents. This also able to fulfill the need to provide specific guidance to inmates who have children, living inside or outside of prison.

Development of A Hybrid Instructional Model For Learning Management of Pre-Service Teachers

Intira ROBROO

Department of educational Innovation and technology

Faculty of Education

Suan Sunandha Rajabhat University

Thailand

intira.ro@ssru.ac.th

ABSTRACT

The purposes of this study were to development of a hybrid instructional model for learning management of pre-service teachers, the justification of the components of the proposed model by a panel experts using the Delphi technique. The sample used in this research, researcher chooses a panel of 19 experts in teaching and learning management in faculty of education. The findings of an appropriate hybrid instructional model for learning management of pre-service teachers in Thailand which the expert judged to be appropriate consistently of major components as follows. 1. Principles, concepts and theories, By focusing on student-centered organize learning environment by mixing face to face classroom with e-learning and organize active learning activities and evaluate learning outcomes according to authentic assessment. 2. Teaching process, the learners create new knowledge and recognize content based on the insights gained from learning experience. And they should be able to transfer knowledge to friends. The learners demonstrate the empirical evidence of the knowledge acquired and present appropriately. And encourage the learners to use a learning contract to engage in the learning process. The instructor serves as a friendly supporter and counselor to create an appropriate learning environment and set a lesson plan that is consistent with the learning objectives and subject description. To engage learners in learning activities, the instructor should motivate them as using stimulating questions to communicate with each other. It should be a discussion and criticize the issue of knowledge between learners and set criteria of evaluation for learning specified in learning contract. Learning outcomes are situations where the learners and instructors cooperate with the planning of the content which meets the needs of learners. The instructional plan must cover the learning object by using a learning contract as a guideline and evaluate by authentic assessment. Including the learners can invent a new self-knowledge and relay to friends.

Key words: Instructional model, Learning management, Pre-service teacher

INTRODUCTION

Development of learning model to be consistent with social progression and changing environment of communication technology rapidly is important. In present progression of application of Information and Communication Technology (ICT) is rapid. Learning management should be adjusted consistently with the changing of ICT which can be used in several forms such as e-learning via internet or off line and using distance learning that is an innovation to support learning more effectively and make learning process more completely. It essential for educational administrator and related personnel to modify learning model up to date and suitable for technology advancement according to National Education Act of Thailand 1999 (2nd amendment 2002). Combination of learning with communication make it convenient to access to knowledge and add data source to study that is appropriate for learning. It increases efficacy for learning also. Ndon (2007) has studied experience of instructors who used blended learning. The results found that learning model that is the best available because it combines study mode with communication that it is convenient, has variety of resources, interacts with learners and interacts between learners and teachers. In addition what has been from online classroom learning environment is accession information unlimited and supports learning activities both individual and group learning by contacting each other online. Face to face learning activities help learners to succeed in learning and support critical thinking skills. Which correspond to Gagné and Brigg, (1985, pp. 246-2560; Gagné et al. (2005, p. 205) that explained design of learning model within the blended learning theory (eclecticism). It is blending between behaviorism and cognitivism with emphasis environmental arrangement that is suitable for learning and supports learning process inside the brain by arrangement external condition favor for internal learning process of learners with emphasis using in learning management. Brown et al. (1983, pp. 3-15) emphasized learners-centered by consideration learning methods of each learner is important and let instructors to set learning to be consistent with the needs and interest of learners with 4 elements that are goals, conditions, resource and outcomes of learning process. This maybe judged from the success on achievement from learning objectives and considered the necessary factor to improve learning process.

Researcher is interested to study hybrid instructional model for learning management of pre-service teachers correspond to advancement of technology in the context of learning society to achieve the most effective outcomes for learners.

OBJECTIVES

1. Were to develop of a hybrid instructional model for learning management of pre-service teachers.
2. Were to study experts' opinions about hybrid instructional model for learning management of pre-service teachers.

METHODOLOGY

Population and sample used in study layout of hybrid instructional model are used by Delphi technique. Population in this study are 19 experts who are experts in learning management in faculty of education and experts in learning management via e-learning. And selected snowball sampling to obtain 19 experts, be an expert in teaching and learning management and specialist in instructional management in faculty of education. Three rounds data collection with Delphi technique. The research will do the following. Round 1 the researcher will deliver by hand and ask for the convenience of submitting a questionnaire. After about 3 days the researcher will telephone to ask for a result back. And round 2 and 3 the researcher will deliver questionnaire by convenience of experts (such as deliver by hand or ems). Data analysis and statistic used in data analysis as, Round 1 analyze data from the answer to open-ended question to create a 5 level estimation question for the question in round 2. Round 2 Analyze data by calculating median and interquartile range to use as a basis for summarizing expert opinion and take median and interquartile range displayed in the questionnaire in round 3 in order for the expert to consider the answer already answered. Then, round 3 analyze data by calculating median and interquartile range data verified from the questionnaire in round 3 again to conclude expert opinion.

FINDINGS

Expert opinion about elements of hybrid instructional model of learning management for pre-service teachers as follows:

1. Elements of a hybrid instructional model of learning management for pre-service teachers: Principles, concepts and theories should be consistent with National Education Act 1999 (2nd amendment 2002), National Education Plan and National Economic and Social Development Plan include other related policies. In addition, it should pay attention to current situation in technology and communication system with rapid progress. Technology adoption to apply in learning management consistently and suitably the needs of learners is essential to open opportunity for learners to learn happily and have internal reinforcement to pursue lifelong learning. Learning management should consider learners mainly and open opportunity to take part in the responsibility in their learning process. Guidelines in learning management include the following principles. Principle 1 In learner-centered instructional management, instructor has a role as source of knowledge and adviser. Principle 2 Learning environmental arrangement by mixing face to face classroom with electronic media to give learners opportunity to create workings by self-seeking knowledge to reflect ability for application knowledge both theory and practice. Principle 3 Active learning activity arrangement is to encourage learners' ability to create knowledge themselves and participate in leaning process and self-assessment, promote in using electronic media as learning source which has variety of knowledge that can be reviewed it themselves. Principle 4 Authentic assessment by compiling and preparation portfolio, creativity and self-evaluation combined with the assessment of achievement by using the test in theory.

2. Learning process, when summarizing learner roles, instructor roles and expected results with the following issues. Learner roles; Let learners create knowledge and understanding, remember the content and principles by understanding received from learning experience. Learner must invent new ideas by themselves and transfer knowledge to friends. Learners comment and present work appropriately. Learning uses learning contract to bond with. Instructor roles; The Instructor acts as a supporters to give an advice, creates suitable environment for learning, has consistent instructional plans with the objectives and subject matters. Let learners participate in learning activities by encouraging motivation. The instructor should use questions to stimulate communication, discussion, critique among the learners and indicate in learning contract. Learning outcomes; Learning outcomes are learning situation that learners and instructor plan together appropriately with subject matters and meet the needs of learners. Determining the lesson plan must cover learning objectives, consistent with the content and suitable for learners by using learning contract to commit to learning and as a guideline to evaluate learning results. Learners can invent new ideas themselves and transfer to friends.

The results of analysis of data in round 2 and 3. It is analysis the opinion of experts on a hybrid instructional model for learning management of pre-service teachers. Analysis of data in this round is an analysis of the elements for a hybrid instructional model for learning management of pre-service teachers both in principles, concepts and theories, environmental arrangement according to a hybrid instructional model and evaluation of

learning outcomes by analyzing from rating scale questionnaire that the researcher summarized the results shown in the following table.

Table 1: Median and interquartile range of expert answers on a hybrid instructional model for learning management of pre-school teachers

Elements of a hybrid instructional model for Learning management of pre-service teachers	\bar{x}	Mnd	I.R.	level of agreement
Principles, concepts and theories				
1.1 learner-centered learning management	5.00	5	0	completely agree
1.2 organize learning environment by mixing face to face classroom with e-learning	4.95	5	0	completely agree
1.3 active learning activities	5.00	5	0	completely agree
1.4 authentic assessment by using portfolios, creativity and self evaluation	5.00	5	0	completely agree
average	4.99	5	0	completely agree

From table 1 showed that elements of a hybrid instruction model for learning management of pre-service teachers in principles, concepts and theories. Overview experts completely agree, highest fit and expert opinion is very consistent ($\bar{x} = 4.99$, Mdn = 5, I.R. = 0). When consider average value per item found that expert opinion completely agree 4 issues include learner-centered learning management, active learning activities and authentic assessment by using portfolio, creativity and self-evaluation. And subordinate is organization learning environment by mixing face to face classroom with e-learning ($\bar{x} = 4.95$, Mdn. = 5, I.R. = 0)

Table 2: Median and interquartile range of expert answers on a hybrid instructional model in environmental arrangement of hybrid instructional model

Elements of a hybrid instructional model for learning management of pre-service teachers	\bar{x}	Mnd	I.R.	level of agreement
2. environmental arrangement of hybrid instructional model				
2.1 learning support resources in the school	5.00	5	0	completely agree
2.2 learning support resources in the community	4.89	5	0	completely agree
2,3 learning support resources on the internet	5.00	5	0	completely agree
2.4 e-learning medias on the internet	5.00	5	0	completely agree
2.5 traditional classroom lecture activities	4.84	5	0	completely agree
2.6 learning activities on the internet	5.00	5	0	completely agree
2.7 mixing rate of e-learning : regular learning is about 30 : 70 of time in one semester	5.00	5	0	completely agree
average	4.96	5	0	completely agree

From table 2 showed that elements of a hybrid instructional model for learning management of pre-service teachers in environmental arrangement of hybrid instructional model. Overview experts completely agree, highest fit and expert opinion is very consistent ($\bar{x} = 5.00$, Mdn = 5, I.R. = 0). When consider average value per item found that expert completely agree 5 issues include learning support resources in the school, learning support resources on the internet, e-learning medias on the internet, learning activities on the internet and mixing rate of e-learning : regular learning is about 30 : 70 of time in one semester. And subordinates are learning support resources in the community ($\bar{x} = 4.89$, Mdn = 5, I.R. = 0) and traditional classroom lecture activities ($\bar{x} = 4.84$, Mdn = 5, I.R. = 0) respectively.

Table 3: Median and interquartile range of expert answers on learning process of a hybrid instructional model for learning management of pre-service teachers in aspect of learner role

Learning process according to a hybrid instructional model for learning management of pre-service teachers.	\bar{x}	Mdn	I.R.	level of agreement
Learner role				
- knowledge and understanding building	5.00	5	0	completely agree
- remember content and principles by understanding gained from the experience	4.95	5	0	completely agree
- invent new ideas by himself	4.95	5	0	completely agree
- transfer knowledge to friends	5.00	5	0	completely agree
- comment and present works properly	5.00	5	0	completely agree
- use a learning contract to engage in learning	5.00	5	0	completely agree
average	4.98	5	0	completely agree

From table 3 showed that learning process of a hybrid instructional model for learning management of pre-service teachers in aspect of learner role, overview experts completely agree, highest fit and expert opinion is very consistent ($\bar{x} = 4.98$, Mdn = 5, I.R. = 0). When consider average value per item found that expert completely agree 4 issues include knowledge and understanding building, transfer knowledge to friends, comment and present works properly and use a learning contract to engage in learning ($\bar{x} = 5.00$, Mdn = 5, I.R. = 0). And subordinates are remember content and principles by understanding gained from the experience and invent new ideas by himself ($\bar{x} = 4.95$, Mdn = 5, I.R. = 0).

Table 4: Median and interquartile range of expert answers on learning process of a hybrid instructional model for learning management of pre-service teachers in aspect of instructor role

learning process of a hybrid instructional model for learning management of pre-service teachers	\bar{x}	Mdn	I.R.	level of agreement
Instructor role				
- as a supporter to give an advice	5.00	5	0	completely agree
- create suitable environment and be friendly with learners	5.00	5	0	completely agree
- teaching plan that corresponds with learning objectives	5.00	5	0	completely agree
- design teaching plans that correspond with the content	4.95	5	0	completely agree
- participate in learning activities by encouraging motivation and use stimulating questions to communicate, discussion and critique between learners	5.00	5	0	completely agree
- set criteria for school record evaluation to indicate in the learning contract	5.00	5	0	completely agree
average	4.99	5.00	0	completely agree

From table 4 showed that learning process of a hybrid instructional model for learning management of pre-service teachers in aspect of instructor role, overview experts completely agree, highest fit and expert opinion is very consistent ($\bar{x} = 4.99$, Mdn = 5, I.R. = 0). When consider average value per item found that expert completely agree 5 issues include as a supporter to give an advice, create suitable environment and be friendly with learners, teaching plan that corresponds with learning objectives, participate in learning activities by encouraging motivation and use stimulating questions to communicate, discussion and critique between learners and set criteria for school record evaluation to indicate in the learning contract ($\bar{x} = 5.00$, Mdn = 5, I.R. = 0). And subordinate is design teaching plans that correspond with the content ($\bar{x} = 4.95$, Mdn = 5, I.R. = 0).

The conclusion of 2nd and 3rd delphi analysis which are analyze in expert's opinion for a hybrid instructional model for learning management of pre-service teachers. Components of a hybrid instructional for learning management of pre-service teachers are principles, concept, and theory. In overall image, experts' opinion chose agreed at "highest", suitable at "highest", and all the opinions are similar with each other. In more detail, from average value in each section, we found that experts have highest which are learner-centered instructional management, active learning activities and authentic assessment, using portfolio, the learner evaluates the results of the creative work. Followed by environmental aspects of the hybrid learning model, by mixing face to face classroom and e-learning. In part of learning environment in a hybrid instructional model overall experts' opinion are agreed in "highest", suitable at "highest" and all the opinions are similar with each other. In more detail, from average value in each section, we found that experts have highest in 5 aspects which are Institutional support resources, the learning support resources on the internet as the electronic media and e-learning, mixing online and face-to-face delivery. Proportion of content delivered online and typically has some face-to-face meetings 30-70 of a semester. Followed by the learning resources in the community, learning process

arrangement by mixing face to face classroom with electronic, respectively. In part of learning process of a hybrid instructional model in learner role aspect, overall experts' opinion agreed at "highest", suitable at "highest", and all the opinions are similar with each other. In more detail, from average value in each section, we found that experts have highest in 6 aspects which are the learners create self-knowledge, recognize content based on the insights gained from learning experience, the learners should be able to transfer knowledge to friends, the learners demonstrates the empirical evidence of the knowledge acquired and presented appropriately, encourage the learner to use a learning contract to engage in the learning process in instructor role aspect, experts' opinions in overall agreed at "highest", suitable at "highest", and all the opinions are similar with each other. In more detail, from average value in each section, found that experts have highest in 5 aspects which are serves as a friendly supporter, counseling, create an appropriate learning environment, set a lesson plan that is consistent with the learning objectives and subject description, to engage learners in learning activities by motivating them while using stimulating questions to communicate with each other, set a discussion, the issue of knowledge between learners. learning outcomes, found that experts have highest in 6 aspects which a situation where the learners and instructors cooperate in the content planning which meets the needs of learners, the instructional plan cover the learning object, using a learning contract as a guideline, evaluation by authentic assessment, the learners can invent a new self-knowledge and can relay to friends.

DISCUSSION

The results of this research can be discussed as the following: Principles, concepts and theories of instructional model should according with education 1999 (2nd amendment 2002), National Education Plan and National Economic and Social Development Plan including associated other policies. In addition, it should be given priority of current situation of information and telecommunication system that is rapid progress. Applying technology for learning consistently and appropriately for the needs of the learners to open the opportunity for the learners to learn happily and reinforce them for pursuing lifelong learning. In learning management, the learners should be consider as important to take part in the responsibility in learning process themselves to reinforce ability in self-seeking knowledge another way also. Overview of concepts and theories, experts agree at the highest level and most appropriate and experts' opinions have in the most consistency with the principles such as learning by using learner-centered which correspond with learning model of Brown et al. (1983, pp. 3-15) that presented learning model that emphasize learning by using learner-centered by considering learning style of individual of each learner as important. To teach to correspond with the needs, ability and interest of the learners, it should organize active learning activity and evaluate learning outcomes according to the authentic assessment by using portfolios, creativity and self- evaluation followed by learning environmental arrangement by mixing face to face classroom with e-learning. In learner-centered instructional management, instructor has a role as the source of knowledge and adviser. Learning environmental arrangement by mixing face to face classroom with e-learning including give opportunities for learners to create workings by self-seeking knowledge to reflect ability for application knowledge both theory and practice. Active learning activity arrangement is to encourage learners' ability to create knowledge themselves and participate in learning process and self-assessment, promote in using electronic media as a learning source which has variety of knowledge which can be reviewed the knowledge themselves. It corresponds with concepts of Gagné et al., (2005, p. 205) which emphasize external arrangement to support learners' internal learning process and using media in learning. And It correspond the study of Suwapat Srikassapa (2015) which studied Interactive learning via Internet: a case study of Studio in Design. The result of this research was that interactive learning via internet will promote learner to access information and understand content easier and clearer.

Overview mixed-use learning environment, experts agree with this in the highest level, most appropriate and experts' opinion is very consistent. Because in the present information technology and communication are very advance. Most people can access information rapidly anywhere and anytime and can communicate easily. It is information and knowledge accessment absolutely unlimitless. But education management in Thailand still prioritizes to classroom learning so that by the opinion of experts should be in the range 30-70 percent of one semester which corresponds to Allen and Seaman have explained that blended learning between face to face classroom and online learning. In general presentation most content should be online between 30-79 percent of all educational content. That mixing ratio at this level is coming from blended learning development for enhancing self-seeking both learning activities in classroom, e-learning and creating learners' portfolio. It makes us understand that learning models should be variety ways to suitable application for changing social learning changes, fully potential development in self-seeking and learning basics lifelong (Intira Robroo, 2010, p. 169). Recommendations should be further study to learning achievement of students learning through hybrid instructional model for pre-service teachers, and should be further to study the learning outcome through hybrid instructional model for pre-service teachers, in terms of responsibility, leadership and morality, ethics etc.

ABSTRACT

Peer instruction is an interactive student-centered teaching method. Ensuring student interaction during the lesson and concentrating the attention of the students on the basic concepts are main aims of the peer instruction. A typical peer instruction sequence is similar to a strategy of learning a “Think-Pair-Share”, which students should think individually on questions before sharing their ideas and solutions with classmates in either in pairs or on groups of different sizes. In order to determine students’ views on peer instruction method, which is quite popular today and which has been studied much over the last 20 years, different data collection tools have been developed by different researchers under different names. When these data collection tools developed by different researchers are examined in detail, it is seen that it is needed that general evaluation form which can be used to determine views for all stages of the peer instruction method. For this reason, it was aimed to develop a student evaluation form toward peer instruction method within the scope of this research. Student assessments toward peer instruction method in the developed form were examined as 'student evaluation toward peer instruction', 'student evaluation toward questions asked' and 'student evaluation toward discussions made' in three sub-dimensions and 25 items.

INTRODUCTION

Peer instruction is an interactive student-centered teaching method developed by Eric Mazur (Mazur, 1997), engages students during class through structured, frequent questioning and is often facilitated by classroom response systems (Miller, Schell, Ho, Lukoff, & Mazur, 2015). To provide a positive role for interaction among peers in the knowledge construction, this method has been extensively supported by a socio-constructivist approach to learning (Morice, Michinov, Delaval, Sideridou, & Ferrières, 2015). Ensuring student interaction during the lesson and concentrating the attention of the students on the basic concepts are main aims of the peer instruction (Mazur, 1997). In this context, it was indicated that the general format that each ConcepTest used in peer instruction by (Mazur, 1997) should have; 1) Question posed, 2) Students given time to think, 3) Students record individual answers (optional), 4) Students convince their neighbors (peer instruction), 5) Students record revised answers (optional), 6) Feedback to teacher: Tally of answers and 7) Explanation of correct answer. However, the PI method can be different for different learning scenarios because it is a flexible and student-centered approach (Chou & Lin, 2015; Crouch, Watkins, Fagen, & Mazur, 2007; Morice et al., 2015). In the study conducted by Dancy and Henderson (2010), it was revealed that less than 12.8% of the teachers using peer instruction do so as it was originally designed to be implemented (As cited in Michinov, Morice, & Ferrières, 2015). More generally, a typical peer instruction sequence is similar to a strategy of learning a "Think-Pair-Share" (e.g., Watkins & Mazur, 2010), which students should think individually on questions before sharing their ideas and solutions with classmates in either in pairs or on groups of different sizes (Michinov et al., 2015).

When the literature is examined, it is seen that the PI method has been developed in Physics to improve student understanding of deep conceptual concepts and has been used in other sciences such as biology (e.g., Perez et al., 2010) and computer science (e.g., Lee, Garcia, & Porter, 2013) have also been used successfully. In this context, in order to determine students' views on peer instruction method, which is quite popular today and which has been studied much over the last 20 years, different data collection tools have been developed by different researchers under different names. Within this scope; some scales such as "attitude toward peer instruction method survey" by Şekercioğlu Çirkinoğlu (2011), "student evaluation of peer instruction questionnaire" by Cortright, Collins, and DiCarlo (2005), "a survey to get students' impressions of the PI" by Lee et al., (2013) and a "peer Instruction self-efficacy instrument" by Miller et al. (2015) were developed. When these data collection tools developed by different researchers are examined in detail, it is seen that it is needed that general evaluation form which can be used to determine views for all stages of the peer instruction method. For this reason, it was aimed to develop a student evaluation form toward peer instruction method within the scope of this research.

METHOD

In this section, research design, the participants, the data collection tool and the information about the analysis of the data are given.

Research Design and Participants

Within the scope of the research, survey model was used to examine the views of pre-service teachers on the method of peer instruction. Participants of the study were 179 pre-service teachers who attended at least one course in which peer instruction method was used in the faculty of education in a state university during the 2016-2017 academic year. Pre-service teachers who attend the research study at the department of mathematics and science education and in department of computer and instructional technology education. When the distributions of pre-service teachers in terms of their gender characteristics are examined; it is seen that 65.3% ($n = 117$) were female and 34.7% ($n = 62$) were male.

Data Collection Tools

The data in this study were obtained from a student evaluation form developed by the researchers. In the first stage of the student evaluation form development process, the problem situation is determined and appropriate themes were determined for this problem situation by reviewing the literature. These sub-themes are determined as 'student evaluation toward peer instruction', 'student evaluation toward questions asked' and 'student evaluation toward discussions made'. Following the determination of the sub-themes, an item pool including 55 items was established in line with the information obtained from the reviewing of the literature. 35 items which are suitable for inclusion in the draft of the student feedback form were selected from the item pool, and a pre-application form with Likert type rating was constituted. A Turkish language expert and three experts in educational technology who work in the field of computer and instructional technologies were consulted regarding the prepared pre-application form. The linguist examined the written materials in terms of clarity, language and expression. Educational technology field experts evaluated form in terms of content, criterion, construct and face validity. The necessary arrangements were made on the student evaluation form in line with the feedback obtained from the experts. Then, the pilot application of the student evaluation form was carried out on 65 pre-service teachers who are out of the sample and it was reevaluated in terms of language validity, comprehensibility, level of eligibility and was put into final form. Thus, the final form of student evaluation form toward peer instruction is structured as a five-point Likert type with three parts and 25 items.

Data Analysis

Factor load values for the developed data collection tool, KMO (Kaiser-Meyer-Olkin Measure of Sampling Adequacy) coefficient for determining the suitability of the sample for measurements, Bartlett test for determining consistency between items and Cronbach α reliability coefficient for reliability are examined. Factor loadings of 25 items range from .90 to .93. The value of KMO was found as .86. When values of KMO close to 1, factor analysis becomes more meaningful. If the average level of KMO is between .50 and .70, it is the medium-level, if it is between .71 and .80, it is the good level and if it is between .81 and .90, it is very good level and it will be the

excellent level if it is .91 and above (Field, 2005). From this point of view, it can be said that the sample is sufficient for data analysis. The Bartlett test showed that the results of the analyzes were significant (chi-square = 2329.147, $p < 0.01$). When the reliability of the student assessment form for the peer instruction method was examined, it was determined that the reliability coefficient of Cronbach α was .92. These results indicate that the data collection tool is reliable. In the analysis of collected data, frequency and percentage values are used.

FINDINGS

In the process of preparing the data collection tool, certain themes have been set out. These include 'student evaluation toward peer instruction', 'student evaluation toward questions asked' and 'student evaluation toward discussions made'. The analysis results of the first theme which is student evaluation toward peer instruction are given in Table 1.

Item	Strongly Disagree →---← Strongly Agree	Total					
			1	2	3	4	5
Table 1. Student Evaluation Toward Peer Instruction Items							
Peer instruction method was clear.	f	3	7	21	69	79	179
	%	1.7	3.9	11.7	38.5	44.1	100.0
Peer instruction method was easy to follow.	f	3	5	35	72	64	179
	%	1.7	2.8	19.6	40.2	35.8	100.0
Peer instruction method was interesting.	f	7	13	40	63	56	179
	%	3.9	7.3	22.3	35.2	31.3	100.0
Peer instruction method was enjoyable.	f	2	12	37	58	70	179
	%	1.1	6.7	20.7	32.4	39.1	100.0
Peer instruction method helped to better understand the course topics.	f	7	14	31	65	62	179
	%	3.9	7.8	17.3	36.3	34.6	100.0
Peer instruction method helped me to move beyond my previous level of knowledge.	f	7	13	42	64	53	179
	%	3.9	7.3	23.5	35.8	29.6	100.0
Peer instruction method helped to assess the level of knowledge regarding course subject.	f	4	7	24	80	64	179
	%	2.2	3.9	13.4	44.7	35.8	100.0
Immediate feedback with the peer instruction method helped me to complete my shortcomings.	f	5	12	40	58	64	179
	%	2.8	6.7	22.3	32.4	35.8	100.0
Peer instruction method has increased my confidence in the ability to do courses.	f	4	11	42	77	45	179
	%	2.2	6.1	23.5	43.0	25.1	100.0
Peer instruction method increased participation in class.	f	5	7	39	56	71	1
	%	2.8	3.9	21.8	31.3	39.7	.6
Peer instruction method increased my motivation towards the course.	f	4	8	32	72	63	179
	%	2.2	4.5	17.9	40.2	35.2	100.0
When I consider all the activities in the course, I think that the allocated time for the peer instruction method is sufficient.	f	11	22	49	58	39	179
	%	6.1	12.3	27.4	32.4	21.8	100.0
I think it is difficult to apply the peer instruction method.	f	34	63	36	28	18	179
	%	19.0	35.2	20.1	15.6	10.1	100.0
I think peer instruction method is useful.	f	5	3	29	64	78	179
	%	2.8	1.7	16.2	35.8	43.6	100.0
I think peer instruction method should be used in other courses as well.	f	11	10	50	57	51	179
	%	6.1	5.6	27.9	31.8	28.5	100.0
I think peer instruction method is educationally attractive.	f	5	6	31	76	61	179
	%	2.8	3.4	17.3	42.5	34.1	100.0

When Table 1 is examined, the majority of the students stated that peer instruction method is clear ($f = 148, 82.6\%$) and follow-up is easy ($f = 136, 76\%$). In addition, more than half of the students found peer instruction method as interesting ($f = 119, 66.5\%$) and enjoyable ($f = 128, 71.5\%$). When the student responses are examined in detail, it is seen that many of them believe that the peer instruction method helps to get better understanding of the course subjects ($f = 127, 70.9\%$) and to go beyond previous knowledge levels ($f = 117, 65.4\%$). In addition, they stated that this method helped to complete the deficiencies ($f = 126, 68.2\%$) and evaluate the level of knowledge about the subjects ($f = 144, 80.5\%$) by receiving immediate feedback. Nevertheless, they also stated that their confidence ($f = 122, 68.1\%$), their participation ($f = 127, 71\%$) and their motivation ($f = 135, 75.4\%$) increased. Almost half of the students think that allocated time is enough for this method ($f = 97, 54.2\%$) and that this method is not difficult to apply ($f = 97, 54.2\%$). The majority of the students stated that this method is useful ($f = 142, 79.4\%$) and that it can be used in other courses as well ($f = 108, 60.3\%$) and educationally attractive ($f = 137, 76.6\%$). The analysis results of the student evaluation toward questions asked which is second theme are given in Table 2.

Table 2. Student Evaluation Toward Questions Asked

Items		Strongly Disagree ←---→ Strongly Agree					Total
		1	2	3	4	5	
17. The questions posed in the question-and-answer process of the peer instruction method generated my interest.	f	7	10	47	72	43	179
	%	3.9	5.6	26.3	40.2	24.0	100.0
18. The questions posed in the question-and-answer process of the peer instruction method made it easier to understand the important points about the topic.	f	2	12	28	92	45	179
	%	1.1	6.7	15.6	51.4	25.1	100.0
19. The time allocated for the questions posed in the question-and-answer process of the peer instruction method was sufficient.	F	20	33	48	38	40	179
	%	11.2	18.4	26.8	21.2	22.3	100.0
20. The level of difficulty of the questions posed in the question-and-answer process of the peer instruction method was appropriate for my level.	F	7	15	43	83	31	179
	%	3.9	8.4	24.0	46.4	17.3	100.0

When Table 2 was examined, it was determined that the questions asked in the peer instruction method were interesting ($f = 115, 64.2\%$) and facilitated to understand important points ($f = 137, 76.6\%$). Furthermore, about half of the students stated that the time for the questions asked was satisfactory ($f = 78, 43.5\%$) and more than half of them stated that questions were appropriate for the difficulty levels of the questions ($f = 114, 63.7\%$). The point to note here is that the time allocated for the questions posed in the question-and-answer process is not sufficient for more than half of the students. As long as the given time is too long, students may be tempted to try to find answers using different sources, and in a very short period of time they may be answered without thinking. For this reason, while the period to be set aside for the questions asked in the process are determined; it is important to consider various variables such as the subject studied, the difficulty level of the question being asked, and the learning levels of the students. Table 3 shows the results of the analysis of student evaluation toward discussions made on the third theme.

Table 3. Student Evaluation Toward Discussions Made

			Strongly Disagree ←---→ Strongly Agree					Total
			1	2	3	4	5	
21.	The discussion level in the process of peer instruction method was high.	f	9	19	36	71	44	179
		%	5.0	10.6	20.1	39.7	24.6	100.0
22.	I participated actively in discussions in the process of peer instruction method.	f	3	14	28	67	67	179
		%	1.7	7.8	15.6	37.4	37.4	100.0
23.	I liked expressing my ideas during discussions in the process of peer instruction method.	f	4	12	27	63	73	179
		%	2.2	6.7	15.1	35.2	40.8	100.0
24.	The peer instruction method enabled me to be aware of the ideas of my classmates.	f	9	8	31	67	64	179
		%	5.0	4.5	17.3	37.4	35.8	100.0
25.	I liked to see different perspectives with the peer instruction method.	f	3	11	34	71	60	179
		%	1.7	6.1	19.0	39.7	33.5	100.0

When Table 3 was examined, students reported that the level of discussion in the process of peer instruction method was high ($f = 115$, 64.2%) and they participated effectively in discussions ($f = 134$, 74.8%). Furthermore, they expressed that they liked to express their opinions ($f = 136$, 76%), they were aware of their friends' opinions ($f = 131$, 73.2%) and liked to see different views ($f = 131$, 73.2%).

CONCLUSIONS

In this study, a student evaluation form toward peer instruction method was developed to determine the evaluation of university students toward peer instruction method and the evaluations of students who use peer instruction method were examined. Student evaluations toward peer instruction method in the developed form were examined as 'student evaluation toward peer instruction', 'student evaluation toward questions asked' and 'student evaluation toward discussions made' in three sub-dimensions.

When the student evaluations for the use of the peer instruction method are examined, the majority of the students stated that peer instruction method is clear and follow-up is easy. More than half of the students stated peer instruction method as interesting and enjoyable. Students stated that the peer instruction method helps to get better understanding of the course subjects and to go beyond previous knowledge levels. They stated that this method helped to complete the deficiencies about the subjects by receiving immediate feedback. It is seen that they also stated that using peer instruction method increased their confidences, their participations and their motivations. When the literature is examined it is seen that similar research results which support these results are obtained. For example, in the study conducted by Gok (2015), it was seen that peer instruction method has developed students problem solving strategies, academic achievements and homework performance, and students stated positive opinions toward peer instruction method. In a research conducted by Simon and Cutts (2012), it was seen that peer instruction method developed deep learning. Schmidt (2011) concluded that peer instruction method is effective to increase student satisfaction.

When students' evaluations are examined, it is seen that the questions asked were interesting and facilitated to understand important points. Furthermore, about half of the students stated that the time for the questions asked was satisfactory and more than half of them stated that difficulty levels of the questions were appropriate for their levels. When student evaluations toward discussions made are examined, it is seen that students reported that the level of discussion in the process of peer instruction method was high and they participated effectively in discussions. Furthermore, they expressed that they liked to express their opinions, they were aware of their classmates' opinions and liked to see different views. When the literature is examined it is seen that similar research results which support these results are obtained. For example, in the study conducted by Trottier, Kamp and Mirenda (2011), it was revealed that the discussion process in peer instruction developed social interaction among students.

Some suggestions can be made about peer instruction practices that will be designed by taking into account student evaluations. Firstly; at the beginning of the teaching period, students can understand and follow the method by explaining them what peer instruction method is, how to apply it and what to watch out for. In the peer instruction process, it is important that the feedback provided to students is well structured. Through feedback, students must be aware of the deficiencies and mistakes in learning, and these deficiencies and mistakes should be removed. Strategies such as scaffolding and metacognitive support can be used in this process. Another point to note is the process of structuring and managing the discussion used in peer instruction. In this process, it should be encouraged to express students' opinions and ideas clearly. In the process of managing student discussions, different discussion methods such as individual and group discussion can be tried. Student discussions can also be conducted through virtual environments, such as social networking environments. Thus, it can be provided that discussions in the classroom are not applied only at classroom and it is also possible to reach discussion records in the desired place and time. Finally, in the future research; it is important that new studies considering different individual differences of students at different levels of education (primary school, secondary school, associate degree, post graduate, etc.) will provide information about more variables related to peer instruction method.

ABSTRACT

This study aimed to explore the development of water resource management (WRM) awareness in teacher training curriculum. The WRM awareness was urgency to study in order to solve the current water pollution problems. There were 12 informants involved in providing data to create the teacher training curriculum. This is followed by 12 experts to validate the created teacher training curriculum. Finally, a total of 38 Grade 6 science primary school teachers in Namphong sub-basin, Thailand were randomly selected to test their understanding and satisfaction. The research procedure of the curriculum developmental process was comprised of four stages namely diagnosis of needs, design a curriculum, produce curriculum package for tryout, and testing for the curriculum effectiveness. Hence, pretest-posttest result indicated a significant difference on teachers' understanding with a high level of satisfaction.

Keywords: Awareness; teacher training curriculum; water resource management

INTRODUCTION

Education acts as a powerful tool in the socio-economic renovation of a society, community and nation. It sharpens the appreciation of knowledge, develops awareness and makes thoughts logical (Chaturvedi, Kumari and Singh, 2014). Teacher being the agent of social change, play an active role in shaping the behavior of students to promote desire for environmental awareness. The environmental awareness particularly in water resource management is urgency to develop due to the current water pollution problems in Thailand. On this line of reasoning, teacher development is very important as it is the key to the creation of citizen who are able to manage their lives and be connected with others in the ever-changing, dynamic and complex society (Mitkovska, 2010). In order to produce high quality teachers to fulfill the above demands, teacher training will be the most appropriate platform to be utilized to develop necessary knowledge and skills of teachers as well as their understanding (Art-in, 2014).

Currently, one of the critical environment problems in Thailand is water pollution and water resource management (WRM) due to low awareness of Thai people related to the value of water resources (Pongsasanongkul, 2004). Over the past 55 years of implementing National Economic and Social Development Plan in Thailand, it has caused serious water pollution problems resulted from the industrial economic development. There are 25 river basins with their sub-basins in Thailand. The Namphong sub-basin is one of the 20 watershed basins, which covers four provinces and 12 districts in northeastern of Thailand. Various factors such as rapid industrial advancement, increment of population and high demand for water have caused water contamination in the Namphong sub-basin area. Contamination in Namphong sub-basin would create problem to the communities who reside along the riverside.

Thailand's dramatic economic growth has caused numerous environmental problems such as water pollution, soil erosion, water scarcity, and waste issues. In order to control the situation, Thai government called for its Seventh Economic and Social Development Plan (1992-1996) declaring the environmental protection as a top priority (World Bank Team, 2001). A 2004 indicator in Environmental Monitor (2006) showed that the cost of air and water pollution for Thailand scales up to approximately 1.6 to 2.6 percent per year. Thailand's rivers are being increasingly polluted by industrial waste water and solid waste dumping, but Thai government has no clear strategy for water pollution (Runsuk, 2011). According to a World Health Organization report, diarrhea caused by this type of contaminated water causes 2.2 million deaths each year worldwide.

All these are greatly responsible for rapid degradation of the environmental quality at grass root level. The water resource management awareness moves people towards water resource protection and improvement. All these are possible only through water resource management awareness through education. As such, by water resource management awareness simply mean having the latest knowledge of/ or envisioning the possible dangers, threats of environmental degradation. It includes making the people conscious of the physical, social and aesthetic of the water pollution. These elements are interrelated and interdependent and are essential for the survival of the humanity. Awareness needs sensitivity (Chaturvedi et al., 2014). A sensitive teacher concerns the water pollution from its reckless exploitation. Researchers see the water resource management as the very potential of education, it can safely be concluded that such awareness can be realized through education, whatever mode it comes from.

Awareness means having update knowledge of recognizing the possible threat of a mechanism. Awareness to preserve, protect and conserve the environment is one of five goals that have been identified in the Basic Education Core Curriculum B.E. 2551 (A.D. 2008) of Thailand. The new Basic Core Curriculum provides local communities and schools with a framework of learning standards and indicators. Schools are given freedom to increase learning time allotment, local wisdom, and desirable characteristics depending on their readiness and priorities. To achieve this end, schools should prepare all subjects as specified by the standards and may create additional contents or integrate subjects to form a new learning unit. However, teachers faced many problems to develop their school curriculum and also trying to integrate the local wisdom and additional contents into the core curriculum framework. Furthermore, Rungnana (2002) found that principals and teachers generally were optimistic for the school-based curriculum project but these local schools were far from their readiness for this kind of radical change. Traditional hierarchical bureaucracy in organizational structure caused the schools tend to play a passive role rather than creating curriculum and units of learning based upon their own needs.

Teachers can play their significant roles in developing learners' awareness on water resource management. Teachers can provide opportunity to observe local environment features of water pollution, problems and phenomena and changes in community. They can allow learners to classify living and non-living things on the basis of criteria chosen by learners themselves regarding water pollution. Moreover, teachers can help learners to draw obvious inferences from their observation and such classification. Teachers organize out of class activities based on learning on immediate environment. Hence, teachers correlate the water resource issues while teaching the curricular subject. This is followed by creating awareness on renewal and non-renewal resources. This will enable learners to acquire basic knowledge and understanding of the total water resource, its problems and role of human being. During the usual classroom teaching, teachers encourage learners in acquiring social values through active participation in water resource protection activities. Finally, teachers can provide ample knowledge and skills regarding water resource management concept of development.

A teacher training provides a platform to teachers to acquire knowledge, skill and develop positive attitude, values, and beliefs. This can be done with the help of the provided curriculum. In other word, the quality of teacher produced invariably depends on the curriculum offered to them during their training period (Jadhav & Patankar, 2013). As curriculum is the best mean of overall development of students, teacher is the mediator between curriculum and students. In short the quality of teacher training is maintained by teacher training curriculum. The curriculum development process is a dynamic process which has to take into account society, learner and subject matter need.

RESEARCH AIMS

The major aim of this study is to develop a primary school population aware of and concern about the water pollution and its associated problems by integrating water resource management (WRM) in a teacher training curriculum. More specifically, researchers sought to:

- a) Create a teacher training curriculum in enhancing awareness on water resource management.
- b) Validate the created teacher training curriculum by experts.
- c) Investigate the understanding and satisfaction of primary school teachers after trial out of the created teacher training curriculum.

METHOD

Researchers employed a mixed mode method consists of philosophical assumptions that guide the way of the data collection and analysis and combination of qualitative and quantitative methods in three phases in the research process. The method employed here is a three-phase process that effectively captures most features inherent in a logical and structured approach to curriculum design. Essentially the research design identifies the following phases in the development of a curriculum to enhance awareness on water resource management.

Two approaches were employed to develop the teacher training curriculum namely Tyler's rational-linear

approach and Hilda Taba's approach. Tyler proposed four major concerns while developing a curriculum pertaining to selection of objectives, selection and organization of learning experiences, as well as evaluation. Taba further refined Tyler's curriculum model by adding another three concerns encompassing diagnosis of the learners' educational needs, formulating specific objectives, selection of content based on those objectives, organization of the content into the appropriate levels and sequences, selection of learning experiences that assist the learners in learning the content, organization of those learning experiences, and evaluation on the meeting of objectives. The conceptual framework was developed based on Tyles's and Taba's approaches coupled with the backward design proposed by Wiggins and McTighe (1998). The two approaches and the backward design were the guidelines for researchers in designing the created teacher training curriculum.

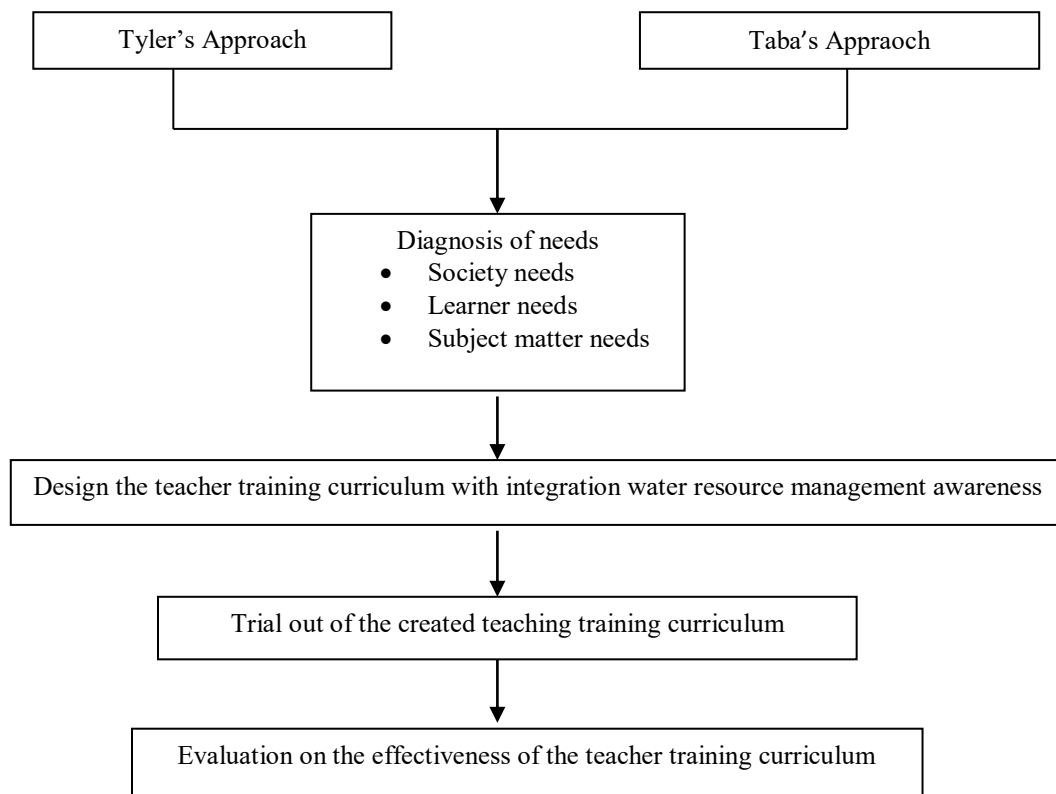

Figure 1. Conceptual framework of the teacher training developmental process

Phase 1: Drafting a teacher training curriculum in enhancing awareness on water resource management

This teacher training curriculum was created according to the types of diagnostic needs in the realms of societal, learning, and subject matter. Society needs refer to the current problems and context in water resource management areas. Focus group discussion was utilized to 12 informants consisted of three local knowledge wisdoms in the northeastern region, three leaders of Namphong sub-basin area, three supervisors from the office of Educational Service Area 4, Khon Kaen and three primary school Grade 6 teachers using purposive sampling. The number of participants who involved in the focus group discussion was a small group of six people led through an open discussion by a skilled moderator. The group of six would be sufficient to generate rich discussion. The participants who involved in the Phase 1 to collect diagnosis needs data mainly cover society needs, learner needs, and subject matter needs.

By investigating the current problems and context in water resource management area from the local knowledge wisdoms to obtain data related to society needs. On the other hand, learner needs and subject matter data were collected from supervisors and teachers. At phase 1, researchers planned to capture the most meaningful information to create the teacher training curriculum and manual courses to develop awareness related to water resource management for primary school teachers. The instrument used in Phase 1 was a semi-structured interview protocol. Data was collected from written field notes and audio recorded and analyzed using content analysis. Data was analyzed by comparing to the complete transcript in order summarize the meaningful information (Krueger & Casey, 2000). Researchers aligned the curriculum development process with the

information collected from Phase 1 to create teacher training curriculum and curriculum manual with integration water resource management awareness. The teacher training curriculum development process covers formulation of objectives, selection and organization of content, selection and organization of learning experiences and determination the measurement and evaluation.

Phase 2: Validation of the WRM training curriculum

The created teacher training curriculum and the manual courses with integration of water resource management was validated by a group of experts from Faculty of Education, Khon Kaen University. A total of nine experts from various specializations were purposively selected to revise the created teacher training curriculum. They were three experts from the field of curriculum and instruction, three professional scientists of water resource management, three experts in measurement and evaluation area, and three supervisors who are responsible of school curriculum standard.

The components of curriculum teacher training were containing introduction, vision, structure, goal, contents, activities, media and materials, and evaluation documents. Likewise, the components of curriculum manual were covering learning units with lesson plans, media, and assessment forms. A rating scale questionnaire was used to assess the validity of the created teacher training curriculum by the 12 experts. Data from rating scale questionnaire was analyzed using descriptive statistics such as mean score and standard deviation.

Phase 3: Investigation on the understanding and satisfaction of primary school teachers

The pretest-posttest design involves two measurements of the 38 primary school teachers who were teaching science in Grade 6 using simple random sampling. In this design, samples serve as their own control and comparisons are made before and after treatment. An assumption is made that differences between pretest and posttest are due to the treatment. There were two instruments used in Phase 3. The first instrument was an achievement test comprised of 30 multiple choice items to assess teachers' knowledge of understanding and the second instrument was a 30-items rating scale questionnaire used to evaluate teachers' satisfaction of water resource management training. The achievement test had an average value of the corresponding index of a rating scale questionnaire as 0.84 and reliability by KR20 as 0.87.

Quantitative data from Phase 3 was analyzed by descriptive statistic using the mean score and standard deviation and inferential statistic using paired t-test. Paired t-test was used in 'before-after' water resource management training. Paired t-test was identified to be suitable for this study because all the participants were matched pairs and it was considered as a case-control group. Researchers provided treatment that is water resource management training to these 38 primary school teachers and followed by the investigation on the impacts of treatment related to knowledge of understanding and their satisfaction on the created teacher training curriculum.

RESULTS

Results are presented according to the aim as mentioned above. The results demonstrate in three parts and organized according to quantitative and qualitative methods. The initial results highlight the teacher training curriculum development process derived from the 12 informants through focus group discussion. This is followed by the results of feedback from the 12 experts through their ratings. Finally, the difference between the pretest and posttest was measured on primary school teachers' understanding about the teacher training curriculum thus measuring their satisfaction level as well.

Phase 1: Identifying problems and suggestions from focus group informants to design the teacher training curriculum

Focus group discussion findings provided by the six local wisdoms and leaders (R1 to R6) basically enable researchers to identify the society needs to diagnose while designing the teacher training curriculum. From the focus group discussion with R1 to R6, researchers identified the following water resource problems. These problems were explicitly pointed out by these six informants as follow:

"The waste water in the river is caused by manufacturing process and the process of disposing chemicals from industrial facilities located near the river, such as from an ace factory, sugar factory, and paper mills." (R1)

"...lack of water during the drought season. In rural areas, there is not enough water. The village has no running water standards." (R2)

"People in the area dump garbage into the river and use chemicals in rice herbicide that kill snails and chemicals leach into the rives." (R3)

"Fish farming has the foulest stench. The settling of fish residues and dung results from fish in shallow water. This affects Namphong sub-basin water in its flow and water hyacinth weeds such as morning glory and cattail." (R4 and R5)

"Cutting wood near the river cause erosion of the banks." (R6)

After analyzing the above problems raised by the six local wisdoms, researchers suggested to integrate the following contents to enhance water resource awareness as below:

- i. Accelerate the provision of the clean water sources and store clean water from consumption.
- ii. Focus on educating about water use efficiency and maximize the benefits to local residents, especially young people like school students.
- iii. Provide awareness through education to all sectors of the local population particularly highlighting the negative impact of the dirty water.

Besides the water resource problems, water resource management problems were also investigated. The following are the water resource management problems indicated by the six informants (R1 to R6):

"People do not appreciate the importance of water and do not conserve water" (R1)

"Lack of water during draught means lack of water to farmers, which is the main occupation of the community." (R2 and R4)

"The government needs to promote conservation in Namphong sub-basin, as public awareness is lacking." (R3 and R6)

"The establishment of the restaurants on the waterfront is a problem. The dumping of food waste and sewage waste into the Namphong sub-basin is caused by them." (R5)

By analyzing the qualitative findings based on water resource management, researchers determined the following contents to be put in the teacher training curriculum.

- i. Supply water for agriculture store and use it throughout the year.
- ii. Use the media to engage in public relations and educate the local population.
- iii. Focus on creating awareness among the new generation in schools.
- iv. Focus on diverse media in the course.

Focus group discussion results derived from the three supervisors of the office of Educational Service Area 4, Khon Kaen (R7 to R9) and three primary school Grade 6 teachers (R10 to R12) enable researchers to determine the learner and subject matter needs that researchers have to diagnose and integrate into the created teacher training curriculum. There were two major concerns that researchers have taken into consideration while interviewing namely school curriculum and curriculum training model. Qualitative results derived from R7 to R9 providing researchers with the following concerns in school curriculum:

"Lack of regular and continuous activities on water resource management..." (R7)

"Education on water-saving practices and sustainable use is lacking. No one has talked about doing a course on water resources." (R8)

"There is no content knowledge or information about water resource management of Namphong sub-basin in the Basic Core Curriculum. Each school in Namphong sub-basin and in the cluster of Khon Kaen Educational Service Area 4 needs to develop their local curriculum by themselves." (R9)

"Teachers' knowledge and time are insufficient to create learning units about water resource management. Teachers need support from principals and supervisors or external experts to provide workshop training." (R8)

"Most of the schools in Namphong sub-basin have their awareness about environmental conservation in their school vision and mission." (R7)

Basing on the above findings from the three supervisors, researchers concluded the following contents:

- i. Encourage activities related to water resource management as regular and continuous activities.
- ii. Raise the students' awareness regarding the necessity of water and knowledge related to water resource management to ensure water sufficiency.

Based on the discussion with R10 to R12 who are teachers in primary schools, researchers gathered the following information related to the suitability of teacher training curriculum model as such:

"Teachers need knowledge about water resource management and teaching models to raise the awareness of students." (R10 and R11)

"Teachers need to be good example of water resource management learning units or lesson plans and the materials or teaching aids for applying to their teaching." (R10 and R12)

As a result, researchers concluded the following teacher training curriculum model as follow:

- i. Workshop training should be done within 3 to 5 days during the weekend or the end of the semester.
- ii. The content of training curriculum should focus on water resource management and awareness in

- protection and conservation of the environment around Namphong sub-basin.
- iii. Activities in the workshop training should be active learning, contextual learning and must be suitable to learners.
- iv. Materials in workshop training should support teachers' practices, completed with good examples.

After diagnosing the three perspectives of needs, researchers started to design the teacher training curriculum. It was designed based on learner centered, active and contextual learning. On top of that, the curriculum contents were focused on water resource management in the Namphong sub-basin and real life in the community. In addition, the suggested teaching strategies were problem-based, collaborative learning, critical thinking, problem-solving, searching skills, demonstration and exhibition. In regard to this, researchers proposed a 5-steps learning process as shown in Figure 2.

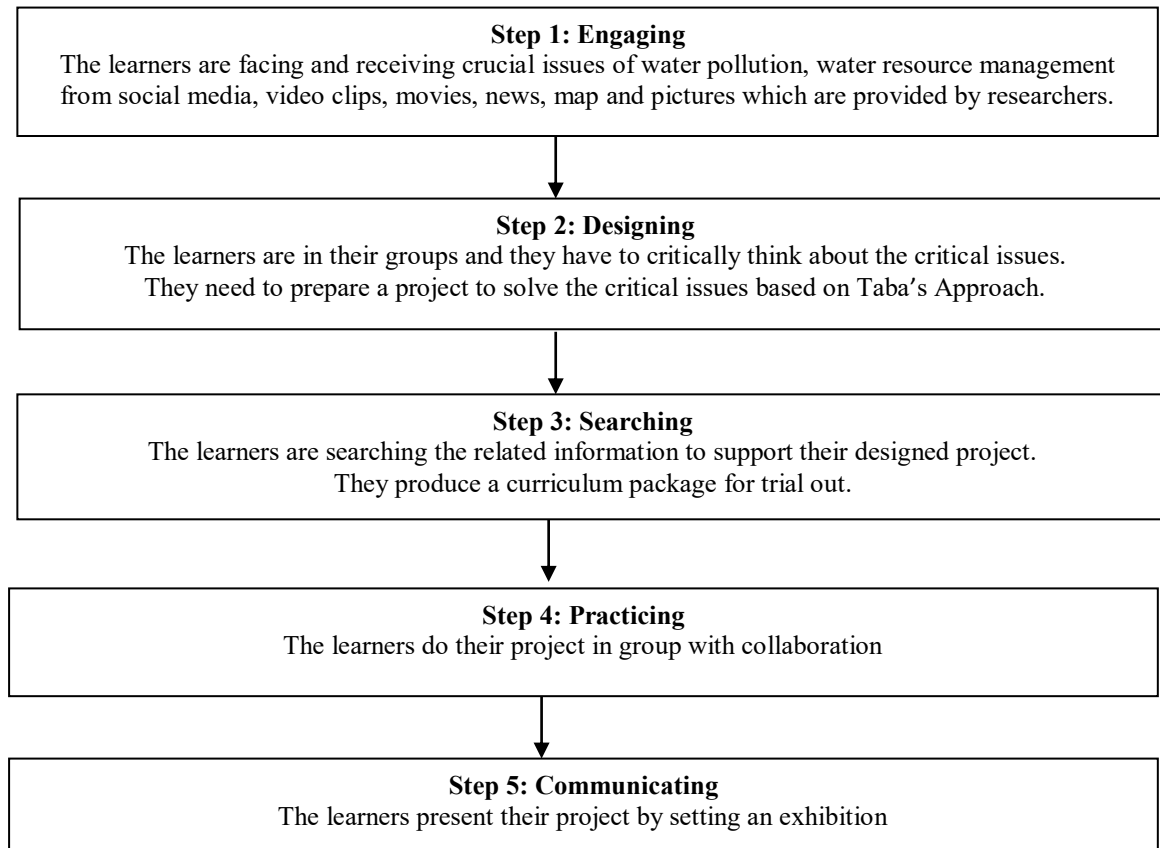

Figure 2. Learning process

Phase 2: Validation of the WRM training curriculum

The created teacher training curriculum documents were validated by a group of multidisciplinary experts as indicated before. Those experts evaluated the created teacher training curriculum documents by using the rating scale questionnaire. All the 12 experts had validated the teacher training curriculum according to each component. Results of the Phase 2 revealed all the components of the created teacher training curriculum were at good level except structural content. Table 1 shows the mean scores and standard deviations of components in the created teacher training curriculum namely introduction, vision and principles, structural content, learning objectives, contents, activities and teaching strategies, media and materials, and assessment method. As indicated in Table 1, the mean score for eight components ranged from 3.81 to 4.47 while the standard deviation ranged from 0.47 to 0.68.

The result of the study revealed that all the components in the created teacher training curriculum were highly rated by experts. Considering the first two orders, found that the highest mean score was media and materials ($\bar{x} = 4.47$, $SD = 0.60$). The second order was introduction ($\bar{x} = 4.42$, $SD = 0.59$). This is followed by activities and teaching strategies ($\bar{x} = 4.33$, $SD = 0.69$), vision and principle ($\bar{x} = 4.27$, $SD = 0.47$), learning objectives ($\bar{x} = 3.97$, $SD = 0.67$), contents ($\bar{x} = 3.95$, $SD = 0.63$), and assessment method ($\bar{x} = 3.81$, $SD = 0.68$). The component with the lowest average value was structural content ($\bar{x} = 3.27$, $SD = 0.47$). The overall mean score was at high

score ($\bar{x} = 4.12$, $SD = 0.62$).

Result implies that the experts' judgments were corresponding of water resource management curriculum in the same direction of our curriculum for developing awareness about water resource management for primary school teachers in the Namphong sub-basin by focusing on the three focal of needs namely society, learner, and subject matter needs in Phase 1. In addition, the curriculum package which consisted of learning units with lesson plans, media and assessment forms will lead to actual practices that reducing the teaching workload of teachers and enhance the potential of students' learning.

Table 1: Validation results of the created teacher training curriculum

Components	Mean score	Standard Deviation	Interpretation
Introduction	4.42	0.59	Good
Vision & Principles	4.27	0.47	Good
Structural content	3.27	0.47	Fair
Learning objectives	3.97	0.67	Good
Contents	3.95	0.63	Good
Activities/Teaching strategies	4.33	0.69	Good
Media and materials	4.47	0.60	Good
Assessment method	3.81	0.68	Good
Overall	4.12	0.62	Good

Phase 3: Results on the understanding and satisfaction of primary school teachers

The descriptive statistics of pretest versus posttest of 38 primary school teachers' understanding on water resource management awareness are presented in Table 2. All the posttest results show an increment compared to the pretest results after they attending the training. The assumption was made at the initial stage of the mean scores of the paired samples are equal which means that the pretest scores is equal to the posttest scores. The level of significant was identified as .05. Result of the study revealed that the mean score between the pretest and posttest was different between all the paired samples. In other words, all the 38 primary Grade 6 school teachers in Namphong sub-basin gained a higher score in their posttest compared to their pretest.

Table 2: Paired samples t-test

Treatment	\bar{x}	SD	t	p value
Pretest	15.34	4.19	9.891*	0.00
Posttest	21.79	3.13		

Additionally, the result indicates that these 38 Grade 6 primary school teachers were satisfied with the teacher training management with integration of water resource management awareness. The result of evaluation on their satisfaction level after the intervention that is the training was found to be encouraging, mean score ranged from 4.15 to 4.29. It can be concluded that teachers satisfied with the course, skills of trainer and learning climate of the teacher training.

Table 3: Teachers' satisfaction on curriculum for developing water resource management awareness

Aspects	Mean score	Standard deviation	Interpretation
Course	4.15	0.62	Good
Skills of trainer	4.28	0.63	Good
Learning climate	4.29	0.57	Good
Overall	4.21	0.61	Good

DISCUSSION

Environmental education like water resource management awareness can take the form of science enrichment curriculum, natural history field trips, community service projects, and participation in outdoor science schools. Therefore, water resource management awareness policies assist schools and organizations in developing and improving environmental education programs that provide learners with an in-depth understanding of the environment. School policies should focus on three main components namely curriculum, facilities, and training. School can integrate water resource management awareness into their teacher training curriculum so that teachers can play their significant roles during their teaching in the classroom.

Results of this study revealed that the created teacher training curriculum which consisted of eight components was found to be highly consistent with the Tyler's and Taba's curriculum model. On this line of reasoning, the created teacher training curriculum with integration of water resource management awareness is based on theoretical concepts on the basis of contextualized theory (Bray, Adamson & Mason, 2007). Since the created teacher training curriculum has been validated and assessed its effectiveness, teachers are encouraged to utilize what they learned to help learners as well as illiterate adults to know, to protect, and to enrich the environment from water pollution (Chaturvedi et al., 2014).

Traditionally, teacher has been regarded as an agent of social change and transformation. Learners imitate their teacher and draw stimulation from them especially in primary schools. A primary school teacher therefore plays an important role in providing water resource management awareness and developing a positive attitude towards environment among learners by shaping cognitive, affective, and psychomotor simultaneously. Water resource management awareness not only educates the population in Namphong sub-basin about the natural environment and its problem but also aims at developing them the knowledge, attitudes and skills necessary to protect the natural balance in water resource besides working for its enrichment.

Water resource management awareness has to be conceived in a sustainable way as long-term activities. School curriculum has to be integrated water resource management awareness in every subject especially in the seven subjects with 36 indicators such as sciences, social, religion and culture, career and technology, health, mathematic, and language and art. Moreover, parents and communities are encouraged to participate in the monitoring and evaluation of the curriculum implementation particularly in environmental and community accountability.

In order to develop the water resource management awareness through formal education, certain required activities under the various levels of formal education have to be carried out. At primary school level, the main focus must be the awareness or the consciousness of the water resource in general. The water resource material should be embedded with the contents in language, social science and natural sciences. The teacher concerned should follow the teaching strategies of direct observation supported by audio-visual aids. On the other hand, location orientation awareness and conservation knowledge and skill should be given due emphasis at the secondary level of formal education. The content of secondary school level can remain the same as it is at the primary school level, but the teaching strategies employed should be action oriented. Finally, higher education has the most important role in curbing environmental imbalances. Higher education should focus on the sustainable development, conservation, and recycling knowledge and skill depending upon the nature of the courses offered in teacher training. Research activities must be encouraged in this respect at the maximum including the extension works.

ABSTRACT

The purposes of this study were to, develop an instructional model based on reading apprenticeship approach and semantic mapping strategy for enhancing analytical reading ability of undergraduate students; and evaluate the efficiency of the instructional model. The research procedure was divided into phases; 1) development of an instructional model based on real problem; and 2) effectiveness evaluation of an instructional model through implementation with the subjects who were thirty undergraduate students, Suan Sunandha Rajabhat University, Thailand. The duration of experiment was one semester. The research instruments were analytical reading test. The data were analyzed by using T-test dependent. The research result shows that: 1) The objectives of the developed instructional model were to enhancing analytical reading. This model consisted of 3 substages which were 1.1 Beginner and Reading Apprenticeship 1.2 Process of Reading Apprenticeship 1.3 Experiences Interchange. Quantitative and qualitative data measurement and evaluation were carried out during and after the instructional process. 2) The effectiveness of the instructional model after implementation, it was found; The score of analytical reading higher than before the experiment at .01 level of significance in all components. The ability with most significant improvement.

Keywords: Reading apprenticeship approach , Semantic mapping strategy, Analytical reading

INTRODUCTION

Reading is important skills and really essential for educational system that is the major part and tools of the world purpose for seeking the knowledge, ideas creation, decision making and solutions. In addition, reading can help learners to be quickly and widely in mindset of academic from both inside and beyond classrooms entirely. 80-90 percentages activity of academic institutes have concerned to the reading and learners who have its skillful to encourage as well as acquisition of knowledge. Otherwise reading can improve individual working competency and be required for the knowledge based society (Ministry of Education, 2009; OECD, 2010)

Ministry of Education has realized to this matter, so they contain this curriculum to improve the reading skill for all levels of education, especially, undergraduate study (Office of the Higher Education Commission, 2013) Every institute is highly interesting and contains it into general subject so as to be the principle and how to read academic writings namely fictions, non-fictions, prose and compose. Those emphasized knowledge, ideas, moral and value of words formation. This level of reading is in depth of vocational education and prepares completeness before occupation (Sinlarat, 2012, p.4) accompanying with understanding and preciousness in the contents by readers. Otherwise, they should interpret it reasonably so that why it is primary character of critical reading.

Therefore, the Department of Thai language would encourage collage students to have analytical reading. According to it was a knowledge and understanding skills then using in daily life, reflecting and giving the suggestion in contents with engagement in its for targets approach of each people. To develop knowledge and self-competency and social contribution (OECD, 2013; OECD, 2010, p. 37) the learners of University used reading to learn in their objectives with complex stories and specific interesting stories to encourage literacy in own academic contents (Lee and Spratley, 2010).

The result of study from concepts, theories, principles of literature reviews and researches related to analytical reading enhancement showed that the theories might be able to utilize in fundamental schooling development so as to encourage analytical reading for the learners in University based on the Reading Apprenticeship Approach And Semantic Mapping Strategy Therefore, the aim of this study is formulated as follows:

The purposes of this study were to, develop an instructional model based on reading apprenticeship approach and semantic mapping strategy for enhancing analytical reading of undergraduate students; and evaluate the efficiency of the developed instructional model.

LITERATURE

Analytical reading

Analytical reading is defined to intensive reading and considers writing intention to analyze context compartment such conceptual content, interpretation, significant and relevant content. Readers must purify the component of context structure to summarize its concept and value. Each part of the definition is explained further:

The competency of analytical reading defined to the ability of literature reading completely with writing style and structure, content, writing strategy and language idioms. By the way, readers could analyze text and interpretation for attitude of editors and their significant. Otherwise, reader could be diverse the ideas by reading information to evaluate from competency quiz of analytical reading and the result of examination.

Then, researchers designed as following components:-

- 1) Writing styles Analysis, precisely content analysis in conformity with type of writing, presentation strategy, and language idioms in the definition stories or events.
- 2) Interpretation was ability to explain precisely editors' attitude, emotion, feeling in the content, the purpose of editors, views of context, main ideas majority and minor in the definition stories or events.
- 3) Reasonable criticism was ability of reader comments in conformity with stories, giving the reason and example to relevant with point of view and brought applicable concept.

In order to achieve one's goals, to develop one's knowledge and potential, and to participate in society – this statement is intended to capture the full scope of situations in which analytical reading plays a role. To achieve one's goals and to develop one's knowledge and potential refers to the idea that analytical reading enables the fulfilment of individual aspirations. The word participate is used because it implies that analytical reading allows people to contribute to society as well as to meet their own needs. (OECD, 2010, p. 37; 2012, p. 61)

Therefore analytical reading development for the learners, teachers needed to focus on the development of the learners in reading skill for understanding and reflecting resulted to the objective of learners and good reader (Guthrie, 2000 cited in Loera, 2006)

Reading Apprenticeship Approach

Reading Apprenticeship Approach was applied by fundamental of Social Constructivism and Social Cognitive Learning Theory. The major character of this concept was teachers, experts and friends to be practice guideline for the process of reading in various types (Schoenbach, 2000 cited in Mehdian, 2009, p. 4-5). Role of teachers was the original various systematic applications with extra practice and encouraged the learners to control self-systematic reading Knowledge acquisition was based on Metacognition Conversation how to choose the context and ensure comprehension while reading and evaluating the knowledge outcome, jobs assignment and appropriate reading system for complex contents (Matz, 2012, p. 37-38). The prior reading experiences of learners helped the understanding of content (Brenner, 2009). Learning was emphasized with interaction between learners, teachers and colleagues by group-knowledge sharing, independent group assignment namely pairs, small group, classroom debate and conclusion together (Mehdian, 2009, p. 5).

Moreover, Reading Apprenticeship Approach was the original pattern for all writing styles, reading development for all educational levels, and capability encouragement to utilize the various reading methods to concern with the contents. Reader could understand and gather from the main idea of contents. Otherwise it acquired skills of thinking and knowledge to extend for higher education and self-access. This method of reading raised teamwork and motivated all learners. As noticed, the Reading Apprenticeship Approach emphasized to understand and gather from the main ideas conforming to Pressley et al., (1992, p. 524-525) stated “General researchers did not study for the method of interpretation, but focusing on the main ideas and raising readers competency. The learners’ interpretation happened during achievement test, which was provided by their teachers, because learners’ interpretive capability was from their knowledge basis, attitude, ideas and method of reading entirely to explain vocabulary, idioms and context. They were shown by interaction between teachers, learners and text” In addition, Johnson Pittelman and Heimlich (1986, p.778) stated that most researchers aimed to reading comprehension, not in details of words. In fact, words were important components of reading and its interpretation from the meaning.

Students can use Reading Apprenticeship Approach for a variety of text types. In several instructional settings, including reading groups that focus on high-quality literature. When a child has difficulty decoding a word, the teacher prompts the child to choose one or two of several fix-up strategies that have been taught, such as: Sound out the word, Look for context clues, Reread and Skip the word. (Pressley et al., 1992, p. 257)

Therefore, the important guideline for learners to have ability of reading analysis and to know meaning of word for interpretation was Semantic Mapping Strategy.

Semantic Mapping Strategy

That strategy explained to the meaning of word from interpretation of connotation context approach which was invisible and complexity in mapping form (Vadasy and Nelson, 2012, p. 104). It could help teachers to inspect obviously understanding of learners correlate with Semantic Mapping Strategy to develop reading. Coleman (1995, 15) was found that learners showed imagination of main ideas to relevant the structure of prior knowledge. It assisted readers to be visible comprehension in main ideas with supported information and mapping from which readers’ selection. (Suphamonkhon, 2010; Coleman, 1995)

As the results, Reading Apprenticeship Approach and Semantic Mapping Strategy were efficiency to develop competency of the learners into analytical reading with good attitude from them, enthusiasm, and their showing the criticism of selecting context.

METHODOLOGY

This study was a research and development based on Reading Apprenticeship Approach and Semantic Mapping Strategy to encourage analytical reading of undergraduate students by quasi-experimental research, with a one group pre-test post-test design . The purposes of this study were to, develop an instructional model based on Reading Apprenticeship Approach and Semantic Mapping Strategy for enhancing analytical reading on University students, Suan Sunandha Rajabhat University, Thailand; and evaluate the efficiency of the instructional model. The selected participant of 2nd semester 2016 was 30 college students 2th year in Bachelor Degree from Faculty of Education.

1. The research procedure was divided into phases

1.1 Development of an instructional model based on real problem; and

1.2 effectiveness evaluation of an instructional model through implementation with the subjects who were thirty University students. They learn Reading subject .

2. Research content was course syllabus in Bachelor of Reading for Intellectual Development. It was about analytical reading in academic writing, journals, documentaries and short stories by learner selection and it appeared on undergraduate study.

3. The research instruments

There was main research instrument and a RAA and SMP lesson plan such as: Analytical reading test (pre-test and post-test). It contained 38 multiple-choice items and Completion Question 12 items. Totally 50 items.

4. Efficiency evaluation for learning improvement. This Research variable consisted of Manipulate variable to define Reading Apprenticeship Approach and Semantic Mapping Strategy. Dependent variable was competency of analytical reading.

5. Period of data collective to study effective program for 16 weeks totally 32 studied periods in Semester 1 yearly 2016.

6. The data were analyzed by using T-test dependent and descriptive statistic: Frequency, Percentage, Mean, Maximum value, Mode, Standard Deviation and judged value of mean were examined to describe students' analytical reading ability

FINDINGS

Reading Apprenticeship Approach and Semantic Mapping Strategy defined the circumstance of regulatory learning to bring them in the curriculum and encourage the learners in various reading strategy by lecturers, experts and colleagues advice. They were conducted to consider the content with the prior knowledge of vocabulary, idioms and content to interpret and mapping the meaning of words from reading context. This method emphasized from Metacognition Conversation and Semantic Mapping. The cumulative learning by interaction resulted to the competency of analytical reading as Reading Apprenticeship Approach and Semantic Mapping Strategy categorized by 4 basics.

1. Reading Apprenticeship Approach induced learners to bring their knowledge for planning how to select efficiently analytical reading, practice and self-evaluation.

2. Content learning by mapping prior knowledge with vocabulary, idioms and main idea toward better story comprehension.

3. Reading knowledge Indication and Explanation to categorize respectively for semantic mapping and to show in diagram. They were useful for all learners more understandable contents and reading structure.

4. Reading Inspection and Evaluation Involvement by interchanging, criticism with appropriate learning circumstance and to encourage learners' attention.

The instructional model based on Reading Apprenticeship Approach and Semantic Mapping Strategy had 3 teaching stages as follows:

Stage 1 Beginner and Reading Apprenticeship Approach

- 1.1 Lecturers/ Experts share reading fundamental
- 1.2 Model presentation/ analytical reading demonstration
- 1.3 Learner practice by model

Stage 2 Process of Reading Apprenticeship Approach

- 2.1 Learners indicated prior knowledge to relevant with context.
- 2.2 Learners chose Reading Apprenticeship Approach
- 2.3 Learners indicated vocabulary, idioms and important statement to definition
- 2.4 Learners used semantic mapping strategy with key words.

Learners Team diversified reading information.

Stage 3 Experiences Interchange

- 3.1 Learner shared knowledge and criticism.
- 3.2 Lecturers inspected and gave suggestion for additional information
- 3.3 Learner concluded and gave important suggestion.

Part 1 Quality Inspection of schooling by experiment

The results of schooling model to experiment with University students, Suan Sunandha Rajabhat University total 30 students, they were as similar as the sample group in first semester year 2016 as following;

1. First experiment was found that the learners could not reflect ideas from reading contents and explain its content to apply reasonably. The researchers demonstrated conceptual reflection samples and brought ideas from reading contents to apply with the learners by using the technical questions so as to encourage the learners to think and make reasonable decision for some information properly.

2. Second experiment was found that the learners could reflect the ideas from reading contents. Nevertheless, the process of knowledge relaying, various learners could not bring the knowledge from reading contents to use appropriately. The researchers used a teaching by rising up the sample situations related to the reading contents and asking learners to analyze the issues with suggestion.

The result of teaching experiment was taken to enhance reading management plan of sample group.

Part 2 The effectiveness of the instructional model based on Reading Apprenticeship Approach and Semantic Mapping Strategy

Table 1. The comparison result of average score in analytical reading against the sample before and after the experiment (N = 30)

Analytical reading	Pre test		Post test		D	t	p
	\bar{X}	S.D.	\bar{X}	S.D.			
score 50	29.63	3.362	37.30	3.030	29	10.884	.000*

significant difference * $p < .01$

As table 1 found that after experiment of the sample group had overall analytical reading higher than criterion 70 percentages and higher than before the experiment at .01 level of significant. Score of before experiment at 29.63 percentages and score of after experiment was increased at 37.30 percentages.

Table 2. The comparison result of average score in analytical reading against before and after the experiment categorized by component (N = 30)

Analytical reading	Pre test		Post test		t	p
	\bar{X}	S.D.	\bar{X}	S.D.		
1. Writing styles Analysis (24)	14.56	2.062	16.36	2.606	-3.366	.002*
2. Interpretation (14)	8.23	1.546	8.93	1.552	-1.948	.061
3. Reasonable criticism (12)	6.83	1.782	12.00	0.000	-15.874	.002*
Analytical reading (50)	14.56	2.062	16.36	2.606	-3.366	.002*

significant difference * $p < .01$

.01

As table 2 found that after the experiment to the sample group had overall analytical reading higher than criteria at .01 levels. The average score of writing styles analysis, and reasonable criticism were higher than before the experiment at .01.level of significant. The interpretation of sample group had score higher than before the experiment, but not different at 0.01 level of significant.

CONCLUSIONS

The population of this study was 30 students from University students. Findings were average score of analytical reading higher than before the experiment at .01 level of significance in all components. The teaching 3 stages were 1.beginner and reading apprenticeship approach 2.process of reading apprenticeship approach 3.experiences interchange. Students who were participant, provided activities and enjoyable learning. Students had reading skills performed best on the analytical reading test.

Reading Apprenticeship Approach and Semantic Mapping Strategy instruction had significant on students' analytical reading ability. The core reason that made Instructional model successful was that all stages, conducting research, self-reflection on own learning were constructed based on the 4 principles of Reading Apprenticeship Approach and Semantic Mapping Strategy

During the stages, students were used reading strategy support and guidance from Reading Apprenticeship. Teacher scaffolding was one of the most important factors. This support the instructional model by Lowery (2010) found that reading guidance assisted the learners understanding of what they read including used the knowledge and relayed its correctly on objective. Reading Apprenticeship Approach and Semantic Mapping Strategy make proficient readers. In investigations spanning several decades, researchers studied skilled reading to learn more about interpretive thinking and strategic actions. From this research, two models of expert reading emerged (Pressley & Afflerbach, 1995) and the Good Strategy User Model (Almasi, 2003). Both theories depict the knowledge and strategic resources that capable readers rely upon when reading. According to these models, good readers tap their academic and nonacademic knowledge, monitor their comprehension.

Mean while Reading Apprenticeship Approach and Semantic Mapping Strategy instructional model assisted all learners having motivation with reading habit, and interpreting. (Jesson and Lacey, 2011, p. 31; Saththapong, 2015).The results of research in transactional strategies instruction assisted enhancement of reading for understanding. Students who practiced on that instructional, could understand and penetrate the main point of the contents. Moreover they could link and well relay on the reading (Gutkind, 2012). The Literacy Management strategies assisted enhancement the reading for understanding, attitude and motivation for University students.

ABSTRACT

This study aimed to examine the analytical thinking skills development through learning management plans. Research and development design coupled with case study method was employed to Thai Basic Education University students from a public university in Khon Kaen province, Thailand. There were two groups of samples consisted of 45 teacher educators and 1,575 Basic Education university students. The quantitative finding indicated that teacher educators' analytical thinking score was 36.54 out of the full score as 45, higher than defined criterion of 70 percent while focus group interviews showed positive feedback including analytical thinking knowledge and practices in handling learning management.

Key Words: Analytical thinking, university students, learning management plans

INTRODUCTION

Analytical thinking skills are critical in today advanced technology work place, particularly in the teaching profession. This is because analytical thinking skills help teachers or teacher trainees to gather information, articulate, visualize and solve complex problems in the rapid information age of changing trend world. Hence it becomes a necessity for every country to develop its future human resource to be able to think analytically, critically, know how to solve problems, acquire creative and initiative thinking skills, know how to acquire knowledge from multiple sources, learn and construct bodies of knowledge by themselves, adapt themselves in time for the ever-changing situations and be prepared to confront the challenge of the world. University students are expected to develop analytical thinking mind and they must not only understand what they read but also pick it up apart, question it, evaluate it and assess it. Analytical thinking involves questioning and reflecting upon ideas. University students must look deeper into what they are learning and think about its relation to the bigger picture. They must be able to present their critique and a structured, clear, and well-reasoned and supported way (UCL Transition Program, n.d.).

It is essential to develop teachers' analytical thinking skills so that they are able to integrate analytical thinking skills in their learning management. Even teachers have gone through comprehensive training, there will be many times where teachers will put on the spot to think analytically and the right or wrong answer could make a difference with regard to their upward mobility within the schools. To what extent teachers are able to incorporate training of analytical thinking skills, thinking process, management, and situation confrontation in their learning management so that students learn from real experiences is still questionable (Pamphilon, 2000). In order to develop analytical thinking skills among the learners in current rapid changes, the world is extremely vital because learners have to be prepared by teachers to face it. As a result, Basic Education pre-service teachers have to be appropriately equipped to practice the integration of analytical thinking skills in their learning management as they are going to become Basic Education teachers in the future. Pre-service teacher trainees or Basic Education university students have to be trained accordingly so that they will be responsible for developing their students with strong analytical thinking skills to live in the 21st Century (Jones, 1997; Wasee, 1999; Pamphilon, 2000; Makanong, 2001; Paziotopoulos & Kroll, 2004).

Thailand Basic Education Core Curriculum (2008) stipulated the significant competencies of students which mainly cover thinking competency especially analytical thinking, synthetic thinking, creative thinking, which will lead to the construction of bodies of knowledge or information, or to appropriate decision for themselves and the society (Ministry of Education, 2008). The importance analytical thinking skill-oriented instruction has been highlighted in National Education Act of 1999 and the amendment versions 2002 and 2010 (Ministry of Education, 2015) whereby teachers are required to incorporate analytical thinking process, situation confrontation practices, and application of knowledge in prevention and solution of problems in students' learning process. As a consequence, the capability of teachers to instill thinking skill in their teaching processes is extremely vital in order to fulfill the Thailand educational goal. Although some research studies had been carried out on students' analytical thinking for the past decades, findings revealed that Thai students' analytical

thinking still failed to optimally be developed and seemed to reach only at certain limitation (Office of Education Standard, Ministry of Education, 2006). The evaluation of students' analytical thinking competence indicated that the achievement level requires improvement and is not satisfied (Nonglak, Suwimon, & Uayporn, 2004; Office of National Education Standards and Quality Assessment (ONESQA), 2007).

ANALYTICAL THINKING THEORY (BLOOM, 1956)

Researcher utilizes Benjamin Bloom and his associates' discussions about analytical thinking as the theoretical foundation of this study. Their taxonomy for information processing skills (Bloom, 1956) is one of most widely cited sources for educational practitioners when it comes to teaching and assessing higher order thinking skills like analytical thinking skills. Bloom's taxonomy is hierarchical, with 'comprehension' at the bottom and 'evaluation' at the top. The three highest levels (analysis, synthesis, and evaluation) are frequently said to represent analytical thinking (Kennedy, Fisher, & Ennis, 1991).

The benefit of this Bloom's educational approach is that it is based on years of classroom experience and observations of student learning (Sternberg, 1986). However, some have noted that the educational approach is limited in its vagueness. Concepts within the taxonomy lack the clarity necessary to guide instruction and assessment in a useful way (Ennis, 1985; Sternberg, 1986). Furthermore, the frameworks developed in education have not been tested as vigorously as those developed within philosophy or psychology (Sternberg, 1986). On this line of reasoning, researcher considers analytical thinking abilities according to past researchers of analytical thinking typically agree on the specific abilities encompassed by the definition, which includes:

- Analyzing argument, claims, or evidence (Ennis, 1985; Facione, 1990; Halpern, 1998; Paul, 1992).
- Making inferences using inductive or deductive reasoning (Ennis, 1985; Facione, 1990; Paul, 1992; Willingham, 2007).
- Judging or evaluating (Case, 2005; Ennis, 1985; Facione, 1990; Lipman, 1988; Tindal & Nolet, 1995), and
- Making decisions or solving problems (Ennis, 1985; Halpern, 1998; Willingham, 2007).

Other abilities or behaviors identified as relevant to analytical thinking include asking and answering questions for clarification (Ennis, 1985); defining terms (Ennis, 1985); identifying assumptions (Ennis, 1985; Paul, 1992); interpreting and explaining (Facione, 1990); reasoning verbally, especially in relation to concepts of likelihood and uncertainty (Halpern, 1998); predicting (Tindal & Nolet, 1995), and seeing both sides of an issue (Willingham, 2007). According to Bloom, Engelhart, Furst, Hill, and Krathwohl (1979), the analysis is the major component of analytical thinking skills in this study. Therefore analytical thinking skills have to be operationally defined into three types of analytical thinking namely analysis of elements, analysis of relationships, and analysis of organizational principles. At the first level, Basic Education university students are trained to break down the material into its constituent parts. This is followed by identification and classification process of the elements of the original material. At the second level, Basic Education university students are required to make explicit reports on the relationships among the elements, thus to determine their connections and interactions. The final level involves recognition of the organizational principles, the arrangement and structure, which hold together the learning process as a whole.

Analysis of elements

Most of the learning management may be conceived as composed of a large number of elements. Some of these elements are explicitly stated or contained in the learning processes hence these elements can be recognized and classified easily and relatively. However, there are also high possibilities that learners have difficulty in recognizing the elements which are taught and identified by teachers. Learners may be unable to recognize the conclusions drawn by their teachers due to the analysis of elements are not explicitly stated by teachers. There are still many other elements during the learning management which are not clearly communicated, labeled or identified by the teachers that may cause the students cannot do their thinking appropriately. On top of that, many of these elements may be of paramount importance in determining the nature of learning management until the stage that learners cannot detect and have difficulty in fully comprehending or evaluating the whole learning. Thus there are some unstated assumptions being made by teachers which can only infer from an analysis of a series of statements within learning materials. It is also the value to the learner if he or she can detect the nature and function of particular statements including statements of fact, statements of value, and statements of content in the learning management.

The following are the analytical thinking skills related to an analysis of elements which should be considered to integrate into learning objectives.

- Ability to recognize unstated assumptions.
- Skill in distinguishing facts from hypotheses.

- Ability to distinguish factual from normative statements.
- Skill in identifying motives and in discriminating between mechanisms of behavior with reference to individuals and groups.
- Ability to distinguish a conclusion from statements which support it.

Analysis of relationships

Having identified the different elements within a learning management, learner still has to have the ability to determine some of the major relationships among the various parts of the learning process. Learners may need to determine the relationship of the hypotheses to the evidence and in turn the relationship between the conclusions and the hypotheses as well as the evidence. This type of analysis includes the relationship between different kinds of evidence presented. In addition, analysis of relationships can be quite difficult when the essential parts of learning are contradicted between each other, which in turn hinder learners to expand, develop, or support their learning progress. Most of this type of analysis may deal with the consistency of part to part, or element to element or the relevance of elements or parts to the central idea.

The following are the analytical thinking skills related to an analysis of relationships which should be considered to integrate into learning objectives.

- Skills in comprehending the interrelationships among the ideas in a passage.
- Ability to recognize what particulars are relevant to the validation of a judgment.
- Ability to recognize which facts or assumptions are essential to the main learning or to the argument in support of the learning.
- Ability to check the consistency of hypotheses with given information and assumption.
- Ability to distinguish cause-and-effect relationships from other sequential relationships.
- Ability to analyze the relations of statements in an argument, to distinguish relevant from irrelevant statements.
- Ability to detect logical fallacies in arguments.
- Ability to recognize the causal relations and the importance details from historical account.

Analysis of organizational principles

The most complex and difficult level of analytical thinking is analyzing the structure and organization of the learning process. It is rarely teachers will explicitly point out the organizational principles they have used frequently they may not be aware of the principles they have utilized. Thus their purpose, point of view, attitude or general conception of the learning process may be discerned in their teaching and learners may be unable to fully comprehend or evaluate the learning until they have determined them. Similarly, some teachers select some form, pattern or structure to organize their arguments, evidence or other elements. This type of analyzes underlying organizational qualities to assist in the comprehension as well as evaluation of the entire learning process. Frequently it is impossible to make an evaluation until the analytical thinking process has been done.

The following are the analytical thinking skills related to an analysis of organizational principles which should be considered to integrate into learning objectives.

- Ability to analyze, in a particular work of art, the relation of the materials and means of production to the 'elements' and to the 'organization'.
- Ability to recognize form and pattern in literacy or artistic works as a means of understanding their meaning.
- Ability to infer the teacher's purpose, the point of view or traits of thought and feeling as exhibited in his or her teaching.
- Ability to infer the teacher's concept of science, philosophy, history, or his or her art as exemplified in his or her practice.
- Ability to see the techniques used in persuasive materials, such as advertising, propaganda, etc.
- Ability to recognize the point of view or bias of a teacher in a historical account.

LITERATURE REVIEWS

Researcher explores the teaching ability of analytical thinking, as well as the instructional implications of the empirical literature on analytical thinking skills. Specific instructional recommendations for fostering the development of analytical thinking will be summarized as follows:

The teaching ability of analytical thinking

Many researchers argued that analytical thinking skills and abilities can be taught. For example, Halpern (1998) offers evidence of two instructional programs aimed at improving the analytical thinking skills and abilities of college students. In one of Halpern's study, students who were taught general problem-solving skills improved on Piagetian-inspired measures of cognitive development. In the other study, Halpern found that college students instructed in a specific type of problem-solving strategy produced mental mathematics representations that were more like those of experts than of novices. Kennedy et al. (1991) concluded that instructional interventions on students' analytical thinking skills have generally shown positive results. In a meta-analysis of 117 empirical studies examining the impact of instructional interventions, in general, have a positive impact, with a mean effect size of 0.34. However, the distribution of effect sizes was highly homogeneous, with effect sizes varying dramatically by type of intervention and sample characteristics. For example, effect sizes for students in K-12 settings were higher than those observed among undergraduates.

Specific instructional strategies

A number of past researchers have recommended using particular instructional strategies to encourage the development of analytical thinking skills and abilities namely explicit instruction, collaborative or cooperative learning, modeling and constructivist techniques. For instance, many researchers have noted that analytical thinking skills and abilities are unlikely to develop in the absence of explicit instruction (Abrami et al., 2008; Case, 2005; Facione, 1990; Halpern, 1998; Paul, 1992). Facione pointed out that this explicit instruction should also attend to the dispositional or affective component of analytical thinking. Proponents of collaborative or cooperative learning include Thayer-Bacon (2000), who emphasizes the importance of students' relationships with others in developing analytical thinking skills. Bailin, Case, Coombs, and Daniels (1999) argued that analytical thinking involves the ability to respond constructively to others during group discussion, which implies interacting in pro-social ways by encouraging and respecting the contributions of others. Similarly, Heyman (2008) indicated that social experiences can shape students' reasoning about the credibility of claims. On top of that, Abrami et al. (2008) found a small but positive and significant effect of collaborative learning approaches on analytical thinking.

Besides, teachers are urged to use constructivist learning methods, characterized as more student-centered than teacher-centered (Bonk & Smith, 1998; Paul, 1992). Constructivist instruction is less structured than traditional instruction, amplifying students' roles in their own learning and de-emphasizing the role of the teacher. Educators should model analytical thinking in their own instruction by making their reasoning visible to students.

RESEARCH AIMS

The major aim of this study was to investigate the analytical thinking skills in learning management for Basic Education students. Researchers seek to investigate: (i) Developmental process of integration of analytical thinking skills by Basic Education teacher educators while managing learning process through training; (ii) Teacher educators' achievement in integrating analytical thinking skills in learning management after training by evaluating their learning management plans; (iii) Basic Education university students' analytical thinking skills and satisfaction level after receiving intervention, and (iv) teacher educators' feedback after implementation of learning management plans.

METHOD

Researchers utilized Research and Development design to develop analytical thinking of Thai Basic Education university students from a public university located in Khon Kaen province, Thailand. Researcher aimed to develop pre-service teachers' competency to emphasize analytical thinking in their learning management. Case study research design was utilized. Case study research intensively investigates a small set of cases, focusing on many details within each case and context. In short, it examines both details within each case's internal features as well as the surrounding situations. Case study enables researchers to link the micro level that is undergraduate program pre-service university students to the macro level, or large-scale structures and processes (Vaughan, 1992). The logic of the case study is to demonstrate a causal argument about how general social forces shape and produce results in particular setting (Walton, 1992).

The research and development procedure was used as a guideline for the study and conducted in two phases. The first phase was to develop educators' learning management through training. Researchers worked with the sample group to identify problems and to find effective ways of solving them. Several meetings were organized in order to make the objectives of the project clear to the participants who are teacher educators and to discuss a training workshop which emphasizes on analytical thinking learning management. This is followed by evaluation of the results of the development.

The following was the research procedure: (i) Researchers held a meeting with research working group to explain the objectives for integrating analytical thinking skills in learning management, the training procedures, evaluating procedures, training schedule and value, and the roles as well as duties of research working group; (ii) Researchers invited four experts in the areas of development of analytical thinking skills and learning management to conduct a comprehensive training workshop; (iii) Subsequently researchers held several meetings with the four experts for common understanding of the use of the learning management model to develop analytical thinking (Sitthipon Art-in, 2011) and the planning of the training; (iv) A total of 45 teacher educators were volunteering to participate in training. These teacher educators were trained to develop learning management from October 20 to 21, 2014 at the Faculty of Education, a public university in Khon Khen city, Thailand; (v) The training activities emphasized three main competencies namely the basic knowledge of analytical thinking, training analytical thinking process, and learning management model to develop analytical thinking; (vi) By the end of the training, evaluation was carried to measure the outcomes of the training; (vii) Teacher educators' analytical thinking skills were tested and their learning management plans with analytical thinking skills integration were evaluated by the end of the training, and (viii) teacher educators were assigned to construct two analytical thinking learning management plans for their teaching within duration of four weeks and submitted their plans for evaluation.

The second phase of this study was to construct learning management plans, implementing learning management, and measure feedback from Basic Education university students and teacher educators. The following steps had been taken: (i) Researchers and the 45 trained teacher educators attended a workshop from January 18 to 19, 2014 at Faculty of Education, a public university at Khon Kaen city, Thailand; (ii) This workshop mainly aimed to plan and draft the learning management plans with integration of analytical thinking skills based on the learning model; (iii) The Learning Management Model emphasizing analytical thinking (Sitthipon Art-in, 2011) has six steps namely orientation, presentation of learning task, practice of analytical thinking individually or small group, presentation and discussion of ideas, and conclusion; (iv) A total of 12 learning management plans had been developed and would be implemented for 12 hours per one class for each cohort for a period as one semester; (v) Teacher educators who applied the 12 learning management plans were responsible for developing analytical thinking skills of their Basic Education university students in their respective classes; (vi) By the end of the 12 hours learning management processes, the Basic Education university students were tested on their analytical thinking skills; (vii) The test results of Basic Education university students were analyzed and interpreted by comparing with the defined criterion as 70 percent, and (viii) researchers interviewed teacher educators to collect their feedback after implementing learning management plans.

The target group in this study consisted of two groups of samples. The first target group consisted of 45 teacher educators from undergraduate programs in Khon Kaen city, Northeast of Thailand utilizing purposive sampling technique. All the 45 teacher educators agreed to participate in designing learning management plans that emphasizing analytical thinking skills. The second target group comprised of 1,575 Basic Education university students from nine undergraduate programs. This group of students has to attend the 12 hours learning management process for the first semester of 2014.

The instruments utilized in this study were learning management plans, evaluation tools, and interview protocol for teacher educators. There are two types of evaluation tools. The first type of evaluation tool is a 45 four-choice items test used to evaluate teacher educators' analytical thinking skills after the training. It had been tested for content validity with the Index-Objective Congruence (IOC) as within 0.80 to 1.00, item difficulty level as within 0.24 to 0.72, item discrimination factor as 0.35 to 0.86, and reliability value as 0.86. The second type of evaluation tool is a 16 five-scale rating items used to evaluate analytical thinking of the Basic Education University students.

RESULTS

Results of this study are presented in accordance with the research aims that are indicated above. The initial finding is the result of analytical thinking test of teacher educators and evaluation of learning management plans after training. This is followed by the Basic Education university students' achievement test on analytical thinking skills according to defined criteria. Finally, results of feedback from teacher educators after implementing learning management. Results were organized according to quantitative and qualitative methods.

Quantitative results

The result indicates that teacher educators' analytical thinking score was 36.54 out of the full score as 45 (standard deviation = 3.68) after training. This shows that teacher educators' analytical thinking skills were higher than the defined criterion of 70 percent. Besides, the result of evaluation of their learning management

plans which emphasized analytical thinking skill after training was at ‘good’ and ‘very good’ quality level. As indicated in Table 1, a total of 34 and 11 teacher educators are able to construct the ‘very good’ and ‘good’ quality learning management plans respectively after training. On the other hand, the average score in analytical thinking skills for the overall Basic Education University students after the intervention was 78.19 percent which was higher than the defined criterion of 70 percent. The percentage for the nine programs ranged from 76.95 to 79.51.

Table 1. Evaluation on teacher educators after training

Quality level of learning management plan	Frequency	Percentage
Very good	34	75.56
Good	11	24.44
Mean score of analytical thinking test (\bar{x}) = 36.54		
Standard deviation (SD) = 3.68		

Additionally, the result indicates that Basic Education university students were satisfied with the learning management with integration of analytical thinking skills. The result of evaluation on their satisfaction level after the intervention was found to be encouraging, mean score ranged from 4.59 to 4.63. As a result, Basic Education university students’ achievement was higher than the defined criterion thus they were satisfied with the learning management.

Qualitative results

The qualitative findings were found to support the quantitative findings above. From the focus group interview with teacher educators, researchers found that the training has been successfully assisted teacher educators to acquire better understanding and knowledge, be able to practice self-analytical thinking, be able to write learning management plans, and confidence to handle effective learning management. These points were explicitly pointed out by teacher educator 1 to teacher educator 11 (T1, T2, T3, T4, T5, T6, T7, T8, T9, T10, and T11).

“I acquire knowledge...a clear understanding of analytical thinking.” (T2)

“The analysis of elements, analysis of relationships, and analysis of organization principles including learning management model is very useful to emphasize analytical thinking.” (T4)

“I will use the learning management to develop analytical thinking of my students.” (T1)

“I now able to practice the process of self-analytical thinking.” (T3)

“As a result, I can practice a higher analytical thinking to my students.” (T8)

“And I will apply learning activities to develop my students’ analytical thinking” (T5)

“I have the practice to write learning management lesson plans that emphasize analytical thinking.” (T6)

“I always discuss with my friends and speakers of the training, I find myself good at writing learning management plans now.” (T7)

“Training makes me possible to write effective learning management plans” (T9)

“I am now very confident that I can handle learning management that emphasizing analytical thinking to develop analytical thinking of students effectively.” (T10)

“I will apply the knowledge gained from the training to learning management to develop analytical thinking of students.” (T11)

DISCUSSION

Findings of this study show that teacher educators’ analytical thinking achievement was improved after the training. This finding corresponds to Khaemmanee (2003), Baldwin (1984), National Council of Social Studies NCSS (1989) ideas. According to Khaemmanee, individual thinking process could be developed. On the other hand, statement from Baldwin and National Council of Social Studies indicated that there were three important activities namely provision of basic knowledge in analytical thinking, analytical thinking process, and provision of knowledge on the designed patterns of procedures for learning management that emphasizes analytical thinking are able to train them to think and understand the thinking process. Results from this study revealed that teacher educators acquired knowledge and clear understanding related to analytical thinking after the training. They found themselves are able to practice thinking analytically, exchange knowledge, share ideas with other teacher educators, and enable to know and understand the patterns or procedures of learning management model after the training. These teacher educators also had the chance to practice designing learning management plans that involve analytical thinking. They presented the plans and discussed their opinions and shared with others who criticized the plans. This is why those teacher educators had been trained to design quality learning management plans.

In addition, findings also indicated that teacher educators’ attitudes toward the training are positive. The majority

of them reflected that they obtained knowledge and understood analytical thinking process clearly. They are able to practice thinking analytically and their analytical thinking competency becomes higher than before. They also acquired knowledge and understanding related to the model of learning management that emphasizes analytical thinking and had a chance to practice designing the learning management plans that involve analytical thinking. They agreed to apply their knowledge obtained from the training to improve their students' analytical thinking skills. On this line of reasoning, the learning management plans enable students to practice thinking in order to find answers. The learning management plans consisted of situations, contents, stories, articles, events or interesting phenomena since the heart of process-based learning is the use of questions to encourage students to think. Therefore, the students became eager to know and search for the answers. All the students participated in the activities had practiced thinking both individually and as a small group. They practiced analyzing the importance, relationships, and principles and that was where students acquired thinking skills and shared their opinions together. Group discussion and learning in the group also promoted the atmosphere to encourage students' thinking. This implies an effect on the students' development of thinking process (Pollack, 1987; Tackington, 1989).

Furthermore, presentation and discussion activities were found to assist in developing students' thinking process. The relationship between teacher educators and students as well as among the students enable students to extend the boundaries of their thinking at a wider and more complicated scale (Gall & Gall in Dillon, 1984), resulting in the students to achieve the higher level of analytical thinking. This finding is correlated to the work of Sitthipon Art-in (2012, 2014). Finally, the results were derived from the fact that learning management with integration of analytical thinking activities is learner-centered. Students are able to do the activities and construct their own knowledge to practice thinking analytically according to the given situations, stories or events. Students learned the content of the course and at the same time practiced analytical thinking.

ABSTRACT

This research aims to develop and evaluate the model of flipped classroom instructional model by using WebQuest based on constructivist theory for creating critical thinking and problem-solving skills that divide into 2 stages: the first stage was to develop flipped classroom instructional model by using WebQuest with constructivist theory for creating critical thinking and problem-solving skills, the second stage was to assess the appropriateness of the model. Research findings showed that the model of flipped classroom instructional model by using WebQuest with constructivist theory for creating critical thinking and problem-solving skills that analyze and synthesis includes the 4 main parts: 1) Need analysis included the 2 elements: (1) Learning context analysis, and (2) Pre-learning activities, 2) Learning Process have included the 3 elements: (1) Homework with WebQuest, (2) Class Time, and (3) The major method's constructivist theory offer. 3) The authentic assessment was included the 1 element: Evaluation, and 4) Feedback. The samples were 10 experts selected by purposive sampling. The data was analyzed by means and standardized deviations statistically. The research result shows that the overall model evaluation scores were suitable ($\bar{X}=4.59$).

Keywords: Flipped classroom, WebQuest, Constructivist Theory, Critical Thinking, Problem-solving

1. INTRODUCTION

Technology innovations are used in education for two main causes: as a tool for expanding the effectiveness of instruction and to coordinate technology into the curriculum (Gülbahar, Madran, & Kalelioglu, 2010). The flipped classroom instructional model by using WebQuest is based on constructivism. The constructivist view supports constructing meaningful knowledge based on student experiences and using social coordination during learning to establish the significance of knowledge. From a constructivist perspective, interaction and discussion among learners facilitate the construction of knowledge and skills (Duffy & Jonassen, 1992). Constructivism maintains that students learn through thinking and that they should contemplate on their learning processes. The source of learning is thinking, which affects learning (Jonassen, Peck, & Wilson, 1999). Scaffolding theory and collaborative learning extend from constructivism and are constituents of the development of the WebQuest model (Segers & Verhoeven, 2009). Scaffolding theory supports a teaching strategy derived from the zone of proximal development that was proposed by Vygotsky (1978). In the framework of learning in the 21st century is also concerned with critical thinking skills, problem-solving skills, skills of information and technology. The skills that complement recent technological innovations and that machine cannot easily substitute include problem solving and critical thinking abilities, as well as the ability to communicate effectively through oral and written means (Murnane & Levy, 1996).

The important characteristic of the flipped classroom is focusing on active learner of active learning in small group classes and comes from knowledge searching for using for solving problems that have been assigned. The process of learning will run systemically step by step, acquiring up-to-date knowledge and it can be applied for the student in the real life which is effective for teaching and also it is unlimited to disseminate the knowledge into others sciences. flipped classroom usage is a strategy that encourages students to develop critical thinking skills and the student is able to apply knowledge to solve problems effectively. Therefore, it is very necessary to develop critical thinking skills for making the learning skills to students. The researchers proposed in this study are as follows:

- (1) To development of flipped classroom instructional model by using WebQuest based on constructivist theory for creating critical thinking and problem-solving skills.
- (2) To evaluate the flipped classroom instructional model by using WebQuest based on constructivist theory for creating critical thinking and problem-solving skills.

2. LITERATURE REVIEW

2.1 Flipped classroom

The flipped classroom (FC) model of instruction has become popular in recent years. In an FC environment, students can access to learning contents related to the new topics that they will learn through such materials as lecture videos outside the classroom where they have face-to-face classes. Later, students work on assimilating the new material they learned through such methods as cooperative learning activities in the classroom, project work and group discussions and through videos (Smith, 2015). The objective in this model is to provide online access to learning contents and materials and to help students' in-depth and active learning in the classroom. Studies revealed that active learning strategies increase students' participation in the learning environment and improved learning process and results (Freeman et al., 2014; Yılmaz, 2016). However, the strategies, methods and techniques used within the scope of active learning could consume the time that should be saved for the student in the classroom. In addition to many other benefits, FC model of instruction offers a solution to this problem as well. Thus, the concept of FC becomes a new fad with the need to reconstruct the learning environments in the light of the technologies advances and around student-centred instructional approached (Yemma, 2015).

2.2 Webquest

WebQuest teaching strategies can be used to enhance students' learning motivation (Halat & Peker, 2011). The WebQuest model is a comprehensive learning method by way of which learners understand and organize diverse learning content to construct a systematic context and ultimately consolidate various data (Allan & Street, 2007). Because WebQuest provides an accurate framework and successfully enables children to learn and complete tasks using the Internet, teachers have accepted and recognized the WebQuest model. Furthermore, teachers can create their own WebQuest activities, thereby generating themes that involve the interests of students (Segers & Verhoeven, 2009).

2.3 Constructivist theory

Constructivist learning theory considers knowledge as personal and context-bound, to be actively constructed by the learner in communication with others such as teachers, students, and practitioners (Ausubel, 1963; Vygotsky, 1978). In many countries, constructivist learning theory is applied in competency-based vocational and professional education to facilitate the integration of theoretical and other forms of professional knowledge and to prepare students for active, self-directed lifelong learning (Wheelahan, 2010). Throughout a constructivist program, integrated learning of knowledge, skills, and attitudes is stimulated by using authentic learning contexts (Lave, 2009). Authentic professional tasks are designed to invoke active inquiry, problem-solving and social interactions in real life or lifelike circumstances (Vygotsky, 1978). Theoretical lectures and skills trainings are planned just-in-time, when relevant for the task at hand (Van Merriënboer, 1997). Active knowledge building is stimulated by teaching students how to reflect on and subsequently regulate their own learning (Spiro & DeSchryster, 2009). Progress towards self-directed learning is supported by an increasing degree of freedom in task planning, execution, and evaluation and by expanding opportunities for choosing specializations (Vermunt & Verschaffel, 2000).

2.4 Critical thinking

Thinking combines the related structures and processes of perception, memory, forming ideas, language and use of symbols – the basic cognitive skills which underlie the ability to reason, learn and solve problems. Thinking is inclusive of imagining, recalling, solving problems, free association, daydreaming, concept formation, and a variety of other procedures (Psychology Dictionary, 2017). Critical thinking skills the goals for education, whether one asks developers of curricula, educational researchers, parents, or employers. Although there are some quite diverse definitions of critical thinking nearly all emphasize the ability and tendency to gather, evaluate, and use information effectively (Beyer, 1985). Whereas there are different explanations of widely-used critical thinking terms, each model describes similar elements of thinking, critical thinking, creative or all of them. Some researchers have quite completely studied critical thinking and developed useable explanations.

2.5 Problem Solving

Problem-solving has been studied by researchers for many decades (Gagné, 1959; Jonassen, 2003; Mayer & Wittrock, 2006) and is seen as one of the most important cognitive skills in any profession, as well as in daily life

(Jonassen, 2003). Mayer and Wittrock (1996, 2006) identified several characteristics of problem-solving: (a) it is a cognitive process; (b) it is goal-directed, and (c) the complexity (and hence difficulty) of the problem depends on one's current knowledge and skills.

3. METHODOLOGY

1) Study and analyze the relevant documents and researches of flipped classroom instructional model by using WebQuest based on constructivist theory for creating critical thinking and problem-solving skills.

2) Development of flipped classroom instructional model by using WebQuest based on constructivist theory for creating critical thinking and problem-solving skills

3) Assessment of the appropriateness of flipped classroom instructional model by using WebQuest based on constructivist theory for creating critical thinking and problem-solving skills. The statistics utilized in this study were arithmetic means (\bar{x}) and standard deviation (S.D.) following the weighing criteria of appropriateness of the design using five rating scales of Likert

4. POPULATION AND SAMPLES

1) Population:

Population is the experts in the field of computer education, or education technology.

2) Samples Groups:

Samples were selected from the experts in the population using purposive sampling technique. The 10 experts comprised of computer education, or education technology. They are highly-experienced experts in these fields for at least 5 years.

5. RESULT

Stage 1: The model of flipped classroom instructional model by using WebQuest based on constructivist theory for creating critical thinking and problem-solving skills is composed of 4 key components which are:

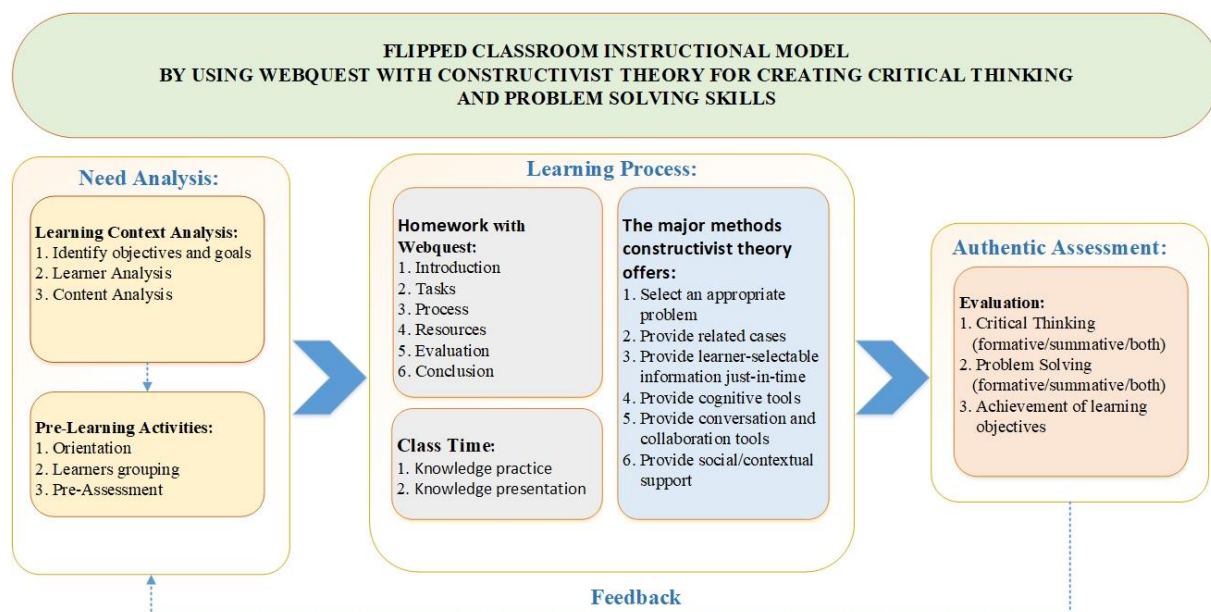

Figure 4. Flipped classroom instructional model by using WebQuest based on constructivist theory for creating critical thinking and problem-solving skills

1) Need analysis comprises of two components as follows:

1.1) Learning context analysis consists of five components as follows:

1.1.1) Identify objectives and goals: Establish clear learning objectives. Objectives are the desired outcomes of learning for each student. Students set goals and plan learning. The exchange of learning between the instructor and classmates is done via WebQuest, such as Wix, WordPress, and Blogger Application, to help the students practice initiatives.

1.1.2) Learner analysis

1.1.3) Content analysis

1.2) Pre-learning activities includes

1.2.1) Orientation: Orientation was the stage that the learners were presented content, teaching process, learning strategies, and criteria for grading and performance rules. The aim of this state was to guide and make understanding between teacher and learners

- 1.2.2) Learner grouping
- 1.2.3) Pre-assessment.
- 2) Learning Process are categorized as below:
 - 2.1) Homework with Webquest consists of six components as follows (Dodge, 1997):
 - 2.1.1) Introduction
 - 2.1.2) Tasks
 - 2.1.3) Process
 - 2.1.4) Resources
 - 2.1.5) Evaluation
 - 2.1.6) Conclusion
 - 2.2) Class Time includes
 - 2.2.1) Knowledge practice: Students learn through the use of the learning plan, using tools that they define, and conclude the learning of new knowledge.
 - 2.2.2) Knowledge presentation: The students and the instructor discuss and summarize knowledge via Webquest.
 - 2.3) The major methods constructivist theory offer (Jonassen, 1999):
 - 2.3.1) Select an appropriate problem
 - 2.3.2) Provide related cases
 - 2.3.3) Provide learner-selectable information just-in time
 - 2.3.4) Provide cognitive tools
 - 2.3.5) Provide conversation and collaboration tools
 - 2.3.6) Provide social/contextual support.
- 3) Authentic assessment consists of:
 - 3.1) Evaluation
 - 3.2) Critical Thinking skill
 - 3.3) Problem-Solving skill
 - 3.4) Achievement of learning objectives.
- 4) Feedback

Stage 2: The result of appropriateness measurement of the system architecture of business intelligence to AUN-QA Framework for higher education institution

Table 1: Explain the model assessment

Assessment Topics	\bar{X}	S.D.	Assessment Result
1. Basic elements of the model	4.66	0.47	Highest
2. Need analysis step	4.63	0.49	Highest
3. Learning Process step	4.53	0.50	Highest
4. Authentic assessment step	4.56	0.50	Highest
The overall results	4.59	0.49	Highest

In Table 1, the research found that the model of flipped classroom instructional model by using WebQuest based on constructivist theory for creating critical thinking and problem-solving skills was evaluated at the highest level in Basic elements of the model, Need analysis step, Learning Process step, and Authentic assessment step. The model of flipped classroom instructional model by using WebQuest based on constructivist theory for creating critical thinking and problem-solving skills showed overall results at highest level (arithmetic mean=4.59, standard deviation = 0.49)

6. CONCLUSIONS

The flipped classroom instructional model by using WebQuest based on constructivist theory for creating critical thinking and problem-solving skills that composed of 4 components: Need analysis, Learning Process, Authentic assessment, and Feedback. The samples were 10 experts selected by purposive sampling. The data was analyzed by means and standardized deviations statistically. The research result shows that the overall model evaluation scores were suitable (\bar{X} =4.59).

ABSTRACT

Experiment study aimed to find out how Model-Based Skills Guskey, Humanist, Mental (SHM) with Interactive Learning Simulation (ILS) to develop the professionalism of tutors science of the 21st century is the research subject tutor activity of the Teaching and Learning Centre (CLC) in Serang city, tutors were selected randomly as much as 5 out of every CLC, Research-Based Model Guskey SHM to develop professionalism. The Tutor after the implementation of this model shows that the model Guskey has a positive impact on the quality of the learning process. In detail the impact of the implementation of the model Guskey it is (1) increased knowledge of the subject matter better; (2) Tutor-Tutor is able to plan the learning process to encourage participants to be more active Tutor; (3) Tutor skill in conducting the learning process CLC changed for the better; (4) Tutor efficacy in performing the learning process increases CLC better.

Keywords: Guskey Model, Skills, Humanist, Mental (SHM), Interactive Learning Simulation (ILS), Professionalism Tutor Science, Community Learning Center (CLC)

INTRODUCTION

Throughout the first decade of the twenty-first century, the reform and reconstruction of professionalism in public service work have been a key goal of governments in countries such as Australia, New Zealand and the UK. This political project includes teachers, and has resulted in extensive debate about the de-professionalisation of teaching (Borg, 1983; Brown, 2001). However, current reforms might be alternatively seen as part of a revised discourse of professionalism, one comprising 'organisational' (Clarke, 2002) 'governmental' professionalism that is, professionalism imposed from above, by employers, managers and government agencies, involving 'externalized forms of regulation and accountability measures such as target-setting and performance review' (Clarke, 2002). While there is a consensus that a return to or defence of traditional forms of professionalism, which have been critiqued by Clarke and Newman (2009, p. 52) for 'mean and discriminatory paternalism', is not the way forward, there is less consensus about how public service work might be reformed against increasingly dominant discourses of professionalism from above.

Learning achievement is the result of learning achieved after going through the process of teaching and learning activities. Learning achievement can be demonstrated through the value provided by a Tutor of the number of subject areas that the Tutor Participants have learned. In the process of achievement, learning achievement is strongly influenced by various factors. One of the main factors that is very influential in the success of learning is the existence of Tutor. Tutors are agents of change (Johnson, 1996a), the term "Tutors are agents of change" (Clarke, 2002), Tutors as change agents have multiple meals, and each interpretation may be related to a particular perspective Tutor professional development (Carr, 2011; Opfera and Pedder, 2011).

Given the existence of Tutor in the process of teaching and learning activities are very influential, then it should be the quality of the Tutor should be considered. As noted above, that in an effort to improve the quality of education, the main aspect that is determined is the quality of the Tutor. For that, the initial effort made in improving the quality of education is the quality of the Tutor. The Tutor's educational qualifications correspond to the minimum requirements set by the requirements of a professional Tutor. Professional Tutor is a qualified

Tutor, competence, and Tutor desired to bring learning achievement and able to influence the teaching and learning process Participants Tutor which will result in good learning Practice Participants Tutor (Pantića, and Wubbelsb, 2010).

Tutors or educators are true leaders, wise counsellors and directors, sculptors and leaders of the human. The Tutor does understand according to Law no. Law is a professional educator with the main task of educating, teaching, guiding, directing, training, assessing, and evaluating the Participants of the Tutor in the following chapters. Primary and secondary education. Professional Tutor defines that: "A professional tutor is a person who has the ability and special expertise in the field Tutor so he is able to perform tasks and functions as a Tutor with maximum ability". Conceptually, the Tutor's performance according to the Department of Education and Culture and Johson, as cited by Martinis Yamin includes three aspects, namely; (A) professional ability, (b) Social skills, and (c) personal (personal) abilities.

But looking at the reality that exists, the existence of professional Tutor is very far from what is aspired. The proliferation of CLC. The low quality community gives a hint that the professional Tutor is just a discourse that has not been realized evenly in all education in Indonesia. This raises a concern that not only comes from academics, but even laypeople comment on the irregularities of education and teaching staff. The fact inspires the academics, so they formulate to improve the qualification of Tutor through empowerment and professional enhancement Tutor from training to instruction to have a minimum education qualification of Bachelor (S1). The new problem is, Tutor only understands the instructions only as a formality to meet the demands of an administrative needs. So the competence of Tutor professional in terms of learning the maximum. Though this Tutor Participant is the target of education. Which is formed through guidance, exemplary, help, practice, maximal knowledge, skills, skills, values, good attitude of a Tutor (Chong, 2009). So only with a professional Tutor it can be realized in full, so it will create conditions that generate awareness and seriousness in the process of teaching and learning activities. Thus, what a Tutor says will affect the learning outcomes.

Conversely, if the above is not realized well, it will result in dissatisfaction of Tutor Participants in the process of teaching and learning activities. The incompetence of a Tutor in the delivery of teaching materials indirectly will affect the outcome of learning. Because the learning process can not only be achieved by courage, but the main factor is the competence that is in the person of a Tutor. Limitations of the Tutor's knowledge in the delivery of the material, whether in terms of methods or other basic learning support will affect the learning?

Attempts to improve the quality of Tutor include: Learning to love Tutor's work. This means learning to look for things that are positive from the Tutor's work, and then to be grateful for it. Loving work can happen, among other things, if we feel close to the work done and appreciate the work that is being done. Therefore learn to love work Tutor other learn familiar with the work of Tutor and learn to gain meaning in doing such work. Learning through work. In working, we can learn at once. The experiences of doing the Tutor work teach us what is right and right to do and what is not or is not right or right done. From there we can learn which work techniques should be established and which work techniques still need to undergo change, adjustment or replacement. Higher-level business operations will further intensify pre-service educations and Community Learning Centers (CLC) and their management agencies.

Based on the above problems, we proposed Model-Based Skills Guskey, Humanist, Mental (SHM) with Interactive Learning Simulation (ILS) to develop the professionalism of tutors science. Looking at the above discourse, it is very apparent that Tutor professionalism can have an effect on learning achievement. On the basis of existing discourse in the field, the authors want to prove whether the perception that exist in the community about the problem of professionalism Tutor is true or vice versa, by doing a research. According to the authors based on facts in the field, generally the condition of Community Learning Activities Center that there is still a Tutor who is not professional. The Tutor Competencies in the Center for Community Learning Activities have not fully met the criteria as required by the requirements of the Professional Tutor. Therefore, the government conducts certification programs to the Court by requiring teachers to have a minimum education qualification S1 in accordance with their respective fields. Based on the background of the above problems, the authors are interested in conducting research entitled "Model-Based Skills Guskey, Humanist, Mental (SHM) with

Interactive Learning Simulation (ILS) to develop the professionalism of tutors science of the 21st century is the research subject tutor activity of the Teaching and Learning Centre (CLC) in Serang city, Banten, Indonesia".

THE STUDY

This research uses Quasi Experiment method with research design using The Randomized Posttest-Only Control Group Design Cresswell, (2014). The timing of the research is planned 10 months from the proposal submission to the reporting. The research location is CLC Serang city, academic year 2015/2016.

Eksperiment	<i>R</i>	<i>O</i>	<i>X_I</i>

Figure 1. Research Design The Randomized Posttest-Only Control Group Design

Information:

R: Selection of class at random O: Provision of the SHM Model in the experimental class.

X1: Final test with SHM Questionnaire in the experimental class.

Research subject in this research is CLC class level teacher in Serang City. With a random sample technique taken 5 Tutors from the total of all Tutors in proven Banten as an experiment. The steps taken in this research include 5 steps, namely: preliminary study, literature study, instrument design, instrument trial, implementation, and ending with result analysis and drawing the full conclusion can be seen in the flow of research picture.

FINDINGS

The results of the study are presented in two parts, namely the results of research (1) on the implementation of CLC program, and (2) about the professional development model of CLC Tutor. In the first part, research on the implementation of CLC program basically seeks to evaluate and then describe the various weaknesses and ineffectiveness of the implementation of the program in achieving the expected goals. It is also intended to identify the various needs of CLC Tutors to be able to develop Professional Tutorial Teachers CLC manage the learning process better. Based on the weakness of CLC program implementation found, then developed CLC model which the result presented in second part of this research.

Implementation of CLC programs that have been running so far, identified there are still some weaknesses. The weaknesses include (1) no CLC program activities that require participants to share about learning problems and find appropriate solutions; (2) participants tend to be passive during the CLC program activities; (3) resource persons of CLC programs are often less qualified as conveying materials needed in order to improve learning practices; (4) lack of follow-up after the CLC program meeting is implemented; And (5) CLC programs are not conducted regularly within a certain time. Participants' feedback about the weakness of CLC program implementation is given by the following Tutor:

I see many (deficiencies in the CLC program), such as the lack of communication among CLC members; Lack of detailed information and guidance from CLC, for Tutors in providing competent speakers / instructors; Lack of supporting facilities at the CLC. The main complex; CLC program resource persons are often poorly qualified as conveying materials needed in order to improve classroom learning practices; And CLC program activities never ask participants to share about learning problems and find appropriate solutions (Interview, October 28, 2016). Quantitative identification showed that 38% of participants of CLC program stated never, 58% stated rarely, and only 12% of participants stated quite often that CLC program activities asked participants to identify learning difficulties Participants Tutor and seek solutions collaboratively. Thus, it can be mentioned that various CLC program activities have been focused on technical matters and have not touched substantive matters, ie activities to develop the quality of learning.

The results of observation on the learning practices conducted by the CLC Tutor at the time before the implementation of CLC model were identified by not paying much attention to the variation of the Participants' needs and conditions during the learning process. This is demonstrated by some facts that prior to the

implementation of the CLC model (1) Tutors often do not design activities intended to prepare the Physician and mentally the Tutor Participants to start learning; (2) learning activities are often inadequate with learning objectives, Tutor Participants' needs, changing situation, and environment; (3) the learning process has not used a lot of learning aids (media) in accordance with the purpose, condition of the Tutor Participants, and the demands of situation and environment ILS (learning context); And (4) the variation of learning activities has not been much emphasized based on individual, group or classical activities that need to be done to meet individual differences of the Tutor Participants and or form the impact of companion in the form of life skills.

Furthermore, it was also identified that the level of efficacy of Tutor-Tutor is also still relatively low. Some characteristics of the low level of efficacy of this Tutor are often criticized Tutor Participants as less creative, stupid, lazy, and rowdy-making individuals; Likes to control excessively the learners behaviour of Tutor Participants that result in the creativity of Participant Tutor as if open; Often neglecting Participant Tutor who has slow learning ability; And likes to punish Participant Tutor.

Empirical facts as described above have resulted in the learning process cannot develop well and ultimately the achievement of predetermined learning objectives is also not optimal. Different conditions are shown after the implementation of CLC model. By participating in the implementation of this CLC model, participants (CLC Tutors) are able to (1) implement a collaborative work mentality in an effort to improve the learning process conducted on a daily basis; (2) become more sensitive to the learning process problems faced by the Tutor Participants; And (3) able to anticipate various learning problems that may appear and faced by Tutor Participant, so that Tutor can prepare and determine anticipative solution that will be given. In addition there are changes in the behaviour of CLC Tutors, the Tutors are encouraged to want to talk about various issues of learning CLC intensively with fellow CLC Tutor. Another impact of the implementation of this CLC model is the change in the effectiveness of CLC Tutors for the better.

The change of efficacy level is marked by the Tutor's behaviour to always communicate high expectations related to the learners' learning outcomes; Help Tutor Leaders learn according to their conditions and needs; Shows a warm and friendly relationship with the Tutor's Participants; Looking at slow-learning Tutor participants not as a learning process constraint; Encourage confidence in the Tutor Participants who are slow to learn that the Tutor Participant can succeed in learning, and apply the appropriate management system to solve the learning problem faced. The occurrence of this level of efficacy has led CLC Tutors to adopt the latest CLC learning innovations. This is shown by the efforts of CLC Tutor to find teaching materials and learning models of CLC from internet. The changing of learning process quality, behaviour, attitude, and effectiveness level of CLC Tutor in the time before and after implementation of CLC model shows that the implementation of the model effectively has been able to improve the professionalism of the Tutor. Tutors become increasingly reflective of the learning process that has been done. In addition, the implementation of the CLC model has been able to provide opportunities for Tutors to discuss and exchange ideas that can encourage each Tutor to be able to understand the different perspectives of Participant Tutor. Furthermore, the CLC model has been able to create a mutual learning culture among actors through the real conditions that occur in the classroom. The change in professionalism this tutor is not an immediate event. There is a series of activities that need to be done, so that CLC Tutors are able to change this learning behaviour for the better.

After the developed CLC model was piloted in the field, it was found that some technical constraints resulting the modelling are sometimes difficult to achieve. The technical constraints refer to the model implementation procedure. The revised model, in addition to the four domain sequences and mechanisms that are the "triggers" of an activity on a domain within the model, as well as revisions intended to improve the model implementation procedure. The final product is a model of professional development of CLC Tutor (CLC model). The final product of this CLC model consists of five main domains, in contrast to the initial drafts of only four domains. The five domains are (1) Domain Requirement Analysis of CLC Teachers (English Teachers' Need Assessment / TNA); (2) Domain In-service Activity (IA); (3) Domain on service Activity (OA); (4) Climate Domains and Working Conditions in CLC; And (5) Domain Enhancement Professionalism of CLC Tutor (Outcomes). The relationship of these five domains does not show a rigid sequential relationship, but the relationship of the five domains is more interactive and cyclical. The form of activity and destination of each domain are described in the following sections.

1. Domain Requirement Analysis Tutor (Teachers' Need Assessment Domain)

The purpose of the Tutor needs analysis is to identify the material and context as needed by the CLC Tutor, so that the performance of CLC Tutor will be better, then the implementation is done by CLC guides together with CLC Tutor, that is (1) identifying Various needs of CLC Tutor to support the learning process conducted by CLC Tutor, (2) to identify various learning problems often faced by CLC Tutor, (3) to find alternative solution from various learning problems that have been identified , (4) identify which knowledge and skills need to be developed to support the quality of learning, and (5) identify what conditions or contexts need to be created to improve the effectiveness of professional development of CLC Tutor.

2. Domain of In-Service Activity (Domain of In-Service Activity)

The preparatory work exercise aims to provide a broader and deeper understanding to the CLC Tutors on curriculum implementation; Development of teaching materials; learning model; And other supporting aspects of the learning process. Implementation is done by lecturers from high performance as experts in the field of learning and learning through the following steps, (1) provide feedback on learning problems often faced by CLC Tutor, (2) expand and improve the knowledge of CLC Tutor about material CLC and knowledge of learning methodology, (3) consult the Tutor on how to plan, implement, and evaluate the learning process, and (4) disseminate quality teaching practices through workshop and / or seminar activities.

3. Domain of On-service Activity (Domain of On-service Activity)

Exercise in the work aims to train the CLC Tutors to improve the quality of learning, so Tutor-Tutor able to reorient the learning process is active, creative, effective, and fun for learners. This domain is carried out following the philosophy of lesson study that requires the Tutor to work collaboratively in conducting a learning process. This activity is carried out by CLC Tutor collaboratively, by (1) doing learning planning, such as determining learning objectives to be achieved, (2) developing lesson plan, (3) selecting material or teaching materials; Preparing instructional media; Determining learning strategies; And choosing the procedure and the type of assessment, (4) carrying out the learning process whereby one of the Tutors acts as the Tutor model and the other as the observer, and (5) implements the learning process that has been done to identify the strengths and weaknesses of the learning process Has been done (after the lesson is over). Furthermore, lecturers from high performance as experts in the field of learning and learning together Tutor guides will (1) make observations on the learning process planned and carried out collaboratively by the CLC Tutor group, (2) provide feedback on the learning process that has been done by The CLC Tutor group, and (3) if necessary, assisting the CLC Tutor group in improving the lesson plan for the re-learning process. After reflecting on previous lessons, CLC's Collaborative Teachers will (1) make improvements to the lesson plan, if necessary, to define new learning strategies and approaches, to conduct the learning process, (b) to re-learn, (c)) To re-reflect on the learning process that has been done collaboratively on the second occasion, and (d) to document the learning process that has been done.

4. Climate Domains and Working Conditions at the CLC (Domain of Climate and Working Condition at School)

The purpose of analysing the climate and working conditions of the CLC is to create a context that can: (i) encourage participants to participate actively in professional development programs, and (ii) encourage participants to apply the knowledge, skills and attitudes gained during participation in Professional development program. In practice, the Head of the CLC will play a role by (i) providing support to the Tutor, (ii) identifying the urgent needs of the Tutor, then providing feedback on that need, (iii) influencing the perspective of the Tutor, (iv) initiate planning of the objectives to be achieved from a professional development activity, (v) fostering the Tutor's commitment to change after participating in a professional development activity; (vi) clarifying the various constraints faced by the Tutor to change, (vii) explaining the possible consequences of the action being taken By Tutor, and (viii) provide follow-up to the Tutor's performance after participating in a professional development activity.

The colleagues play a role in (a) assisting participants (other CLC Tutors) in planning the collaborative learning process, (b) observing the learning process, (c) providing suggestions and feedback on the learning process undertaken by the participants, and (d) Conduct formal evaluations intended to improve the implementation of the curriculum and instructional techniques in the classroom. The core tutor acts as a facilitator and resource

person to deliver or disseminate knowledge and skills to the participants of the CLC program, and (b) a motivator for the participants of the CLC program to discuss and express ideas in order to improve the learning process. And supervisors of the CLC (i) assist in the preparation and implementation of CLC programs, and (ii) encourage tutor to participate in CLC activities, and (iii) monitor Tutor in applying CLC activities results in Their classes.

5. Domain Enhancement Professionalism Tutor (Outcomes)

Domains outcomes refer to the level of CLC Tutor-Tutor professionalism as the impact of the implementation of the previous four domains after implementation learning Interactive Learning Simulation (ILS). This indicator of professionalism is seen from the change, as follows (Figure 1).

Figure 2. Implementation Model-Based Skills Guskey, Humanist, Mental (SHM) with Interactive Learning Simulation (ILS) in Teaching and Learning Centre (CLC)

CONCLUSIONS

The result of the impact of the implementation of the Model-Based Skills Guskey, Humanist, Mental (SHM) with Interactive Learning Simulation (ILS) in Teaching and Learning Centre (CLC) included (1) increased knowledge of the subject matter better; (2) Tutor-Tutor is able to plan the learning process to encourage participants to be more active Tutor; (3) Tutor skill in conducting the learning process CLC changed for the better; (4) Tutor efficacy in performing the learning process increases CLC better. Guskey model that requires the inquiry process, joint study, observation, reflection, discussion and collaboration among CLC actors conducted following the philosophy of this lesson study has led to the increased professionalism of CLC Tutor.

Implementation of this Guskey model in the future can be utilized by the local government in order to improve the quality of education in the region. Implementation of this model requires a partnership between CLC Tutors, Tutor guides, and lecturers from high per post as a resource that many master the materials and learning methods. This partnership process of course requires adequate financial support. Thus, the support of local governments in providing financial assistance for the implementation of this model in the future is necessary. In accordance with the principle of regional autonomy, this support is one form of public service from local government in order to improve the performance of the organization of CLC through improving the quality and professionalism of the Tutor in line the result research Loughran, (2014). It is also in line with the spirit of

regional autonomy that local governments need to improve public services in all areas of life, including quality education services in educational units at the CLC.

One of the limitations of this Guskey model is that this model has not looked at the impact of the model on improving the learners' learning outcomes. The reason, to see the impact of the implementation of this model on improving learners' learning outcomes required observation in a relatively long time. Therefore, there needs to be further development of this model in the future. The development of this model needs to be done not only to examine the impact of model implementation on improving the professionalism of the Tutor, but furthermore it is also necessary to observe the impact of the model implementation on improving the learners' learning outcomes.

Indonesia

ABSTRACT

Research has been conducted on the development of interactive learning project (ILP) model to develop creative thinking skills on the concept of educational technology. The purpose of this study is to get an overview of the improvement of creative thinking skills as the impact of model development. The research method used experimentally with two group pretest-posttest design. The research subject used student of the second semester (two) in one of the University in Serang City, Banten, Indonesia. The research instrument consists of a test of creative thinking skills. The results showed that after the development of learning model some creative thinking skills are high. This is indicated by an average of normalized gain scores $\langle g \rangle$ creative thinking skills in experiment group 1 increased by 0.84 and in experiment group 2 increased by 0.74. These results indicate that the ILP model is one of the learning models that can improve creative thinking skills.

INTRODUCTION

Education is a fundamental need for every human being. It is education that will lead to the improvement of one's life or society. Education is defined as a conscious and planned effort to create an atmosphere of learning and learning process so that learners actively develop their potential to have spiritual, religious, self-control, personality, intelligence, noble and skill Which needed him, society, nation and state. The purpose of national education is to develop the intellectual life of the nation and develop the whole Indonesian people, that is, the man who is faithful and devoted to God Almighty and virtuous noble character, possessing knowledge and skills, physical and spiritual health, solid and independent personality and sense of community responsibility And nationality The concept is an abstraction professionals that represents a class of objects, events, activities, or relationships, which have the same attributes (Wibowo, 2017). The behavior to be acquired through the exercise or training to facilitate student learning and classroom management (Suherman, 2017).

Many methods, strategies and learning models developed by experts to build student conceptions either through scientific methods, demonstration, discussion or investigation. One of the methods developed to build conception is with Interactive Learning Project model. Interactive Learning Project model which is a student centered learning. The Interactive Learning Project model is suitable for large classes, and as a bridge from traditional models using lecture methods to innovative models using constructivism approach (Mazolini et al, 2011).

Interactive Learning Project model is a learning that presents a project in learning either in the form of real phenomena, experimental tools or visual aids. Project is done by the teacher in front of the class while the students are asked to predict the result of the project. In Interactive Learning Project, students are asked to predict the outcome of a project, observe the results, compare and discuss it (Crouch, 2016). The Interactive Learning Project model is developed so that students are able to understand the concept more deeply, reduce misconceptions and also change concepts that were previously mistaken for a scientific conception.

The process of education will not be separated in a learning process. As for science is a very important science that must be taught to students in the learning process. Science is a science that studies about nature and all life either about living things or inanimate objects. The educational technology as one branch of science of science that studies about the phenomena or natural phenomena that occur in the natural world or the universe. The purpose of learning century is as a means to develop the ability of analytical thinking inductive and deductive by using the concepts and principles of educational technology to explain various natural events and solve problems both qualitatively and quantitatively, to master the knowledge, concepts and principles of educational technology and have knowledge, scientific skills and attitudes. The universe as a whole must be studied because knowledge of human nature will increase the strength to resolve the problems (Wibowo, 2016).

Mastery of knowledge is the main goal of the education of a field of science including the field of educational technology. It is very important that after following the learning of educational technology students are expected to master the teaching materials well and fully understand. By having a full understanding of the concepts, principles, principles and laws of educational technology, students will be able to use and apply them in a real-life context and can master technology as applied to educational technology. In the study of educational technology, students are expected to not only be able to calculate the educational technology formula and memorize the existing educational technology theories but the students are expected to be able to understand it completely so as to be able to solve the problems related to the concept in everyday life. But the reality in the field shows less favorable circumstances, educational technology has long been considered a difficult lesson and hard to understand. Many students fail to understand educational technology as a whole and most of them only understand some or not even a few who experience misunderstandings. This happens because learning still tends to memorize verbalism and mathematical formulation of the laws of educational technology (Wibowo, 2013). The effects of such learning tend to rarely result in misconception. The result of Wibowo (2013) is shows that the number of students experiencing misconceptions on educational technology concepts is quite large. Misconceptions that occur in students will cause mistakes in drawing conclusions in each lesson. The results of preliminary research conducted by a researcher in one of the high schools in Serang related to the level of students' understanding shows that most students are in the category of "partial understanding" level of understanding, even amongst those who do not understand. Based on the background of the above problems, the authors are interested in conducting research entitled "Development of Interactive Learning Project (ILP) Model For Unveil Creative Thinking Skills Concept".

THE STUDY

The research method used is pre experimental. Pre-experimental or called initial experiment and no controller treatment. While the research design using one group posttest only design. In this study, the group was given a final test after treatment Cresswell, (2014). Figure 1 shows a one group posttest only design chart.

Class	Pre- Test (Pre-Test)	Treatment (treatment)	Post-Test (Post-Test)
Experiment Gruop 1	-	X	O
Experiment Gruop 2	-	X	O

Figure 1. One group posttest only design

Information:

O: Comprehension material test

X : The treatment is an Interactive Lecture Project model

The population in this study used student of the second semester (two) in one of the University in Serang City, Banten, Indonesia where the sample was selected one class randomly from eight classes available through the draw on the grounds that the six academic characteristics of the class were almost the same. The research instrument consists of a test of creative thinking skills. Torrance (Wibowo, 2013) A creative thinking skill test involves asking skills, guessing skills for an event, the guessing skill of an event, and the skill of improving the output of the material. 4 Implementation of the ILP model in improving cognitive students' creative thinking skills, is determined on the basis of normalized average gain scores.

FINDINGS

The study was conducted during three meetings in the experimental class treated (treatment) in the form of application of ILP model. Based on the analysis of data presented, the average gain score <g> normalized creative thinking skills of 0.84 in the experimental group 1 and 0.74 in the experimental group 2 see Fig. 1 and Fig. 2. The average normalized gain score of this magnitude when confirmed with Category (g) of Hake (1999), included in the medium category. This increase is not in accordance with the expected increase of high categories. Some of the things that led to it; (1) there is no continuous practice by the students to master the four activities of creative thinking skills. (2) Time constraints so that there is no monitoring of the students' creative thinking skills activity, since the students when they have completed the project task have been considered mastering creative thinking skills. See Table 1 stages Interactive Learning Project (ILP).

Table 1. Interactive Learning Project (ILP) Stages

Learning Stages	Teacher Activity	Students Activity
1. Introduction	<ul style="list-style-type: none"> ✓ The teacher opens the lesson. ✓ Teachers convey the scope of the discussion to be discussed as well as the learning 	Students answer questions asked by teachers.
	<ul style="list-style-type: none"> objectives. ✓ Teacher gives apperception for example by asking questions. ✓ Teachers provide motivation early in the learning process ✓ The teacher explores the student's initial conception of the material to be learned by asking students questions. 	
2. Core Activities 2.1. Predictions	<ul style="list-style-type: none"> ✓ Teacher shows a project of a phenomenon, event or event related to a real-world context relevant to the material to be learned and asks the student to make a prediction. ✓ The teacher asks the students to discuss their predictions with their seek friends. ✓ Teacher asks students to discuss their predictions in small groups with some of their nearest neighbor. ✓ Teacher asks each group to express the prediction agreed by each small group ✓ Teacher asks student to record class agreed prediction on sheets of prediction • Students pay attention to teacher project. 	<ul style="list-style-type: none"> ✓ Students record class agreed predictions on prediction sheets ✓ Students make individual predictions regarding projects that teachers show on a prediction sheet. ✓ Students have discussions with their friends about the predictions model. ✓ Students discuss in small groups with some of their closest neighbors about the prediction of the phenomenon that the teacher project until a group agreement is reached. ✓ Each group of students expresses agreed predictions regarding the phenomenon that the teacher project.
2.2. Experience	<ul style="list-style-type: none"> ✓ Teacher presents an advanced project of phenomena or physical events with an interesting display (e.g. slide projector). ✓ Teacher asks students to expose their observations to the phenomenon or event that the teacher project and discuss it with a group of friends 	<ul style="list-style-type: none"> ✓ Students present their observations on the phenomenon or event that the teacher project and discuss it with a group of friends ✓ Students observe projects presented by the teacher and fill in the requested items on the worksheets provided.
2.3. Reflection	<ul style="list-style-type: none"> ✓ Teacher asks students to compare project results with their predictions. ✓ The teacher displays a similar phenomenon or event based on the physical concept discussed ✓ The teacher asks the students to discuss in their group to look for similar phenomena or events based on the concept discussed ✓ Teacher directs students to make conclusions about learning materials. 	<ul style="list-style-type: none"> ✓ Students make inferences about learning materials ✓ Students identify the difference between what they predicted and the outcome of the project activity. ✓ Students pay attention to the teacher's impressions of phenomena or similar events based on the physical concept discussed ✓ students conduct discussions in their groups to look for similar phenomena or events based on the concepts discussed
3. Closing	<ul style="list-style-type: none"> ✓ Teacher assigns a structured task to the students. ✓ Teacher closes learning. 	

Creative thinking skills developed are creative thinking skills in everyday life. The indicator of creative thinking skills used consists of four activities namely (1) asking, (2) guessing for an event, (3) guessing the consequences of an event, (4) improving the output. Improving creative thinking skill on guess activity because an event is 0,76 and 0,73 with medium category. The improvement of creative thinking skills in this activity is low compared with other activities. This is because the questions on the activity of guessing because an event of the concept of Heat there are questions that rely on deep creative thinking skills. Problems in guessing activities because an event requires understanding the concept first before answering by determining the cause of an event.

For example, in the case of creative thinking skills number 2, 5, 7, and 10, students must understand the concept of the problems encountered, only the upper groups who can answer the problem description. The lower and the mean group responded incorrectly by determining the cause of an event but not related to the concept of Heat and not to the context of the problem.

Figure 1. Average Skills of Creative Thinking Skills (Experimental Group 1)

Figure 2. Average Skills of Creative Thinking Skills (Experimental Group 2)

Based on Fig. 1. Improvement of creative thinking skill in activity to improve output result and activity of asking magnitude of equal increase, that is 0,74 with medium category. This increase is due to the learning of project-based educational technology has several advantages such as goal-directed activities that will strengthen the relationship between activity and knowledge. In addition students are given the freedom to do project tasks done by emphasizing student autonomy (self-regulation) that will develop thinking skills.

The improvement of creative thinking skill in the guessing activity due to an occurrence of 0.84 and 0.74 in the high category. Improvement of creative thinking skills in this activity is high compared with other activities. This is due to increased motivation because students are challenged to work on project tasks and planting concepts conducted with experiments so that students find and understand the concept. This is in line with Renata's (2008) research results, project-based learning helps students develop thinking skills and improve understanding of science. This is also in accordance with Yalcin's (2009) research result that the effect of project based learning on the first year of science undergraduates' is attitudes towards educational technology, achievement, and development of scientific process skills.

CONCLUSIONS

The result showed that after the development of learning model some creative thinking skills are high. This is indicated by an average of normalized gain scores $\langle g \rangle$ creative thinking skills in experiment group 1 increased by 0.84 and in experiment group 2 increased by 0.74. These results indicate that the ILP model is one of the learning models that can improve creative thinking skills.

ABSTRACT

The aims of this research were: (1) to develop the research-mindedness scale of undergraduate students from the faculty of education at universities in the northeastern region of Thailand (2) to verify the quality of this research-mindedness scale. Research instrument was the research-mindedness scale which consisted of 2 sections including the Likert rating scale and the Multiple Choices Test with 3 multiple choice items. Data collection was conducted in 2 phases. The first phase focused on verifying the construct validity through the Exploratory Factor Analysis (EFA) based on the Orthogonal Rotation and Varimax Approach. Sample selected by Cluster Random Sampling Technique, was 780 third and fourth year undergraduate students of faculty of education from 9 universities. The findings of this phase revealed the three factors of research-mindedness scale which included: (1) curiosity and interest consisted of 4 sub-factors dividing into 18 items, (2) fairness and ethic consisted of 4 sub-factors dividing into 12 items, and (3) critical thinking consisted of 11 sub-factors dividing into 35 items. The second phase emphasized on verifying the quality of the scale towards the construct validity through the Confirmatory Factor Analysis (CFA) using the sample of 800 students. The Structural validity using second order confirmatory factor analysis showed the model fit well with the empirical data set (Chi-square = 232.273, df = 149, p-value = 0.00, TLI = 0.973, CFI = 0.977, RMSEA = 0.27, and SRMR = 0.30).

Keywords: Research-Mindedness, Confirmatory Factor Analysis, Exploratory Factor Analysis

INTRODUCTION

KhonKaen University (2014) was announced and appointed as a national research university in 2010. Continuing our mission on conducting research is one of the key missions of KhonKaen University. This is to build ethical researchers and produce quality research, as well as erasing the bad images of research being “on the ivory tower”, and most importantly the benefits from each research must be able to truly respond to the needs of the society and provide a research-based learning environment for the staff. This is done through all the training sessions and follow-up sessions provided which are in accordance with the organization.

Social Care Institute for Excellence (2014) gives an importance on social science research, as the institute believes that the ability to perform an assessment and conduct research is the best way to facilitate the works of social work researches and practitioners, which in this case, research-mindedness is a part that will reflect the way one searches for knowledge and leverages one’s abilities to be a professional. The institute also gives a definition for research mindedness that in order to have effective learning and working, practitioners and learners must understand well from key literature and related studies, and must consider how the said studies could be connected to their practices and research.

For social science workers, assessment and research skills have become their professional expectation, as the skills are determined as the basic professional skills required for social-science-related jobs. As a result, for many past years, there have been movements in order to cultivate research mindedness and research literacy onto those who work in the social science field, government studies, education and learning management.

Research Mindedness consists of the following:

- 1) An ability to reflect critically, which is derived from knowledge and studies
- 2) An ability to use studies as an argument against inequality, discrimination, racism, poverty, disadvantages and injustice -- which is in accordance with the virtues of social science research, and
- 3) An understanding of research system and the use of research in creating a theory and in practice, which is a qualification that should be promoted among learners who need to conduct research on social science issues (Social Care Institute For Excellence, 2014)

Apart from the above-mentioned, Harrison & Hympeys 1988 mentioned that practitioners define and give an importance on the attributes of research mindedness per below:

- 1) A qualification required for practitioners
- 2) An ability to reflect critically towards practice and to develop research questions
- 3) An ability to identify knowledge and conduct research related social values, and
- 4) An ability to understand how to design research and related research methodology in order to create a theory related to tasks performed at work.

Also, Austin & Other (2012) studied about research mindedness which consists of Curiosity & Interest, Critical Reflection and Critical Thinking.

LITERATURE REVIEW

Research minded has become a key skill for social science learners and practitioners. The ability to assess and to use research results to provide advice and support ensures that the tasks performed are best selected. For social work learners and practitioners, research mindedness has become a key element that will prove and provide guidance for paths to knowledge and practice. It is a Professional Capabilities Framework or PCF and another way of professional assessment. As a result, there is an institute called Social Care Institute For Excellence that helps learners and practitioners in the field of social care and social work, thus a more effective use and covering academic research for practical usage. Also, the institute focuses on social science research, as it believes that having the ability to do an assessment and conduct research is the best way to facilitate the work of social work researchers and practitioners, which in this case research mindedness is a part that will reflect the ways one searches for knowledge and leverages one's ability into becoming a professional. Moreover, the institute has also provided a definition of the word "research mindedness" that, in order to effectively learn and work, practitioners and learners need to truly understand from the key literature and related studies, and then consider how the said studies are connected to how they practice or search for knowledge, which means that research mindedness is a thing that researchers have to create from the learning process and from their thoughtful considerations in selecting things that they would define as knowledge.

For those working in the social science field, these skills have become another of their professional expectations. The assessment and research skills have been determined as basic skills for social science related jobs. Therefore, these many past years, there have been movements to cultivate research mindedness and research literacy onto those working in social science field, government research, education and learning management (Social Care Institute For Excellence, 2014).

Research Mindedness consists of 3 elements:

- 1) An understanding of research system and the use of research in creating a new theory and in practice
- 2) An ability to use research to provide an argument against inequality and discrimination, without bias
- 3) An ability to reflect critically, which is derived from knowledge and research.

Should an educational academic try to give a definition of "research-mindedness", in general, it is focused on 1) being a research consumer or the use of those research with knowledge (sometimes it is referred to training assessment results) and on 2) starting to become a social science researcher. But for practitioners, it focuses on and gives an importance to the following attributes of research mindedness:

- 1) an essential practitioner attribute,
- 2) a capacity to critically reflect on practice to develop researchable questions
- 3) a capacity to be informed by knowledge and research related to social work values, and

- 4) capacity to understand research designs and related methodologies in order to theorize about practice (Harrison & Humphreys, 1998).

These three elements are the focus of the next section, and examined further especially in relationship to facilitating research-informed practice (see Figure 1).

Figure 1 Key elements of the research minded. (Austin, M.J., Santo, T.S. & Lee, C., 2012)

Researcher's Code of Ethics

Ethics code of researchers refers to a code of practice for researchers designed to ensure that their research conduct is based on appropriate ethics and academic principles for the purpose of assuring quality and maintaining the dignity and integrity of researchers and research subjects (The National Research Council of Thailand, 1998).

Ethics Code of Researchers & Principles of Guidance:

- 1) Researchers should be honest and fair-minded with regard to academics ambitions and management.
- 2) Researchers should abide by research obligation and agreements specified by and entered into with fellow researchers, funding agencies, and their affiliates.
- 3) Researchers should have impeccable training in the academic field related to their research.
- 4) Researchers should treat all research subjects, whether animate or inanimate, with appropriate respect and consideration and should take full responsibility for the impact and consequences of their research.
- 5) Researchers should have respect for their human subjects' dignity and right.
- 6) Researchers should enjoy freedom of the intellect and should be free from bias at very step of the research undertaking.
- 7) Researchers have a moral obligation to put their research findings to good use.
- 8) Researchers should respect peers' opinions.
- 9) Researchers should have a firm sense of commitment as regards all strata of society.

RESEARCH AIM AND CONCEPTUAL FRAMEWORK

In this research, the main aims to develop a research-mindedness scale of undergraduate students in faculty of education, through identifying indications. In the first phase, it is an exploratory factor analysis, starting from using theories and concepts related to research mindedness, which consist of the following scales:

- 1) Curiosity & Interest and fairness and ethics in referring research in creating research methodology, using 5-level Likert Scale, and
- 2) Critical thinking that is developed into multiple choice tests.

Also, there will be a quality test for the discrimination index, the content validity ratio and the reliability. In the second phase, there will be a quality test for construct validity, through an analysis of confirmatory factor, which can be summarized into a framework for the development of the assessment in figure 2.

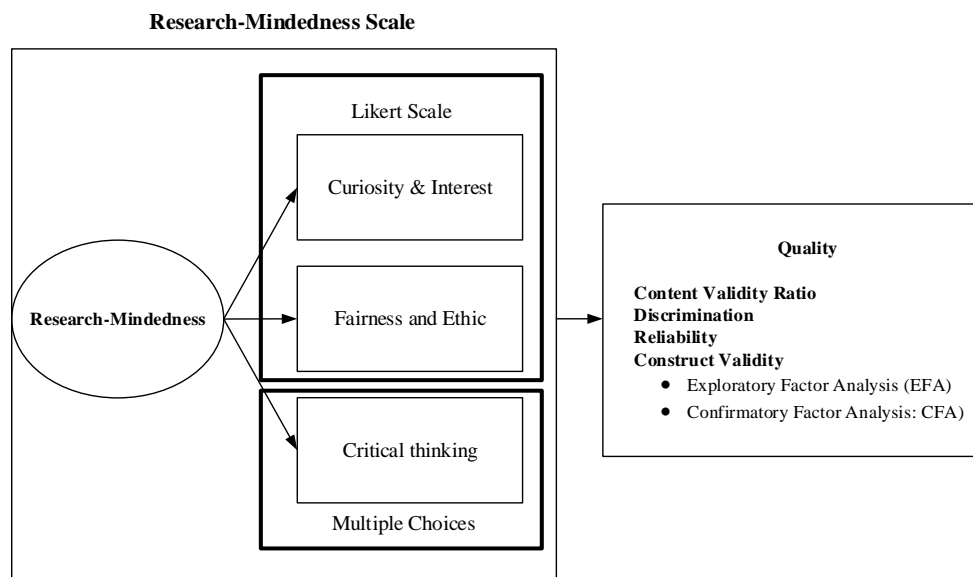

Figure2 Conceptual Framework

METHOD

The researchers employed the survey questionnaire as a method to collect quantitative data. The first phase focused on verifying the construct validity through the Exploratory Factor Analysis (EFA) based on the Orthogonal Rotation and Varimax Approach. Sample selected by Cluster Random Sampling Technique, was 780 undergraduate students of faculty of education from 7 universities. The second phase emphasized on verifying the quality of the scale towards the construct validity through the Confirmatory Factor Analysis (CFA) using the sample of 800 students from 7 universities. Sample selected by Cluster Random Sampling Technique. Research instrument was the research-mindedness scale which consisted of 2 types including the Likert rating scale and the Multiple Choices Test with 3 multiple choice items.

Cronbach's α test was used to examine unidimensionality of the scale. Ideally, the α -coefficient of a scale should be between 0.70 and 0.90 (Streiner and Norman, 2001). The correlation between each item and the total score (corrected item-total correlations) was calculated, as well as the impact on the alpha value of deleting the separate items from the pool (alpha if item deleted). The criterion of correlation 0.20 was used, as suggested by Streiner & Norman (2001). This analysis was used to help deciding whether some items should be excluded, and was done before performing the EFA. The suitability of the data for EFA was examined, by inspecting the correlation matrix for coefficients 0.3, and calculating the Kaiser–Meyer–Olkin measure of sampling adequacy (KMO) (Kaiser, 1974) and Bartlett's test of sphericity (Bartlett, 1954). The factor structure was then identified by using the method of varimax rotation of the factors, allowing for correlation (Kristopher, Preacher & MacCallum, 2003). Unidimensionality of the total scale and of eventual sub-scales was finally examined using.

Confirmatory Factor Analysis (CFA) was applied to test the goodness of fit of the hypothetical model and empirical data. The goodness of fit statistics consisted of Chi-square statistic (χ^2), Goodness of Fit Index (GFI), Root Mean Square Error of Approximation (RMSEA), and Standardized Root Mean Square Residual (SRMR).

The Chi-Square value (χ^2) is the traditional measure used for evaluating overall model fit and, assesses the magnitude of discrepancy between the sample and fitted co-variances matrices' (Hu and Bentler, 1999: 2). According to Kenny and McCoach (2003), the Chi-Square statistic would lack of power when small samples are used. Thus Chi-square values may not discriminate between good and poor fitting models. Owing to the restrictiveness of the Model Chi-Square, Wheaton, Muthen, Alwin and Summers (1977) suggested the other alternative statistic that can minimizes the impact of sample size will be relative/normed chi-square (χ^2/df)

Confirmatory Factor Analysis (CFA) is a powerful statistical tool to examine the nature and relations among latent construct (Brown, 2006; MacCallum& Austin, 2000). The RMSEA tells us how well the model, with unknown but optimally chosen parameter estimates would fit the population covariance matrix (Byrne, 1998). Recommendations for RMSEA cut-off points have been reduced considerably in the last fifteen years. Up until the early nineties, an RMSEA in the range of 0.05 to 0.10 was considered an indication of fair fit and values above 0.10 indicated poor fit (MacCallum, Browne, & Sugawara, 1996).

The Root Mean square Residual (RMR) and the Standardized root mean square residual (SRMR) are the square root of the difference between the residuals of the sample covariance matrix and the hypothesized covariance model. The range of the RMR is calculated based upon the scales of each indicator. The standardized RMR (SRMR) resolves this problem and is therefore much more meaningful to interpret. Values for the SRMR range from zero to 1.0 with well-fitting models obtaining values less than 0.05 (Diamantopoulos & Siguaw, 2000), however values as high as 0.08 are deemed acceptable (Hu & Bentler, 1999). The Comparative Fit Index (CFI) is introduced by Bentler (1992) and subsequently included as part of the fit indices in his EQS program (Kline, 2005). This statistic assumes that all latent variables are uncorrelated (null/independence model) and compares the sample covariance matrix with this null model. A cut-off criterion of $CFI \geq 0.90$ was initially advanced however, recent studies have shown that a value greater than 0.90 is needed in order to ensure that miss-specified models are not accepted (Hu & Bentler, 1999). From this, a value of $CFI \geq 0.95$ is presently recognized as indicative of good fit (Hu & Bentler, 1999).

FINDINGS

The first phase focused on verifying the construct validity through the Exploratory Factor Analysis (EFA) based on the Orthogonal Rotation and Varimax Approach. Sample selected by Cluster Random Sampling Technique, was 780 undergraduate students of faculty of education from 7 universities.

Table 1. Comparison of eigenvalues from the Exploratory Factor Analysis (EFA) and the corresponding criterion values obtained from parallel analysis; the criterion value of the forth factor exceeded the eigenvalue. (Curiosity & Interest)

Component number	Eigenvalues	% of Variance	Cumulative %
1	7.433	37.165	37.165
2	1.873	9.366	46.531

Critical		-0.014*	0.124	-0.150	-0.014	-	0.000	
χ ²	=	232.27	df	=	149	χ ² /df	=	0.557
						P-value	=	0.000
RMSEA	=	0.027	CFI	=	0.977	TLI	=	0.973
						SRMR	=	0.030

* p -value < .05 , ** p -value < .01

Result from Table 5 reveals that standard component score (β) which indicated significantly high and positive correlations at 0.01. Besides, it was found that the measurement model of internal quality assurance operations has goodness fit with evident data, with $\chi^2= 232.27$, $df= 149$, $p= 0.000$, $\chi^2/df= 0.557$, $RMSEA = 0.027$, $SRMR = 0.030$, $CFI = 0.977$ and $TLI = 0.973$. Result shows that Research- Mindedness Model was consistent with empirical data (Shama, et al., 2005; Steiger, 2007; Tabachnik&Fidell, 2007).

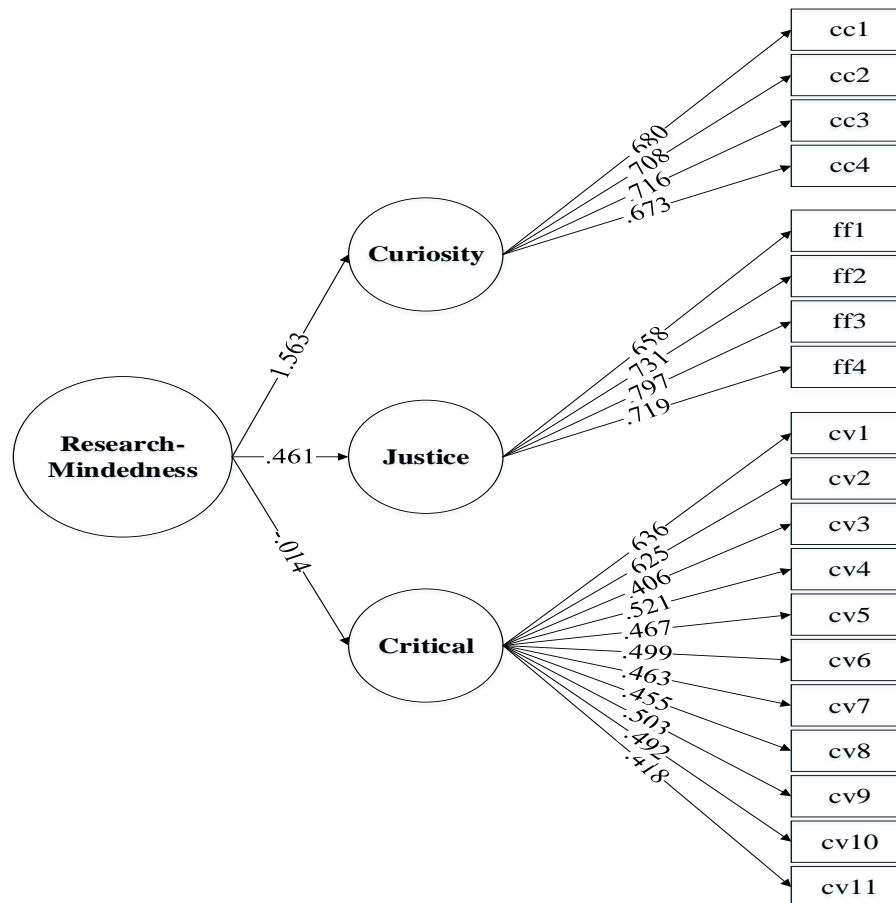

Figure 3 Research- Mindedness Model

DISCUSSION

From the developments of the research-mindedness scale conducted by the undergrad students at the Faculty of Education, it was found that the Likert scale form and the 3-choice test were a high-quality type of test, especially the reliability level of the Likert scale that was at a very good level or at 0.946, while the multiple-choices test had the reliability level at 0.901, which was at a very good level, in accordance with what Devellis (1991) mentioned that the reliability level at 0.90 or higher is at a very good level, meaning that the assessment form created by the researchers was reliable.

Based on the analysis of the exploratory elements in the aspect of curiosity and interest, there were fewer elements. This was different from Austin & Other (2012). In the aspect of fairness and ethics there were fewer elements, different from what The National Research Council of Thailand (1998) had determined. However, the elements in the aspect of critical thinking, there were more elements. This was maybe due to the fact that it was within the coverage of the research conducted by the undergrad students of the Faculty of Education only. Anyway, in order to make the element analysis more reliable, there had to be another time of a confirmative element analysis or CFA.

For the secondary order confirmatory analysis of the research-mindedness scale model, when considering the model which consists of three sub elements, it was found that, the elements in the aspect of critical thinking had the standard component score (β) at -0.140. This was due to the attributes of the test that provided situations in the test. They all were only experimental and scientific research situations. And for the data collection from the samples, there were many fields of subject for the tests, which might not be suitable for the undergrad students from other faculties of majors. The researcher analyzed the average score and found that in terms of the test scores in this part compared to the average scores between the groups of science-related majors and other groups of majors, the former had mean score at 25.74 and the S.D. was at 2.11, while the latter had mean score at 11.25 and the S.D. was at 5.63, which were different, resulting in all the average scores being low. This might lead to the critical thinking element shaving a negative standard grade weight. All in all, all the indexes of harmony were as follows: (Chi-Square; χ^2) was at 232.27; df was at 149; p at 0.00; TLI was at 0.973; CFI was at 0.977; RMSEA was at 0.027; and SRMR was at 0.30. This indicated that the research mindedness scale model for the undergrad students at the Faculty of Education was consistent with empirical data

ABSTRACT

The aims of this research were to investigate the key factors and indicators of sustainable leadership, followed by testing the goodness of fit of the identified sustainable leadership indicators from the developed model against its empirical evidence. A total of 500 high school principals were selected from a population of 9,521 utilizing a multi-stage random sampling. This study employed quantitative survey design using questionnaire as an instrument and analyzed by structural equation modeling. Initial data was collected through reviewing the related past literatures and in-depth interviewing with scholars. Results revealed that the identified components of sustainable leadership were comprised of seven main components and 89 indicators. These indicators were consistent with empirical data, with $\chi^2 = 17.31$, $df = 13$, $p = .18$, $RMSEA = .029$. According to school principals' ratings in chronological order as follows: possessing in-depth knowledge, diversity in problem-solving and performance, resources management, justice, length (keeping good personnel), being conservationist, and distribution of leadership.

Keywords: High school principals; indicators; key factors; sustainable leadership

INTRODUCTION

Sustainable leaders are individuals compelled to make a distinction by extending their attentiveness in relation to surrounding (The Sustainable Leadership Institute, 2011). Therefore, sustainable leaders assume new ways of seeing, thinking, and interacting that result in innovative and sustainable solutions. Hargreaves and Fink (2004) stated that educational leaders have to encourage others to join them in working towards those goals and leave a lasting legacy if they want to achieve those goals. Consequently, charismatic and sustainable leader turns around an underperforming school and enhances his or her institution's reputation by exerting a pull on top students across the nation. Hargreaves and Fink (2003: 3) defined sustainable leadership as a shared responsibility, which does not unduly deplete human or financial resources, and that cares for and avoids exerting negative damage on the surrounding educational and community environment. Sustainable leadership has an activist engagement with the forces that affect it, and builds an educational environment of organizational diversity that promotes cross-fertilization of good ideas and successful practices in communities of shared learning and development.

According to Hargreaves (2003), schools as a teaching and learning institution need to be reconfigured to prepare all their students to participate in transforming their countries into creative knowledge economics and to have opportunities to be employed at the highest levels of economics, in high skills with high wage societies. In the current rapidly transforming situations of Thailand which have created tremendous social problems are the results of the focus on economic development as the sole governmental policy. These in turn caused the imbalance to the developmental structures and personnel thereof (Office of the Educational Council Revised Edition, 2002). In order to reach the national balanced and sustainable development, one must put emphasis on the fortification of the available resources of the nation in order to move forward the developmental process, especially the

development of people or human resource in order to make them ready for coping with the changes of 21st century. This includes the promotion of requisite factors that would facilitate the development of quality manpower as well as structure so that they become immune to future changes (Educational Consultant, 2010).

In regard to organization and its development, it implies that school principals should find ways to change the organization from its current state to a better developed state (Avery & Bersteiner, 2011). Consequently to manage sustainability, the society has to formulate transparent and measurable sustainability goals that are to be regularly revised and specified. The conception of sustainable development obliges organizations to change their behavior with respect to the interested parties. Therefore, the sustainability of an organization is based on the economic, environmental protection, and social responsibility aspects (Hargreaves & Finks, 2004).

CONCLUDING THE CONCEPTS OF SUSTAINABLE LEADERSHIP

Researchers conceptualized sustainable leadership in accordance to the seven principles of sustainable leadership proposed by Hargreaves and Finks (2003).

Possessing in-depth knowledge

The possessing in-depth knowledge refers to the high school principals have to responsible to organize learning that engaging students intellectually, socially, and emotionally. According to Hargreaves and Finks (2003), sustainable leadership goes beyond temporary gains in achievement scores to create lasting meaningful improvement in learning. In other words, sustainable leadership preserves, protects and promotes in education what is itself sustaining as an enrichment of life: the fundamental moral purpose of deep, broad and lifelong learning (rather than superficially tested and narrowly defined literacy and numeracy achievement) for all in commitments to the relationships of abiding care for others. The key factor of sustainable leadership is leadership for learning and leadership for caring for and among others.

Diversity in problem-solving and performance

Sustainable leadership encourages cohesive diversity. Strong ecosystems are bio-diverse ones. Strong organizations too, encourage diversity and evade the standardization that weakens learning, adoptability and flexibility in the face of unexpected changes and risks. Sustainable leadership, by contrast, fosters and learns from diversity in teaching and learning and moves things forward by creating consistency and networking among its richly varying components. Sustainable leadership recognizes and develops many kinds of excellence in learning, teaching, and leading, and it provides the networks for sharing these different kinds of excellence in cross-enriching processes of improvement (Louis and Kruse, 1995; McLaughlin and Talbert, 2001). Sustainable leadership does not execute standardized patterns on everyone.

Resources management

Sustainable leadership develops and does not exhaust material and human resources. Sustainable leadership recognizes and rewards the organization's leadership talent in earlier rather than later career. It takes care of its leaders by getting them to take care of themselves. It renews staff's energy. It does not drain its leaders dry through innovation overload or unrealistic overload or unrealistic timelines for change. Sustainable leadership is practical and resourceful leadership that wastes neither its money nor its staff. Sustainable leadership systems provide intrinsic rewards and extrinsic incentives that draw and preserve the best and brightest of the leadership pool. Such systems provide time and opportunity for leaders to network, learn from and support one another, and trainer and mentor their successors. Sustainable leadership is economical without being cheap. It carefully distributes its resources in developing the talents of all its educators rather than loading rewards on a few proven stars. Sustainable leadership systems take care of their leaders and encourage leaders to take care of themselves.

Justice

Sustainable leadership is not only about maintaining improvement in one's own school. Leaders who care about sustainability accept responsibility for the schools and students that their own actions affect in the wider environment. Sustainable leadership does not damage to and actively improves the surrounding environment. It does not attack the best resources of outstanding students and teachers from neighboring institutions. It does not prosper at other schools' expense. It does no harm to and actively finds ways to share knowledge and resources with neighboring schools and local community. Sustainable leadership is not self-centered; it is socially just. Sustainable leadership is alert of how lighthouse, magnet, and charter schools and their teachers can leave others in the shadows and is sensitive to how privileged communities can be tempted to scan the cream off the local leadership pool. Sustainable leadership recognizes and takes responsibility for the fact that schools affect one another in webs of mutual control.

Length (Keeping good personnel)

Sustainable leadership demands that leaders pay serious attention to leadership succession. Sustainable leaders can achieve this goal by preparing successors to continue important reforms, by keeping successful leaders in schools longer when they are making great strides in promoting learning, by resisting the attraction to search for irreplaceable charismatic heroes to be the saviors of the schools, by requiring all district and school improvement plans to include succession plans, and by slowing down the rate of repeated successions so teachers do not sarcastically decide to 'wait out' all their leaders. Sustainable leadership means planning and preparing for succession – not as an afterthought, but from the first day of a leader's appointment. Hargreaves and Fink offered rare hints of thoughtful and effective succession management. For example, there was one school built on its enthusiastic and positive principal's success in forging a democratically developed school improvement plan by grooming his assistant principal to replace him when he retired.

Being a conservationist

Standardized reform has embellished the problems of the traditional schools, turning these schools into less-motivated versions of their former selves. Meanwhile, the innovative schools have lost some of their edge. Sustainable leadership honors and learns from the best of the past to create an even better future. In the midst of the chaos of change, sustainable leadership is steadfast about preserving and renewing its long-standing purposes. Most change theory is change without a past or a memory. Sustainable leadership revisits and revive organizational memories and honors the insight of their holders as a way to learn from, preserve, then move beyond the best of the past.

Distribution of leadership

One method for leaders to leave a lasting inheritance is to ensure that others share and help develop their vision. Therefore, leadership succession means more than preparing the principal's successor. It means distributing leadership throughout the school's professional community so others can carry the torch after the principal has gone (Spillane, Halverson and Drummond, 2001). Sustainable leadership is not just the responsibility of the school administrator. In a highly complex world, no one leader, institution, or nation can control everything without help (Fullan, 2001). Sustainable leadership must be a shared responsibility. It sustains as well as depends on the leadership of others. In a complex world, no one leader, institution or nation can control everything without be of assistance. Sustainable leadership is distributed leadership – as an accurate description of how much leadership is already exercised, and also as an ambition for what leadership can, more deliberately, become.

LITERATURE REVIEWS

Wayne and Polly (2011) had successfully created a clearer understanding of the nature of sustainable leadership and how it could contribute to a transformational change. They located sustainability within the leadership literature, defined the concept of sustainable leadership, and presented a sustainable leadership model in practice. In addition, they also tested the model with a sample of senior business leaders and refined the model in accordance with senior business leaders' feedback. Wayne and Polly's sustainable leadership model covered three major areas namely context, individual characteristics, and actions.

According to Simanskiene and Zuperkiene (2014), the major factors that affected by sustainable leadership are individual, team, organization, and society. They had examined the important factors to encourage managers to think broadly and be responsible sustainable leader. Simanskiene and Zuperkiene found that leaders should have self-awareness before they can start any changes in organization. Sustainable leaders have to face ever new challenges and need novel ideas in order to handle with them. Those external and internal pressures make leaders look for new methods which would assist both in retaining the quality of products and services and in fostering the morale of the employees, as well as assuring the stability in the organization. Sustainable leader should start with oneself such as to analyze one's own personal qualities and skills, and having identified insufficient abilities, to learn consistently and thus set an example for the employees, to use of innovations and creativity.

Somprach, Tang and Popoonsak (2016) explored the relationship of essential leadership styles of school principals in supporting teachers' participations in professional learning community practices in basic education schools in northeastern Thailand. They found that sustainable leadership is the second highest frequently leadership style practiced by school principals with mean score 4.41. Moreover, Somprach et al. found that sustainable leadership ($r = 0.627$; $p < 0.05$) with the strength of association being substantial to very strong and positive towards teachers' participation in professional learning community practices. However, their finding showed that sustainable leadership failed to be significant predictors out of the nine leadership styles that have an impact to teachers' participation in professional learning community practices.

Grooms and Reid-Martinez (2011) conducted a longitudinal cross-cultural case study to investigate the evolvement of sustainable leadership in an orchestrated education programs. Grooms and Reid-Martinez found that leadership sustainability was an intricate weaving of multiple factors in three critical areas namely sustained communication in the ICT/Blended environment, sustained mentoring, and sustained curriculum and learning. They further emphasized about the synergy of sustained educational and communicational elements to the key factor together with immersed learners in a virtual or blended learning environment that focused on ethics, values, and transformation at the personal and organizational levels. Through modeling and mentoring, learners received intentional leadership support while learning to build leadership sustainability within themselves and their followers. Such learning creates a cycle of ongoing leadership development that continuously moves current and upcoming leaders from information to the formation of reservoirs of knowledge and wisdom, further expanding and sustaining leadership. This continuous leadership growth provides an important persistent in the development of sustainability, demonstrating that like sustainable development, sustainable leadership represents a process, not an end state.

RESEARCH OBJECTIVES

The main aim of this study was to develop the sustainable leadership indicators for high school principals in Thailand. More specifically, the study sought to:

- a. Identify the key factors and indicators of sustainable leadership indicator for high school principals.
- b. Test the goodness of fit of the sustainable leadership indicators with empirical data.

METHOD

A survey questionnaire was employ as a method to collect quantitative data. Sample size was determined based on Hair, Black, Anderson, and Tatham's (2006) rules of thumb. Hair et al. proposed that the ratio between the samplings and the parameters or variables in a factor analysis should be at a minimum of 50 but not less than 100 in proportion with the variables. Since the population consisted of 9,521 high school principals in year 2016, the ratio between population and parameters was 10 to 1 so the identified sample size was 500. Multi-stage random sampling technique was employed to select the samples.

Before researchers started to collect the quantitative data, researchers carried out the preliminary study to conceptualize the sustainable leadership indicators. This phase includes activities with a solid conceptual component to identify the indicators of sustainable leadership. According to Brink, Van Rensburg and Van der Walt (2012), conceptualization refers to the process of emerging and filtering non concrete ideas. During this preliminary stage, researchers categorized and developed sustainable leadership indicators to form a framework by analyzing documents and related previous research as well as interviewing some academic experts. Hence researchers had pleaded on the skills and capabilities of creativity, analysis and insight, as well as on the fixed grounded of existing research on sustainable leadership.

Survey questions in the form of a questionnaire were distributed to the 500 high school principals in order to collect information on their perceptions about validity of sustainable leadership construct. This method benefits the study in terms of obtaining data more efficiently as time, energy, and costs were minimized (Sekaran, 2006), and it provided an excellent means of measuring attitudes and orientations in a large population which can, therefore, be generalized to a larger population (Babbie, 2002).

The five-point Likert scale survey questionnaire instrument was administered in the Thai language to make sure that the respondents were clear about the statements. There were 94 items including five items of demographic and 89 items of sustainable leadership items at their workplace. The survey questionnaire consisted of two sections. Section A was intended to gather information regarding the demographic factors of the respondents while Section B was specifically designed based on the preliminary research findings as mentioned above to gauge the perceptions about the construct validity of the high school principals' sustainable leadership indicators.

In addition to the expert advice, a confirmatory factor analysis (CFA) was used to investigate the construct validity of the instrument. Several fit indices were selected in order to test which CFA model best represented the present dataset: root-mean-squared error of approximation (RMSEA) (Browne & Cudeck, 1993), comparative fit index (CFI) (Bentler, 1990), chi-square, and change in chi-square given the change in degrees of freedom between models. RMSEA is a measure of the average of the residual variance and covariance; good models have RMSEA values that are at or less than 0.08 (Hu & Bentler, 1999). CFI is an index that falls between 0 and 1, with values greater than 0.90 considered are to be indicators of good fitting models (Hu & Bentler, 1999). When comparing models, a lower chi-square value indicates a better fit, given an equal number of degrees of freedom. Since the RMSEA was 0.031 (<0.08) and CFI was 0.998 (falls between 0 and 1, with values greater than 0.90) these

verifications indicated that the model of the relationship between leadership styles and principals' competencies in managing high performance schools was consistent with the empirical data.

Structural Equation Modeling (SEM) was used in order to fit the model with empirical data. SEM is a mixture of factor analysis and regression or path analysis. SEM is a complete statistical modeling tool for analyzing multivariate data involving complex relationships between and among variables (Hoyle, 1995). In addition, SEM is a dominant method that can merge complex path models with latent variables (factors). Using SEM can identify the relationships between variables using two main sets of equations namely measurement equations and structural equations. Measurement equations are used to examine the accuracy of proposed measurement by considering relationships between latent variables and their respective indicators. The structural equations are used to drive the assessment of the hypothesized relationships between the latent variables, which permit testing the statistical hypotheses of the study (Byrne, 2010). In addition, SEM considers the modeling of interactions, nonlinearities, correlated independents, measurement error, correlated error terms, and multiple latent independents each measured by multiple indicators. As a result, the interest in SEM is often on the theoretical constructs are represented by the latent factor.

RESULTS

The results of this study are presented in accordance to the research objectives indicated above. The preliminary results were conceptualization of sustainable leadership to identify the key factors and indicators for high school principals. Results of the actual study are presented by analyzing the factor loading and validity of observable variables to test the goodness of fit of the sustainable leadership indicators with the empirical data.

Identification of sustainable leadership key factors

Based on the investigation on the synthesis of concepts, theories, and previous research, the key factors of sustainable leadership were (i) possessing in-depth knowledge; (ii) diversity in problem-solving and performance; (iii) resource management; (iv) justice; (v) length (keeping good personnel); (vi) being a conservationist, and (vii) distribution of leadership.

Factor loading and validity of key factors

After identifying sustainable leadership key factors, researchers aimed to estimate the parameter of the sustainable leadership model, the factor loading and validity of observable factors of sustainable leadership. As indicated in Table 1 below, factor loading values of all the sustainable leadership key factors ranged from 0.554 to 0.847 are statistically significant at 0.01. Factor loading is the importance of standard factors of each key factor in sustainable leadership model of the high school principals that have been taken into consideration. The co-variance with sustainable leadership was from 30.70 to 71.70 percent. The key factor with the highest factor loading was possessing in-depth knowledge. This is followed by diversity in problem-solving and performance, resources management, justice, length (keeping good personnel), and being a conservationist key factors respectively. The key factor that had the lowest factor loading was distribution of leadership. As a result, all the key factors were found to be important construct of sustainable leadership.

Table 1. Factor loading and validity of observable variables in the measurement model

Sustainable leadership factors	Matrix of Factor loading		
	β	t	R ²
Possessing in-depth knowledge	0.847	0.000	0.717
Diversity in problem-solving and performance	0.828	0.000	0.685
Resources management	0.816	0.000	0.666
Justice	0.792	0.000	0.627
Length (keeping good personnel)	0.762	0.000	0.580
Being a conservationist	0.756	0.000	0.571
Distribution of leadership	0.554	0.000	0.307

Result also indicated that there are 89 sustainable leadership indicators which derived from seven key factors as shown in Table 1 above. This is coupled with the experts' recommendations to fit the 89 indicators with seven key factors according to Thailand context. Majority of the experts suggested to use the mean score 3.00 or more as cut-off point and coefficient of dispersion as 20 percent or less to synthesize those key factors of existing research on sustainable leadership. The following Table 2 indicates the first three most weighted indicators of each sustainable learning key factors.

Table 2. The first three most weighed indicators

Sustainable leadership factors	Indicators
Possessing in-depth knowledge	1. Skill knowledge / competencies 2. Expertise 3. Experience
Diversity in problem-solving and performance	1. Best/good practices 2. Diversity culture 3. Integration
Resources management	1. Providing maintenance 2. Efficiency 3. Quality
Justice	1. Neutrality 2. Accuracy 3. Decision-making
Length (keeping good personnel)	1. Caring 2. Empowerment 3. Participation
Being a conservationist	1. Knowledge management strategies 2. Indigenous knowledge 3. Future research
Distribution of leadership	1. Shared vision 2. A culture of team learning 3. Leadership practice

Goodness of fit the sustainable leadership indicators with the empirical data

Result of the study revealed that sustainable leadership model has goodness of fit with evident data, as $\chi^2 = 17.31$, $df = 12$, $p\text{-value} = 0.18$, $RMSEA = 0.029$ as illustrated in Figure 1 below. Finally, it was found that the sustainable leadership model agreed with empirical data.

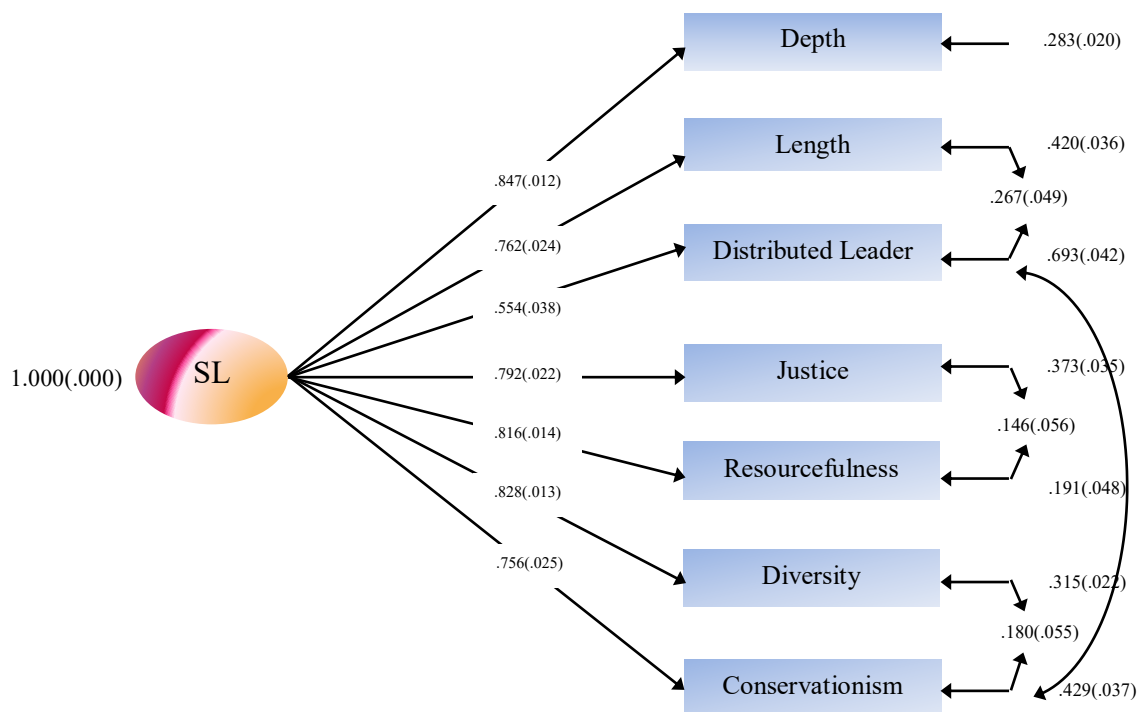

Figure 1. Sustainable Leadership Model

DISCUSSION

The essential results of this research was on the importance of standard factor loading of each key factor in the sustainable leadership model revealed that all of the synthesized factors of sustainable leadership conformed well

with the empirical data with statistical significance (Tuksino, 2009). Hence all the seven key factors are vital factors and seem to be in line with theories and previous research studies. The results implied that an empirical definition was adopted from various scholars and literatures including local and international articles which were elaborately reviewed thus they enable to increase the possibility to define accurately the terms according to the objectives of the study. Furthermore, results indicate that the assigned indicators conformed very well with the empirical data. This reflects that the empirical definition is close to the theoretical definition and supported by theory, concept, academic documents, and previous studies (Wirachchai, 2002). Likewise, the created theoretical conceptual framework was found to be acceptable to assess the quality of developed indicators. Concepts were also identified through the interviews of educational experts in Thailand who possess sufficient knowledge and experiences at the preliminary stage would assist in developing the solid framework.

In addition, results illustrated that the Goodness of Fit index (GFI) of the sustainable leadership model followed by the designated criteria revealed that the structural relation analysis between sustainable leadership of high school principals and empirical data. The most significant key factor of sustainable leadership was possessing in-depth knowledge. This implies that high school principals have to responsible to organize learning in order to engage their students to learn intellectually, socially, and emotionally. Thus sustainable leadership practice was an intricate weaving of multiple factors as indicated by Grooms and Reid-Martinez (2011). The suggested approach to develop sustainable leadership skills will help the high school principals to develop in-depth knowledge, diversity in problem-solving and performance, resources management, justice, length (keeping good personnel), being a conservationist, and distribution of leadership as proposed by Hargreaves and Finks (2003).

The overall results of this study revealed the importance of sustainable leadership of high school principals. This testifies that Thailand Ministry of Education should recognize that high school principals play an important role in the organization of quality education hence project development to upgrade teachers and educational personnel is a necessity. The integration of knowledge and new existing experiences can lead to a creation of innovation. Moreover, application of different techniques during the problem-solving process can help schools to gain competitive power. On this line of reasoning, results are in accordance with the opinions of the experts at the preliminary stage that concerning about high school principals must take teachers and educational personnel to learn and realize that the educational world is in a constant state of changing.

Finally, researchers would like to suggest to the Thailand Ministry of Education to prepare an administrative leader preparation training including sustainable leadership skills development model. This is to ensure that school administrators at all levels must play their roles as a sustainable leader. The two highest key factors namely possessing in-depth knowledge and diversity in problem-solving and performance should be highlighted during the professional development process. As to the structural model of sustainable leadership, its main aim is the nature of current leadership and trends of leadership in the future and found that the current leadership style has changed and differs considerably from the leadership of the past. The school leaders now have to be able to create atmosphere of cooperation and free expression of ideas from their staff. They must be flexible and adaptable to changes, and to be able to cooperate and create connections in the non-boundary world (Simanskiene & Zuperkiene, 2014). They must also be able to create new innovations, to contribute to the maintenance of co-leadership and cordial relations among the staff of the organization. In addition, school leaders should be sympathetic about other people's feeling and to communicate with them effectively, to be creative and be able to manage changes to create personal relations as well as business networks in such a way that would lead to better management and flexibility with local organizations as well as external organizations (Grooms and Reid-Martinez, 2011).

In conclusion, researchers would like to suggest for future researchers to develop a comprehensive guidelines which will model the way of empowerment and development of teachers rather than deplete human resources as it encourages sustained leadership through sustained communities of learning. Such sustained learning creates a cycle of ongoing leadership development that continuously moves current and future school principals from information to the creation of reservoirs of knowledge and wisdom, further deepening and sustaining leadership.

ABSTRACT

Smart phones are among the most prevalently used technological devices due to their various features including internet, sound recording, navigation, shooting as well as communication purpose. Areas of usage of the smartphones and the number of users are increasing more and more and they are getting more space in the daily life. The education on how to use smart phones effectively constitutes great importance in individuals' lives. When the literature is examined, there has not been any evaluation tool for smart phone education, for usage of smart phones in educational environments or for educators' skills of using smart phones with educational purposes. The current research aimed to develop "Usage of Smart Phones in Teaching-Learning Environments Scale" in order to determine whether university students use smart phones in educational environments with educational purposes. Accordingly, "Usage of Smart Phones in Teaching-Learning Environments Scale" was developed. Validity and reliability findings of the scale were demonstrated.

Key Words: Smart phone, teaching-learning environment

INTRODUCTION

Individuals composing the modern society in our day possess and use more intense and advanced technology compared to what previous generations have had. People, especially children and teenagers, feel and live through technology more effectively in their daily lives (Yildirim, Yasar and Duru, 2016). A modern individual continuously alters and improves the technology, therefore the behaviours of the individuals are developed after being affected by the changes.

Technology and educational technology requires to provide functional educational service to broader masses, to uplift the human resources to a more productive function, to supply individual differences and social requests, to improve social justice, democracy and equality of opportunity, to decrease the costs and to make the best use of already existonf opportunities. These indispensable facilities that educational technology provides depend on the power of technology, quality of educational philosophy and reliability of the learning science. The success of educational technology improves as long as education is given necessary importance. Besides, educational technology determines the actual educational requirements on a scheduled basis and comes into existence as long as these aspects are provided (Alkan, 1997; Ministry of National Education, 2002).

Information technologies in education are defined as the subsidiary tools which enhances and increases the quality of education during the educational activities (Askar, Seferoglu, 2006). On the other hand, teaching technology is defined as the implementation of the systematic information obtained in scientific research on practical area (Yalin, 2003). Teaching technology applies the systematic strategies and techniques obtained from the contents of behavioral sciences and physics in solving the educational problems. Therefore, teaching technology deals with the ways to solve the problems that are encountered in education depending upon the scientific principles. When teaching is supported by technology and materials, it is concluded that it takes shorter time to determine the requirements of the students and to arrange the teaching accordingly. When the notions of technology and material are handled in educational aspects, it can be seen that they have a great deal of functions. The main functions are as follows: They are teaching and learning materials, they convey information, they provide the demonstration of reality, they can be regarded as objectified educational systems, they can work as symbolization tools (Kaya, 2006).

Research results on the place and importance of the materials in education demonstrate that teaching Technologies and materials should be implemented in order to reach the targeted purposes in each kind and level of educational activities. The more senses a teaching activity addresses to, the more permanent the learning item is. Forgetting levels decrease as the teaching activates more sense organs. Learning occurs via 83% seeing, 11% hearing, 3.5% smelling, 1.5% feeling and 1% tasting experiences. Teaching costs can be decreased to more

economic levels with the use of technology and materials (Yalin, 2003). At this point, smart phones provides teachers and students with various opportunities more quickly and they require less effort and resources. Many objects, occasions, personal information, photographs and situations used in teaching can be instantly obtained and used in educational environments.

Attitudes of teachers towards technology and material usage and their skills to use them affect students' learning levels. Some teachers may possess necessary knowledge about the utilization of the technology and materials while some may not be competent enough. Also some teachers may be reluctant to use new technology and materials. Some may think that it is hard to use technology and materials, therefore they may feel themselves under pressure and may stick to traditional strategies, technologies and materials with the sense that they are more beneficial. Besides these assumptions, it is indispensable that smart phones will be used in educational environments. Therefore, teachers need to be competent on utilizing the smart phones with educational purposes. In order to reduce the negativities in this issue, teachers should be provided with necessary training and information on how to make use of the educational technology products (Kaya, 2006).

Teaching technologies and material usage are consulted in educational applications in order to meet three main requirements: to provide educational services to broader masses, to improve the productivity of teaching-learning processes and to individualise the teaching-learning activities. Previously stated all other facilities that teaching Technologies and materials provide are implicitly or explicitly related to these three main requirements. To narrow it down, it can be said that teaching technology and materials mostly deal with developing systems to create capacity in education and to increase the productivity of education (Hizal, 1983).

Previously, teaching Technologies and materials had secondary importance in educational environments. In recent years, technology and material usage has become prominent with the development of teaching Technologies and materials. Usage of technology and materials in teaching is harder than the use of traditional lesson tools. They require more technical, complicated and combined information and skills. Thus, including technology and materials in managerial applications has not been easy in that advanced technology and materials may cause more obstacles, they are more complicated and they are more expensive. Also technology and materials attracts the attention more than traditional ways do and their use requires guidance and training (Kaya, 2006).

When the results stated above are examined, it can be seen that the importance of using teaching Technologies and materials cannot be ignored and that technology should be more utilized in order to obtain faster and more effective learning. Teaching tools provide various ways and environments through which the information is conveyed to the learner (Yalin, 2003). Therefore, technology in educational environments needs to be handled as a tool, not as a purpose. The existence reason of technology is to develop tools and methods in order to provide solutions to problems of people. These tools and methods can serve their purposes as long as they are used appropriately (Kaya, 2006).

In this current informational age, the information increases incrementally as a result of technology. Problems in today's world such as excessive increase in population, knowledge explosion, information generation, individualization can be solved only by using modern technologies. It is not possible that we can solve today's problems using old solutions. Therefore, we need to solve the problems of our day using today's opportunities. In our day, most of the work is carried out on free and mainstream information networks. According to Masrap (1999), innovations in science and technology, especially in information technologies, triggers modern-day organizations to search for more successful managerial applications (cited from Balay, 2013). One of the productions of this search is the smart phones which are among the mostly prevalently used technological tools.

Smart phones are popular technological devices which provides many features such as internet, camera, video, voice recorder, navigation, music player besides their communicative purposes. These features increase the areas and rates of their usage (Demirci, Orhan, Demirtas, Akpınar and Sert, 2014). Smartphones have a variety of features and these features can be used interactively. Therefore, they are getting more and more integrated in all areas of life that it is impossible to prevent it. Since the young generation is highly interested in mobile phones, teachers and academicians cannot prevent their usage during the lessons. In this case, it is necessary that these tools should be used in line with the educational purposes. In literature, there has not been any assessment instrument which determines the aims of mobile phone usage in educational environments and measures their usability during the lessons. The present research aims to develop "Usage of Smart Phones in Teaching-Learning Environments Scale" in order to determine whether university students use smart phones in educational environments with educational purposes.

FINDINGS AND RESULTS

Research Population and Sample

Research population consists of students from Science Teaching, Mathematics Teaching, Kindergarten Teaching, Music Teaching, Psychological Counselling and Guidance Teaching Departments in Aksaray University Faculty of Education. There are 996 students in these departments in total. Random sampling method was conducted in order to form the research sample out of the students in the research population and one section from each department was determined as representatives. Since Psychological Counselling and Guidance Teaching Department is divided into two as daytime and evening education, one section from each division is included in the research. There are 280 students in the research sample. Research forms were distributed to 253 of 280 students, however statistical applications were conducted on 226 of them. Demographical variables determined in the research are gender, branch and age. The distribution of the student teachers according to these variables are demonstrated in the tables below. Distribution of the student teachers according to gender is given in Table 1.

Table 1. Distribution of Participants According to Gender Variable

Gender	N	%
Female	163	72,1
Male	63	27,9
Total	226	100

According to Table 1, %71,1 of the student teachers are female; %27,9 of them are male. It can be seen that the rate of female participants is more than that of males in the research sample.

Distribution of the participants according to branch variable is given in Table 2.

Table 2. Distribution of Participants According to Branch Variable

Branch	N	%
Mathematics	41	18
PCG	102	45
Kindergarten	38	17
Science	23	10
Music	22	9

While most of the student teachers participated in the research are Psychological Counselling and Guidance Teaching students, the smallest number of participants is from music teaching department.

Table 3. Distribution of Participants According to Age Variable

Age	N	%
17-25	219	97
26 and above	7	3
Total	226	100

Most of the student teachers participated in the research is between the ages of 17-25.

Development of Data Collection Tool

Quantitative methods were used in the research. “Smart Phones Usage Scale” was applied to all student teachers in research population in order to collect data. Also a personal information form prepared by the researchers was used in collecting personal data. The personal information form includes variables such as gender, age, branch.

Literature Review

It was aimed to determine the items for the scale after national and international literature about smartphone usage had been reviewed. Although smartphones are widely used at the present time, not many resources are available related to its usage in education. After findings of the national and international resources were evaluated, the items to be used in the scale were determined.

Formation of Item Pool (Suggested Items) and Expert Opinion

While determining the suggested items, opinions of the academicians who have conducted research on smartphone usage were consulted and their suggestions on how to form the item pool were taken into consideration. After related literature was reviewed and academicians who have research on the issue were consulted, items were suggested by the researchers. Since there is a lack of research on related scale in national and international resources, all items of the scale were created by the researchers. After the items were suggested, a semi-structured interview form which included open-ended questions was prepared and applied to student teachers in order to increase the content validity of the scale and to collect the opinions of the target population. The semi-structured interview form was implemented and data analysis was carried out by using content analysis method which is one of the qualitative research methods. New items that had been formed were added to the item pool. Thus, the number of items in the item pool increased to 24 with the new items from the interview forms. This item pool was decreased to the 19 suggested items according to reviewed literature and opinions of experts.

Validity and Reliability

Content Validity

The 19-item trial form was evaluated in terms of language and expression. Also the items that may be misinterpreted were decided to be omitted. Therefore an implementation was carried out with a group of 20 student teachers who did not attend the research sample. Face to face interviews were conducted with the group and they were asked to express the items which are not quite understandable. The clarity of the items were ensured with the feedback obtained from the student teachers.

The template sample developed was applied to 250 student teachers who are apart from the implementation area as a trial application. Item analysis was carried out on 226 scales that were collected. Tavsancil (2002) stated that the number of samples in factor analysis should be 5 or 10 times more than the item numbers (Yigit, Butuner and Dertlioglu, 2008). Accordingly, 10 times more than 19 items to apply in the research were targeted and 250 scales were distributed. However, 226 scales were obtained and factor analysis was carried out on them.

Construct Validity

Among the validity operations, factor analysis was carried out first in order to determine the grouping among the items (factor). In the process of factor analysis, Kaiser-Meyer-Olkin (KMO) and Bartlett's Test of Sphericity values were determined; Principal Components Analysis was conducted and varimaxrotated operations were completed.

KMO value in Principal Components Analysis was found as ,875. KMO test evaluates whether the partial correlations are small and whether the distribution is sufficient for the factor analysis. Kaiser states that the value gets perfect as it gets closer to 1 and that it is non-acceptable if it is below 0.50 (0.90 is perfect, 0.80 very good, 0.70 and 0.60 are average, 0.50 is poor) (Tavsancil, 2010). KMO value was found to be very good in this research. Bartlett's test result was found as 1049,404 ($p < .000$). The fact that Bartlett's Test of Sphericity values are meaningful supports the hypothesis that the data have multivariate normal distribution (Buyukozturk, 2005).

Table 4.KMO and Bartlett's Test Values Kaiser-Meyer-Olkin Sample Sufficiency

Kaiser-Meyer-Olkin Sample Sufficiency		,875
Bartlett's Test of Sphericity	X-square value	1049,404
	S.Level (df)	78
	P	,000

On the first factor analysis, distribution of the items to the factors were identified using the Varimax Technique and it was observed that some of the items had high values ($<.45$) in multiple factors. Items which had higher values than 0.45 in multiple factors were observed in terms of the load and items that had less than %10 difference were eliminated (Buyukozturk, 2007). At this stage, 5th, 8th, 9th, 10th, 14th and 15th items were eliminated respectively and the analysis was conducted again. Factor analysis was carried out with 13 items. According to the results of the analysis, eigenvalues of the subdimensions of the scale and their variance percentages were demonstrated in Table 5.

Table 5. Eigenvalues of the Subdimensions of the Scale and Their Variance Percentages

Factor	Initial Eigenvalues			Total Factor Loads		
	Total	Variance %	Cumulative %	Total	Variance %	Cumulative %
1	5,081	39,087	39,087	2,930	22,541	22,541
2	1,476	11,356	50,444	2,710	20,918	43,459
3	1,018	7,829	58,273	1,926	14,814	58,273

In AFA results, it was determined that there were 3 subdimensions whose eigenvalues were bigger than 1 in the scale. The first subdimension explains the % 39,087 of total variance, the second subdimension explains the %11,356 of the total variance and the third subdimension refers to %7,829 of the total variance. These three subdimensions explains the % 58,273 of the total variance. Factor load values of the scale were demonstrated in Table 6.

Table. 6. Factor Analysis Results of the Scale and Corrected Total Correlations of the Scale

Items of Smartphones Usage Scale	Factors			Corrected Total Correlations of the Items
	1	2	3	
S11	,766			,62
S12	,758			,66
S13	,744			,66
S16	,754			,51
S19	,482			,47
S6		,771		,68
S4		,744		,64
S3		,733		,69
S1		,661		,54
S7		,404		,30
				,52
S18			,792	,74
S17			,742	,73
S2			,547	,49

The fact that factor load value is .45 or more is a good criterion for the decision (Buyukozturk, 2007). On Table 6, it can be seen that factor load values of the scale ranks between ,404 and ,792.

The scale consists of three subdimensions. The first dimension of smartphone usage in education scale is “How smartphones will be used”, the second dimension of the scale is “The purpose of using smartphones” and the third dimension is “The design of using smartphones” as they can be seen in the texts of the items. Both first and second dimensions have 5 items and the third dimension has 3 items.

Baseline chart of the factor analysis is demonstrated in Figure 1.

Figure 1. Line Chart of the Smartphone Usage in Education

When the line chart is analyzed, it is seen that the scale has three dimensions. Subdimensions determined in the factor analysis and the items of each subdimension are demonstrated in Table 7 below.

Table 7. Subdimensions Determined in the Factor Analysis and Items Loaded in the Dimensions

Factor	Number of Items	Numbers of the Items
The usage of smartphones	5	11,12,13,16,19
The purpose and necessity to use smartphones	5	1,3,4,6,7
Development of smartphone usage	3	2,17,18

Reliability operations of the smartphone usage in education scale developed were carried out by the researchers. Besides, Cronbach Alfa internal consistency coefficient was considered in order to determine the reliability of the scale. When there are 3 or more answers for the scale items, Cronbach α coefficient is used. The fact that Cronbach α reliability coefficient is .70 or more demonstrates that the reliability of the test points are sufficient (Buyukozturk, 2005). Some researchers indicated the criteria used in the evaluation of the Alpha coefficient as follows (Kalayci, 2008; Ozdamar, 2013);

If Cronbach Alpha value; is $0.00 \leq \alpha < 0.40$, the scale is not reliable.

If it is $0.41 \leq \alpha < 0.60$ the scale has low reliability.

If it is $0.61 \leq \alpha < 0.80$ the scale is considerably reliable.

If it is $0.81 \leq \alpha < 1.00$ the scale is highly reliable.

Cronbach Alfa internal consistency coefficients obtained for the each dimension of the scale and for total points were demonstrated in Table 8.

Table 8. Reliability Coefficients Related to Subdimensions and Total of the Scale

Dimensions of the Scale	Cronbach Alpha(α)
The usage of smartphones	,811
The purpose and necessity to use smartphones	,765
Development of smartphone usage	,665
Total	,864

When the reliability levels of the subdimensions and total of the scale were examined, it can be seen that Smartphone Usage in Education Scale used in the research is reliable.

Table 9. Pearson Product-Moment Correlation Analysis Results

	1	2	3
Akıllı telefonun nasıl kullanılacağı	1,00	,464**	,522**
Akıllı telefonun kullanım amaç ve gerekliliği	,464**	1,00	,383**
Akıllı telefonun kullanımının geliştirilmesi	,522**	,383**	1,00

**p<.001

Pearson Product-Moment Correlation Analysis was conducted in order to determine whether there were a meaningful relationship between the factors. If the correlation coefficient is between 0.71 – 1.00 as absolute value, it is defined as high. If the correlation coefficient is between 0.50 – 0.70, it is moderate; if it is between 0.30-0.50, it is defined as low level of relationship (Buyukozturk, 2005). Pearson Product-Moment Correlation analysis results demonstrate that there is a positive meaningful relationship among the factors. These results prove that the three factors are in the same structure.

CONFIRMATORY FACTOR ANALYSIS RESULTS

Confirmatory Factor Analysis (CFA) of the scale which was applied to 226 student teachers was conducted. Confirmatory Factor Analysis (CFA) is based the measurement of the prediction that particular variables mainly take part in previously determined factors (Buyukozturk, 2009). Many fit indices have been used in order to reveal whether the model tested in Confirmatory Factor Analysis is sufficient or not (Simsek, 2007). In CFA, fit indices of the smartphone usage scale to the three factorial model was examined in teaching-learning process. Confirmatory factor analysis operations were carried out with the help of Lisrel 8,71 packaged software. The results are demonstrated in Figure 2.

Figure 2. Confirmatory factor analysis of smartphone usage in teaching-learning process scale

When Figure 2 is examined, it can be seen that the fit indices are meaningful in the smartphone usage in teaching-learning process scale which consists of 13 items and 3 subfactors ($\chi^2=109.02$ (P = 0.00021)). Correlations related to fit indices obtained from CFA results are demonstrated in Table 10.

Table 10. Fit indices obtained from CFA results

x-square	Sd	x-square	RMSA	NFI	CFI	GFI	AGFI	RFI	IFI
109.02	62	1.76	0.058	0.95	0.98	0.93	0.90	0.94	0.98

When Table 10 is examined, x-square/sd value is found as 1.76. The fact that this value is less than 5 proves that the model has high consistency. RMSA value was found slightly higher than 0.05, which is the maximum rate. NFI, GFI, CFI, RFI and IFI values are above 0.90 and this indicates that the model has quite high consistence (Simsek, 2007). When all of the consistency coefficients are examined, it is seen that CFA analysis results confirm the explanatory factor analysis results.

RESULTS

The present research aimed to develop “Usage of Smart Phones in Teaching-Learning Environments Scale” in order to measure whether university students use smart phones in educational environments with educational purposes. First of all, an item pool which consists of 24 items was formed after interviews were conducted with the students related to the topic. Then expert opinions were consulted and the number of items was reduced to 19. The scale was applied to research sample and factor analysis was implemented. Criterion for the items to involve in the scale was based on 0,30 factor load values or more (Buyukozturk, 2002). Accordingly, the final state of the scale was determined as three factors and 13 items. Analysis results to measure the reliability and validity of the scale demonstrated that “Usage of Smart Phones in Teaching-Learning Environments Scale” was suitable for measurement. The final state of the scale was given in Appendix 1. This scale that has been developed can be utilized in order to determine the purposes with which the smartphones are used in educational environments and whether student teachers, teachers and academicians have necessary skills to use these tools according to educational purposes.

ABSTRACT

The aim of this article is to evaluate unemployment of college (university) graduates in the Czech Republic from the perspective of labour market applicability. Data from years 2006-2015 from the Education Policy Centre were used for the purpose of this article. The data included information about graduates of public and private universities with focus on the field of study. Methods of descriptive and inductive statistics were used for data processing, namely the analysis of variance and test of relative frequencies. It resulted from the conducted analysis that the unemployment of university graduates is higher than the average unemployment rate in the Czech Republic. It was furthermore proven that private universities report lower percentage of unemployed graduates in the most of the monitored years. It is evident from the analysis that students studying in the capital city have better applicability in the labour market than students from other parts of the republic. The highest unemployment rate in the monitored period was proven in the fields of agriculture and forestry and in the arts, whereas other faculties from different fields of study report also a high ratio of unemployed, e.g. architecture, which belongs to the technical fields.

INTRODUCTION

Unemployment belongs to the most monitored and discussed problem in society not only in the Czech Republic. Unemployment as a macro economic effect is a natural part of market oriented economy. Not finding a job in a short time after graduation can have a big impact mainly in the fact that people don't obtain work habits and also existence problems can appear. Many fields of study can be chosen while selecting the study and it is necessary to realize that it would be appropriate also to consider the field of study also in terms of applicability after graduation.

The goal of this article is an evaluation of Czech university graduates unemployment. From the perspective of applicability of graduates on the labour market it was necessary to analyse the field of study and also to distinguish between private and state universities. For the purpose of this article, the universities were divided according to the fields of study at schools - economic, humanitarian, pedagogical, medical, artistic, technical, law and agricultural. Several working hypotheses were created within the processing and the data were monitored between 2006 and 2015.

Main purpose of the paper Varshavskaya (2016) is to analyse school-to-work transition of Russian youth. It was proven in the article that the university education increases the success during the transition from the school to the work, thus it increases the employment rate of the graduates. The author proved that the graduates living in big cities have easier transition to the labour market thanks to the bigger jobs offer. It was also one of our sub-objectives to confirm, eventually disprove this statement that graduates living in the capital city of the Czech Republic have better applicability in the labour market than students from other regions. Assumption that

unemployment is the highest in agricultural fields and the lowest in medical fields was set as next sub-hypothesis. At the same time, we assume that there is a high demand for graduates from pedagogical schools and, as a result, even the unemployment of these graduates will be at a relatively low level as expected. Similar research can be found in a paper by Pellakuri and Rajeswara (2016) which deals with various data sets like number of graduates in various fields such as medical, agriculture, engineering, veterinary etc., to make a forecast on the number employments to be availed in the coming future to overcome the problem of unemployment, and Dohnalová (2016), where the author deals with unemployment of high schools graduates. Kuncová and Mulač (2016) compared trends in higher education in the Czech Republic, Slovakia and Austria. The situation at Czech universities and colleges study articles by Zámková, Prokop and Stolín (2016) and Zámková and Blašková (2014).

The overall unemployment in the Czech Republic has been decreasing for the last years; it reached the level of 4.1% in May 2017, while it was around 6% in the year 2015. We set an assumption as a next hypothesis that unemployment of graduates is bigger than the overall unemployment in the Czech Republic. It is worth noting that unemployment in EU countries in 2015 was 10% on average (the unemployment for young people up to age of 25 was even 22% in Germany) and 11.2% in Turkey in total (young Turkish had unemployment even around 20%), see (Economic newspaper, 2017), (Business Info, 2017). According to the article Akkoyunlu (2016) there was an increased number of university graduates in Turkey, but unemployment rate of young educated people rose at the same time. The German system of university education was analysed in the article for the purpose of gaining the guidance for an effective system of education. Similarly the aim of study from author Unay-Gailhard (2016) is to provide insight into the determinants of job access after leaving education in Germany among the young population aged 15-29 based on the Labour Force Survey of 2002-2009.

MATERIALS AND METHODS

Primary data was taken from the database of the Education Policy Centre of Charles University (Education Policy Centre, 2017). Unemployed graduate is an applicant for a job registered in the Labour authority who graduated 2 years in the past at the latest. The data therefore concerns so called registered unemployment. The registered unemployment differs. It can be higher in some cases and sometimes it can be lower. In case of graduates it can be lower, because they are legally entitled to the support only in case that they provably worked for at least half a year during last 3 years. As the state pays the insurance for them, in case that they are registered in the Labour authority, they have motivation to be registered.

Associated Student Register provides information about total amount of university graduates and about students who continue in study after gaining the diploma (for example the most of bachelor students continue in follow-up master study (Czech statistical office, 2017). Data from the register are defined and processed in the way to fully correspond with the time when the Labour Authorities collect information about unemployed graduates. So they also relate to 30th April and 30th September. Only graduates, who graduated 2 years before the identification date at the latest, are analysed. For the purpose of this analysis, the term of unemployed graduate means such applicant registered in the Labour Authority, who successfully graduated 2 years ago.

Relative frequencies were used to test statistical hypotheses. The paper uses simple and multiple-sample testing of relative frequencies and ANOVA. The testing statistic for testing relative frequencies is:

$$U = \frac{p_1 - p_2}{\sqrt{\frac{(n_1 p_1 + n_2 p_2)(n - n_1 p_1 - n_2 p_2)}{n n_1 n_2}}} \quad (1)$$

If the value of this statistic calculated is greater than the critical quantile value ($\alpha = 0.05$), the hypothesis H_0 is rejected and the existence of different percentage of unemployment may well be assumed. For further details, see (Hindls, 2003). Gretl and Statistica software was used for primary data processing.

FINDINGS

The number of university graduates has changed fundamentally in recent years in the Czech Republic (CR). An

overview of unemployment development in the Czech Republic is stated in the [Table 1] in total and also from the perspective of university (UNI) graduates. It is evident in the [Table 1] that the number of university graduates grew markedly till 2011. Then the number of university graduates has decreased gradually since 2011. We tested the hypothesis, that the graduates unemployment rate is higher than the overall unemployment. This assumption was statistically proved only in years 2013-2015. We were not able to prove this assumption for the previous years. The percentage of unemployed graduates has ranged above 9% limit since the economic crisis which took place in 2009. The biggest change occurred in case of UNI graduates in comparison of rising unemployment between 2007 and 2013, namely an increase of almost 230%. A significant increase in the number of unemployed university graduates is largely caused by a steady increase in the number of graduates entering the labour market, but even so, these figures show that the consequences of the economic crisis avoided them no less than graduates with lower education. A significant increase in the number of new graduates applying for employment at Labour Authorities confirms the fact, that, graduates belong to the group of people who are the most vulnerable to unemployment in times of lack of vacancies. In years 2014 and 2015 there was a decrease and in 2015 there were almost 19% of unemployed graduates less than in 2013. However, the numbers of unemployed graduates are, of course, different in Prague than in the Ústecký or Moravskoslezský Region, regardless of which university they graduate. Graduates of particular schools enter regional labour markets, which are quite different in terms of job opportunities. Therefore, we will focus in our further processing on the last two years in view of the comparability of different schools, study fields and local jurisdiction of the university.

Years	Labour force (in thousands)	Unemployment Total	No. of graduates (in thousands)	Unemployment of graduates
2006	5 199.4	7.10%	50.302	10.3%
2007	5 198.3	5.30%	59.686	8.0%
2008	5 232.3	4.40%	68.555	7.5%
2009	5 286.5	6.70%	76.710	9.0%
2010	5 268.9	7.30%	82.307	10.1%
2011	5 223.0	6.70%	86.151	9.9%
2012	5 256.9	7.00%	85.116	9.1%
2013	5 306.0	7.00%	83.157	11.8%
2014	5 297.9	6.10%	80.406	11.3%
2015	5 309.9	5.00%	74.638	9.9%

Table 1: Overall unemployment and graduates unemployment.

If we look at the overall number of UNI graduates, it is evident that the number of graduates of the public universities has decreased regularly for the last three years, similarly the graduates number has decreased in the private universities, namely the 25% decrease. Private universities have contributed only about 13-15% to the total number of graduates in recent years, i.e. the unemployment rate of this group (if it was not extremely high) would not be a serious problem. The West Moravian University of Třebíč, o.p appears as the least successful private university, from the point of view of the unemployment of graduates, which underlines the consideration, that place of the founder is very important for the private universities. This university has about 25% unemployment. The school has around 150-200 graduates every year. Most of the private universities have the number of unemployed graduates of units, a few dozen at most. In [Table 2] there is an unemployment rate of graduates divided into private and state universities and both types according to the founder are further divided into schools having a place of study in the capital and elsewhere in the Czech Republic. Data on 49 private universities and 152 public university faculties were available.

Years	Private UNI – capital city	Private UNI – rest of CR	Public UNI – capital city	Public UNI – rest of CR
2006	2.34%	5.81%	3.20%	8.22%
2007	2.14%	3.65%	2.52%	5.88%
2008	2.27%	2.80%	2.48%	5.47%
2009	2.66%	3.54%	2.67%	6.39%
2010	2.89%	5.59%	3.24%	7.46%
2011	3.17%	5.78%	3.26%	7.40%
2012	2.78%	4.22%	3.25%	6.95%
2013	3.82%	7.79%	4.28%	8.81%
2014	4.36%	8.91%	3.95%	8.72%
2015	5.18%	7.23%	3.79%	7.39%

Table 2: Percentage of unemployed graduates according to the founder and place of study.

Graduates of private universities have reported better employment [Table 2] in comparison with graduates of public universities for several years. Their unemployment rate has been lower for 6 years, which is a significant change from the previous years. Their unemployment rate in 2012 was only 4.2%, while it was 5.8% for graduates of public universities. There are two main reasons for it. Many private universities are situated in the capital (Prague), and their graduates find the job much easier due to the low unemployment of university graduates in Prague and a much wider offer of appropriate jobs than in other regions. Perhaps the most significant cause is the fact that private universities are more often attended by older people who already have jobs and only supplement or increase their qualifications. We create two hypotheses to confirm this assumption:

1. percentage of unemployed graduates studying in the capital city is significantly lower than in the rest of the Czech Republic,
2. percentage of unemployed graduates of private universities is lower than for graduates of public universities.

[Table 3] lists the test criteria values complemented by significance. In most cases, zero hypotheses about the frequency match of the two monitored files were refuted. As a positive fact it can be claimed that in 2014 and 2015 there was no evidence of a significant difference between the unemployment of graduates for private and public universities.

Years	1st hypothesis	2nd hypothesis
2006	-2.56***	-2.99***
2007	-1.47	-3.74***
2008	-0.88	-5.88***
2009	-0.03	-6.37***
2010	-1.59	-4.37***
2011	-0.43	-3.85***
2012	-2.25**	-7.03***
2013	-1.86**	-2.06**
2014	1.61	0.39
2015	5.06***	-0.29

Table 3: Frequency match test (*** p-value< 0.01, ** p-value< 0.05, *p-value<0.1).

We will now focus on public universities students in detail. Number of graduates has been decreasing since 2011, so we will relate the comparison of years 2014 and 2015 to this year. Number of graduates decreased by 5% in 2014 (if we relate it to the previous year, it would be only 4.7%) The increase of the number of graduates can be observed in the fields of medicine, architecture and informatics. These increases are only about 2-3%. In 2015 there were 11% less graduates than in 2011. If we look at particular fields then the biggest decline of the number of graduates was in science and economics, where the decline was around 15%. It is however true, that these universities have the highest number of graduates from the long term perspective. Unlike these fields the number of graduates raised in architecture and arts. Percentage rate of university graduates unemployment

according to the type of faculty is shown in [Table 4]. Additionally an analysis by means of analysis of variance was conducted for the year 2015, see [Figure 1].

UNI faculty type	2015	2014	2011
Science	13.00%	15.11%	11.69%
Philosophy and Humanities	10.72 %	11.75%	9.64%
Medical fields	6.30%	6.79%	5.68%
Technical fields	11.61%	13.50%	12.96%
Law	6.24%	6.22%	7.73%
Pedagogy	6.36%	8.72%	6.85%
Agriculture and forestry	17.74%	20.74%	24.42%
Economy	11.92%	14.03%	13.27%
Arts	12.28%	15.40%	11.80%

Table 4: Unemployment according to the type of studied faculty.

It is evident from the [Figure 1] that there exists a statistically significant difference in the unemployment rate for agricultural and medical faculties as well as for agricultural and pedagogical. The year 2014 appears from the study's view like a year with significantly higher unemployment rate than the two remaining years in [Table 4]. Pedagogical, legal and medical fields appear like fields with the lowest unemployment rate and there is therefore better applicability than elsewhere. The results from [Table 4] are then supported graphically for the year 2015 in [Figure 2]. If we look at particular fields in details, it is apparent that within the technically oriented universities there is one faculty with significantly higher graduates' unemployment rate. Based on the tests this faculty was identified as extreme. The analysis is conducted in [Table 5] and [Table 6]. In these tables there are always 5 faculties with the lowest and the highest graduates' unemployment rate in 2014 and 2015.

Figure 1: ANOVA: Unemployment according to the type of studied faculty.

Figure 2: Box plot: Unemployment according to the type of studied faculty

The smallest percentage of unemployed graduates is in both years at the Faculty of Mathematics and Physics of Charles University, which has a long-term percentage of unemployed graduates less than 1%. This information should not be surprising, as there are a large percentage of students studying physics and informatics where there is a long-term demand for graduates. Only 5 faculties reported unemployment of graduates under 2% in 2015. On the contrary, unemployment over 30% occurred at 6 faculties in 2014 and at only 3 faculties in 2015. Field of architecture was evaluated as the most problematic field from the long term perspective - faculty of architecture BUT had almost 57.32% of unemployed graduates in 2015. This faculty is the extreme from [Figure 2] mentioned above.

Type of UNI faculty	2014	2015
Mathematics and Physics Faculty (CU)	0.905	0.498
Theatre faculty (AMU)	1.786	1.205
Faculty of Film and Television (AMU)	2.564	1.333
Pedagogical faculty (CU)	2.889	1.445
Faculty of Law (CU)	1.815	1.84
Catholic theological faculty (CU)	1.351	8.451
Evangelical Theological Faculty (CU)	1.471	9.589

Table 5: Faculties with the lowest graduates' unemployment rate [%].

Type of UNI faculty	2014	2015
Faculty of Architecture (BUT)	52.5	57.317
Faculty of Agronomy (MENDELU)	39.394	31.633
Ladislav Sutnar's Faculty of Design and Art (UWB)	35.484	31.325
Faculty of Veterinary Hygiene and EUNlogy (UVPSB)	23.148	29.008
Academy of Fine Arts in Prague (AFA)	23.81	27.273
Faculty of Fine Arts (BUT)	31.915	24.0
Faculty of Architecture (CTU)	34.682	21.649

Table 6: Faculties with the highest graduates' unemployment rate [%].

DISCUSSION AND CONCLUSIONS

The aim of this article is to evaluate unemployment of university graduates from the perspective of labour market applicability in the Czech Republic. Data from years 2006-2015 from the Education Policy Centre were monitored. Analysis of contingency tables was used for processing of the data, hypotheses were tested by means and test of relative frequencies and also ANOVA was used. According to the processed evaluation it is evident that number of graduates in the Czech Republic grew significantly till the year 2011. Number of university graduates has been then decreasing gradually since 2012. The hypothesis, that unemployment of university graduates is higher than the overall unemployment in the Czech Republic, was tested. This assumption was statistically proven only for the years 2013-2015. The percentage of unemployed graduates has ranged above 9% limit since the economic crisis which took place in 2009. It is apparent that the consequences of the economic crisis avoided them no less than graduates with lower education.

The research shows that graduates of private universities report better employability compared to graduates of public universities. Their unemployment rate in the school year 2012 was only 4.2%, while it was 5.8% for graduates of public universities. It is evident, that many private universities are situated in the Czech capital city, where their graduates find the job much easier due to a much wider offer of appropriate jobs than in other regions. Another reason is the fact, that private universities are more often attended by older people who only supplement or increase their qualifications. A hypothesis, that percentage of unemployed graduates studying in the capital city is significantly lower than in the rest of the republic, was tested. It was proven that students studying in the capital city of Prague have really a better applicability in the labour market than students from other parts of the Czech Republic. Subsequently a hypothesis that percentage of unemployed graduates of private universities is lower than for graduates of public universities was tested. It was proven by the test that indeed the private universities report lower percentage of unemployed graduates in the most of the monitored years. The private universities have contributed only about 13-15% to the total number of graduates in recent years. The West Moravian University of Třebíč, o.p. was evaluated as the least successful private university, from the point of view of the unemployment of graduates.

The unemployment rate of graduates of public universities was monitored according to the type of faculty studied in a more detailed analysis. It was proven that there exists a statistically significant difference in the unemployment rate for agricultural and medical faculties as well as for agricultural and pedagogical faculties. According to the analysis, pedagogical and medical fields were stated as fields with the lowest percentage of graduates' unemployment. The highest unemployment rate in the monitored period was proven in the fields of agriculture and forestry and in the arts. The smallest percentage of unemployed graduates in the years 2014 and 2015 is at the Faculty of Mathematics and Physics of Charles University, which has a long-term percentage of unemployed graduates less than 1%. Field of architecture was evaluated as the most problematic field from the long term perspective - faculty of architecture BUT had almost 57.32% of unemployed graduates in 2015.

While it is evident from our analysis that the number of university graduates in the Czech Republic decreased in the monitored period, it was proven in the article Akkoyunlu (2016) that the number of graduates in Turkey is growing. Similarly to our article, it was proven by the author Akkoyunlu (2016), that the number of unemployed educated people is increasing. Likewise in our article, author Varshavskaya (2016) has proven that graduates living in big cities have easier transition to the labour market thanks to a wider job offer.

If we consider the selection of the university in terms of a chance to find a job easily, medicine appears as a long term prospective field. The law and pedagogical fields look also very positive from the overall overview. On the other hand, those with the worst applicability are all fields related to agriculture, forestry and agronomy, but also, for example, economics faculties. It points to the fact, that the labour market is saturated by graduates of these fields and therefore it is more difficult to find a job in this branch. If we look at particular faculties in details it is apparent that the study of architecture has very poor results. This field belongs to the technical fields and it increases the percentage of unemployed people in this direction of study. Further extended analysis of the fields of study will be certainly interesting and therefore following publications will be focused on this topic.

ABSTRACT

The effect of written corrective feedback (WCF) has been a highly controversial issue in second language acquisition and writing research and various views have been put forward. Therefore, in order to support findings in the literature, this study aims to focus on the possible effects of various feedback types and revision process on EFL learners' writing performance by replicating the study of Shintani, Ellis and Suzuki (2014). The participants of the study are 146 EFL learners who study at the School of Foreign Languages at a state university in Turkey and have A2 level language proficiency according to CEFR descriptions. As the design of the study, the participants were divided into five feedback groups; namely direct corrective feedback (DCF), metalinguistic explanation (ME), direct corrective feedback and revision (DCF+R), metalinguistic explanation and revision (ME+R) and a control group. Following a treatment session consisting of three writing tasks including direct and indirect corrective feedback, the learners' performances were evaluated in terms of their accuracy in the use of past simple tense and indefinite articles in each task and they were interviewed considering their views about the effects of each feedback type. The findings suggest that there is no statistically significant difference in the effect of types of direct corrective feedback or revision process on grammatical accuracy in writing whereas indirect corrective feedback seems effective and learners preferred it for their written products.

Key words: direct corrective feedback, indirect corrective feedback, revision, accuracy, writing

INTRODUCTION

In recent years, there has been an increasing interest in the research on the effect of written corrective feedback. While the studies have commonly focused on the effect of direct corrective feedback (DCF) on basic grammatical forms such as past simple or articles, alternative feedback types such as metalinguistic explanations or indirect corrective feedback such as using correction codes have been neglected. Likewise, as Sheen, Wright and Moldawa (2009) have indicated the number of the studies on focused CF (on a single form) is limited. Moreover, there are few studies on the effect of revision process on the accuracy in writing tasks as stated by Shintani et. al., (2014). Another issue which is needed to shed light on is how language learners regard these feedback types or which feedback type they find the most effective for their accuracy in the use of grammatical forms in writing as also proposed by Poulos and Mahony (2008) "... little known research has focused on students' perceptions of feedback and the contribution feedback makes to students' learning and teaching" (p. 143). To this end, Bitchener and Knoch (2015) have stated that "While a growing body of research has begun investigating these issues over the last 15–20 years, the field is in need of replication studies before firm conclusions can be reached." (p. 405) Thus, the current study addresses these issues and aims to support the research on the topic by replicating the study of Shintani et. al., (2014) with the permission of the researchers and investigating further the effect of revision and indirect corrective feedback.

THEORATICAL BACKGROUND

The notion of corrective feedback

Corrective feedback (CF), which can be defined as any attempts to focus on L2 learners' errors and provide correct linguistics forms, has been one of the controversial issues in second language writing and acquisition since views about its types, effects or benefits vary. For example, Kepner (1991) and Truscott (1996;1999;2007) have claimed that error correction in grammatical forms has nothing to do with writing skill, therefore, one-shot error correction by teachers proves no benefit for language learners to improve their writing skill. Conversely, Bitchener and Knoch (2008; 2009), Ferris (2003; 2004; 2006), and Sheen (2007) have proposed that corrective feedback is positively effective in the improvement of L2 writing skill.

As much as the effect of corrective feedback has been discussed, another highly discussed issue is the "correct form of corrective feedback". In other words, there is also no agreement on when or how to provide corrective

feedback to learners. With this regard, corrective feedback has been classified and named as direct (explicit) or indirect (implicit) corrective feedback (e.g., Ferris & Roberts, 2001) focused or unfocused corrective feedback (e.g., Bitchener, 2008; Ellis, Sheen, Murakami & Takashima, 2008; Sheen, 2007; Sheen et.al, 2009), written corrective feedback or metalinguistic explanations (e.g., Shintani et.al., 2014), coded or uncoded corrective feedback (e.g., Hartshorn, Evans, Merrill, Sudweeks, Strong-Krause & Anderson, 2010), and revised or unrevised corrective feedback (e.g., Chandler, 2003; Fathman & Whalley, 1990; Ferris, 2006; Ferris & Roberts, 2001). Lastly, another discussed issue in CF research is the availability of a control group in the study design. While a number of researchers have stated that it is not fair to provide feedback to a group of participants when control group is made deprived of it (e.g., Ferris, 2004;2006), other researchers have supported the idea of designing a control group (e.g., Bitchener, 2008). To this end, the current study combines these categories and focuses on direct (written corrective feedback and metalinguistic explanations) and indirect corrective feedback (coded) with revision process on focused forms (indefinite articles and past simple).

Direct or indirect corrective feedback

Considering the evidence from the literature, it seems obvious that one of the ubiquitous types of CF for researchers has been direct and indirect CF for years. Direct CF including written corrective feedback and metalinguistic explanations provides learners with the correct language forms whereas indirect CF including underlying and coding the errors guides learners to correct the errors themselves. In the literature, there has been continuous interest in the effects of direct CF and indirect CF and studies have set forth various findings (e.g., Chandler, 2003; Ellis et. al., 2008; Ferris, 2006; Ferris & Roberts, 2001; Storch, 2009; Van Beuningen, De Jong, & Kuiken, 2008). For instance, the study of Chandler (2003) has revealed that direct CF was more effective than indirect CF while indirect CF emerged to be more effective in the long term. Similarly, Ferris and Helt (2000) have indicated a positive effect of indirect CF. Conversely, Van Beuningen et. al., (2008) have concluded that despite no obvious effect in short term; direct CF is more effective in long term than indirect CF. Yet, a number of studies have revealed no difference in the effects of these feedback types (eg., Ellis, et.al, 2008; Sheen, et. al., 2009; Storch, 2009). Consequently, considering this variety in the findings, Ellis et. al., (2008) have suggested that making a distinction between the effects of the two types makes no sense. Thus, more empirical data are essential to base the findings on the grounded theory.

The views of learners about CF

While there is a lasting debate on the effects of CF types and how it is provided (e.g., focused vs unfocused, revision), one of the neglected issues in this research area is how the learners regard the effect of these types (e.g., Armhein & Nassaji, 2010; Ashwell, 2000; Poulos & Mahony, 2008; Schulz, 2001). To start with, the study of Poulos and Mahony (2008) on the effect of feedback as an umbrella term has revealed that learners have positive attitudes towards receiving feedback by their teachers. Lee (2005) has found out that learners preferred overt correction by their teachers, but they also benefitted from indirect CF in the form of coding. The study of Armhein and Nassaji (2010) that has investigated views of ESL teachers and learners about CF has revealed that teachers and learners agree on the importance of CF, but their views differ to a certain extent. In that study, similar to the findings of Lee's (2005) study, it has emerged that ESL learners also preferred overt correction and error correction with a comment by the teacher. Nevertheless, few studies have focused on learners' beliefs about the effect of feedback as also suggested by Poulos and Mahony (2008). Considering limited number of studies on learners' beliefs and the other theoretical issues mentioned above, this study addresses the research questions¹ below:

1. Is there any difference in the effect of variables (feedback type, revision and frequency of feedback) on EFL learners' grammatical accuracy in writing?
2. What are EFL learners' views about corrective feedback?

THE STUDY

Setting and the participants

The study was carried out at a state university in Turkey with 146 EFL learners who have A2 level language proficiency according to CEFR descriptions after having obtained the approval of Ethical Committee of the university and the Department of Basic English. The university provides higher education in various departments and also English language learning program for an academic year. The students who pass the English proficiency exam administrated at the beginning of each academic year by obtaining 60 points or above out of 100 carry on their education in their departments and a number of courses are presented in English to them. On the other hand, the students who fail the exam are required to launch at English language learning program which is appropriate for their language level. The program provides integrated courses for 30 hours a week and language use (grammatical accuracy) constitutes 40 % in the distribution of each language skill and knowledge area in the

¹ Adapted from the study of Shintani et.al (2014)

curriculum. Language forms are taught in contexts implicitly and revised regularly. Furthermore, the skill of writing is highly significant and constitutes 15 % in the distribution. In this sense, learners are presented with various genres and styles and they keep track of their own progress in writing by keeping their products in portfolios. Following a writing task, students are provided with corrective feedback by their teachers by using correction codes that they were taught through norming sessions. Considering the meanings of the codes, students revise their products and write the second version and after teachers have checked these versions, students keep their products in their portfolios until they are evaluated by their teacher at the end of the academic year. Considering the importance of grammar and writing in this language program, it seems clear that it is eligible and convenient for the design of Shintani's et al (2014) study.

As for the participants, they are 146 A2 level learners who study at five different classes and who are selected on voluntary basis. Having been informed by the researchers about the aim and the process of the study, they became volunteers to involve in the study by signing a consent form and they were active participants in the study. However, since a small number of students did not show up for all three tasks, they were eliminated from the study. Thus, the total number of the participants was determined as 146. See Table 1 for the distribution of the participants

Table 1. The distribution of the participants

	Frequency	Percent	Valid Percent	Cumulative Percent
1 ME	34	5.3	23.3	23.3
2 DCF	25	3.9	17.1	40.4
3 ME+R	28	4.4	19.2	59.6
4 DCF+R	30	4.7	20.5	80.1
5 Comp.	29	4.5	19.9	100.0
Total	146	22.8	100.0	

Research design

Both quantitative and qualitative research designs were employed in the current study in light of the study of Shintani et. al., (2014). In order to collect data, first, the learners were assigned groups as mentioned above and received treatment for 3 weeks on the target forms past simple and indefinite articles. The reason for selecting these structures as the target forms stems from what Storch (2010) has suggested (See below) and other researchers who have proposed that articles are particularly difficult to acquire for language learners whose native language does not have articles (e.g., Ellis et. al, 2008; Bitchener et al., 2005). Furthermore, Ellis et. al., (2008) have claimed that CF is likely to be more effective in language forms that language learners have partially acquired such as articles.

As the study was conducted in real classroom situation, no modification was made for the treatment. In other words, the same procedure for writing classes was also adopted for the study. Writing tasks which were involved in the syllabus were used as the material of the study and class teachers involved in the feedback process based on the suggestion of Storch (2010):

...Thus future research on WCF needs to be conducted in authentic classrooms so that the feedback is given within the context of an instructional program, with ecologically valid writing tasks, and where revision is meaningful for the students because it has a clear purpose (e.g. assessment). Such studies need to be longitudinal to allow for more than one treatment occasion... It also needs to reflect and reinforce what is taught and emphasized in the class. (Storch, 2010, p. 43)

In this sense, in the first week, the learners were assigned a writing task (See Appendix A for a sample task). Their class teachers who were trained and informed about the procedures and data collection process collected the papers of the participants and gave corrective feedback to the papers for the target structures (past simple and indefinite articles) appropriate for their treatment group. In the second week, the participants were allowed to look through their first assignment accordingly for five minutes and assigned the second task. In other words,

DCF= Students were provided with the correct forms of the target forms explicitly by the teacher.

ME= Students were provided explanations about the correct use of the target forms.

DCF+ R= Students were provided with the correct forms explicitly by the teacher and allowed to revise them in the second draft.

ME+R= Students were provided explanations about the correct use of the target forms and allowed to revise them in the second draft.

Control Group= Students had no feedback for their first task and were assigned the second task.

Similarly, having collected the second task, the class teachers gave corrective feedback to the students' papers. Yet, this time; they used a different feedback type and provided indirect corrective feedback by using correction codes to the students' papers. All groups except for the control group received indirect corrective feedback through correction codes and wrote the third and the last task.

Table 2. Research design

	ME (n=34)	DCF (n= 25)	ME+R (n=28)	DCF + R (n=30)	Control Group (29)
Week 1	Writing Task 1				
Week 2	ME (5 min)	DCF (5 min)	ME (5 min) Revision (20')	DCF (5 min) Revision (20')	No treatment
	Writing Task 2				
Week 3	Writing Task 3 (correction codes)				

In order to obtain quantitative data of the study and compare the effects of these feedback types, the scoring principle '*means of obligatory occasion analysis*' (Ellis & Barkhuizen, 2005) was adopted and used by the researchers to evaluate the accuracy of the target forms. Therefore, total score of students was compromised for the assigned task by dividing the total number of correct use of the target forms by the total number of obligatory occasions. SPSS version 20 was used to conduct analyses. Additionally, as the last step of the research design, randomly selected participants were interviewed to support the findings (See Appendix B for interview questions).

FINDINGS AND DISCUSSION

In order to collect data, a three-week treatment was carried out with five groups of CF (WCF, ME, WCF+R, ME+R, control group). Following the treatment in the first two weeks, learners received coded indirect CF in the third week. Accuracy scores of the students for the use of simple past tense and indefinite articles were calculated and repeated measures ANOVAs and Post-Hoc Bonferroni analyses were conducted in order to compare the scores of the groups. With this regard, the findings related to the first research question which addressed whether there is any difference in the effect of type and frequency of feedback on EFL learners' grammatical accuracy in writing reported that there is no significant difference in the effect of types of feedback [$F(4,141)=4.858, p=0.01$] for the use of past simple and [$F(4,141)=2.131, p=.080$] for the use of indefinite articles. Similarly, there was no significant effect of revision process on grammatical accuracy in writing tasks. See tables 3 and 4 for the analyses of comparisons.

Table 3. Pairwise comparison for the use of past simple
Measure: time effect (past simple)

group	time	Mean	Std. Error	95% Confidence Interval	
				Lower Bound	Upper Bound
1 ME	1	8.882	.532	7.830	9.935
	2	8.088	.607	6.888	9.289
	3	11.559	.860	9.859	13.258
2 DCF	1	5.680	.621	4.453	6.907
	2	5.640	.708	4.240	7.040
	3	8.280	1.003	6.298	10.262
3 ME+R	1	5.821	.586	4.662	6.981
	2	7.321	.669	5.998	8.644
	3	9.107	.947	7.234	10.980
4 DCF+R	1	7.933	.567	6.813	9.053
	2	7.067	.647	5.788	8.345
	3	12.400	.915	10.591	14.209
5 Comp.	1	6.586	.576	5.447	7.725
	2	6.276	.658	4.976	7.576
	3	9.276	.931	7.436	11.116

Table 4. Pairwise comparison for the use of indefinite articles
Measure: time effect (articles)

Group	time	Mean	Std. Error	95% Confidence Interval	
				Lower Bound	Upper Bound
1 ME	1	1.853	.158	1.541	2.165
	2	1.265	.127	1.014	1.516
	3	2.000	.213	1.579	2.421
2 DCF	1	1.520	.184	1.157	1.883
	2	1.400	.148	1.107	1.693
	3	1.680	.248	1.189	2.171
3 ME+R	1	1.679	.174	1.335	2.022
	2	1.571	.140	1.295	1.848
	3	2.643	.235	2.179	3.107
4 DCF+R	1	1.600	.168	1.268	1.932
	2	1.767	.135	1.499	2.034
	3	2.233	.227	1.785	2.681
5 Comp.	1	1.759	.171	1.421	2.096
	2	1.345	.138	1.073	1.617
	3	1.828	.231	1.372	2.283

As could be seen in the tables concerning the use of simple past and indefinite articles, there was no significant difference between the mean scores in any groups related to feedback types. Likewise, the mean scores in revision groups of ME and DCF were not statistically different from each other. These findings support the previous ones that have revealed no significant difference among types of CF (eg., Ellis, et.al, 2008; Sheen, et. al., 2009; Storch, 2009).

With respect to frequency of feedback, the study aimed to explore whether one-shot corrective feedback influences grammatical accuracy as stated in the literature (eg., e.g., Bitchener et al., 2005; Hartshorn et al., 2010). Therefore, the participants received various types of corrective feedback for the second task in treatment groups and all participants in treatment and control groups received coded corrective feedback that had been used as part of the practices of the program for a long time for the third task. Thus, a comparison was made between the effects of one-shot CF and long term CF. To this end, the output of the analyses suggested that one-shot CF did not have a positive effect on grammatical accuracy as compared to receiving the same type of feedback for long, which is illustrated in Figures 1 and 2.

Figure 1. Comparison of the treatment groups for the use of past simple

Figure 2. Comparison of the treatment groups for the use of indefinite articles

It is seen in the Figures 1 and 2 that the scores of the participants dropped at Time 2 when they received various types of CF that were different from what they had already been familiar with for their grammatical errors. Their scores rose at Time 3 when they received coded CF which they had been familiar with for relatively longer time compared to receiving one-shot CF. Therefore, these findings are in line with Truscott and Hsu (2008) who have asserted that giving feedback only once does not benefit to learners. On the other hand, the findings are contrary with what has been commonly suggested in the literature considering that they revealed a positive impact of receiving on-shot CF for treatment (e.g., Bitchener et al., 2005; Hartshorn et al., 2010; Sheen, 2007). Conversely, it could be assumed that the findings are in line with the research considering receiving long term CF (Chandler, 2003; Van Beuningen et. al., 2008) as beneficial.

As for learners' views about CF which is suggested to be neglected as a research concern, the content analysis of the study sets forth varied findings that support quantitative findings. In other words, while there was no statistically significant difference in the effect of feedback types, interviews also revealed no significant difference in the effect of particular feedback type reported by the participants. Ten out of twenty participants stated that the feedback type used in their treatment group enabled them to focus on their errors more whereas the other ten indicated that the coded CF that they are used to proves more beneficial to them since it encouraged critical thinking and awareness. Moreover, while eleven participants reported that they focused their errors on the use of indefinite articles, nine reflected that they focused on their errors on the use of simple past tense. Lastly, the participants who were in the treatment groups of revision pointed out a positive effect of revision process as it helped them notice the errors and avoid repeating them. As a reason for their being attentive to their errors, they stated that it was because they did not want to write the draft again (See Appendix C for a sample of interviews). As a whole, supporting statistical data with learners' voices was one of the purposes of the current study that could be thought to be important considering the highlighted lack of research in the literature on learners' views about CF (e.g., Armhein & Nassaji, 2010; Poulos & Mahony, 2008)

CONCLUSION

The aim of this study was to investigate probable effects of CF on the accuracy in writing by supporting findings with learners' views through a three-week treatment session. The effect of potential variables (type and frequency of feedback) was considered while searching for evidence corresponding with findings of the previous research. Thus, research questions addressed the factors (type and frequency of CF) that might have an impact on EFL learners' grammatical accuracy in writing and their views about the effect of different types of CF. The data emerged as a result of experimental designed suggested that there was no significant difference in association with feedback type, but there was a considerable difference in the tasks related to frequency of treatment. As addressed in the second research question, participants' views supported the variety in the effects of type and frequency of CF, thus proposing use of various feedback types in writing classes. Furthermore, it could be suggested that an agreed type of feedback might be determined by negotiating with students. As for the limitations of the study, it could be stated that the sample may not reflect the population or time constraint of the treatment could be a concern. For further research, it is suggested that the study be conducted in various setting and with more participants and long term effect of each feedback type could be investigated to obtain more reliable findings to support existing research.

APPENDICES

Appendix A: A sample task used in the treatment

Write a paragraph about a memorable night by answering the questions below:

- When was it? - Where were you? - Who were you with?
- What did you do? - How did you feel? - Why was it a memorable night?

Appendix B. Interview questions (Adapted from Shintani et.al, 2014)

For ME treatment

1. You were given the grammar explanation sheet with your original writing. Did you understand the explanation well?
2. When you analyzed your own writing based on the grammar explanations did you identify your errors?
3. Then you worked on another writing task. What did you pay attention to while you were writing?

[If the participant did not mention the target structure or mentioned only one of the two target structure, the interviewer further asked whether he/she paid any attention to any of the target structure].

4. Did you think about the grammar points explained in the sheet?
5. What about ____ (the target structure that the participant did not mention)?
6. Did you focus more on your errors related to the use of simple past or indefinite articles (a/an)?²

For DCF treatment

1. You read your original writing with some correction on it. Did you try to analyse the corrections to work out why you had made the errors?
2. Then you worked on another writing task. What did you pay attention to while you were writing?

[If the participant did not mention the target structure or mentioned only one of the two target structure, the interviewer further asked whether he/she paid any attention to any of the target structure].

3. Did you think about the correction that you received on your original writing?
 4. What about this correction (pointing the CF on the error that the participant did not mention)?
 5. Did you focus more on your errors related to the use of simple past or indefinite articles (a/an)?³
-

² included in the questions by the researchers

Appendix C. Transcript of a sample interview

(This interview was conducted by Researcher 1)

1. You read your original writing with some correction on it. Did you try to analyze the corrections to work out why you had made the errors?

S27: Yes, I did.

2. Then you worked on another writing task. What did you pay attention to while you were writing?

S27: Yes, first of all, grammar was simple past, so I had to use 'was' not 'is'. I focused on this on my first draft, but I made an error. You wrote me directly the correct form. I would prefer discovering the error myself, though. I did not make any errors on my second draft. To me, encouraging us to find our own errors is more useful than this feedback type.

R1: You mean, you would like to receive feedback by using correction codes, right?

S27: I think we need to work hard to find our errors. You try to find your errors. If you can't, you look up reference books. I believe it is better.

R1: So, you don't think that receiving direct corrective feedback is helpful.

S27: No, I don't.

3. Did you focus more on your errors related to the use of simple past or indefinite articles (a/an)?

S27: I have problems with the use of a/ an, so a/ an

Digital Stories to Teach English to Young Learners: Prospective ELT Teachers' Beliefs, Attitudes and Experiences

Şule Çelik KORKMAZ

English Language Teaching Department

Uludağ University

Turkey

scelik@uludag.edu.tr

ABSTRACT

Equipping prospective teachers (PTs) of young English learners with a variety of child-appropriate materials and techniques is very prominent. Digital Stories (DSs) with their multimodal features enable teachers to meet the needs of 21st century digital native students when learning a foreign language. Thus, the study aims to investigate the beliefs, attitudes and experiences of 75 prospective English teachers of Uludağ University ELT department about the creation and using child-appropriate digital stories to teach English to young learners (YLS). The data were collected through a 5-point Likert scale questionnaire with 26 items and the Cronbach alpha of the items was .87. In addition, a semi-structured interview was conducted with 10 participants to delve into the results obtained from the questionnaire. The descriptive analysis of the questionnaire revealed that nearly all of the participants agreed that digital stories should be used to take children's attention easily, better learn a foreign language, increase YLS' motivation, change the dynamics of the traditional classrooms, and keep YLS' attention throughout the lesson. However, based on their own experience in creating a child-appropriate digital story, nearly half of them reported that it was not easy to create an effective DS without being educated.

Key Words: ELT prospective teachers, a child-appropriate digital story, teaching English to children, beliefs and experiences.

INTRODUCTION

Children have fantasy world and like meaning-based imaginative play. Through stories, children's interests, attention, and imagination are engaged meaningfully (Read, 2007; Robin, 2008). In addition, stories with familiar cross-curricular topics can bring the world into the classroom to enable learners compensate the distance between learners' world and the language (Skouge & Rao, 2009; Yılmaz & Karatepe, 2013). Because children have great capacity to pick up ready phrases, in other words, chunks (Moon, 2000) both digital and print-based stories with repetitive and predictable formulas and patterns help learners develop cognitive and language skills (Porras González, 2010). Furthermore, they foster learners' social/ emotional skills and attitudes as they listen, provide a response of laughter, sadness, excitement, and anticipation, collaborate, take turns, show respect for others (Brewster, Ellis & Girard, 1992; Çubukçu, 2012; Haznedar, 2010; Read, 2007). Thus, it is very prominent for teachers to have the repertoire of various stories as teaching resources (Skouge & Rao, 2009).

Human cognition and learning could be facilitated through the growing use of intelligent software agents (Natriello, 2007). Hence, in addition to print-based stories, the digital storytelling should be used as one of the innovative pedagogical tools as it is considered as "a modern incarnation of the traditional art of oral storytelling" to provide deeper and more meaningful learning (Smeda, Dakich & Sharda, 2014, p.2),

DIGITAL STORIES AS INNOVATIVE PEDAGOGICAL TOOLS

DSs are defined as; "3-5 minute long computer-based and user-generated short video clips that enable learners to utilize and combine various skills" (Köse & Küçüköğlu, 2012, p. 396). They help learners build communication and information-creation skills (Abdul-Ameer, 2014; Köse & Küçüköğlu, 2012; McGeoch, 2012; Salkhord, Gorjian & Pazhakh, 2013). DSs with multimodal features such as visual and audio component through the integration of text, images can motivate and engage learners easily, develop the ability to solve problems, facilitate their meaning making, and enable learners to work with both text and multimedia to gain multiple skills (Keşli Dollar & Tekiner Tollu, 2015; Ohler, 2013; Oskoz & Elola, 2016; Salkhord et al., 2013; Tiba, Condy, Chigona & Tunjera, 2015; Timuçin & Irgin, 2015; Xie, 2016).

Among a great deal of research related to digital storytelling, the following studies are the most related ones to provide a basis for the present study. For instance, Xie (2016) conducted a one-year teaching project in which 54 Chinese university-level students were created digital stories in small groups in a content-based course after being introduced how to do it to explore how and to what extent students' motivation and efficiency in EFL learning were influenced through digital storytelling. The results indicated the following positive points regarding digital story telling; project-based group learning was considered as an efficient way to feel stronger sense of competition and achievement; students' passion and motivation were enhanced, the ability to integrate

various materials was developed, students' sense of achievement were increased through having product outcomes, target content was learned more efficiently besides having deep learning due to the students' reflection on what they were learning critically and creatively. However, the following challenges were reported regarding making a digital storytelling such as the necessity of being trained about how to use the required software to make videos, limited time to create their own videos, and their worries with regards to the use digital storytelling efficiently in crowded classrooms.

Furthermore, the study by Lei (2009) which was conducted with 2007 intake freshmen in teacher education programs at a large northeastern university revealed that most of the participants had moderate confidence in using classroom technologies despite having strong positive beliefs in technology. The study indicated that being digital native students might not guarantee being digital native teachers. Hence, teacher education programs are responsible for helping them become digital-native teachers who can use classroom technologies in critical, wise and meaningful ways by considering that not all pre-service teachers were exposed to the digital technologies equally despite growing up in digital age. The following suggestions were given in the study:

(a) expose preservice teachers to a variety of technologies that can be used to support different teaching and learning activities, (2) emphasize subject-specific technology, (3) include assistive technology as an important component of teacher technology preparation programs, (4) help preservice teachers understand the enabling conditions for technology use, (5) help preservice teachers make meaningful connections between technology and teaching" (Lei, 2009, p. 92-93).

Tiba et al. (2015) conducted a qualitative study with 50 South African pre-service teachers via five focused group interviews to explore their perceptions of the potential benefits of Digital Story Telling (DST) and perceived barriers to DST uptake during in-service practice. The results of the transcribed data revealed that most of the participants valued the importance of DST in today's classroom as it has potential to motivate and engage learners easily, to promote collaboration and self-expression besides developing multiple skills including critical thinking, communication and language skills, particularly writing skills. However, they also remarked the following perceived barriers to DST uptake during in-service practice such as a lack of resources, self-confidence and time due to restrictive curricula in addition to their lack of technological knowledge of how to teach with DST.

Timuçin & Irgin (2015) examined how 16 Turkish EFL university students studying at the Preparatory School of a state university in Turkey construct knowledge with digital storytelling. The participants were provided the digital environment for digital stories is Kerpoof Studio website operated by Walt Disney Company. The overall results indicated that digital environment increased the students' motivation to learn and increased the creativity of learners. In addition, this experience helped the participants become aware of both media and visual literacy, transform the curricular content into the digital storytelling, take up multidimensional roles, and develop their writing skills.

The fact that students who were taught via DSs online by computer outperformed the students who were taught through the stories based on only the teacher not the technology was reported in the following studies such as Abdul-Ameer (2014) for comprehending new vocabulary items and gaining four basic language skills particularly listening comprehension, Salkhord, Gorjian & Pazhakh (2013) for reading skills, Verdugo & Belmonte (2007) for listening skills, and Hwang, Shadiev, Hsu, Huang, Hsu, & Lin (2016) for oral skills. Being aware of the emerged positive experimental research results in favor of the use of DSs in EFL learning, EFL teachers and PTs should be trained about how to create and integrate DSs.

In addition, constructivism has been adopted by the Turkish Ministry of National Education as an educational philosophical viewpoint since 2005 (Özar, 2012). However, as reported by Kırkgöz (2009) constructivist approach has not been adequately implemented in the realms of Turkish classrooms. Thus, EFL teachers should seek for innovative pedagogical tools which foster constructivist thinking. As suggested by Smeda et al. (2014), digital storytelling is one of the most suitable ways to follow a constructive approach to learning as students who were given basic instructions construct and reflect their own understanding via interactions and experiences to be able to create their own digital story.

Therefore, as also mentioned by Tiba et al. (2015), it is very prominent for PTs to be equipped with not only content and pedagogy knowledge but also with technological knowledge to enable them to integrate technology into their curriculum. For instance, ELT prospective teachers can learn how to digitalize a story as a tool for language learning and teaching material for YLs by using some of the most common free-of-charge digital story telling programs such as Windows Movie Maker, Microsoft Photo Story 3 (for Windows based PCs), and iMovie for Macintosh computers (Köse & Küçüköğlu, 2012). However, the challenges of integrating technology

into classrooms should be considered to get benefit from technology more effectively. Groff and Mouza (2008, p. 42) reported many challenges some of which were as follows: “lack of teacher input on the development of innovations for instructional use; teacher beliefs, attitudes, and concerns about classroom technology use—inexperience with technology, the shift of pedagogical practices, management issues, and the possibility of new roles and teaching style...”. Believing that teachers’ experiences are affected by their beliefs and attitudes, the researcher aimed to answer the following research questions:

- RQ1: What are the beliefs and attitudes of the 3rd year ELT prospective teachers with regard to the use of digital stories to Teach English to Young Learners (TEYLs)?
- RQ2: What are the experiences of the 3rd year ELT prospective teachers in creating child-appropriate digital stories to TEYLs?
- RQ3: Is there a statistically significant difference between digital native and digital immigrant participants regarding the creation of child-appropriate DSs and integrating them into YLs’ classrooms?
- RQ4: Is Microsoft Photo Story 3 (for Windows based PCs) an effective program to digitalize a child-appropriate DS?

METHOD

A mixed method research design with both quantitative and qualitative methods was used to answer the aforementioned research questions.

Context and Participants of the Study

The study was conducted with 75 third year ELT students of Uludag University enrolled in TEYL course I which is a part of the National Curriculum ELTP by Turkish MoNE. The participants who were trained about some knowledge about children’s characteristic and how they learn a language were expected to be equipped with how to teach YLs. The participants, as a group of 5 or 6 members, were demanded to prepare ten different tasks such as preparing child-appropriate materials, activities, and lesson plans to be performed in the practice part of the course throughout the term after being lectured in the theoretical lesson. As a final task, they were asked to create a child-appropriate DS based on one of the units of the Turkish primary state school curriculum in two-weeks. In the first week, they wrote their script. After getting feedback from the instructor about the title, content, context, characters, length and language aspect of the story, they digitalized their stories in the following week to be watched as a class and evaluated by the instructor in the practice part of the course. In addition to watching previously created DSs to discuss their weaknesses and strengths, the participants were informed about DSs, particularly how to digitalize an effective child-appropriate DSs through Microsoft Photo Story 3 (for Windows based PCs) in the theoretical course to support the participants to complete the task. Although Microsoft Photo Story 3 was suggested and explained step by step (for further see Köse & Küçükoğlu, 2012) in the course, the participants were free to use another programs to digitalize their stories.

Data Collection Instruments

The data collection instruments were a 26-item 5-point Likert scale questionnaire, an open-ended questionnaire, and a semi-structured questionnaire. First part of the closed questionnaire aimed to find out their beliefs about the use of DSs in the YLs’ classrooms whereas the second part aimed at investigating their experiences when creating their DSs. Simultaneously, an open-ended questionnaire was administered to the participants to enable them to share their views and experiences with regard to the program they used to create their DSs. Finally, a semi-structured interview was conducted with 10 participants (5 digital native & 2 half digital half immigrant & 3 digital immigrants) to delve into the results obtained from the questionnaires. The interview questions were as follows:

1. What do you think of the use of child-appropriate DSs in YLs’ classrooms?
2. How was your experience in creating your DS as a two-week group task?
3. How do you define yourself? Digital Native or Digital Immigrant? Do you feel yourself competent in using DSs? Why?

Data Analysis Procedure

The quantitative data were analysed firstly through descriptive statistics including mean, standard deviations and frequencies of the items secondly through independent sample t-test to compare the results based on the groups (digital native & digital immigrant). The Cronbach’s Alfa coefficient was found 0.87 which is acceptable. Therefore, the structured questionnaire could be said to have acceptable internal consistency. Moreover, the opinions of the three experts in instructional technologies and material design were taken to validate the content of the questionnaire. 4 items were modified based on their comments. On the other hand, the qualitative data obtained from the open-ended questionnaire and the extracts of the interviews were analysed through content analysis of the participants’ manuscripts.

RESULTS

RQ1: What are the beliefs and attitudes of the 3rd year ELT prospective teachers with regard to the use of digital stories to TEYLs?

The results of the closed questionnaire were presented in two different tables: table 1 displays the participants' beliefs about the benefits of using DSs into YLs' classrooms and table 2 shows their beliefs about the integration of DS into YLs' classrooms and the necessity for effective teacher training.

Table 1 Results of the Descriptive Statistics Regarding Beliefs about the advantages of using DSs into YLs' classrooms

Items	N	\bar{X}	SD	Strongly Disagree/ Disagree (%)	Neutral (%)	Strongly Agree/ Agree (%)
12. It becomes easier for teachers to take children' attention through DSs due to its multimodal components	73	4,45	,76	2.7	8.12	89
4. DSs help YLs better learn a foreign language due to its multimodal components.	74	4,35	,81	1.4	13.5	85.1
8. I believe that teachers can increase YLs' motivation through the use of DSs.	72	4,34	,69	0	12.5	87.5
7. I believe that teachers can change the dynamics of the traditional classrooms through the use of DSs	74	4,24	,79	2.7	13.5	83.7
13. It becomes easier for teachers to keep YLs' attention throughout the lesson via DS-based activities	72	4,23	,84	2.8	18.1	79.1

The results revealed that nearly all of the participants whether they were digital native or immigrant were (93.2%) agreed that DSs should be integrated into YLs' classrooms in this 21st-century. It was clear that most of the participants believed the advantages of using DSs with their multimodal components as follows; taking children' attention easily, better learning a foreign language, increasing YLs' motivation, changing the dynamics of the traditional classrooms, and keeping YLs' attention easily throughout the lesson. The following interview extracts can shed light on the participants' aforementioned high level positive beliefs about the use of DSs into YLs' classrooms referring to some advantages of them.

I3: «Children love looking at the screen. They tend to watch TV or play with tablet or mobile phone. They are familiar with technology. We can say that today's children are digital native. Thus, we cannot ignore the use of technology in our classrooms».

I2: «I think we should certainly use DSs when teaching English because children learn by doing. When I observe them in real classrooms, I realized that they continuously repeated the chunks in the video. They didn't want us to close the video. Even after closing the video they went on repeating by themselves. In a sense, they made their own videos. Thus, their learning became easy and permanent».

I01: «I think DSs help children understand the target language as we have opportunity to visualize the target chunks. If the chunks are repeated several times they keep on saying them. In addition, they tend to imitate what they are watching».

Table 2 indicates the results of the descriptive statistics regarding the participants' beliefs about the integration of DS into regular classroom teaching and necessity for effective training to be able to achieve this appropriately.

Table 2 Results of the Descriptive Statistics Regarding Beliefs about the use of DSs into YLs' classrooms.

Items	N	\bar{X}	SD	Strongly Disagree/ Disagree (%)	Neutral (%)	Strongly Agree/ Agree (%)
2. DSs should be integrated into YLs' classrooms in this 21st-century.	73	4,54	,70	2.7	4.1	93.2
1. I believe that teachers need effective training to use DSs appropriately in their classrooms.	73	4,27	,76	1.4	13.5	83.6
10. Integrating DSs into regular classroom teaching might be challenging for teachers.	74	3,74	,90	8.2	28.4	63.5
18. I believe that teachers can easily integrate DSs into their English lessons.	74	3,72	,94	10.9	24.3	64.9

As seen in the above table, there appeared contradictory results concerning the integration of DSs into the participants' classroom teaching despite their high level of positive beliefs about the necessity for the use of DSs into YLs' classrooms (93.2%). More than half of the participants (63.5%) thought that it would be neither challenging nor easy (64.9%) for teachers to use DSs into language classrooms. This result was supported by their positive beliefs about the importance of teacher training as most of them (83.6%) believed that they needed to be trained effectively to use DSs in their classrooms appropriately. The following interview extract might support the aforementioned results.

I7: "I do not think that I am good at something done with the computer. Actually, we learnt many things concerning the use of technology during the course entitled "Instructional Technologies and Material Design" at the university. However, I hold off from using the technological devices in the classroom".

It is understood that some of the participants had hesitation in integrating technology into their classrooms due to lack of technology competence and self-confidence. Therefore, most of them believed (83%) the necessity for teachers to be trained to use DSs appropriately in their classrooms.

RQ2. What are the experiences of the 3rd year ELT prospective teachers in creating child-appropriate digital stories to TEYLs?

The results of the second part of the questionnaire regarding the experiences of the participants were presented in three different tables indicating the skills developed through creating DSs, the process through which they were instructed about child-appropriate DSs, shown previously created DSs, and given opportunities to discuss about their quality based on the criteria given by the instructor, and the participants' affective states respectively. Table 3 demonstrates to what extent creating a child-appropriate DS contributed their development from various aspects.

Table 3 Results of the Descriptive Statistics Regarding the advantages of creating a DS for ELT Prospective Teachers

Items	N	\bar{X}	SD	Strongly Disagree/ Disagree (%)	Neutral (%)	Strongly Agree/ Agree (%)
3. Putting the pictures into logical order when creating our DS increased my organisation skills.	74	4,32	,77	2.7	10.8	86.4
6. Vocalizing our DS helped me understand how I use English including pronunciation, intonation etc.	74	4,28	,80	2.8	9.5	87.8
25. Creating a DS helped us use our information creation skills.	74	4,05	,80	2.8	17.6	79.7
5. Writing the script increased my creativity	74	4,08	,79	2.7	19.2	78.1
14. Creating a DS as a group helped us develop our social skills.	72	3.75	1,08	11.1	27.8	61.1
24. Creating a DS helped us develop our language skills.	74	3.71	1,02	9.5	29.7	60.8
21. Creating a DS helped me understand the world of the child better.	74	3.83	1,02	9.5	28.4	62.1

Based on the mean scores, it is clear that creating a child-appropriate DS made a significant contribution to the participants' organisation skills via putting the pictures into logical order ($M= 4.32$) and phonological development through vocalizing ($M= 4.28$) at the very most. In addition, most of them remarked that they used their information creation skills when creating their DSs (79.7%) and writing the script increased their creativity (78.1%). Finally, more than half of them reported that they developed their social skills (61.1%), language skills (60.8%), and understanding the world of the child better. The interview results support some of the aforementioned points as follows:

I3: "Children follow the process very carefully and give too much importance to visuality. Although we were able to write the script in a very short time, we allocated much of our time to find and form our pictures. The subject was daily routine; thus, it was very important to find night pictures with our character. We discussed what to do as a group. We could not exclude the night part of the story. Finally, we decided to blacken the

background colour. It was very time-consuming and difficult to organize pictures to have meaningful and coherent story...”.

I7: “Knowing the programs is not enough to be able to create a child-appropriate DS. It required us to be aware of the children’s interests. They do not watch Buggs Bunny as we did. Thus, we asked many 4th graders to get information about their favourite cartoons to be able choose our story characters. We believed that once we found their favourite characters, it would be easier to take their attention and sustain their interests throughout the lesson...”.

Table 4 displays the results concerning both theoretical and practical process to create a DS.

Table 4 Results of the Descriptive Statistics Regarding the Process of Creating a DS for ELT Prospective Teachers

Items	N	\bar{X}	SD	Strongly Disagree/ Disagree (%)	Neutral (%)	Strongly Agree/ Agree (%)
20. The elements of an effective DS explained by the instructor helped us to create the DS of better quality.	74	4,25	,75	1.4	14.9	83.7
22. Discussing the elements of an effective DS in the lesson helped us to create the DSs of better quality.	73	4,21	,73	2.7	9.6	87.7
19. Watching the final version of our DSs in the classroom helped us to reflect on our own learning.	74	4,18	,80	4.1	12.2	83.8
16. I can individually prepare a DS-based lesson plan with child appropriate activities.	74	4,01	,86	6.8	16.2	77
11. Creating a DS required us to possess high computer skills.	74	3.13	1,12	32.4	21.6	45.9
26. I could have easily created a DS without watching and discussing on the samples.	74	2.64	1,23	48.7	27	24.4

As presented in table 4, to be able to create a DS of better quality the participants got benefit from the explanation of the instructor about the elements of an effective DS ($M= 4.25$) and the discussion part immediate after the lecturing ($M= 4.21$). This can be supported by the following interview extract:

I3: “Creating an effective DS is not an easy job such as writing on Microsoft Word. I think creating a DS is not something done with computer easily. It is a complex task which required us to vocalize, combine many pictures together to have a meaningful story. Thus, what you said about creating an effective child-appropriate DS helped us understand your expectations besides the discussion we had after watching the sample DSs which enabled us to have an idea about the qualified DS...”

Moreover, majority of them (83.8%) asserted that they did reflection on their own learning after watching their DSs. The following two extracts might show how they did reflection.

I7: «Watching the sample DSs prepared by the former PTs helped us to understand your expectations from us when preparing child appropriate DSs. You (referring the instructor) explained the reasons why the samples were bad or good. When watching our own DSs we said that our group’s DS was not bad at all but could have been better».

The results also revealed that although most of the participants (77%) felt confident in planning a DS-based lesson with child appropriate activities, half of them reported lack of confidence in creating a DS alone without watching and discussing on the samples (48.7%). Similarly, nearly half of them considered that creating a DS required them to possess high computer skills (45.9). The extract below might explain why they found difficult to create a DS alone.

I10: «I could plan a lesson based on a DS but I cannot prepare a DS alone. I think I am not a digital native, so it is too difficult for me to prepare alone. Preparing as a group is better because there are lots of things to be considered, for instance, their ages. Our story was for 2nd graders. It was also 3rd unit. It means that it was a starting point. Because they do not know anything in English creating a meaningful and child appropriate context became very difficult for us. I can say that we forced ourselves to be creative. Keeping the story at i+1 level was really trouble for us. Choosing the characters was also very difficult. We thought our childhood firstly

(Cedric) but we noticed that we did not know currently popular characters (Niloya). Thus, we searched on YouTube...».

Table 5 indicates the descriptive statistics of the participants' affective states with regard to creating a child-appropriate DS.

Table 5 Results of the Descriptive Statistics Regarding Affective Aspects of Creating a DS for ELT Prospective Teachers

Items	N	\bar{X}	SD	Strongly Disagree/Disagree (%)	Neutral (%)	Strongly Agree/Agree (%)
23. Creating a DS helped us build self-confidence in using technology for educational purposes.	73	4,10	,90	6.8	10.8	82.4
17. I was happy to learn how to create a DS.	74	4,22	,88	2.8	17.6	79.7
9. I was motivated to learn how to create a DS.	72	3.69	,97	12.5	25	62.5

As revealed in table 5, while more than half of the participants (62.5%) were motivated to learn how to create a DS it is notable that some of them (25%) were not motivated before involving the process. However, after the process, most of them (79.7%) fostered positive attitudes towards learning how to create a DS. In the wake of this experience, it is pleasing that creating a DS helped most of them (82.4%) build self-confidence in using technology for educational purposes. In the following extract, one of the interviewers mentioned about her feelings after watching their product outcome.

I5: «When watching our own DS I firstly said «Yeess! We did a good job. Later, I thought that we could have found better pictures... Because I know that I can prepare lots of materials even DSs I feel happy as a PT...»

RQ3. Is there a statistically significant difference between digital native and digital immigrant participants regarding the creation of child-appropriate DSs and integrating them into YLs' classrooms?

Depending on whether the participants were digital native or immigrant, the T-test results indicated a significant difference pertaining to only one item, which is displayed in table 6.

Table 6 Independent Sample T-test Results Regarding the Integrating Child-appropriate DSs

Item 10	Groups	N	\bar{X}	SD	df	t	p
Incorporating DSs into regular classroom teaching might be challenging for teachers.	Digital Native	39	3.46	,94	67	-2,897	.005
	Digital Immigrant	30	4.06	,73			

As seen in table 6, the results of the independent sample T-test revealed a significant difference between two groups regarding only one item. Based on the mean scores, it is clear that ELT prospective teachers who were digital immigrant believed more than the digital native participants that incorporating DSs into regular classroom teaching might be challenging for teachers. The extracts below indicated how creating a DS was considered differently by the participants depending whether they were digital native or immigrant:

I9: «The process was easy for me because I know the required programs. I think I am a digital native but not at advanced level. The most difficult aspect for lots of my friends was to find out the most appropriate pictures for the script. However, I know the programs to design pictures... »)

I4: «It was very challenging for me to understand the required programs. Therefore, I contributed to the other tasks. For instance, I am good at drama and I vocalized different characters».

RQ4: Is Microsoft Photo Story 3 (for Windows based PCs) an effective program to digitalize a child-appropriate DS?

The results of the open-ended questionnaire revealed the frequency of the programs used by the participants as displayed in the following table. Table 7 indicates the frequency of the programs used by the participants to create their DSs.

Table 7 The Frequency of the Programs Used by the Participants to create a child-appropriate DS

The Programs used to create DSs	Microsoft Photo Story 3	Movie Maker	Microsoft Photo Story 3 & Camtasia	Story Bird	Microsoft Photo Story 3 & Toondo	Paint & PowerPoint
Number and Frequency of the of the Participants	36 (%48)	18 (%24)	5 (% 6.6)	6 (% 8)	4 (% 5.3)	6 (% 8)

As indicated in table 7, more than half of the participants (60 %) reported that they used Microsoft Photo Story 3 to create their DSs and it was an effective program with technical facilities to create DSs whereas 40 % of them used another programs considering that the program was very old and not effective. Content analysis of the students' extracts revealed that most of the participants who used Microsoft Photo Story 3 stated that the program was very useful, free, and easy to be used even by those who were digital immigrant or those who had never used any applications before. They also reported that they could add images, narrate their voices, and add texts at the same time easily besides setting the time to customize motions as they wanted. As a drawback of the program, they mentioned that the effects of the program were not of high quality as it was old software.

The analysis indicated that those who were digital native preferred to use different programs from Microsoft Photo Story 3. They mentioned about why they tended to use additional or another programs as follows: for Camtasia, they believed that they could insert background sound of better quality and also narrate their voices more than once; for Toondo, they explained that they wanted to create their stories as cartoon style believing that it was advantage to create new images freely; for PowerPoint, they emphasized that it was alone a good program to create a DS. If it was used with some programs which allow designing pictures such as Paint, Pixlr, Photoshop etc. it would be better and more attractive; for Moviemaker, it was reported that it easier via this program to adjust the sound and pictures. Customizing notion was smoother and of high quality; for Storybird, they stated that they could not only set subtitles and photos but also break down the videos into parts as they wished.

DISCUSSION AND CONCLUSION

The study aimed to reveal ELT prospective teachers' beliefs, attitudes and experiences regarding the use of and creation of child-appropriate DSs. As mentioned by some researchers such as Porras González (2010), Read (2007), Robin (2008), Tiba et al. (2015), and Timuçin & Irgin (2015), the overall result of the study indicated that nearly all of the participants agreed that DSs should be integrated in YLs' classrooms believing the power of it to take the pupils' attention easily, help them better learn a foreign language, increase YLs' motivation, change the dynamics of the traditional classrooms, and to keep YLs' attention easily throughout the lesson. This result may be attributed to the fact that ELT prospective teachers are aware of how the use of technology becomes unavoidable in today's world through having an impact on variety of fields, and education is no exception. Their high motivation and their positive attitudes towards learning how to create and integrate DSs in their future classrooms to teach a foreign language to YLs corroborates the fact that the teachers of 21st century should not be digital immigrant when teaching to the learners who are mostly technology savvy (Tiba et al., 2015).

As suggested by Tiba et al. (2015), this study revealed that creating a child appropriate DS enabled ELT prospective teachers blend technological, content, and pedagogy knowledge as they were required not only to write a script including the chunk/s compatible with the target unit of the curriculum, choose the most appropriate characters by taking the target group's age and interests into account, upload well-matched pictures with the text, vocalize the story by giving importance to the supra-segmental features. In other words, due to having multidimensional roles, they used not only their technology competence by using the programs to create their DSs but also their knowledge about how children learn and how to teach them accordingly. Therefore, in line with the study by Xie (2016), the participants of this study suggested that creating a child-appropriate DS as a group-work task rather than an individual task was better to prepare a more effective and of high quality DS. Furthermore, as also mentioned by Robin (2006), when working as a group for digital storytelling, they develop their social skills as they brainstorm and discuss their ideas collaboratively in addition to work sharing depending on their individual strengths such as having content knowledge, pedagogy knowledge and technological knowledge.

In line with Smeda et al. (2014) who asserted that DST is one of the most innovative pedagogical tools to foster constructivist thinking, the ELT prospective teachers in this study constructed their own understanding and reflected on their own learning via creating a child-appropriate DS, which is the essence of constructivism.

Because constructivism has been suggested by MoNE as an educational philosophical viewpoint since 2005, the PTs should be given more tasks such as creating DS to develop various skills including organization skills, information creation skills, social skills, and language skills in addition to developing autonomy through constructing their own learning.

In addition, similar to the findings of the study by Lei (2009), most of the participants of this study fostered positive attitudes towards learning how to create a DS, which increased their self-confidence in using technology for instructional purposes. Before being involving in preparing a DS as an instructional technology, motivating students particularly those who are digital immigrant might be difficult as experienced in this study. However, providing support such as informing the elements of an effective DS, enabling students to discuss about strengths and weaknesses of sample child-appropriate DSs, and allowing them to work as a group might facilitate the process of creating a DS.

Another point to consider based on the interview results is that, the experiences of the participants varied depending on whether they were digital native and digital immigrants. It is clear that digital native participants contributed technological aspects such as the use of story-telling programs more to the completion of the task. On the other hand, those who were digital immigrants considered the process of creating a DS challenging and thought that it required them to have high computer skills. However, performing the task collaboratively enabled them to contribute to the achievement of the task through writing the script through finding an interesting and child appropriate context, finding the most matched pictures, vocalizing the story as dramatic as they could. Agreeing with Lei (2009) who claimed that being a digital native student cannot guarantee being a digital native teacher, the study suggest that teacher educators who expect their PTs to perform tasks that require the use or creation of instructional technologies should provide support without considering whether they are digital native or immigrant. The participants of the study created their DSs via using different programs reporting their pros and cons. Thus, it would be better for teacher educators to keep up with the technological innovations to be able to suggest the newest and the most qualified apps for digital storytelling.

To sum up, it is clear that we are living in the digital age and technology is moving too fast. Hence, it was not easy for some PTs to create a DS without being educated and supported due to lack of knowledge about the required software to create DSs and lack of confidence in using them in the realms of classrooms as also noted by Xie (2016) and Tiba et al. (2015). Thus, as revealed by Timuçin & Irgin (2015), this study support that the more students are exposed to digital environment and the more they are given tasks including the use of technological devices the more they become aware of both media and visual literacy and they foster positive attitudes towards creating and using technological tools for instructional purposes.

IMPLICATION AND SUGGESTIONS

Today's children are born into digital environment and grow up with technology in different aspects of their lives. Because learners of new generations are mostly digital native, teachers, PTs, and teacher educators should ask themselves whether they are digital native or immigrant. They should seek for opportunities for integrating technology into regular teaching to better teach a foreign language. We, teacher educators, evaluate our syllabus to decide whether we prepare PTs for teaching to new digital native learners. If not, we should revise our lessons to better prepare future teachers. Furthermore, teachers should know how to embrace and integrate technology in their classrooms which should be technologically well-equipped.

ABSTRACT

The purpose of this study is to assess the work conducted on effective leadership. The research was carried out using the “document screening method”. The data were obtained through various journals, theses and the Internet. In the study; 17 articles and 7 master's theses covering the years 2009 and 2017 were evaluated. When the findings of the research were examined, it was found that 16 were quantitative and 8 were qualitative. In the field of educational administration, the body of literature conducted on effective leadership has been examined. A good leader must influence and motivate the employees, create solutions and also pioneer changes in order to achieve certain goals because leadership is a group function. Group members with different roles form integrity by interacting with each other to achieve common goals. In this study, the concept and purpose of leadership, characteristics of a leader, leadership behaviours and leader types, leadership theories, effective leadership and studies on effective leadership are explained. In conclusion, the transformational leader is more prominent in leadership and makes the process stronger. In this process, in addition to internal factors such as hope, optimism and energy, principals like responsibility, fairness and commitment have a more positive influence on the educational administration system since they are in the foreground.

Keywords: Leadership, effective leadership, research method.

INTRODUCTION

1. The Concept of Leadership

The process of driving someone to act under certain conditions in order to achieve an aim is one of the definitions of leadership. Leadership in principle is to direct people to a particular goal (Kılınç, 2009) While leadership can be developed by education, it generally bears traits of those with positive characters. Those having a negative character cannot maintain leadership traits. Leadership education does not end with the certification obtained and the leader maintains the life-long education process (Sertoğlu, 2010). If the subordinates of a leader are contented, then the leader is successful. If they are not, then one cannot speak of successful leadership (Alici, 2004). Any individual who implements the strategic vision successfully, resolves critical problems and does the strategic planning bears leadership traits (Cascio, 2010). The leader is the person who convinces members of the organization and inspires his employees (Lunenburg, 2011). Having the power, charisma and different personality traits slightly contributes to leadership. Understanding the employees, being a good listener and resolving problems are also important in terms of leadership. These make people meet to reach a common goal (Akyar, 2014). Motivating employees, encouraging them for the works to be carried out, governing them for shared goals and promoting creativity are of common features of leadership (Gürel and Yılmaz, 2014).

2. Leadership Behaviours and Leader Types

There are different types of leadership behaviour.

Autocratic Leadership: The autocratic leader has the absolute power. He sets the group policy and does the planning himself. He determines the relationships between group members. He is the one who rewards and also punishes (Serinkan, 2008). The creativity of groups members diminishes in the case of such leadership. The leader's being self-centred or his ignorance of the ideas and beliefs of group members disrupts the motivation of the members and creates psychological dissatisfaction in employees. Thus, employees start to have a strong dislike of the leader and internal conflicts and disagreements increase

(Eren, 2005)

In such leadership, the leader is highly motivated. The decision-making process is fast as he merely takes decisions himself. In this type of leadership, there is decreased motivation due to the extremely strict nature of the leader. The followers may display psychological dissatisfaction, decrease in morale and conflict (Kılınç, 2009). The excessive self-centeredness of the leader results in a decrease in creativity within the group (İlgar, 2005)

Democratic Leadership: The leader includes all the employees in the process of formulation and implementation of decisions. This results in sound communication between the leader and the subordinates. Thus, the willingness of the staff to serve increases (Serinkan, 2008).

In democratic leadership, the whole team acts as a social group due to the presence of a central authority. The employees are informed, their ideas are asked and they are encouraged by the leader (Doğan, 2007.)

Cosmopolitan Leadership: The cosmopolitan leader who is focused on learning is the one who pushes the limits in a disciplined manner. These leaders learn the answers to the questions largely from their followers (Memişoğlu, 2003).

Such a leader immediately responds to the wishes and needs of his followers. Thus, he elevates their sense of subordination. He also influences the employees by means of his cosmopolitan skills. (Uğurluoğlu and Çelik, 2009)

Visionary Leadership: In visionary leadership, individuals are those who can see the future better under a shared vision. The leader facilitates individuals' innovations and trials and takes risks (Günlü, 2012). The visionary leaders who are always open to innovations are aware that new ideas bring about new initiatives and new horizons. They keep making trials and they are insistent. They do not easily give up what they plan to do and are highly skilled on convincing (Gedikoğlu, 2015).

The leadership style which is oriented towards seeing the future in the real sense is visionary leadership. Such leaders analyse uncertain situations with success. They put forth ideas which will resolve problems and increase opportunities (Doğan, 2007).

The Learning Leader: They come to the foreground with their freethinking, convincing skills and their willingness to learn. Such leaders also encourage their teams to learn (V. Çelik, 2011).

Transformational Leadership: Transformational leaders provide their employees with motivation and reveal the synergy. They encourage individuals to use their skills and talents effectively. Group members champion group interests rather than their own (Kurtuluş and Kutanis, 2015).

Transformational leadership assist in the development of skills and potentials of employees. Their performance is far superior than that of the employees (Gedikoğlu, 2015)

Transactional Leadership: The transactional leader who exerts extraordinary efforts in the resolution of problems devises programs and enables communication. Such leaders have a guiding role in decision-making, negotiation and the development of employees (V. Çelik, 2011). Administrators demonstrating transactional leadership make use of money and status for empowerment. They reward employees for their achievements and encourage them to consolidate their success (Şimşek and Fidan, 2005).

This leadership style is characterized by dimensions of conditioned reward, management by exception and laissez-faire leadership (Bukuç, 2009). Management by exception is divided into two as active and passive implementation. In active implementation, the leader corrects the employees' mistakes and deviations from the standard. In passive management, the leader does not do anything for such mistakes and deviations. He remains passive in problem-solving (Buluç, 2009). In laissez-faire leadership, on the other hand, the leader keeps his distance in the face of incidents and his presence is not felt on the ground. It is the slowest leadership style and symbolizes lack of transaction. The leader is ineffective and insensitive. He avoids decision-making and assuming responsibility. Such leaders disappear when they wish to do so (Buluç, 2009).

Charismatic Leadership: Charisma is the quality of the leader. Such leaders feel well psychologically. They convey the enthusiasm they feel to their followers (Sertoğlu, 2010). They are masterful in influencing the employees and making them follow their lead. They have a say in decisions. They keep their distance with the employees and ask the tasks given to be fulfilled. These leaders are influential on individuals and societies. They are nowhere near democracy and appear occasionally (Werner, 1993).

Ethical Leadership: Corruption, bribery and favouritism is eliminated owing to ethical leaders.

Exploitation taking place in countries comes to an end (Gedikoğlu, 2015). Ethical leaders are those with a good personality. They have a strong character and possess the right values. Such leaders help to shape the interactions as well as decisions taken in the workplace. The ethical leader is aware of the ethical system and ethical decision-making (Bakan and Doğan, 2013).

Educational Leadership: Educational leadership has been the most popular type of leadership in the field of education in the last three decades. This leadership pioneers the effective employees in the school. It aims to increase the professionalism of the teachers and the academic achievements of students (Gedikoğlu, 2015).

Educational leadership is the one associated with students, teachers, educational plans and elements of teaching-learning. It is presently one of the indispensable types of leadership (Bakan and Doğan, 2013).

3. Leadership Theories

Leadership theories which include Traits Theories, Behavioural Theories and Contingency Theories are as follows:

Traits Theories: These theories which deal with inherent or subsequently acquired traits form the basis of leadership theories as from 1940's. To be a leader, an individual should have physiological and personal traits different than the others (Bakan and Doğan, 2013).

Subsequent to the failure of existing theories in determining the effective leader, scientists have explored and devised different leadership theories (Gedikoğlu, 2015).

Behavioural Theories: The behavioural approach focuses on the behaviour of the leader towards the employees during the conduct of the work rather than his personal traits. Relations with the subordinates, decision-making style and conflict management are indispensable elements in that regard (Bakan and Doğan, 2013)

What makes a leader successful and effective is his behaviours during leadership rather than his traits.

Behaviours like communication with subordinates, whether or not the authority is delegated, planning and control are factors which determine effectiveness (Sertoğlu, 2010).

According to Rensis Likert, there are two behavioural dimensions of leadership. The first one is leadership which takes into account individuals and the second one is leadership with a spirit of entrepreneurship. Leadership which takes into account individuals inspects performance based on the legal system of reward and punishment. Leadership with a spirit of entrepreneurship, on the other hand, attaches importance to happiness and pursues the satisfaction of employees (Erel and Yalçın, 2014).

Contingency Theories: The Contingency theory has been devised where other approaches were not found satisfactory in terms of leadership. The behavioural approach is preferred more in terms of leadership trait s (Sertoğlu, 2010). As a result of globalization, studies oriented towards distinguishing successful leaders from unsuccessful ones have been made. The traits theory has emerged following the determination of these personal traits. Thus, studies aimed at understanding leadership have been needed to discover what a successful leader does and how he behaves (Bakan and Doğan, 2013)

Researches have been made under the contingency approaches in cases where the behavioural leadership theory fell short. Studies have aimed to determine the effectiveness of a leader based on contingency factors like the type of work, group norms, time limit and organizational culture (Bakan and Büyükbeşe). The activities and behaviours of a leader are determined by his personality and behavioural traits. The members forming the team and following the leader are elements of the environment one is in. The leadership concept on the other hand may be formulated as follows (Erel and Yalçın, 2014).

4. Effective Leadership

Studies on leadership behaviours have initially been made in 1950's. In one research made by Ohio State University on leadership behaviours, studies were focused on attaching importance to the individual and mobilizing the structure.

In another study carried out in Michigan University on leadership behaviours, relationships between the leaders were defined and evaluations were made in relation to group projects and group performances. Likert analysed the differences and similarities of effective and unsuccessful leaders and defined three types of leadership behaviours between the years 1961 and 1967 (Yukl, 2002).

1. Task-oriented Behaviour: Effective administrators are resourceful. They focus on task-oriented functions and coordinate the tasks of employees.

2. Relationship-oriented Behaviour: It is put forth that sound personal relationships, supporting the subordinates and being philanthropic is influential in effective leadership.

3. Participative leadership: Effective administrators ensure that the subordinates participate in decision-making, enhance communication, increase solidarity and facilitate the resolution of complicated problems.

5. Studies on Effective Leadership

In the subject of effective leadership, theoretical deduction and judgment classification was employed to define previous studies and classifications (Kim and Yukl, 1995).

1. Planning and organization: The leader determines long-term goals and strategies. He also looks for ways of developing coordination, productivity and organizational efficiency.

2. Problem-solving: He defines the problems related to the work. It analyses such problems and seeks for reasons and ways to solve the problems.

3. Explaining roles and objectives: He explains the responsibilities related to the work and the targets of the tasks.

4. Briefing: He explains the information necessary for the continuation of the work by using written documents, verifies technical data and ensures that they reach the right individuals.

5. Oversight: He determines the information related to the work as well as the external factors influential on the work. He also inspects the work and its development.

6. Motivation and Inspiration: He employs influential techniques for emotional or rational support, assistance or resources.

7. Consultation: He supports proposals for development.

8. Assignment: While leaders assign their subordinates, they should clearly indicate what should be done or when the work should be completed.

9. Support: The leader acts sincerely and considerately. He is patient and helpful.

10. Development and consultation: He makes suggestions with respect to careers.

11. Conflict management and team-building: He finds constructive solutions to conflicts.

12. Networking: He develops communication with individuals who are sources of information and support and facilitates socialization.

13. Recognition: He commends effective performance and significant achievements.

14. Rewarding: Kim and Yukl who explained managerial applications under headings formed an integrated structure under the scope of behaviour classification. They conceptualized this under three independent dimensions as task efficiency, human relations and adaptive change.

a. Task-oriented: It is related with the successful performance of the task.

b. Relationship-oriented: It is related with the development of multiple relationships, increasing job satisfaction of subordinates and individuals' identifying themselves with the organization.

c. Change-oriented: It is related with developing strategic decisions, making significant changes in products and services and ensuring commitment to changes. Effective leaders should be flexible and adaptive (Yukl, 2002). They decide when and how a work needs to be done.

METHODOLOGY

The present research has been conducted by using the literature review method. According to Büyüköztürk et al (2013), literature review is made by systematic definition and classification of information and documents related to the relevant research and subsequently the data obtained through the review are analysed (Büyüköztürk, Çakmak, Akgün, Karadeniz, Demirel, 2013).

Data Collection Tool

Data pertaining to this research have been analysed after having been compiled from the references contained in several books, articles and theses included in the literature following the screening work conducted in Ulakbilim, Scopus, Ebscohost, Google Scholar and YÖK (Council of Higher Education) databases.

Study Group

This study analyses 17 articles and 7 postgraduate theses written between 2009-2017 with a view to find about studies on leadership and effective leadership.

FINDINGS

The findings section include the titles, sources, years of publication, authors and methodology of the theses and articles under the research. The findings are explained through a table.

Studies made between 2009 and 2017 on leadership and effective leadership are given in Table 1. An analysis of the studies reveals that the sources of the articles are the journals on education.

Table 1. Articles and Theses Written Between 2009 and 2017 on Leadership and Effective Leadership

Trust, Caring And
Organizational Learning: The
Leader's Role

Why Are There So Few
Female Leaders in Higher
Education: A Case of
Structure or Agency?

As seen in Table 1, 17 articles and 7 postgraduate theses written between 2009 and 2017 have been analysed. Of the works analysed, 8 was written through qualitative and 16 by quantitative methods. The examination of the findings reveals that foreign researchers mostly use the qualitative method. When the works are examined, it was also found out that articles were largely published in educational journals and that the majority of the works involved researches where leadership issues were explained.

DISCUSSION AND CONCLUSION

This research has been made to analyse works conducted in relation to leadership and effective leadership. A total of 24 works conducted between 2009 and 2017 have thus been analysed. It has been seen that 8 of the works were conducted by using the qualitative method whereas 16 were conducted by using the quantitative method. Overall, it has been ascertained that the qualitative researches contained the definitions and explanations of the subject matter. In the quantitative researches, on the other hand, the data have generally been collected through a survey. The majority of the references were reached through Scopus database. Since Scopus is the largest database of the literature which contains scientific journals, books and conference reports, it allows retrieving researches all over the world. It is used by more than three thousand institutions globally (www.elsevier.com). When the number of authors of the works conducted was examined, it has been found out that they were largely written by more than one author.

Leadership has come existed everywhere and at all times since the existence of mankind (Bakan, 2008). A strong leadership enables superiority and equality in education as well as the continuity of the vision. It supports people, programs and services in order to realize the vision of the school (Karsh, 2006). Leaders know how to attain their goals and they are generally self-confident individuals who act less personally, generate ideas quickly in case of need for action and subsequently take action (Tahaoğlu and Gedikoğlu, 2009).

Contrary to the active transformational leader who bears effective leadership traits and helps his employees to perform well, the laissez-faire leader is an administrator who stays in his office, meets with few students and employees, ignores teachers' needs and student development and lets everything go on as it is (Hoy and Miskel, 2010). According to Korkmaz (2008), school principals displaying transformational leadership behaviours are more influential in the emergence and development of features like risk-taking and taking initiatives, occupational development, shared and observed mission and collaborative climate, which are described as the features of a learning organization. In terms of the future of organizations, the way leaders are selected is of importance (Kasımoğlu and Küçükaslan, 2005). The non-objectivity of the criteria by which school administrators are designated; failing to attach due importance to educators having a postgraduate degree in the field of educational administration and supervision; the non-ethical nature of the process by which administrators are designated as well as training, electing, assigning and promoting school administrators may cause administrators to attach more importance to the dimension of leadership within the management process (Argon, 2004).

The effective leader should be visionary, democratic and also tolerant. Furthermore, he should be excited about his job and be exemplary. He should be trustful and reliable in nature, give positive energy to those around and have the ability to mobilise and convince them. Effective leaders should have traits like being able to establish communication easily. Therefore, the atmosphere of the school is really important due to

its effect on the education of students. For, it is easier to attain goals by encouraging the behaviour and loyalty of a staff in a school with a positive atmosphere (Öznacar and Osma, 2016).

In conclusion, in a modern society, changes in the structure and management of a school also bring about a change in the roles of school administrators. The school administrator assumes new roles in terms of innovations like globalization, information technology and total quality management. Thus, administrators contribute to training in the field of educational administration. Otherwise, the pursuit of becoming an information society cannot be successful. The transformational leadership is becoming prominent in the field of educational administration as it contains elements of innovation, reform and future. For, the collective action generated through transformational leadership renders the participants of the process stronger. As principles like responsibility, fairness and commitment are in the foreground more in this process in addition to internal factors like hope, optimism and energy, the educational administration system is affected more positively.

ABSTRACT

Purpose: The study was conducted to determine the drug use characteristics of women aged 65 years and older living in a rural area in the Eastern Black Sea Region.

Methods: The universe of the descriptive research was composed of 273 women over 65 years of age registered in the Family Medicine Unit in a rural area in the Eastern Black Sea Region; while the sample consisted of 256 women. Data were collected from March to June 2014 using the "Patient Information Form" using face-to-face interview technique. Number and percentage test were used to evaluate the data.

Findings: Of the elderly women surveyed, 53.9% were in the age range of 65-74, 51.6% were retired, 58.2% were in 'income less than the expense' group and 46.1% benefited from social security. It was found that 92.2% of elderly women used prescribed drugs, 73.0% used drugs regularly, 52.7% knew about the side effects of the drugs they used, 48.4% used 3-4 drugs daily, 41.4% experienced side effects related to drugs and 23.8% of those side effects were gastrointestinal complaints.

Results: Most elderly women use prescribed drugs, and most of them take their drugs regularly. Monitoring the use of drugs is especially important for women living in rural areas.

Keywords: Nursing, Drug, Drug Use, Elderly Women

INTRODUCTION

The share of the elderly population, as determined by the World Health Organization (WHO) "65 years and over", is increasing day by day in many countries around the world. The elderly population constitutes 8.5% of the world's population according to 2015 data, and this rate is increasing rapidly [TÜİK], (2016). The elderly population in Turkey, which is in the process of global aging, is 6.495.239 according to 2015 data and constitutes 8.2% of the whole population. 43.8% of the elderly population is male and 56.2% is female. The Turkish Statistical Institute (TUIK) reports that the life expectancy at birth in Turkey is 80.7 years for women and 75.3 years for men in 2015; and that this ratio will increase by 10.2% for men and women in 2023 [TÜRKSTAT], (2014), [WHO], (2015)

Aging is all the non-reversal, structural and functional changes that occur as the organism progresses at the level of molecules, cells, tissues, organs and systems [Ulker, Göksel S, 2010]. Aging is the process of aging, in which successive changes occur throughout life (Kurt, & Çiçek, 2014). Old age can not be considered independent of social, physical characteristics, conditions and problems. Factors such as education, occupation, income situation, living place (rural-urban), environment can affect the social characteristics and harmony of the elderly (Kurt, 2008). Furthermore, the fact that the life span of men in Turkey and in the world is shorter than that of women, causes the number of widowed women to increase among women over 75 years old; and this situation is referred as "womenalization of older age" (Arun, 2014 & Arun, 2013).

Womens' relatively longer life expectancy causes elderly women to be more susceptible to chronic illnesses than men, and to refer to health institutions more frequently. This increases the use of drugs by older women.(Gökçe ,2006; TÜİK,2016).

While all organs and systems are affected by aging, some situations also vary according to sex. (Efe, & Aydemir, 2015; Tufan, 2007; TUIK, 2016). Elderly women have fewer lung tissue complications, less calcification in the cartilage, and lower thoracic degeneration, and these processes take longer to form. Following menopause in women, ovaries terminate estrogen and progesterone synthesis, and thyroid hormone synthesis and destruction is reduced. In addition to age-related bone loss, there is also a rapid bone loss due to estrogen deficiency in the perimenopausal period. 40% and 25% bone loss occur at advanced senescence period in women and in men, respectively. Elderly women are increasingly susceptible to urinary infection because of short urethra, sphincter muscle loosening, decreased bladder capacity, loss of urine concentration and acidification, and the presence of glycosuria and non-compliance with hygiene requirements. In 2015, the proportion of illiterate elderly women (32.6%) is four times higher than that of elderly men (8.2%). Along with the advancing age, decreasing the productivity of elderly women causes them to lose some physical abilities and change their social position to be exposed to loneliness and neglect. The lack of regular and well-equipped examination facilities for elderly women living in rural areas leads to difficulties in reaching the center to benefit from health services and the control of given drugs leads to the inability for adequate follow-up. These physical and psychosocial differences in older women alter the pharmacodynamics and pharmacokinetics of drugs, making the treatment process more difficult by increasing the risk of drug effects, side effects and interactions between drugs. This research was conducted to determine the drug use characteristics of 65-year-old and older women living in a rural area in the Eastern Black Sea Region.

MATERIALS AND METHODS

This descriptive study was conducted between March and June 2014. The universe of the research was composed of 273 women aged 65 years and over, registered in the Family Medicine Unit (FMU), number 10 in the Eastern Black Sea Region of Rize, Ardesen. In order to reach the whole universe, sample selection was not conducted in the study. However, the study was completed with 256 elderly women for reasons that older women enrolled in FMU should be excluded from the province during the collection of research data and refused to participate in the survey. Thereby, elderly people aged 65 years and over who were able to communicate verbally, good orientated and agreed to participate in the research were enrolled in the study.

Data were collected with the "Patient Information Form" created by the researcher by searching the literature. The Patient Information Form was composed of two parts. In the first chapter; 10 questions to determine the personal characteristics (age, gender, education level, marital status, etc.) of 65 years old and older women; a total of 22 questions were included to determine the characteristics related to drugs (prescribed/non-prescribed drugs, where the drugs were prescribed, daily amount of drugs, which way drugs were taken etc.). The patient information form was filled by the researcher at the AHB using face-to-face interview techniques with older women aged 65 years and older. The questions on the form were asked to the elderly women by the researcher and the responses were recorded. It took about 30 minutes to complete the form. The survey is limited to the search for women aged 65 years and older who are registered with the FMU in the Ardesen district of Rize, eastern Black Sea region only. For this reason, the research results are limited to women aged 65 and over who are registered with the FMU, number 10 in Ardesen, Rize. Required permission was granted from the Rize Public Health Directorate for the research to be carried out.

FINDINGS

Table 1 shows sociodemographic characteristics of older women. Of the elderly women, 53.9% were in the age group of 65-74, 48.0% were in spouse died group, 40.6% of them were primary school graduates, 51.6% were retired, 58.2% were the income fewer than outcome group, 46.1% were in retired group, 44.1% were living with other family members, 100% were non-alcoholic and 83.6% were non-smokers (Table 1).

Table 1. Socio-demographic characteristics of elderly women (n = 256)

Socio-Demographic Characteristics		n	%
Age	65 - 74 years	138	53.9
	75 - 84 years	101	39.5
	85 years and over	17	6.6
Marital Status	Married	117	45.7
	Widowed	123	48.0
	Divorced	16	6.3
Educational Status	Non-literacy	43	16.8
	Literacy	93	36.3
	Elementary School	104	40.6
	High School	14	5.5
	Univercity	2	0.8

	Other family members	113	44.1
Alcohol Use	Yes	-	-
	No	256	100.0
Smoking Status	Yes	42	16.4
	No	214	83.6

It was determined that 98.4% of elderly women have their drugs prescribed at primary health care institutions. Antihypertensive (70.3%), urinary system (48.0%) and endocrine system drugs (45.7%) were the most common prescribed drugs. Only 7.8% of the elderly women use non-prescribed drugs (Table 2).

Table 2. Prescribed Drug Use Characteristics of Elderly Women (n = 256)

Prescribed Drug Use Characteristics		n*	%
Health Institutions ibing The Drugs	Primary Health Care Facility	252	98.4
	State Hospital	51	19.9
	Private Hospital	5	2.0
	Univercity Hospital	8	3.1
		n*	%
Drugs Used by Prescription	Antihypertensive Drugs	180	70.3
	Urinary System Drugs	123	48.0
	Endocrine System Drugs	117	45.7
	Analgesic And Anti-inflammatory Drugs	212	44.0
	Psychotropic Drugs	83	32.4
	Vitamins	74	28.9
	Cardiovascular System Drugs	122	25.3
	Respiratory System Drugs	116	24.1
	Digestive System Drugs	110	22.8
	Haematological drugs	57	22.3
	Antirheumatic Drugs	42	16.4
	Antihistamine Drugs	39	15.2
	Eye-Related Drugs	35	13.7
	Oncological Drugs	20	7.8
Unprescribed Drug Use	Yes	20	7.8
	No	236	92.2

*(More than one reply, value of "n" is folded).

It was determined that 89.8% of the elderly women were informed about the drugs they used, and that 64.5% of the information was provided by the physician (Table 3).

Table 3. Characteristics of Information on Drugs Used by Elderly Women

Characteristics of Information on Drugs		n(256)	%
Gathering Information About Drugs	Yes	230	89.8
	No	26	10.2
		n*(230)	%
Information Gathered By	Physician	165	64.5
	Pharmacist	108	42.2
	Nurse	24	9.4

*(More than one reply, value of "n" is folded).

It was determined that 71.9% of elderly women did not read the drug prospectus that they used, 41.4% did not understand the first line of statement and 18.8% had visual disability (Table 4).

Table 4. Elderly Women's Ratio of Reading Drug's Prospectus and the Reasons for not Reading

Ratio of Reading Drug's Prospectus and Reasons for not Reading		n(256)	%
Reading Drug's Prospectus	Yes	72	28.1
	No	184	71.9
n*(184)			%
Reasons For Not Reading	Misunderstanding The Statement	106	41.4
	Visual Disability	48	18.8
	Not needing to read	42	16.4
	Non-literacy	26	10.2

*(More than one reply, value of "n" is folded).

It was found that 48.4% of the elderly women used 3-4 drugs per day, and that 99.2% of those were taken orally (Table 5).

Table 5. The Amount Of Daily Drugs Used by Older Women And Drugs' Delivery Routes

The Amount Of Daily Drugs, Drugs' Delivery Routes		n(256)	%
The Amount Of Daily Drugs	3-4 pieces	124	48.4
	5-6 pieces	78	30.5
	1-2 pieces	40	15.6
	>7 pieces	14	5.5
		n(256)*	%
Drugs' Delivery Routes	Oral	254	99.2
	Epidermal	44	17.2
	Subcutaneous	41	16.0
	Intraocular	34	13.3
	Inhaler	34	13.3
	Intramuscular	25	9.8

*(More than one reply, value of "n" is folded).

It was determined that 52.7% of elderly women are aware of the side effects of the drugs they use, 41.4% have side effects related to drugs they use and 23.8% of these side effects are gastrointestinal complaints. (Table 6).

Table 6. Adverse Effects Related to Drugs Used by Elderly Women

Adverse Effects Related to Drugs		n(256)	%
Aware Of Side Effects	No	135	52.7
	Yes	121	47.3
		n(256)	%
Experiencing The Side Effects	No	150	58.6
	Yes	106	41.4
Complaints Related To Drugs		n(106) *	%
	Gastrointestinal Complaints	61	23.8
	Cerebrovascular Complaints	23	9.0
	Dermal Complaints	17	6.6
	Muscle-Skeletal Complaints	15	5.9
	Endocrinal Complaints	13	5.1
	Other (Cardiovascular, Respiratoral, Psychiatric) Complaints	4	1.6

*(More than one reply, value of "n" is folded).

It was determined that 73.0% of older women use their drugs regularly. 23.0% of the elderly who do not use their drugs regularly can not keep up with the drug hours and 22.3% forget to take their drugs (Table 7).

Table 7. The Rate of Regular Use of Drugs by Older Women and the Reasons for Not Using

The Rate of Regular Use of Drugs and the Reasons for Not Using		n(256)	%
Regular Use of Drugs	Yes	187	73.0
	No	69	27.0
		n(69)*	%
Reasons for Not Using	Not keeping up with drug taking hours	59	23.0
	Forgetting to take drugs	57	22.3
	Not feeling well and reducing the dose	39	15.2
	Drug tablets being large and hard to swallow	18	7.0
	Felling well and reducing the dose	17	6.6
	Not benefiting from drugs	13	5.1
	Not being able to provide drugs	10	3.9
	Drugs tasting awful	9	3.5
	Disclaiming treatment	2	0.8

*(More than one reply, value of "n" is folded).

It was determined that 99.6% of elderly women are careful to take their drugs on the right pathway and 46.1% have difficulty to use drugs due to dementia. (Table 8).

Table 8. Points Of Consideration By Elderly Women In Their Drug Use And They Experience (n=256)

Points Of Consideration In Drug Use And The Difficulties They Experience		n*	%
	Taking drugs in the right pathway	255	99.6
	Taking drugs as explained in prospectus	239	93.4
	Taking drugs on right time	193	75.4
	Taking drugs on right dose	192	75.0
	Storing drugs properly	180	70.3
	Taking drugs by obeying hygiene rules	178	69.5
	Consuming enough water with orally taken drugs	144	56.3
	Being aware of drugs expiration date	73	28.5
	Reading drugs prospectus	71	27.7
	Following drug related side effects	66	25.8
	Taking information about drug related side effects	64	25.0
The Difficulties in Drug Use	Forgetting to take drugs	118	46.1
	Having to use equivalent (non-original) drug	104	40.6
	Having difficulties to use drugs (injection, inhaler etc.)	95	37.1
	Confusing which drug to use	77	30.1
	Drug not available in pharmacy	68	26.6
	Not taking drugs on right time	64	25.0
	Experience more side effects using more than one drug	58	22.7
	Difficulties to swallow	48	18.8
	Difficulties in prescription	36	14.1
	Difficulties in dosing	31	12.1

*(More than one reply, value of "n" is folded).

DISCUSSION

Elderly people often refer to health institutions related to chronic diseases and drug use (Ünsal ,Demir, Ozkan and Arslan (2011). In our study, nearly all of the elderly women (98.4%) have their drugs prescribed in primary health care institutions. In a study, 55.2% of which consisted elderly women, it was determined that 44.2% of the elderly were referring to primary health care facilities for prescription (Demirbağ & Timur, 2012). The antihypertensive drugs (70.5%), the urinary system drugs (48.0%) and the endocrine system drugs (45.7%) were among the drugs mostly used by the elderly women in our study group.

Akkus and Karatay (2011) found that older women mostly used antihypertensive drugs (68.4%), analgesics (50.0%) and antidiabetic drugs (26.3%); while Demirbağ and Timur (2012) found they used antihypertensive (67.8%), antirheumatic (62.4%) and diuretic drugs (46.0%) . In our study, 92.2% of elderly women use prescribed drugs whereas only 7.8% use non-prescribed drugs. In the study of Unsal and his colleagues (2011), in which elderly women constitute 40.5% of total women population, it was found that 75.4% of the elderly were using prescribed drugs; while 7.9% used non- prescribed drugs and 5.6% used both prescribed and non-prescribed drugs.

It was determined that 89.8% of the elderly women in our study group were informed by physician (64.5%), pharmacists (42.2%) and nurses (9.4%) about the drug they use. In their study consisting %55.2 of elderly women, Demirbağ and Timur (2012) reported that elderly women were informed by phycisian (22.1%), pharmacist (9.7%) and nurse (7.1%) about the drugs they used; while Dolu and Bilgili (2010) determined that elderly people refer to physician (88.7%), pharmacist (23.8%) and nurse (2.2%) for information, both were in line with our findings.

In our study, 71.9% of elderly women stated that they did not read the drug prospectus; the reasons were not understanding the transcripts (41.4%), having visual disability (18.8%), not needing to read (16.4%) and being

illiterate (10.2%). In parallel with our findings, Solmaz and Akin (2009) stated that in their research, which consisted 49.4% of elderly women, 80.8% of the elderly individuals did not read the drug prospectus. In the same study, the reasons for not reading drug prescriptions for elderly people were misunderstanding (77.7%), visual disability (13.0%) and not needing to read (9.3%). Demirbağ and Timur (2012) also stated that in their study, which consisted 55.2% of elderly women, 67.8% of the elderly did not read the prospectus of drugs and that visual disability (42.8%) was the reason for not-reading.

It is reported that in line with the increase of chronic diseases, elderly people have to use more drugs (Feng and friends.2014). In our study, 48.4% of elderly women were using 3-4 drugs per day; while 30.5% used 5-6 drugs daily. In line with our study, Yaylıcı et al. (2016) found that 67.7% of the elderly used at least one drug, while 13.4% used five or more drugs; and Solmaz and Akin (2009) found that 46.5% of the elderly were using three or more drugs daily, whereas Çatak and colleagues (2011) found that 26.5% used five or more drugs daily. In our study, it was determined that the elderly women used the most oral pathway (99.2%) for drug intake. It is thought that orally drug is preferred by both the patient and the physician because of the reason that the elderly can easily reach and apply this form.

Drug related side effects are more common in the elderly (Unsal and friends. (2011). 52.7% of the elderly in our study are aware of the side effects of the drugs they use, and 39.8% of them experience side effects related to the drugs. Gastrointestinal system (23.8%), cerebrovascular system (9.0%) and skin (6.6%) related complaints were among the common complaints experienced by those who had side effects. Solmaz and Akin (2009) reported that 35.6% of the elderly are aware of the side effects related to the drugs they use. Akkuş and Karatay (2011) determined that 47.4% of the elderly had side effects related to the drug they used, and that 21.1% of those who had side effects experienced constipation, 18.4% had fever and fatigue and 9.2% had gastric complaints.

Regular use of drugs is important for the effectiveness of treatment in chronic diseases. Increasing number of chronic diseases in line with age can also increase the amount of drugs and create problems about regular use of drugs (Akkuş & Karatay (2011). While 73.0% of elderly women who participated in our research did regularly used their drugs, 27.0% did not use their drugs regularly. Most common reasons for not taking drugs regularly are forgetting to take drugs (23.0%) and not keeping up with drug taking hours (22.3%). In line with our study results, Dudak et al. (2006) reported that 71.2% of the elderly used their drugs regularly. In the same study, the frequency of regular drug use was found to be higher in women (77.8%) than in men (62.5%).

As a result; most elderly women use prescribed drugs, most of them are informed about the drugs they use, very few read the drug prospectus, almost half of them use about 3-4 drugs per day, almost half of them experience side effects related to the drugs they use and almost half of them forget to take drugs. Periodic monitoring of drug use in older women is recommended.

Ear Training Approach in The Context Of “Do To Do” Scale in Music Education

Deniz TUNCER

*Art, Design and Architecture Faculty
Istanbul Medeniyet University, Turkey
deniz.tuncer@medeniyet.edu.tr*

ABSTRACT

Ear training is one of the most important elements in music education. The purpose of this study is to discuss the approach used as a “Do to do” scale in ear training education by presenting unique charts and examine the advantages in music education. Charts prepared in major and minor tonalities and scales written in all major and minor (including natural, harmonic and melodic- chromatically) scales, are prepared as a guideline to those related with the subject. “Do to do” scale, also known as the Dalcroze scale, is one of the methods used in solfeggio and dictation training which brings a different perspective to tonality.

Key words: Ear training, music education, “do to do” scale, solfeggio and dictation training.

INTRODUCTION

Ear training is training in the power to perceive the tonal elements in musical beauty. It always involves setting up the right kind of responses to music (Jackson, 1963, p. 133). Although the ear training models used in music education methods differ, almost every method aims at not only better hearing, dictation and solfeggio but also development of music literacy; according to Günay and Özdemir (2006, p.73) ear training is also referred to as “Training of Music Capability”. The development of this ability will undoubtedly be the result of desire and effort, and qualified education. According to Egemen (2003) quoted from Yıldırım (2012, p. 4) that the main aims of the solfeggio training program is to improve the students' musical abilities and various musical hearing and reading skills. Widely known approaches are set in accordance with these thoughts are designed and developed by Carl Orff, Zoltan Kodaly, Shinichi Suzuki and Emile Jaques Dalcroze. Among these approaches, ear training has been dealt with in different ways. There are many ear training methods used nowadays and some of those are fixed do, moveable do, numbers and with one syllable.

In the fixed do system, C, D, E, F, G, A and B are called do, re, mi, fa, sol, la and ti. In singing a melody, the name for each note is sung without regard to any accidentals (Berkowitz, Fontrier, Kraft, 1997, p.1). Fixed-do implies that a given syllable denotes a fixed pitch (More, 1985, p.14). In the movable do system, C always represent the tonic or first degree of the scale, regardless of key used. Accidentals are accounted for by changing the syllables. The ascending chromatic scale reads as follows: Do, di, re, ri, mi, fa, fi, sol, si, la, li, ti, do. The descending chromatic scale reads as follows: Do, ti, te, la, le, sol, se, fa, mi, me, re, ra, do. The purpose of this system is to emphasize the relationship between the degrees of scale, and to develop a feeling for tonality even when the tonal center shifts (Berkowitz, Fontrier, Kraft, 1997, p. 1). So, it would appear that the differences between the fixed and movable approaches are so far largely a matter of degree. The fixed-do class would seem to have advanced much less than the movable-do group (Multer, 1978, p. 34). In addition, many years ago, Taylor (1897, p.1) used to define "tonal relation" for movable do and he mentioned that beyond which music neither does nor can extend. Numbers (1, 2, 3 etc.) may be used instead of syllables (Do, re, mi, etc.). The application is the same in the movable system (Berkowitz, Fontrier, Kraft, 1997, p. 1-2).

Aside from what has been presented above, this paper focuses on “do to do” scale which is also known as Dalcroze scale. Emile Jaques Dalcroze (1865-1950) was a Swiss educator who built up and improved the method known as Eurhythmics. According to Abramson (1996, p.1), one of the early pioneers in Eurhythmics, the processes of Eurhythmics, in addition to their value for musical learning, can aid general development in such areas as attention, concentration, memory, coordination, self-control and sensitivity. He is best known for a chapter in Lois Choksy's book, “Teaching Music in the twentieth-century.” In this chapter, Abramson (1986) said that all the pedagogical principles and techniques he discovered in Eurhythmics, Jaques Dalcroze reapplied to the study of sight-singing and ear training. Abramson also indicated that special exercises for the development of perfect pitch, accurate hearing and refined intonations were combined with exercises in mental and musical alertness, concentrations and memory (Choksy, 1986, p. 52).

“DO TO DO” SCALE

The simplest expression for “do to do” scale is singing all scales from tonic to tonic. The most important goal of this approach is to broaden the sense of functioning of the scales. Solfeggio, on the other hand, aims at the development of inner hearing, which means hearing written notations mentally before actually singing or performing. Inner hearing is concerned with the control of sensitivity in musical perception which is related to the

sensitivity of our hearing.

According to Choksy quoted from Abramson (1986), Dalcroze noticed that when major scales were taught from tonic to tonic, students experienced only as transpositions of the same simple melody. Moreover, some scales could not be experienced through singing because students extended beyond their vocal range. He proposed a solution to resolve the difficulties of experiencing, comparing and measuring all the major scales, while keeping all of them within a comfortable singing range (Choksy, 1986, p. 55-56). Thomsen (2011, p. 74) also agreed with the proposition that “do to do” scale is in everyone's vocal range. Stevenson (2016) analyzed “Do to do” scale as based in a series of pitch sets, which are groups of consecutive tones taken from the diatonic scale. The dyad contains two pitches, the trichord has three, the tetrachord has four, the pentachord contains five, the hexachord has six, and the heptachord holds seven pitches. The first three pitch sets are used in the study of the Dalcroze scales, while the pentachord, hexachord, and heptachord are used in the study of triads and seventh chords. From the study of the scales tonicization and modulation to nearly related and distant key centers are experienced and studied. (Stevenson, 2016, p. 18).

His method of fixed do scales used the C major scale melody as the norm to which all other scales were compared; The C Major scale (from middle C to the C above) became the frame which contained the C Major, as well as all the other scales (Choksy, 1986, p. 56). The accidentals of the tonality is also singing within the scale and finishing the tonic of the tonality. In Figure 1, we saw E flat major scale we use now, Figure 2 shows us how to read the E flat major scale as a “do to do” scale with degrees. Figure 3 and Figure 4 are some samples for minor scales. The importance of the “do to do” scale is finishing the tonic of the tonality for closure.

Figure 1: E flat major scale.

Figure 2: E flat major scale in terms of “do to do” scale with degrees.

Figure 3: G harmonic minor scale.

Figure 4: G minor scale (harmonic minor) in terms of “do to do” scale with degrees.

Much of what we know of today as Dalcroze solfege pedagogy comes from other teachers who have added their own ideas to the method (Ristow, 2017, p. 8). In Figure 5, we see an example of Anne Farber's lessons who is the director of the Dalcroze Music School in New York. Farber wanted to help her students find their bearings tonally in the scales, and to encourage them away from feeling the scales as modes, she suggests adding words and rhythms to a scale (Ristow, 2017, p. 8). We can also apply Farber's exercise in a different tonality (Figure 6). Example in Figure 5 is in A flat major, and example in Figure 6 is in A major. Once the accidentals of the tonality are analyzed, differences of the examples arise. Accidentals provide better understanding of the tonality of these examples.

Figure 5: Example in A flat major using Anne Farber's lessons.

Figure 6: Example of the melody at Figure 5 in A major.

Table 1 and Table 2 present two charts for major and minor scales for those who would like to use the “do to do” scale. With these tables prepared for all major and minor tonalities, all the notes of “do to do” scales can be seen. Tonic and also ending notes of all tonalities are shown at the last columns of the tables. At Table 3, all major and minor scales (including natural, harmonic and melodic) are clearly written one by one with the degrees. Scales are written in chromatic way starting with C to B in Table 3.

Table 1: Chart for “do to do” major scales.

C MAJOR	C	D	E	F	G	A	B	C	C
D\flat MAJOR	C	D \flat	E \flat	F	G \flat	A \flat	B \flat	C	D \flat
D MAJOR	C \sharp	D	E	F \sharp	G	A	B	C \sharp	D

Once the advantages of using this scale considered, few subjects should be taken into account. “Do to do” scale is always sung in C range, so it fits with everyone’s vocal range. This helps students be more comfortable with scales in solfeggio and mostly in sight reading. It allows students to sight read the pieces without thinking about their vocal range. For example, to sight read a piece which is in G minor and also the highest pitch is Bb6, one should transpose the note to her own range to make it sound right. However, using the “do to do” scale allows students to indicate specific pitch within a scale. Another advantage of “do to do” scale is to teach students to sing in tune. Students are always ready for C, because C sound is always in their memory. As it was mentioned in Ristow’s (2007, p. 2) translation of Jaques Dalcroze’s *Les Gammes et Les Tonalitiés, Le Phrasé et Les Nuances*, this advantage is invaluable, certainly, in musical hearing. Students trained in our method will have no trouble discerning the key of any excerpt, thanks to the perception of alterations which the scale of C is submitted to, and, experienced in the singing of various intervals in different settings (meaning different keys), they will recognize easily all of the notes, regardless of instrumentation (Ristow, 2007, p.2). Another benefit of using “do to do” scale is to provide the teachers in dictation training. All notes can be dictated to tonic to tonic in C firstly, and then accidentals can be written depending on tonality.

CONCLUSION

Ristow's translation (2007) of Dalcroze’s phrase, every good musical method must be based on the “hearing” of sounds as much as on their performance. “Do to do” scale known as Dalcroze scale provides an opportunity to those who aim to improve their hearing abilities, as well as solfeggio and dictation skills. “Do to do” scale also presents numerous advantages in ear training education; it is in everyone’s vocal range, all keep their own tune when singing solfeggio, sight reading and are more comfortable with dictation due to tonic to tonic. In addition, charts and tables given with this paper are unique and will be essentially beneficial for those who aims to use “do to do” scale for ear training.

Education And Social Engineering: A Study of Human Behavior

Abdelmonem Moheyldeen ELSAYED

*Tanta University ,
Tanta , Egypt*

ABSTRACT

Human behavior is not randomly attempted. Rather it is done according to specific rules. In addition, individuals have to adopt a physical and social behavior to fulfill these roles. Besides, behavior is closely related to society. Therefore, it is necessary to realize the role of education in its mutual relation to social engineering to understand and change individuals' behavior. Social engineering is a social change for individuals. It is done by changing their basic negative intellectual structures and replacing them with more socially compatible ones. The processes of social engineering begins with studying the nature of the relation between the individual and the society to determine the negative conducts of some members of the society. Rather, they are related to social needs in order to establish a mutual relation between individuals and the resources and potentials of society in its production institutions in order to help organize and fulfill its goals.

Key words: Education ,Social, Engineering ,Human,Behavior

INTRODUCTION

It is important to identify the bases of the individual's behavior in order to have a balanced character. Human behavior is not randomly acquired. Rather, it is based on specific rules, because people can no longer communicate with or understand each other.

Once seen by the eye, behavior is sent to the neurotic net that is connected with the brain. It gives specific meanings of that behavior that are associated with the individual. In other words, the significance of a certain behavior varies from one person to another according to the epistemological store of that behavior which is also different from that of another person. Cognitive storing generally refers to the relation of behavior to the variables which affected it, particularly the first time it happened to someone and upon which it was stored. The fact that there is another person at the same time and in the same place does not necessarily mean that his epistemological cognitive system will store the same significance which the first person did (Stanylaf, 2005).

The Formation of Cognitive Behavior Web

The individuals' behavior is affected by what is called "cognitive behavior web" which consists of two compounds: cognitive and behavioral. The cognitive compound is the outcome of the individuals' knowledge and information. It includes several areas of knowledge such as logic, mathematics, physics, history, etc. The final form of that web is the outcome of the reactions of those areas with each other as is shown in the following figure:

Figure (1) explains the interactions of knowledge areas to form the cognitive web.

The final form of that web is the outcome of the interactions of those areas with each other. Thus, each of the epistemological items has a lower effect on forming the cognitive web. The sum of those items gives the web its final shape. Moreover, the final web determines the individual's cognitive potentials. Therefore, the more the individual can affect the interaction among the various cognitive areas and their results as well as the result of the interaction among the areas themselves, the more powerful his /her cognitive status (Peat, 1987).

THE INDIVIDUAL'S BEHAVIORAL WEB

Behavioral knowledge is different from knowledge in natural sciences as it is always associated with specific behavior that is determined by the environment of an individual. In the same way, the behavioral web of a person is strongly affected by the environment in which he acquired it. It is also different from the cognitive one which is not related to a specific environment. Moreover, it acquires a new shape which varies according to the individual's modifications of his behavioral experience. Consequently, people may have similar, but not identical behavior. This is due to the fact that a person gains behavioral knowledge which interacts with his /her conduct or pre-behavior ideas. Since ideas vary from one person to another, the final result of conduct may be similar, but not identical. Behavior, in addition, is divided into two kinds. The first kind is external behavior that complies with others. The second one is internal behavior that is unique for every individual (Simon, 1990). The following figure shows how an individual's behavior is formed.

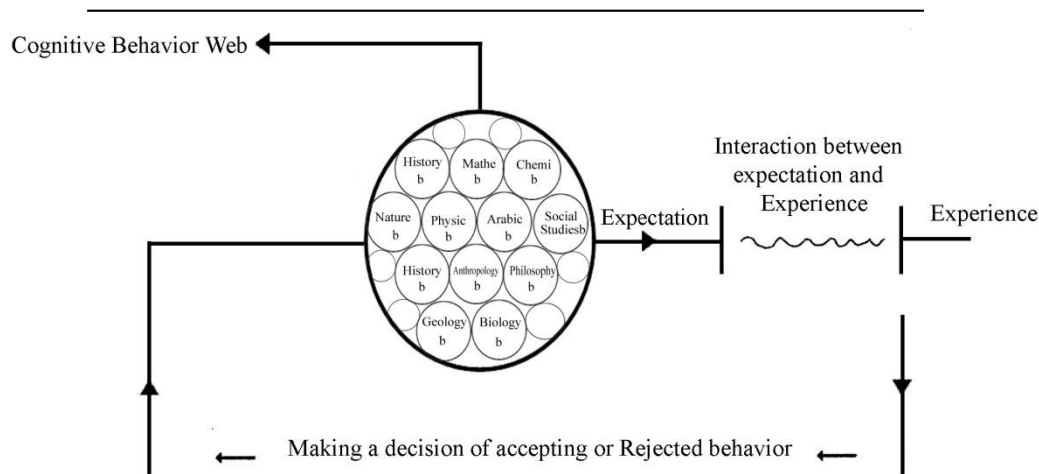

Figure (2) : The Formation of Human Behavior

The previous figure helps formulate an idea of how behavior is accepted or rejected by the individual. As explained before, the behavioral and scientific areas interact with each other (figure 1) to produce new cognitive behavior areas that help the individual to acquire a certain conduct. The expectation interacts with the individual's personal experience, which is also a cognitive behavior area. The result of the interaction between expectation and experience is manifest in the individual's decision to accept or reject behavior. Next, behavior goes from the inner space of the mind – which cannot be seen – to the outer one which is seen by others. The decision is then made to accept or reject behavior after identifying it with the reactions of those around the person and his own behavioral cognitive web (Johnson, 1983).

It is important to notice that practicing any behavior can be implicit. Its real significance can be implied within the cognitive web of the individual. This is confirmed by the fact that if we try to explain some one's behavior, we have to provide our own interpretation of it which may be completely different from his / her own viewpoint. That is why it is referred to as implied behavior. More importantly is the fact that the person may himself fail to justify his / her own behavior. This is perfectly clear when we ask a friend to explain why he did something; his answer may be "I do not know why I did it". This is simply because the friend's behavior is the outcome of a large number of interactive variables which are received by the mind and stored in the intermediate areas that may be called the unconscious memory. That is why he could not identify or even control it. The only thing he could perceive or live is his own conduct. In practical life we depend on an individual's experience. We know he can make a decision in a certain situation because of his own experience or what may be called the unconscious memory. Consequently, the more experience man has of any field, the more his unconscious memories. His judgment on things is unusually right to a great extent because of his increasing unconscious memory. The question that may be raised here is; how can we create this experience? Or what makes an individual's behavioral practices active? We should also determine what do we mean by the word "active" and for whom: the individual or the society? Adopting the idea of social engineering or behavior engineering can solve such problem (Chaiklin, 1993).

SOCIAL ENGINEERING AND HUMAN BEHAVIOR

It has been previously explained that human behavior is not randomly attempted. Rather it is done according to specific rules. In addition, individuals have to adopt a physical and social behavior to fulfill these roles. Besides, behavior is closely related to society. Therefore, it is necessary to realize the role of education in its mutual relation to social engineering to understand and change individuals' behavior.

Indeed, social engineering is a social change for individuals. It is done by changing their basic negative intellectual structures and replacing them with more socially compatible ones. The process of social engineering begins with studying the nature of the relation between the individual and the society to determine the negative conducts of some members of the society. Furthermore, it is necessary to identify the facts that lead to their rise and make people practice them in a negative way. A perception of how to deal with variables affecting people's behavior which lead to the emergences of negative conduct is attempted to change them. Major ideas of social and political systems that use social engineering are discussed. Such viewpoints are not limited to the methods of dealing with individual conducts in isolation from society. Rather, they are related to social needs in order to establish a mutual relation between individuals and the resources and potentials of society in its production institutions in order to help organize and fulfill its goals. (Hands, 1973).

STEPS OF MAKING SOCIAL ENGINEERING

To establish a mutual relation between the individual and the society by using the technique of social engineering, the following steps should be adopted:

- 1- Identifying a specific formulation of social engineering concept.
- 2- Determining the organizing form of society.
- 3- Determining the goals of the society and transmitting them to desired conduct stereotypes.
- 4- Identifying negative behavior types prevalent among members of the society.
- 5- Suggesting a perspective of the variables affecting negative conducts.
- 6- Suggesting a perspective of the variables affecting positive conducts which should replace the negative ones.
- 7- The beginning of forming an unconscious memory for the required conducts.
- 8- Determining the prototype affecting the individual /individuals and the suggested one before the beginning of the formulation process to generalize the required type.

THE ROLE OF SOCIAL ENGINEERING AND HUMAN BEHAVIOR

Social engineering forms the behavioral patterns of society to maintain compatibility between the society and its members. By so doing, the society becomes one web reflecting the dominant culture. Education is used here to determine the patterns of relationships and the values needed in a society. Furthermore, it contributes to socialization which supports positive values and eliminates negative ones. Means of social control represent the guiding tool that promotes individuals to form positive relations and give up negative ones.

The process of social engineering begins by gathering facts and information on the reality of social relations and the factors affecting them. It also studies the effects of those factors on the social structure. In addition, the process of social engineering is fulfilled gradually, beginning with the acknowledged facts identified by the members of society. These facts are then related to the values which society aims to find and acquire direct social relations to certain aspects which fulfill the purposes of the society and enable it to attain its intended goals (Stacey, 1978).

Furthermore, social engineering transforms social behavior from undesired patterns to desired ones by using what is known as the techniques of changing behavioral patterns. The process goes through the following steps:

- 1- Identifying the behavior which needs support and the values that promote it.
- 2- Identifying undesired behavior.
- 3- Determining the means that can be used to transform behavior from one pattern to another.
- 4- Making a plan for the society to be implemented through its different institution.

MODELS OF BEHAVIOR ENGINEERING

Let's agree that what we are suggesting in this paper is not simple. Rather, it is a complex process that needs regular work. Co-ordination among all institutions of society is required. Moreover, it should be under specific supervision. What the paper explains is a very simple example which aims to show the main idea of social engineering. Based on what was said behavior about the way the human mind in stereotyping behavior, we may presume that the main goal of the social engineering process is to eliminate undesired behavior and use a desired one instead. This process is done through a group of mental models which can be illustrated as follows:

The learner receives information by means of what is known as "Input unit" (UNIT LAYER 1) , storing them in the concealment units (UNIT LAYER 2) and taking them out through the production units (UNIT LAYER 3) (Howard, 2003).

Layer 3 units { • • • }
Layer 2 units { • • • • • }
Layer 1 units { • • • }

Figure (3) represents the neurological unit as one of the units that show how behavior is stored.

This model shows two kinds of connection. The first kind is the "Input connection" through which the individual receives information (inputs). Inputs are the units that receives information and external stimuli. The second type is the "Output connection" through which information is sent (Output). Output is the units that send and take out the information they receive from input. This model is used for learning and direct experience that depends on memorization and indoctrination.

Information or behavior is inserted and taken out as it is, without any interference attempted by the creativity and personality of the individual in this production. For example when you teach a child to keep away from fire least he should be burnt, the child is afraid of coming closer to it without even exploring it (Gary, 2010).

Figure (4): The Units of Input, Concealment and Output

The previous figure shows that every unit is connected to the units found in the higher layer. The result is a web of units that are related to several connections among them. Information goes forward through these units from input to concealment and then products units. This model is an example of indirect learning .Information is received in the input units .It is stored in the concealment units which send it to the production ones. The concealment units keep and store the information received by the individual from the input. Next the individual sends the information to the outputs when it is needed. This model enables the individual to innovate rather than memorize and indoctrinate ideas. For example, when a child comes closer to fire, he puts his hand in it. When his hand is burnt he learns that he should not do this. Such information is stored in the concealment area as an experience he gains throughout his life .The model also should be adapted to transform behavior .In other words, it is the active model that may be used in social engineering (Michael, 2004).

Figure (5) explains the multiplicity of concealment units and the frequency of mental activity.

The previous figure shows many of the concealment units and the frequency of mental activity which trains webs and repeats learning. They are also used in learning language. Webs are trained according to the procedures of two phases.

1-The phrase of language exposure:

The learner or the child is exposed to language in order to learn it.

2-The experimental phase:

The child is examined to test what he learned. Through this model it is clear that the mind is in a state of permanent activity which results in more mental output and several behaviors and reactions. This means that the more experience and learning a learners has, the more his mind activity and work becomes. The result is sound ideas and actions. This model is different from the previous one which represents few experiences and consequently little mental activity and output.

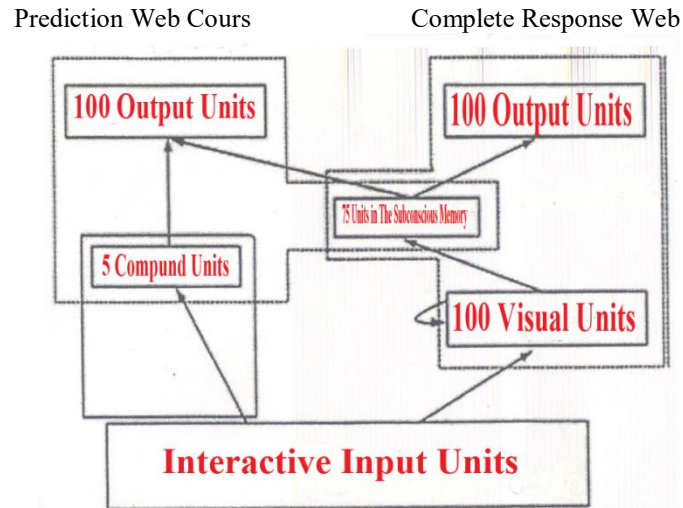

Figure (6) shows the relation between the subconscious memory and other cognitive gains.

The previous model is a schematic summary of the relation between stored subconscious memory in the middle (the hidden) area. In this model, units are divided through two of the participating units. For example, the integration that happens between the concealment units (75 units) and the prediction web course is considered a gate of input information. It is possible that the stored information may not necessarily be compatible with the internal representation and the new information coming from the outside world. Surprise in this phase is caused by the fact that there is a contradiction between the emergence of the unexpected and the real. In other words, there is a contradiction between the stored representation and the new one which provides a new behavior image. For example, when someone is exposed to a new situation, he may be surprised because he does not know how to act. It is probable that his action may be wrong or right. Yet he will learn anyway. He will take the right action. For example, though we may be warned against a certain behavior, we will not be convinced unless we practice it ourselves. If someone is accustomed to driving his car quickly, he will not listen to any one asking him to drive slowly unless he is subject to a traffic accident because of high speed. He realizes that he should have listened to others' advice. Both the young and old are equal (Philip, 2003).

Figure (7) shows how behavior can be modified through learning

The previous model explains how behavior can be modified through learning. Response caused by stimuli which varies from one to another. It may be expected or unexpected by others surrounding the individual. It may be

also unexpected of the same person. The daily behavior of people depends on the flexibility of response to stimuli. This means that the same stimuli may cause a different response even without man's knowledge. It depends on his present condition and previous experiences. For example, revenge may be considered necessary by some and a symbol of ignorance and backwardness by others according to the previous experiences of the avenger which were acquired from his environment. All the former models have one thing in common, i.e., the mind that receives knowledge (information/behavior) through the input units. Information is activated through social interaction in which the hidden units are also activated before outputs are produced (Michael, 2004).

Unlike previous models, there are many others that are identified. As mentioned before, education can be used to construct behavior or reform these models in order to make the required social balance, particularly in the transitional phases of any society. This can be done through the following steps:

1. Identifying the negative behavioral patterns that will be eliminated from the daily practices of the members of society.
2. Identifying the positive behavioral patterns which may replace the negative ones that will be eliminated.
3. Choosing the suitable model for engineering society.
4. Selecting educational methods and means to fulfill the determined model.

The previous four phases are not easy. Fulfilling every phase necessitates conducting a collective research to carry out orders precisely. Such precision is important because we are dealing with reconstructing social engineering. Unintentional mistake may destroy it. Precautionary outlook may hinder approaching that new domain in the world of education.

ABSTRACT

The focus of this post is the issue of education in the key area of prevention of nosocomial infections. Evidence-based practice in the relation of education to the prevention of nosocomial infections is the simplest and best practice of increasing the quality of provided care, leading to the desirable result. The aim of the study was to educate and detect the compliance of hand hygiene among healthcare professionals in prevention of nosocomial infections in comparison with the latest scientific evidences. 164 healthcare professionals from the Department of Anaesthesiology and Intensive Medicine in Slovakia participated in the study. The results of exploratory studies have shown that despite the participation in education and observance of the recommended clinical practices, the hygiene of the healthcare professionals' hands in these workplaces is one of the most well-established and most important strategies leading to the disruption of the transmission and spread of nosocomial infections.

Keywords: Education. Hand Hygiene. Nosocomial infection. Evidence based practice. Prevention.

INTRODUCTION

The presence of multi-resistant organisms and a weakened immunity of intensive care patients at anesthesiology and intensive care medicine wards represent an irrevocable risk of developing an infection with a high morbidity and mortality rate. Hands are both a means of communication and a working tool; they heal, yet can, at the same time, pose a threat. The transmission of infection at these wards most frequently occurs as a result of the microorganism-contaminated hands of the staff. A key area of the prevention of nosocomial infections are, first and foremost, hygiene and hand disinfection. It is precisely the education of medical care professionals in the field in question that represents an inseparable part of health care provision. This paper analyzes the issue of education in the area of the prevention of nosocomial infections in clinical practice as a significant presupposition of good-quality health care provision.

EDUCATIONAL PROCESS

Being a decisive part of both nursing and clinical practice, education has a very long history. According to the legislation, each health care professional is obliged to pursue continuous education throughout his or her career (Regulation of the Government of the Slovak Republic no. 296/2010).

The educational process in clinical practice:

- represents a certain form of the "passing on" of specific information that takes place in a specially arranged environment within the framework of the mutual interaction between an educator and an educatee;
- is intentionally designed to enable someone to learn something;
- is a dynamic relationship between an educator and an educatee;
- is a pedagogic-educational process;
- is part of the nursing process in clinical practice (Nemcová et al., 2010).

The education of health care professionals in clinical practice on the issue of the prevention of nosocomial infections is of utmost importance with respect to the implementation of evidence-based changes (Jarošová,

Zeleníková, 2014). There are strategies and methods enabling to increase the awareness of health care professionals in the field of hand hygiene according to the evidence-based practice principles. Most commonly used is a multimodal strategy that consists of five sequential steps (Chart 1).

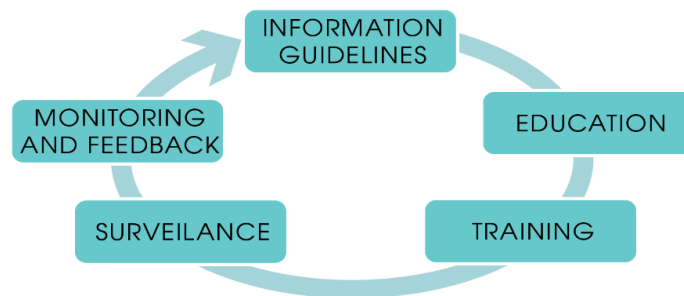

Chart 1: A multimodal strategy in the prevention of nosocomial infections

As the chart shows, working tools contribute to elementary and homogenous education and the implementation of programs for the prevention of nosocomial infections in clinical practice. This includes information tools (an overview of recommendations, WHO recommendations, global patient safety guidelines), educational tools and training (observations, presentations, educational films, flyers, brochures, and posters on the techniques in the field of hand hygiene), observational and monitoring tools (a state-of-play analysis at the health care professional/health care facility level, an opinion survey on the implementation of the change as perceived by health care professionals and managers in clinical practice, a survey and an evaluation of the knowledge of health care professionals in the area of hand hygiene compliance) (WHO Guidelines on Hand Hygiene in Health Care, 2009).

Launched in 2009, the WHO campaign "Save Lives: Clean Your Hands" is a behavioral strategy that focuses on the education of health care professionals. It concentrates on "5 key moments for hand hygiene" that include the hand cleaning and disinfection before patient contact, before aseptic task, after body fluid exposure risk, after patient contact, and after contact with patient surroundings (Chart 2). It visually interprets the representation of patient zones and health care facility zones, respectively. Based on this, it describes the indications that necessarily require hand hygiene. The model is practical, easy-to-remember, compatible, and easy-to-do (Kelčíková, 2013).

Chart 2: „5 moments for hand hygiene“ (Source: WHO Guidelines on Hand Hygiene in Health Care, 2009)

The compliance of health care professionals and the significance and effectivity of hand hygiene in clinical practice are also very robustly encouraged by the visual demonstration of hand cleaning and disinfection technique. This method is also recommended when hand hygiene techniques are practiced as part of the professional training and workshops of health care professionals, but also in clinical practice (Chart 3).

Chart 3: Proper hand hygiene technique (Source: WHO Guidelines on Hand Hygiene in Health Care, 2009)

The strategic goal of the EU member states is to decrease the risk of nosocomial infections by implementing the evidence-based techniques recommended for clinical practice (ECDC, 2015). In Slovakia, these techniques are rooted in the Regulation of the Ministry of Health of the Slovak Republic from 28 June 2015 no. 192/2015 that amends and supplements the Regulation of the Ministry of Health of the Slovak Republic no. 553/2007 Coll. and establishes the details of the requirements for the operation of health care facilities from the perspective of health protection. Clinically recommended techniques confirm that it is necessary to clean and disinfect hands according to evidence-based practice guidelines, while it is first and foremost education that plays a key role in the process. The points of departure for the education regarding hand hygiene issues ought to include scientific information about the positive influence of the increased quality of hand hygiene on the reduced occurrence of nosocomial infections and on the transmission of resistant microorganisms; an interpretation of hand hygiene guidelines; the supplementation of missing knowledge regarding the indications of hand cleaning and disinfection for daily patient care; information on non-compliance with the guidelines and the reasons thereof; and information on solutions for hand hygiene and skin protection (ECDC, 2015).

The education in the prevention of nosocomial infections according to the evidence-based practice principles is the simplest and well-established technique for increasing the quality of provided health care that leads to a desirable result.

THE STUDY

The aim of the research study was to explore hand hygiene compliance in the key area of the prevention of nosocomial infections at anesthesiology and intensive care medicine wards in comparison with the most up-to-date scientific evidence, both before and after the educational process has been accomplished.

164 health care professionals ("nurses") in Slovakia participated in the research study. The basic criteria for making selection files included the affiliation of one's official position in the branches of anesthesiology and/or intensive care medicine; age; years in professional practice; highest achieved education; and participation in a specialized study program. The most numerous group of the selection file consisted of 30.5% of the respondents with completed high school education, while 19.5% of the respondents had some form of advanced vocational training. 22.0% of the respondents had a bachelor degree, while 21.3% of them were awarded a master's degree. 5.5% of the respondents had a first professional degree (PhDr.) and 1.2% of the respondents were awarded a Ph.D. 35.4% of the respondents of the total research sample have accomplished a specialized study program in the field of anesthesiology and/or intensive care medicine. The average age of the respondents was 36.4 years. The average years of professional experience was 12.7 years.

The research study was done in the first line by way of extrospective direct, hidden and structured observation under natural conditions through a pre-prepared standardized research protocol. In the second line, it was done by

way of an educational process that took into consideration the valid legislation and information available in academic literature.

The results acquired in the analytical phase were mathematically evaluated and analyzed through the lens of descriptive statistical techniques and through an analysis of dispersion with the significance level set to the acceptable value of 5%.

FINDINGS

In the field of anesthesiology and intensive care medicine today, one of the goals of nursing practice is to provide a good-quality and scientifically-approved care based on the education of health care professionals ("nurses") in the area of the prevention of nosocomial infections. The most important methods of the prevention of nosocomial infections include the hand hygiene, cleaning and disinfection of health care professionals ("nurses").

Based on a statistical data analysis of individual features of the issue we can identify certain connections and make some conclusions. All in all, we can conclude that there is a statistically significant connection between hand hygiene compliance before and after the educational process has been accomplished because the statistical significance level did not exceed the defined statistical value of 5%. According to the Regulation of the Ministry of Health of the Slovak Republic from 28 June 2015 no. 192/2015 that amends and supplements the Regulation of the Ministry of Health of the Slovak Republic no. 553/2007 Coll. that establishes the details of the requirements for the operation of health care facilities from the perspective of health protection, the indications of hand cleaning include the arrival to the working place; visible hand contamination by dirt, blood or other body fluids; part of personal hygiene before meals and after using the toilet; and cases of possible or documented hand contamination by spore-producing microorganisms with the aim of mechanical removal of visible hand contamination, including organic and inorganic impurities. The "my 5 moments for hand hygiene" strategy includes the indications of consistent hand disinfection. It is also supported by the fact that the strategy in question was only applied correctly by 37.8% of the respondents before the education, while the number went up to 62.8% of the respondents after the educational process was accomplished. The described strategy represented a significant tool in both our observation and the process of education. It describes five clearly defined techniques for easy-to-do monitoring of errors and deficits related to hand hygiene. The concept of the new strategy also established itself as important and successful in the educational process (WHO Guidelines on Hand Hygiene in Health Care, 2009).

The World Health Organization (2009) recommends cleaning hands with regular soap and water no longer than one minute. We also focused on the area of the compliance with the optimal length for hand cleaning. The measuring of the time length for hand cleaning was done by recording a time interval using a stop watch. During our observation, the optimal time for hand cleaning was complied with by 18.5% of the respondents. After the educational process had been accomplished, the optimal length for hand cleaning only increased by 2.7%.

The aim of hand disinfection is a speedy reduction of the transient hand skin microflora as a way of prevention of the transmission of microorganisms (Regulation of the Ministry of Health of the Slovak Republic from 28 June 2015 no. 192/2015 that amends and supplements the Regulation of the Ministry of Health of the Slovak Republic no. 553/2007 Coll.). It is evident from the research studies that only 25% of the health care professionals at anesthesiology and intensive care medicine wards disinfect their hands before coming to contact with a patient during a high working load. In contrast, during a regular working load this percentage goes up to 70%, provided that there is adequate work-force (Hugonnet, 2007). The research study also monitored the compliance with the optimal time for hand disinfection. Today, alcohol-based disinfection solutions are predominantly used in ordinary clinical practice at anesthesiology and intensive care medicine wards. A fluid alcohol-based disinfection solution must comply with certain requirements given by the valid legislation. To enable good-quality and effective hand disinfection it is necessary to use 3 ml of a disinfection solution. According to our tests, it represents one push of the dispenser with a disinfection solution. An important phenomenon in hand disinfection is the rubbing of the disinfection solution onto hands during the whole exposure time. According to clinically recommended techniques, the exposure time for hand disinfection is 30 seconds. Our research has shown that the optimal time for hand disinfection was only complied with by 29.4% of the respondents before the education. In contrast, the value increased significantly after the education of the nurses (Table 1).

The hand cleaning that aims at removing the impurities and reducing the volume of transient microflora on the hand skin is more effective than mechanical hand cleaning, but less effective than hygienic hand disinfection. At the end of our research, we also focused on the proper technique of hygienic hand cleaning and disinfection. Our research has shown that the proper technique of hygienic hand cleaning was complied with by 25.8% and 43.5%

of the respondents, respectively, before and after the educational process was accomplished. The educational process regarding the issue in question was also important in the compliance with the proper technique for hygienic disinfection because the monitored value increased by no less than 26.3% (Table 1).

N		164
Variables	Before education (%)	After education (%)
5 moments for hand hygiene	37,8	62,8
Optimal time for hand cleaning	18,5	21,2
Optimal time for hand disinfection	29,4	50,6
Hand washing technique	25,8	43,5
Hand disinfection technique	31,8	58,1

Table 1: Hand hygiene compliance according to evidence based practice

The findings of the research study have shown that the hand hygiene of health care professionals at wards in question remains to be one of the most fundamental and important strategies to disconnect the transmission and spread of nosocomial infections, despite the participation in education and the compliance with clinically recommended techniques. This fact is related to the accessibility of evidence-based information and the ability of nurses to implement the recommendations acquired in the educational process into their nursing practice, as clearly evident from the findings of research studies (Von, et al., 2004; Kampf, et. al., 2009; Borges, et. al., 2012; Kelčíková, 2013; Marimuthu, et al., 2014).

CONCLUSIONS

The compliance with educational strategies in the educational process, together with the implementation of clinically recommended techniques according to up-to-date scientific knowledge into clinical practice at anesthesiology and intensive care medicine wards represent a way of integrating the best practice known also from traditional nursing. To enable the continuous development of nursing care in the area of education for the sake of the prevention of nosocomial infections at anesthesiology and intensive care medicine wards, it is necessary to make sure that the nurses have up-to-date knowledge and put scientific knowledge into practice by way of creating and complying with unified recommendations, standards, and guidelines.

ABSTRACT

People working in the area of security management have to be professionally, physically and mentally capable to perform their working activities. Psychosocial risks are one of the significant factors that have influence on the work performance. The following psychosocial risks have been identified by the EU-OSHA agency within the ESENER researches: stress in the workplace, time stress, necessity to cooperate with problematic customers. In order to deal with these psychosocial risks, one needs to have abilities and skills that can be developed and improved by university education, as well as by life-long learning. Faculty of Security Engineering is specialized into training of new professionals in the following areas: Protection of People and Property, Civil Security and Rescue Services. The education also focuses on improving of mental abilities of safety management students within subjects such as psychology, manager communication, ethics and sociology. The aim of this work is to define the possibilities of education (theory and practice) that focuses on identification of psychosocial risks, coping with these risks and their possible prevention.

Keywords: education, safety/security management, psychosocial risks, stress, prevention.

INTRODUCTION

Requirements for professional qualification of employees of security services are given by legal norms (law 473/2005 Collection of Laws. Law about providing services in the private safety sphere as amended; ministerial Decree of MV SR 634/2005 Collection of Laws., by which some regulations of law 473/2005 Collection of Laws., about providing services in the private safety sphere as amended). Secondary schools on which future employees can be trained within security services are grammar schools (continuation at university) or secondary technical schools focused on branch of study security services (anti-riot police, traffic, judicial and criminal police). After that universities which train specialists (commanding and executive) in the field of security are categorised to the group of branches of study 8.3 Security services (people and property protection, safety publicly services, theory of police sciences, criminology and criminalistics, occupational health and safety, emergency services and civil safety). There can be also categorised universities which train specialists within the group of branches of study 8.4 Civil defence and soldiery (management of military systems, economics and management of defence lines, arsenal and technique of armed forces, national and international safety, operational and combat usage of armed forces, military connection and information systems, military logistics).

Faculty of security engineering of University of Žilina develops educational and science and research activities aimed on providing complex security of society and individual citizens. Faculty provides academic bachelor, engineer and doctoral studies and many various forms of lifelong learning in accredited study programs (tab. 1). Department of security management from Faculty of security engineering provides education in study program Security management in bachelor, engineer and doctoral degree. Absolvants acquire knowledge in the field of theory and practice of people and property protection, they are able to analyse external and internal secured environment and identify, analyse, evaluate and solve risks. Absolvants have the opportunity to be employed as

security workers (Dlhodobý, 2014; Výročná, 2017):

- Specialists in state and non-state security services and organizations which realise specialised security actions in the people and property protection sector;
- Managerial stuff in the system of police and security services.

Solution of security issues and crisis is influenced by many factors. The most significant common features of crisis are lack of time and information which place high demands on employees (command and executive). Level of competences required from employees of security services is raising proportionally to difficulty of their working activity (Loveček, Ristvej, 2016).

Table 1: Overview of accredited study programs of faculty

Field of study	Study program	Degree	Study form	Degree of study
8.3.1 People and Property Protection	Security Management	I.	Part-time Full-time	Bc.
8.3.7 Civil Security	Crisis Management			
	Security and Protection of Critical Infrastructure			
8.3.6 Rescue Services	Rescue Services			
8.3.1 People and Property Protection	Security Management	II.	Part-time Full-time	Ing.
8.3.7 Civil Security	Crisis Management			
	Security and Protection of Critical Infrastructure			
8.3.6 Rescue Services	Rescue Services			
8.3.1 People and Property Protection	Security Management	III.	Part-time Full-time	PhD.
8.3.7 Civil Security	Crisis Management			
8.3.6 Rescue Services	Rescue Services			

Educating has a form of lectures, seminars, measurements and working in laboratories of faculty of security management. Students participate in educational excursions (e.g.: Grand Power & Apis), educational study exchanges and internships in abroad (e.g.: Mark2 Corporation Czech a.s., Occupational Safety Research Institute)

Outputs of science and research activity of department of security management are used by many various organisations such as: JABLOTRON Slovakia s.r.o., JABLOTRON, s.r.o. Jablonec nad Nisou, EUROSAT CS, Quadriq a.s. Current research outputs gained in the sphere of people and property protection are systematically used in the activity of corporations providing services for private security within a membership in the Slovak Chamber of Private Security.

For the purpose of raising education quality the faculty employees make surveys between their absolvents. Faculty made **The Survey of Absolvents Finding Employment from 21st March 2016 to 20th May 2016**. Questionnaire was distributed electronically and the questions were given to absolvents of second degree of studies in all study programs of faculty in years 2013, 2014 and 2015 (study programs: Security Management, Transport in crisis situations, Crisis Management and Rescue services). Totally 499 absolvents were asked and returnability of questionnaire survey was 50,1% (250 questionnaires/respondents). **Within study program Security Management 218 absolvents were asked and filled in questionnaires was a number of 101 (returnability 46,3%)** (Vyhodnotenie, 2016).

Main parts of survey:

- Absolvents finding employment in their branch of study;
- Time horizon of absolvents employment;
- Application of knowledge from the studies in the practice;
- Evaluation of studies;
- Activity of absolvents in practice;
- Extending of knowledge (sphere);
- Contact with faculty.

From the survey, it is obvious that from the number of 101 respondents, absolvents of study program Security Management:

- 64,3 % is working in studied or similar field of study;
- 27,7 % has been employed during the studies and 40,6 of them till three months since finished studies;
- 32,6 % uses in praxis 41-80 % of knowledge acquired during studies (less than 40 % knowledge is used by 64,4 % of absolvents);
- 78,2 % is satisfied with knowledge, skills and experience acquired during studies;
- 39,2 % is working in the safety and protection sphere, 7,2 % is working in public administration and 4,1 % is working in transport and logistics sphere;

Within the survey there were also identified spheres, in which absolvents needed to be improved, especially language skills (foreign language) and communication skills (Vyhodnotenie, 2016).

Security management students within the first-year studies of engineer degree pass the subject Psychology, which consists of lectures and seminars. The subject is focused on topics: personality of worker, working place, worker's performance, their motivation, mental strain and stress, their management and precautions.

INFLUENCE OF PSYCHOSOCIAL RISKS FOR HUMAN PERFORMANCE

Psychosocial risks are emerged as a result of bad planning, negative working conditions, relationships and work organization. Factors which can lead to emerging of psychosocial risks are for example: excessive working load (psychical and physical), ambiguous tasks, insufficient involvement of workers to making decisions, uncertainty of employees, ineffective or poor communication, bad working organisation, violence or abuse (Psychosociálne, 2016).

The issue of psychosocial risks is being concerned by many researches. Between the most significant ones belong Europe-wide surveys ESENER 1 and 2, which took place in 2009 and 2014. Surveys were done by agency EU-OSHA in European enterprises and they were focused on (Európsky, 2016):

- General risks in the field of occupational health and safety (OHS, Slovak BOZP) and the way of its managing;
- Psychosocial risks such as: stress, bullying and abuse;
- Incentives and barriers connected with measures in leading of OHS;
- Participation of employees on OHS.

As **the most important psychosocial risks by work in organizations** were in surveys ESENER 1 and 2 identified:

- Stress-related work;
- Time stress;
- Be pressed for time;
- Necessity of coming into contact with problematic customers, patients and pupils.

As other psychosocial risks were identified for instance: bad communication between the management and employees, uncertainty of the post, bad cooperation between colleagues, long or irregular working hours, indefinite policy of human resources, injuries risk caused by machines or hand tools, discrimination (e.g.: according to the sex, age or ethnicity), noise and vibrations.

Stress is a result and expression of workload, it represents its border case which is caused by extreme requirements of the surrounding. Stress is a result of psychic and physiological reaction on stressor (stressing event is understood as anything which person considers as threatening) (Bratská, 1992).

People are daily in situations which are subjectively experienced as load. Each individual is unique and distinct from each other and that is why their eking of the same events is in the case of many people absolutely different. Load situations can have positive or negative impact on people. Someone cannot bear up the pressure of load situations, he is beaten by its strain and the other one perceives load situations as an inevitable part of private or working life, which can motivate him for better results. Stress influences eking and behaviour of individuals in an important way. Possible **sources of mental strain (stress)**:

- New, too strong and fast changing stimuluses;
- Interrupting and constant changing of concentration, information overflow;
- Asynchronous orders, tasks, instructions from management at working place;
- Lack of information when worker is forced to take a stand on something, decide, delegate and plan;
- New and sudden requirements for change of every-day used, stereotypical ways of behaviour and others.

Between the sources of load situation is inevitable to classify events from personal life, load life situation (e.g.: the death of close relatives, disease, loss of employment), which can influence work, performance of individuals but on the other hand, various work problems can influence personal life of people.

Stress manifestation is decreasing working performance and motivation, decreased concentration, insufficient coordination, tenseness, duplicate work, irritation, missing flexibility, failure to meet obligations, loss of sense for every-day work, changes in eking and others. Between the signs of stress it is possible to classify (Kačáni, 1999):

- Physiological symptoms (turning red, breathing changes, sweating, vertigo, vomitus);
- Cognitive symptoms (reducing of range and accuracy of perception, thinking, perception, memory, speech disorders, negative changes in social perception, disturbed balance of decision-making and evaluating processes);
- Emotional symptoms (fast changes of mood, strong emotional expressions in mimics, gestures, informal language, emerging negative states in eking – fear, anxiety, insecurity, sense of guilt, apathy, depressions, loss of emotional control);
- Behavioural symptoms (motor activity disorders, decreased cooperation, accuracy and check of movements, motor restlessness is occurred – trembling and torticollis).

Result of the influence of load situations is gradual decreasing of working performance, raising emerge of errors and failures which creates human failure, increases the possibility of injuries and changes in eking and behaviour concerned on gaining the aim which is changing to behaviour concerned on self-defence. States of psychical load and stress are basically emerged and shown in the spheres (eking, motor abilities signs, cognitive and physiological signs), they interfere in volition, they disrupt individual's integrity, cause mobilisation of self-regulation system (Činovský, 2002; Zánická Hollá, 2011). Between **disorders caused by long-term affecting load factors** we can classify: pathological lassitude, acute reaction on stress, dissociative amnesia, permanent personality change after catastrophic experience, mutism, posttraumatic stress disorder, chronic fatigue syndrome and burn out syndrome (Brečka, 2009).

By excessive activation, which is caused by load situations, the disruption of individual functions working is being held and there is emerged incompetence of purposeful and adequate actions but also disorganisation of general behaviour of an individual.

METHODS AND TECHNIQUES AIMED FOR COPING THE STRESS

Coping load situations is possible to be understood as a form of behaviour by the help of which individual can resist or overcome load situations. It is a process of controlling, overcoming with external and internal requirements which are experienced as load, so they are currently surpassing the abilities of individual. This coping is on conscious and unconscious level of eking. It is necessary to give reasons why to cope with load situations and which results on people their long-term usage can have. With coping the load situation, terms adaptation and coping are connected.

Adaptation for subjectively eked reality (load situation) is often provided by defence mechanisms. For the base of defence of self-conception, safety feeling is possible to consider involuntary pushing out and deliberate

suppression. Pushing out is based on elimination of unpleasant and inadmissible psychic experience from the individuals' consciousness. Although the individual does not realise them, they can influence his eking and behaviour. Pushing out is about abandonment of some certain attractive activity or its postponing (Paulík, 2010). Between defence mechanisms we can classify regression, projection, trivialisation, rationalisation, social isolation, compensation and aggression. **Coping** is understood as "defence" of person with inadequate and extreme load which he cannot cope by casual way of behaviour. In comparison, adaptation is understood as coping with load which person can relatively easily control and in some limits, he can defeat it.

Between techniques used in working process for eliminating the occurrence of negative psychical states (tiredness, monotony, limiting or extreme psychical load and others) belong: models of sleeping regime and rest during working time, using of free time and forms of relax (work breaks, tempo a working rhythmizing – optimal working tempo, time management, sleep, relaxation, breathing exercises, movement). Bedrnová (2007) states that, prevention concerns especially the sphere of regime and appropriate working and rest activities. The significant importance has the causes, expressions and results analysis of increased neuropsychological load. Leading worker should pay attention at looking for his effective life way. Then it is looking for such a life program which would provide him as best psychological and physiological development of his potential. There are listed strategies of coping stress which Vymětal divides into: short-term (coping current stress situation) and long-term (preventive) in table 2.

Table 2: Strategies for coping the stress (Vymětal, 2009)

Short-term:	Long-term:
Work with breathing, long breathing; Drink, cool carotid artery; Movement (go for a walk); Internal monologue; Intentional distracting of attention; Positive imagination.	Right regime; Regular physical activity; Relaxing exercises; Analysis of problems and possibilities of its solving; Care of interpersonal relations; Open communication; Self-education.

There are listed principles which are possible to use within coping stress and also its prevention in table 3.

Table 3: Rules aimed for prevention of psychical load and stress (Bartůňková, 2010)

General:	Specific:
Knowing ourselves and our own possibilities; Learning how to cope my emotions; Determine real and attainable aims; Recognise various stressors and estimate stress situation which could occur; Distinguish important from less important and suggestible from not suggestible on time; Accept problems and do not get discouraged by it; Change lifestyle, relax appropriately; Use anti-stress techniques, make assertive behaviour; Movement activity, spend time doing your hobbies.	In crises to name the general problem; Determine priorities and hierarchy of importance; Look for compromises if optimal solutions are not possible; Control emotions (as leading worker or worker); Delegate authority if it is needed; Refuse risky and out of control tasks; Correctly manage time and keep the timetable, Learn to relax.

Very interesting is **prevention and raising of psychic resistance of individuals** with the interest in coping load situations. For prevention has a big impact also self-knowing and self-control which are inevitable for identification of sources of individuals load as their solving and coping. Between preconditions of coping load situations and increasing resistance towards them is possible to classify: interest for own health, well-balanced

diet, positive thinking, relaxation, using tools of time management (e.g.: Paret's principle, Eisenhower's principle and Method ABC), assertive behaviour, rest, movement activity, education aimed on load situations issue and others. In the case of need it is inevitable to find an expert who will suggest possible solution according to some analysis of stated problem.

Appropriate way how to cope psychical load and stress are breathing exercises. **Breathing exercises** are part of body exercises, relaxation techniques and common movement activities and they have an effect on the whole organism. Rhythm of breathing involves muscular and psychic pressure. Inhalation supports active movement, mobilisation of energy, concentration on a certain object and exhalation is connected with release, relaxation by which there is an effort for distracting of attention from undesirable thoughts, visions, disturbing events or stimuluses. In order to be effective and to be able to use them by relaxation or by coping psychic load, such as during solving the crisis phenomena, breathing exercises are needed to be studied – the technique of breathing from professional literature or to learn it by the help of specialist. By the help of conscious breathing it is possible to decrease the influence of stress for individuals' performance, concentration, attention and it helps to cope fits of anxiety (Paulík, 2010; Jones, 2010).

Within the campaign healthy workplaces without stress (SLIC 2012, EU-OSHA) those tools aimed for evaluation and reducing stress were recommended (Zdravé, 2013):

- Handbook of International Employment Office with the name „Stress Prevention at Work Checkpoints“;
- Legal norms for leading the work stress published by Health and Safety Executive in United Kingdom;
- Tool „Faire le Point“ of French National Institute for Research and Safety;
- Belgian strategy SOBANE, strategy for evaluation and prevention of psychosocial risks;
- Other internal tools for coping stress and psychosocial risks are provided by national contact places – agencies EU-OSHA.

CONCLUSION

In present times, psychosocial risks seem to be one of the most alerting problems within working places. Their negative impacts influence workers health and economic terms of organization. Consideration of those risks is not time-consuming but also content demanding, because human factor differs between workers each other. Important psychosocial risks are e.g.: bad communication and cooperation between management and employees and also between colleagues, clients, there is an uncertainty for working place, stress connected with working and time stress. Concerns for handling and especially for prevention of situations, which could lead to stress or other psychosocial risks on the individuals level (self-realisation) and on the employers' level (corporation) which should provide adequate working conditions, are very important.

As mentioned in the article there are many methods, techniques and principles how to cope load situations. Each person should choose the type of coping psychic load and stress which fits him the best. After the appropriate choice and successfully done ways how to cope psychic load and stress there is a precondition that worker will be looking at situations which he can experience subjectively as loading. He can easily concentrate, perform better at work, master his reactions, perceive and solve problems and raise above it and to react better on emerged situations.

ABSTRACT

It has been found that traditional spreadsheet-teaching has a technocentric and decontextualized focus and is aimed mainly at demonstrating the technical features of the computer application. This approach does not help students and end-users in developing their computational thinking, nor with schema-construction, reliable fast thinking, storing knowledge in long term memory, and ultimately, working effectively and efficiently with spreadsheets. However, among several recently published methods, Sprego – Spreadsheet Lego – is free of these misconceptions, and as such, is a high mathability, computer-supported real world problem solving approach for both spreadsheet management and end-user programming, which has been proved to be more effective than the traditional spreadsheet approaches.

Our current work is based on Sprego programming. We developed an educational application to support the students' understanding of the execution processes of algorithms, the building of composite functions, and the process of discussing/debugging problems. The application consists of the animated visual representations of real world problems and a formula evaluator – similar to the one that can be found in spreadsheet applications – for displaying the problem-solving process step-by-step. Our software – available in English and Hungarian languages – currently supports a counting and a searching algorithm with the `{=SUM(IF())}` array formula and the `=INDEX(MATCH())` lookup formula, respectively.

In our classes we conducted experiments using the software, and the responses were positive and encouraging. The students found the graphical design engaging, followed the presentations on how these algorithms and formulas work, and it also helped them solve similar problems, which support schema-construction. From the teachers' perspective, the learning process was more effective after presentation, since the formulas required less explanation and reiteration. Similar results were found in testing high-school and university students, which proved that the method and the application is not restricted to specific age and interest groups.

INTRODUCTION

Teaching spreadsheet management provides knowledge of handling data and structured information that students will use in their everyday life. This topic also lays the foundation for future topics in ICT, such as database management and programming (Hubwieser, 2004, Schneider, 2004, 2005; Zsakó, 2006; Wakeling, 2007; Sestoft, 2011, Csernoch, 2014; Csernoch & Biró, 2015b, Csernoch & Biró, 2017). Moreover, it has the potential to develop computational thinking (Wing, 2006) and algorithmic skills if the appropriate method is used (Csernoch, 2014). The Sprego programming – Spreadsheet Lego – provides an efficient and high-mathability (Baranyi & Gilanyi, 2013; Biró & Csernoch, 2015a, 2015b) approach to teaching spreadsheet management and to facilitate computer-problem solving skills. We provide a more detailed introduction for the method in the following section: "SPREGO". We developed an educational software for the Sprego method (Csapó & Sebestyén, 2017) to introduce visual representations for the most common spreadsheet-problems to support the educational processes. In this paper, we present the currently prevailing situation and problems as regards end-user spreadsheet-management education, and the Sprego method as a possible solution to these issues. We demonstrate our educational software designed for the Sprego method in detail, as well as the underlying technical details and methods used to develop the application. We also share the experiences and feedback we gathered while teaching student groups using the software.

Computer problem-solving

The ability to build up algorithms and computational thinking is essential in our everyday life. Therefore, developing these skills in students is an important task for computer-science education and is mainly carried out within the programming topic. Research shows that students completing their school leaving exams at high schools lack the required level of computer problem solving abilities that they and tertiary education can build upon (Biró & Csernoch, 2013; Biró et al., 2015). This situation poses problems in higher education, such as the

need for reiteration courses for first-year university students, and the divergent and unreliable nature of previously acquired knowledge. In our vision, topics such as end-user computing should focus on developing computational thinking from the beginning in order to support knowledge transfer so as to develop the long-lasting knowledge and algorithmic skills the subsequent topics can rely on. However, the currently applied approaches mainly consist of navigating on the applications' interfaces instead of focusing on the logic behind creating and structuring information. "Traditionally, the teaching of spreadsheets ... has had a technocentric and decontextualized focus, and aimed at mainly demonstrating the technical features of the computer application..." (Angeli, 2013). While these traditional approaches prepare the students for passing the final exams, they do not build up lasting knowledge and invoke a state of sunk-cost fallacy when confronted with alternative methods (Kahneman, 2011). This problem is relevant to students and teachers alike. In our experience while working with Sprego, we found teachers who were open minded towards new educational methodologies, but there is a considerable group of educators who prefer to stick with the traditional approaches with a "belief in the fixed nature of science", and who have neither the time nor the inclination to explore and experiment with alternatively developed areas of the topic (Chen et al., 2015).

Birotical software

Some of the most commonly used applications in every line of work are 'bureautique' software, birotical for short. Nowadays, end-user knowledge of such programs is a requirement for almost every job and can prove to be invaluable for personal use as well. Students are taught birotical software programs from their first ICT years in schools and are constantly using them as they progress in their studies (NAT, 2012; Kerettanterv, 2013). The software used varies according to the individual, but the most commonly chosen packages are Microsoft Office (Microsoft, 2017) and Open/LibreOffice (The Document Foundation, 2017). Google Documents (Google, 2017) is also a valid option for cloud-based and potentially collaborative work.

Since students learn to use birotical software throughout ICT education, it is not uncommon that they develop a certain point of view that they can and are using these applications correctly, and that they create error-free documents. The fact that the newest versions of office software come with built in, user-friendly wizards, commands, and functions designed for specific purposes rather than general usage, means that most students use these software packages in a trial and error, wizard-based way (Csernoch & Biró, 2015a, Csernoch, 2017), navigating and searching for tools that are closest to their needs on the interface without logical structuring or building. This practice results in bricolage (Ben-Ari, 1999; Csernoch, 2009, 2017), documents which carry the potential to cause damage to the individual or the company. For example: bricolage text documents require more effort and resources to update, and present a non-professional image of their creator, while "bricolage spreadsheets" may cause financial losses due to the misuse of spreadsheet functions and calculations ([Horror Stories], 2017). Another problem with teaching birotical software effectively is that it creates the sunk-cost fallacy. Students who have previously learned to use birotical software using a specific methodology tend to insist on continuing to use this approach, even if it is proved to be less-efficient (Kahneman, 2011). Therefore, teaching students who have experience with such software using alternative methodologies requires constant reiteration of the curriculum to make the new information more dominant than the less-efficient previously learned knowledge. Users who have learned end-user text management using traditional methods tend to make several errors (for example formatting, layout, and typographical errors) while creating text documents (Csernoch, 2009, Csernoch et al., 2015). The ERM (Error-Recognition Model) (Csernoch, 2009) methodology focuses on error-detection and correction from the beginning. With the ERM, the students learn how to create well-formatted documents instead of using the previously mentioned trial and error wizard based approach.

Throughout their studies of spreadsheet-management, students learn specific spreadsheet-functions for solving special problems (Csernoch et al., 2014). This results in a large number of functions that the students have to master, remembering the purpose of each of them. Furthermore, each of these functions has different arguments, which further complicates the subject and usually confuses the learners (Csernoch, 2014). Since writing spreadsheet formulas is a functional language (Sestoft, 2011) it can also serve as an introductory programming language for students (Booth, 1992). Using spreadsheet environments to teach programming provides students with a familiar interface and syntax to work with, while also focusing on deepening the spreadsheet management subject area.

Educational software

Nowadays, educational software programs are regarded as popular and useful tools. There are approaches which claim that these applications are more effective than teachers; however, both practice and research confute that assumption. Using only computers instead of teachers in classrooms is not yet possible, since today's educational software can only be efficient with guided instructions (Kecskés, 1987; Wilson et al., 1996; Iacob, 2009). Therefore, it is more accurate to refer to these pieces of software as computer-assisted learning or learning process assisting tools. While every program created with an educational usage in mind is different, they have the same goal: to support the learning processes (Kecskés, 1987) and to make understanding the topic easier through

interactive representations. Using computers to support the learning of schema-construction based on the Cognitive Load Theory (Merriënboer & Sweller, 2005; Skemp, 1971) is a well-founded practice and was one of the ideas behind the development of our Sprego Application. Our goal was to represent the purpose and essence of the Sprego method using a computer-assisted interactive interface: creating and building algorithms, developing long-lasting knowledge, and transforming algorithms into schemas. Since in the spreadsheet management subject area these goals require a deep understanding of the artificial language of the spreadsheet management software, a visually engaging and interactive interface offers the possibility of making the learning process more effective.

SPREGO

The Sprego – Spreadsheet Lego – methodology provides an alternative approach to spreadsheet management teaching. Regarding the results of the TAaAS (Testing Algorithmic and Application Skills) research (Biró & Csernoch, 2013; Biró et al., 2015), students who studied with traditional approaches in high-schools listed 99 different spreadsheet functions when asked to define the most important 15 functions in the subject (Csernoch et al., 2014). This leads to the realization that the learning processes and educational materials used in practice are very different, since every teacher has a preferred function base to work with. This method does not provide effective results, as students applying for computer-science courses in tertiary education lack fundamental knowledge in spreadsheet management (Csernoch & Biró, 2014).

The IEEE ACM report lays down three levels of knowledge (IEEE&ACM, 2013):

- Familiarity: Basic awareness of the concept and its meaning.
- Usage: The application of the concept using a technique.
- Assessment: Examination and consideration of the concept and the selection of the appropriate approach.

The levels above are consistent with the logic of the problem-solving techniques defined by Pólya (1954):

- Understand the problem
- Devise a plan
- Carry out the plan
- Look back

ICT education usually uses an interface based approach which correlates with “Usage” in the IEEE&ACM levels of knowledge and does not reach the Assessment level.

In Sprego the students work with general purpose functions, creating composite spreadsheet formulas (more details are provided in the “Sprego functions” subsection). As a symbol of this approach and of how composite functions work, the method uses Matryoshka dolls (Figure 1) for representation. This approach is based on real-life problem-solving and data, while motivating and facilitating algorithm building for the students. Using this method we focus on developing computational thinking and long-lasting knowledge supported with high-mathability problem solving approaches (Baranyi & Gilanyi, 2013; Biró & Csernoch, 2015a) that means slow thinking for novice and fast thinking for familiar problems (Kahneman, 2011, Csernoch, 2017).

Figure 1: Matryoshka doll designed by Zsuzsanna Biró.

Sprego reaches the third level of the IEEE&ACM levels of knowledge, developing from the first one. Using alternative methodologies sometimes requires a specific environment or software to work with. Therefore, we would like to point out that Sprego is both spreadsheet management software and version independent and is suitable for all age groups. In contrast to other functional programming languages, Sprego does not focus on the language, syntax, and/or tools, but highlights algorithmic thinking and structuring. Consequently this methodology

can also be used when teaching programming to develop students' computational thinking. Sprego programming can prove an effective choice for this topic, especially in educational institutions where the number of lessons is limited, since the students do not have to learn a new interface and language in order to progress forward.

Sprego functions

Instead of using a large number of specialized spreadsheet-functions, the Sprego method defines a low number of general purpose functions (Sprego1&2: N = 12, that can be further extended with Sprego3, Table 1), which, when applied in composite formulas are suitable for solving spreadsheet problems. The functions are separated into three categories according to complexity and instance of use (Table 1). In practice, not all of the 24 functions included are used, since in most of the cases the functions listed in the first two categories can cover the requirements stated by the curriculum (Kerettanterv, 2012).

The widely used problem specific merged functions (for example =SUMIF() and =AVERAGEIF()) can be replaced with composite array formulas using the corresponding general purpose functions (for example {=SUM(IF())} and {=AVERAGE(IF())}. Following on from this principle the required number and various forms of arguments the students have to learn are reduced to a smaller, more manageable group.

	Sprego1	Sprego2	Sprego3
1.	SUM()	INDEX()	SMALL()
2.	AVERAGE()	MATCH()	LARGE()
3.	MIN()	ISERROR()	ROW()
4.	MAX()		COLUMN()
5.	LEFT()		AND()
6.	RIGHT()		OR()
7.	LEN()		NOT()
8.	SEARCH()		OFFSET()
9.	IF()		TRANSPOSE()
10.			ROUND()
11.			RAND()
12.			INT()

Table 1: The Sprego functions listed in 3 categories.

Research proves that students who have learned spreadsheet management using Sprego can solve spreadsheet problems with 40–50% success rates several years after their classes, while for students who have used traditional methods with problem specific functions the rate of successfully solved problems is 5–10% (Csernoch & Biró, 2015a). Therefore, teaching Sprego programming is a more effective approach than traditional methods, providing guidelines which the students can later build upon and a unified framework to develop algorithmic thinking.

Unplugged tools

Using unplugged tools in computer science education stimulates the thinking process even when the students are not in front of a computer. These tools offer the possibility to improve group problem solving abilities and efficiency, and support social activities. Most beginner programmers focus on solving problems by language and syntax instead of thinking about the problem itself (Bell & Newton, 2013).

In Sprego we used 3D printed Matryoshka dolls (Figure 2) to show how composite formulas work. In our experience, this form of unplugged tool can be used regardless of age and educational level. We used the following methodology to help students understand the basic principles of algorithms and build up composite formulas. The students wrote the steps of the discussed algorithm (based on the educator's instruction) on painter's tape. After each step, they stuck the appropriate tape onto a doll and embedded it into a bigger one. At the same time, the students completed the appropriate step on their computer. This process was repeated until all the steps of the algorithm were written down. After we had solved the spreadsheet problem using the algorithm, the students disassembled the dolls, from which they removed the tapes and stuck them into their notebooks (Figure 2) to provide a unified and reliable source of student notes. We found that using unplugged tools throughout the teaching process increased the students' motivation, as well as improving class efficiency, and made the understanding of the algorithms easier (Biró & Csernoch, 2017), especially in the early stage of the topic.

Figure 2: The 3D printed Matryoshka dolls and the pieces of painter's tape stuck into one of our student's notebook with the steps of the discussed algorithm written on them.

VISUAL PROGRAMMING

An alternative programming method which is becoming more and more popular by the day is visual programming (h Pro, 2009; Fincher et al., 2010; Papadakis et al., 2014). With this approach the developers build up their projects and their logic by using graphical interfaces to visually construct every aspect of the software under development. Creating the code for a program using visual programming means that the user works with some form of graphical interpretation of a programming language (usually a specifically constructed version of a programming language) to build up the algorithms. The development environment then translates the visual code into a traditional programming language, usually by code-generators. This programming method is designed to focus on the logic and algorithms in a project by eliminating factors that beginner programmers find distracting and troublesome (for example the syntax of the programming language).

Developing with visual programming provides an easier and more understandable form of programming compared to the traditional text-based languages (Fesakis & Serafeim, 2009; Kim et al., 2012). We found that using visual programming environments speeds up the development process and even seasoned developers choose to work with this approach because of its advantages. These languages have usually been designed with educational usage in mind. This means that learners are provided with several resources and help tools to make the necessary learning curve for the specified language smoother. Note that this may vary depending on the chosen environment. However, we would like to point out that visual programming, since it is based on and is a specifically constructed version of a traditional programming language, has limitations. It varies by development environment, but usually the pre-constructed visual building blocks for the code are more limiting in terms of usage than writing text-based program code. Another problem is that the environments built for such programming are diverse and therefore each uses a special form of visual language, making transition between environments troublesome. However, despite the various forms of visual programming languages, after investigating several environments we found four categories that any visual language we have so far encountered can be fitted into:

- Behavior based: This form uses pre-programmed scripts (called behaviors) to provide the developer with the easiest and most rapid development process in which the user assigns the behaviors to objects. These types of visual languages guarantee results instantly. However, it can be very limiting and usually only minimal configuration is available for the pre-constructed behaviors. For this reason, this method is best used for prototype purposes. An ideal visual programming development environment includes the option to use behavior based methods, but also includes a less-limiting form of visual coding, for example Construct 2 (Scirra, 2017a) and Construct 3 (Scirra, 2017b).
- Block based: This approach can be considered the most popular choice in education based on observing the commonly used learning programming environments. It builds on the structure and logic of traditional text-based languages, but instead of typing commands, it incorporates them into blocks that can be embedded into each other. Therefore, this method is one of the least limited forms of visual programming and the knowledge it develops can be easily translated to traditional programming methods later on. However, due to the fact that it symbolizes the structure of text-based code, some students may find it harder to master than other visual programming forms. The popular Scratch (Lifelong Kindergarten Group, 2017) learning programming environment and the Stencyl (Stencyl, 2017) development software are based on this approach.
- Event-action based: This method uses pre-constructed conditions (included in events) and commands (actions) to provide the building blocks for the project's code. The user creates their custom event blocks

using the conditions provided (note that some environments only let the user include one condition per event) to create situations where the actions will run that they have defined to this block. This form of visual programming results in an easy-to-read code, and at the same time (depending on the environment's condition and action base) does not limit the project in terms of functionality. It is important to note that despite the advantages of event-action based visual programming, we found that it is not a popular choice for education and software development, and only a few development environments can be found using this method, such as Construct 2 (Scirra, 2017a), Construct 3 (Scirra, 2017b), GDevelop (Rival, 2017), and Kodu (Microsoft Research, 2017).

- Node-based: With this form of visual languages, the developers create flowcharts using pre-constructed nodes. Each node defines a purpose in the code and has points for connection (for example input and output). The user builds up the logic of the project by adding nodes to the flowchart and connecting them using the points provided. By observing popular, industry leader development environments, node-based visual programming can be considered the most popular among the categories listed above. It provides a great visual representation of the application's code; however, it can be difficult to see through once the project reaches a higher complexity level. The popular Unreal Engine 4 (Epic Games, 2017), Godot Engine (Linietzky & Manzur, 2017), and GameMaker: Studio (YoYo Games, 2017) all include forms of node-based programming.

Different forms of visual programming have been taught in educational institutes for years, with varying results (Seiter & Foreman, 2013; Kalelioglu & Gülbahar, 2014). Simple forms of learning programming environments can be seen at major events (Code.org, 2017) popularizing programming in order to help students understand and develop a positive image towards the basic principles of programming. For our work, we chose the event-action based visual programming method because of its advantages and future possible integration into the educational processes. Our goal was to use a method and environment that students can also master while providing an example for possible educational software development using visual programming.

Construct 2 & 3

To develop the Sprego Application (Csapó & Sebestyén, 2017) we chose the Construct 2 (Scirra, 2017a) visual programming environment (Figure 3). It uses an event-action and behavior based approach to build up algorithms. The underlying engine of the software is based on HTML5 and the environment is currently available for Windows operating systems. After examining several options for visual programming languages, we decided to use Construct 2 because of its efficiency and general design. The software was designed to support a wide range of applications for development, without locking the user into a pre-defined type of project.

Figure 3: Sprego Application: the layout of the counting problem representation inside Construct 2.

When working with this environment, the developer has to be aware of the three most important aspects of the development process specific to this software: layouts, event-sheets, and objects (Scirra, 2017c). Construct 2 uses layouts to display content on the screen. Every project contains at least one layout that serves as the canvas of the application. The visual code (events and actions) are defined on the event-sheets. These sheets either need to be referenced by one of the layouts or called by another event-sheet in order to run the visual code. The software defines objects as elements that perform most of the useful work in a project. These elements are also important when considering the event-sheets. Every condition and action references an object, therefore the group of available options for the visual code is defined by the objects added to the project. It is important to mention that

the System object is always present in every project by default to manage system-related tasks, for example variables and loops. The software separates the objects into two categories:

- Non-global objects: These elements usually have a visual appearance and can be placed on the layouts. The user has to add these objects to each layout she wants to use them on. This category consists of objects such as images, text boxes, and buttons.
- Global objects: The specialty of global objects is that they only have to be added once to the project and they will be available for the entire development process. Generally, they perform system-related tasks (similarly to the System object) that do not require visual representation on the screen, such as audio, keyboard, mouse, and touch screen input.

Construct 2 is considered a well-supported and documented environment. There is a complete manual available (Scirra, 2017c) covering all features and unique aspects of the software. The community working with this environment is also productive. User-written tutorials (Scirra, 2017d) help the learners to better understand and extend the possibilities of the software. The official forums are active and the inquiries posted there usually receive responses within a day. Further advantages of the community are that the Construct developers also actively respond and help out users, and that there is a dedicated section for the educational usage of the environment (Scirra, 2017e).

While the environment supports text-based programming in a limited form, it also allows the community to create add-ons based on JavaScript and the official SDK (Software Development Kit) for those who find the default behaviors, conditions and actions limiting. The community has already developed and uploaded various add-ons to the official forums in order to extend the capabilities of the software.

Construct 2 is free to use with limitations (educational usage of the free version is permitted). For developers who need extended functions, one-time payment licenses are available for personal and business use. Educational institutes have the option to subscribe to educational licenses to unlock all capabilities of Construct 2, and they also have the opportunity to buy licenses for students to work on their projects at home for a lower price than personal-use licenses.

Since the start of the development of our Sprego Application a new major version of Construct has become available: Construct 3 (Scirra, 2017b). The engine behind the software has remained the same (in the currently available version), while the editor has been rebuilt from the ground up to target web-browsers and to rule out platform restrictions. Construct 3 as a PWA (Progressive Web App) brings new possibilities for educational usage which require further examination. The latest version of the software is currently in a publicly available beta stage. After a stable version of Construct 3 releases, we plan on porting our application's source code to the new environment.

SPREGO APPLICATION

We developed an educational software program for the Sprego method to support its usage in educational processes by providing a visual representation of the most common spreadsheet problems. We focused on creating software that is easy to use and accessible for students. We optimized the interface of our software in a minimalist design, while reflecting on feedback received from in-service teachers during the development to provide an appropriate structuring of the information included. Additionally, our goal was to create a spectacular and aesthetic look to motivate students without compromising on quality and readability.

As we described in the "SPREGO" section, the methodology uses composite formulas in spreadsheet environments. Understanding the algorithm of the problem and the functional language of the software can sometimes pose problems for the students. Therefore, using unplugged and semi-unplugged tools, such as 3D printed dolls and our software, respectively, can help the students grasp the concept and logic behind the Sprego functions.

Based on the frequency of the spreadsheet problems, we implemented a step-by-step visual representation of the following problems:

- `{=SUM(IF())}` counting array formula
- `=INDEX(MATCH())` composite lookup formula

We also included a formula evaluator similar to the Formula Evaluator of spreadsheet applications to list the steps one-by-one in a form that would symbolize how the spreadsheet applications execute the formulas. We used Matryoshka dolls in our design to provide a consistent look with the symbols of the Sprego method. The original dolls we used were designed by Zsuzsanna Biró (Figure 1), which we recolored to create our own set of dolls. It was an important aspect of our work to present these dolls in real-life contexts, similar to that aspect of the Sprego methodology where the students work with real-life data and problems. The software uses sound effects for the presentations with the aim of capturing students' attention through different senses.

Our application currently supports English and Hungarian languages and is available on Google Play (Csapó & Sebestyén, 2017) to download for free.

How it works

After the application starts, the menu appears, where users have the option to choose one of the problems included (Figure 4). The right side of the screen contains the options for the selected problem. Since the available options differ for each problem, they are hidden until the user chooses a problem listed on the left side of the screen. In the current version, the difference between the settings of the two problems is the number of available colored dolls. After the problem has been selected and configured an animated “Start” button is displayed to start the presentation. The menu also contains options for turning sound effects on or off and changing language.

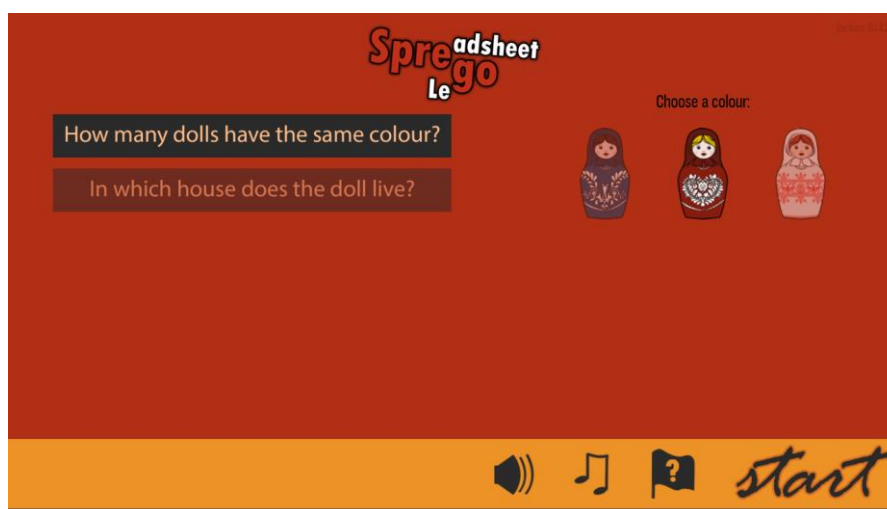

Figure 4: The menu of the Sprego Application with the “How many dolls have the same colour?” problem selected and configured.

The screens presenting the implemented problems (Figures 5 and 6) consist of three major parts (from left to right):

- Buttons for controlling the presentation
- Presentation space
- Formula evaluator

The buttons for controlling the presentation provide options for the user to go back to the menu, restart the presentation, pause or continue it, and slow down the movement of the dolls. Navigating back to the menu allows users to select a new problem, or define different inputs for the currently selected one. Restarting the actual presentation does not change the user’s settings, while generating a different – random – placement for the dolls. The pause and slow-down features are implemented in order to allow the students to examine the content seen on the screen at a slower pace. This can prove essential when going through the displayed content of the formula evaluator.

Counting: $\{=SUM(IF())\}$

The first problem included is based on the following question: “How many dolls have the same color?” In Sprego, to solve this problem (provided we have selected a color beforehand) first we have to apply selection to the vector of the dolls by asking yes/no questions and then making decisions based on the answers by using the $\{=IF()\}$ array formula. The yes/no question outputs TRUE or FALSE logical values for each doll. Before moving to the next step, the learners need to set the arguments of the $\{=IF()\}$ array formula to return 1 (as a number) at the TRUE branch for each doll, while the FALSE branch is ignored. The last step is to summarize the items of the output vector to get the number of the dolls which have the same color as we selected. Following on from the above, this problem is based on the $\{=SUM(IF())\}$ array formula, which serves as a basic calculation method in Sprego, and students learn to work with it when they start the ‘counting formulas’ topic (Csernoch, 2014). We designed a visual representation (Figure 5) for this formula to aid the learning process and to symbolize the steps the spreadsheet management software takes when it executes it.

Figure 5: The representation of the $\{=SUM(IF())\}$ array formula inside the Sprego Application.

The dolls ($N = 12$) whose colors are randomly selected (blue, red, and white) are standing in a circle around a campfire. As the presentation starts, the dolls start to move (“dance”) along the circle. Each doll who reaches the top of the circle (indicated by stones at the top of the screen) has its color compared to the color selected in the menu, and makes the circle stop for a few seconds. This symbolizes that a comparison is happening before the movement begins again. If the doll has the same color as we are looking for it moves (“walks”) closer to the campfire and continues its movement along a smaller circle. If the comparison has returned a FALSE, the doll becomes transparent, indicating that it will be disregarded in the following calculation. This process continues until all dolls are evaluated. After the last doll’s color has been compared with the condition, the dance around the campfire stops permanently and the software counts the number of the dolls inside the smaller circle one-by-one while displaying the result inside the fire.

At the beginning of the presentation, the formula evaluator on the right side displays only the first step of the algorithm, the $\{=IF(dollcolor=selected_color,1)\}$ array formula with the selected color’s name. As each comparison is made, the evaluator lists the compared doll with the selected color next to the result, one after the other. After the evaluation of the colors is completed, the formula of the following step is written below the list of the comparisons: $\{=SUM(results)\}$, surrounding the output of the previous formula. Meanwhile, the array formula at the top is extended to display the complete array formula required to solve the problem: $\{=SUM(IF(dollcolor=selected_color,1))\}$.

Searching in vector with unique items: $=INDEX(MATCH())$

The problem “In which house does the doll live?” is based on lookup formulas. The first step of the algorithm behind solving this problem in Sprego is to find the index of the doll which has the same color as we selected. In the comparison of the dolls’ color-vector to the color we are looking for the $=MATCH()$ spreadsheet function is used (with the “match_type” argument set to “0” for an exact match). The whole number which this function returns will be the index of the colored doll required. The next step is to find the house in which this numbered doll lives by using the previous result in an $=INDEX()$ function. The students will then find the appropriate house based on the doll’s index with this function. A composite formula comprising these two functions is the universal lookup formula for vectors in the Sprego method: $=INDEX(MATCH())$. Our representation of this problem works with this composite formula (Figure 6).

Figure 6: The representation of the =INDEX(MATCH()) composite formula in the Sprego Application.

After the user has selected a color from the menu and started the presentation, all the dolls with different colors ($N = 9$) are distributed randomly on the screen in front of their houses. Note, that the vector of the houses is constant (no change will occur to them on restarting the presentation), and each colored doll only appears once. The context is that the dolls are standing in front of their houses, waiting for the postwoman to check whether they have mail or not. In this situation only the previously selected colored doll has mail and the postwoman will look for her to deliver it. The postwoman starts from the top-left part of the street and moves (“walks”) in front of the dolls, stopping at each one for a few moments and comparing them to the condition (the selected color). If the currently compared doll has the same color as we are looking for, the postwoman turns to her and walks closer to deliver the mail. If the comparison has returned a FALSE, the postwoman continues to move until the appropriate doll has been found. While the design of this presentation splits the dolls into two lines (Figure 6) this has no meaning and effect in the context of the specified composite spreadsheet formula.

The formula evaluator displays only the first step of the algorithm at the beginning of the presentation: $\{=MATCH(doll,dolls_vector,0)\}$ and the vector of the dolls the formula is working with. As the postwoman inspects each doll, the vector of the dolls is extended one-by-one with the comparison at hand, displaying the selected colored doll along with the result (the index of the doll). When the doll in demand is found, its comparing line will be highlighted in the evaluator to mark it as the answer for this step. The software waits for the postwoman to complete her movement (delivering the mail) before continuing to display the formula for the next step at the bottom of the column: $\{=INDEX(houses_vector,doll_index)\}$. Since the presentation with the postwoman has ended, the formula evaluator plays a vital role in displaying the steps the spreadsheet software takes with this formula. The vector of the houses appear next to the dolls at the comparison lines, while the formula at the top is extended to contain the complete solution for this problem: $\{=INDEX(house,MATCH(doll,street,0))\}$. As a last step the answer to the problem (the house in which the selected doll lives) appears at the bottom of the evaluator, next to the $\{=INDEX(house,doll_number)\}$ formula.

TECHNICAL BACKGROUND

After examining the available visual programming environments on the market, we decided to develop the Sprego Application using Construct 2 (Scirra, 2017a). Construct 2 is built on a lightweight HTML5 engine to run the applications developed with it as efficiently as possible and to provide the widest platform support via web-browsers. While developing the Sprego Application we built up the algorithms with a structured, organized, and clean code result in mind. The well-structured form of our visual code allows straightforward error correction and an accessible form to extend the capabilities of the software (for example with newly supported spreadsheet formulas, languages, and platforms).

The software has been optimized for slower devices in terms of its processing power requirements, memory usage, and GPU (Graphics Processing Unit) fillrate. We wanted our application to provide a responsive experience, even on older or cheaper computers, smartphones, and tablets. The graphics included use resolutions and formats to adhere to this purpose while providing detailed visuals on high-resolution displays. We designed our application from the ground up with multiplatform support in mind. While the application is currently only available for download on Google Play (Csapó & Sebestyén, 2017) we built and tested versions for web-browsers and Windows operating systems (32- and 64bit versions) as well. The input types of the most popular devices (mouse and touch) are supported simultaneously and we use cross-platform solutions (for example webfonts and platform-specific functions) to display the included texts correctly. We tested the HTML5 and Android versions of our application prior to release in all major browser software and on the following devices: Asus Zenfone 2, Lenovo IdeaPad 3, LG

G Pad 8.0 and Samsung Galaxy Grand Prime.

The HTML5 technology creates the possibility to support multiple platforms from one codebase through web-browsers or natively by using wrappers. In this process, the code of the application is wrapped together with a modified browser software into a package. When the user starts the application, first the browser software included executes, which then runs the HTML5 application. Our educational software for the Sprego methodology uses the Cordova (The Apache Software Foundation, 2017) wrapper for supporting Android devices natively. It is worth mentioning that due to the availability and technical background of this wrapper, we target Android 5.0 and above versions of the operating system. We decided on releasing the application on Google Play first to provide an easily accessible way for students to download it onto their devices. Based on our observations during the computer science classes, most students have Android smartphones.

The underlying engine of our software supports modern web-technologies, therefore the planned HTML5 release of the Sprego Application will depend on the Service Worker (Gaunt, 2017) solution to provide offline access and running in web-browsers once the students have opened and downloaded the application at the first run.

USING THE APPLICATION IN EDUCATION

We use the Sprego method to teach spreadsheet management in our classes. Therefore, introducing and using the Sprego Application with our groups was an obvious choice. During the counting and lookup formulas sub-topic we presented our software and used it to support the educational processes for two year-9 groups at a local high-school and for pre-service computer science teachers at the University of Debrecen, Faculty of Informatics. The students responded with interest and focused attention when we presented the implemented formulas. They followed the presentations and the instructors' explanations and asked several questions regarding the topic.

The graphical interface caught the students' attention from the beginning and they found the dolls and their environment interesting and motivating. The built-in formula evaluator also proved to be an effective part of the software. Stopping or slowing down the presentations gave the students and the teacher time to inspect the elements displayed inside it and go through the steps the algorithm takes one-by-one. In the affected classes, the learners were more active, responded more frequently, in a more motivated way to the teacher's inquiries. From the educators' perspective, the increased activity the software produced resulted in more dynamic lessons and required less explanation and reiteration of the problems. Using the Sprego Application made the integration of more complex tasks into the topic feasible and provided a better progression through the classes.

The Sprego Application used together with the unplugged tools developed for the Sprego method enhances the learning process and makes it easier for students to grasp the concept of composite formulas and use them to build algorithms. The pre-service teachers accepted the software as a possible educational tool to integrate into their classes, and it also helped them master the Sprego methodology. Using the software as students, the pre-service teachers also found it helpful and motivating, making the understanding of the computational-logic behind the composite formulas easier.

We would like to emphasize that the results stated above were based on teacher and student feedback and experiences during the educational usage of our Sprego Application. To scientifically measure the efficiency and supporting potential of the application for the Sprego method, future research and measurements are required.

CONCLUSIONS

ICT education primarily focuses on teaching the interfaces of the birotical programs and therefore it is limited to the second level of the IEEE&ACM levels of knowledge (IEEE&ACM, 2013). The differentiation observed and measured in spreadsheet management education teaches students various spreadsheet functions specialized for specific problems (Bíró & Csernoch, 2013; Bíró et al., 2015). The Sprego (Csernoch, 2014) methodology provides an alternative approach for teaching spreadsheet management by working with a smaller, general-purpose function base to develop computational thinking and algorithmic skills. We developed an educational software program for the Sprego method to help and foster the students' understanding of programming algorithms. Our application, used together with the already tested (Bíró & Csernoch, 2017) unplugged tools, resulted in higher student attention and motivation and therefore more efficient classes. While our initial experiences and feedback were positive regarding the educational usage of the Sprego Application, exact measurements are needed in the future.

In the current version, the Sprego Application contains the visual representation of two problems and is available on Google Play (Csapó & Sebestyén, 2017) for free. We plan to improve and further develop our application in the following areas:

- Implementing more spreadsheet problems
- Supporting more languages
- Including narration to aid visual explanation
- Supporting multiple platforms
- Testing its efficiency in education contexts

Currently only a few teachers have mastered the Sprego approach and we aim to increase their numbers by providing ready to use tools that make spreadsheet management teaching more effective. The official Sprego textbook (Csernoch, 2014), the unplugged tools, and our application are already available to achieve this goal. We hope to see increased attention given to modern visual programming methods as a viable option to develop educational material with, and towards, unplugged and semi-unplugged tools in general, which can help students understand computer science problems from a different viewpoint.

ABSTRACT

The aim of this contribution is to define the importance of educational value of pupils from bilingual, anglophone backgrounds. The survey is based on assumptions. Firstly, the cultural background of pupils is an important socialising determinant and the fact that school education is perceived as the key to the success of an individual in society. The importance that individuals ascribe to the educational value is later reflected in their individual educational and future career trajectories. In the research, we did not only concentrate on capturing the position of the educational value in the value system of the pupil enrolled in the secondary education level, but also on mapping the main aspects that determine the process of constructing it within the individual's value system and the importance of education from a transgenerational perspective. The result of the research was the comparison of the total data obtained from monolingual and bilingual environments.

Keywords: Educational value, anglophone pupils, value orientation, value preferences, students from different cultural backgrounds

INTRODUCTION

Man has asked questions about values, about what is meaningful, significant, essentially important and determinant since the twilight of humankind. Such questions have been the focus of philosophers, theologians, scientists or teachers; however, in the broad sense they concern the meaning of everyone's lives and the functioning of society as a whole. Cakirpaloglu (2004) defines them as a specific mental category, which forms a relatively stable and permanent structural element of a personality, important for the individual, social and historical realization of man. Durzoi a Roussel (1994), whose contemplations are based on the philosophical perspective, maintain that such issues are moral categories that determine ethical standards. A value is always connected with a human being and only a human being is capable of attributing a meaning to objects by creating a relationship to the objects (Pruner, 2002). Rokeach (1973) defines a value within the framework of three components:

- a cognitive component connected with learning
- an affective component connected with emotional relationship to an object
- a behavior component acting as an intervening variable.

Rokeach's value components are close to the evaluating relationship, which is often interpreted by social psychology as an attitude comprising three components whose nature resembles those of Rokeach's. He further distinguishes instrumental values and terminal values. In each individual, they are formed through experience, taught and acquired rules, family and school education and self-cultivation of each person. The specifically arranged system of values, regulating our behavior, interests, needs and affecting our attitudes and views, is referred to as value orientation in literature.

The level of education is certainly a prerequisite for a successful and quality life of an individual in society, with the importance of education and education for societal growth (Sak, 2006). In the value system, education is the key value for pedagogy. The educational process itself has a significant impact on this value. The importance and significance of the values that children have as they step into the educational system shows that their backgrounds have a significant influence on their understanding of the educational role in society (Katrňák, 2003). Values are in the center of attention of many scientific disciplines. It is understandable that the concept of values lies at the heart of all contemplations about upbringing and school and extracurricular education. In the field of pedagogy, we concentrate in particular on the value systems of youth, education in itself as a social value, and values as part of aims and contents of schooling, defined in educational programs (Průcha, Walterová, Mareš, 2008). The influence of the value system of an individual upon the process of his upbringing and education is particularly important. The value of education is crucial within the system of values. A person's attitude to education differs in the case of high preference of the educational value and in the case of low

preference. Likewise, individual value specifics are reflected in each educational action (Sak, 2000). In our research, we have chosen the value directly relating to upbringing and cultivation from the broad range of values – the value of education. Our assumption is that the importance that is attributed to the educational value by an individual significantly determines the process of his upbringing and education. The environment from which the individual originates has a fundamental influence upon the process of forming this value and upon understanding the role of education in the society. Strictly applying the principle of cultural relativism, we have found out that the concept of educational value may be perceived differently in different cultures. Education may be attributed a different significance on the scale of value preferences of individuals as carriers of a specific culture; the value of education may be placed on a different position and either favored or disfavored. Such different attitude toward education as a value does not mean that there is a better and a worse way of such perception in various cultures.

In Czech schools, pupils coming from another cultural background are in the position of socially disadvantaged or special educational needs students according to the Framework Educational Program for Elementary Education and the School Act (Act No. 561/2004 Coll.). Socially disadvantaged pupils are considered those coming from an environment that is socially, culturally or linguistically different than the environment of pupils in the majority population, pupils who are part of minority ethnic groups living in this country or students coming as immigrants. The number of such children in Czech schools has been steadily rising. Some of them are able to become integrated without any serious problems, others encounter various difficulties due to a different language or due to deeply embedded influence of their families and cultural patterns manifesting themselves in the behavior, conduct, scale of values, lifestyle, conception of raising children, attitude to education etc.

According to Hladík (2016), multicultural learning is a process transferrable from one culture to another. More precisely, multicultural learning and strategy applied during instruction can be applied in other cultures, too. Central European countries (Czech Republic, Slovakia, Poland, and Hungary) do not encounter such cultural variety as the countries of western Europe. Nevertheless, experts in multicultural learning have been increasingly sought also in the Czech Republic (Hladík, 2016). This research project focuses closely on the educational value and aims to specify its importance and position in the value preferences of pupils from a different cultural background (anglophone pupils), while the perceived role of educational value by this group may be different from the perception of pupils from the majority of society. Anglophone pupil is a child whose proficiency in English is on the level of a native speaker. In our sample, they have equal knowledge of at least another language. From international authors specialized in bilingual (or multilingual) Anglophone students we can name Threhub (1976) a Clark (2009). Corresponding research has not been conducted in the Czech Republic, and it is a relatively new research topic. However, previous research has focused on raising children and how to teach them or simply by comparing them to different groups around the world (Du Plessis, 2006, Gogolin, 2002). Application of this research in the Czech Republic is very limited. The English-speaking community here is relatively young as most of this group of foreigners came to the Czech Republic after the Velvet Revolution in 1989.

METHODS

The main aim of this project is to determine the importance of educational values among pupils from a different cultural background, compared to the majority of pupils. Haburajová (2010) defines a minority as a *group of people defined by social and demographic characteristics and the number of members, significantly differing from another group that has an utter majority in the society concerned*. Additionally, factors are identified that have a significant impact on their perception of educational values and the relationship between these determinants and the educational value in the individual value system is explored.

The issues of values, value orientation and preferences are frequently dealt with in specialized literature; however, research in this area has been rather scarce (Prudký, 2009). The reasons are difficulties in finding the right approach to the theme as well as in search for the way to measure values. Although a number of studies have been conducted, experts still seek models and inspiration suggesting the method of approaching the research topic of values (Prudký, 2009).

The present research project specifically aims at the value of education, and its goal is to concretize the significance of the educational value and its position in value preferences of students coming from another cultural background. It is the perception of the role of the educational value by this group that may differ from the perception by students who are part of the majority population. This is the reason why, although we use the above models and approaches, we intend to examine the value of education through a prism of a selected sample of students in detail and use several viewpoints. Thus, we shall combine the established research tools with our own research strategy, aiming at concrete results.

Partial goals:

- Identify the position of education in value preferences of pupils from a different cultural background.
- Capture the educational aspirations of pupils from a different cultural background.
- Identify the reasons and motivations behind education in this group.
- Analyse the opinions and attitudes towards education among pupils from different cultural backgrounds.
- Describe the concepts of education from the point of view of the pupils.
- Find the dominant factors that have an influence on individual conception of educational values.
- Understand the concept of education in the process of intergenerational transfer.
- From the perspective of the importance of education, identify the confrontation of cultural systems in the family versus schools as the main determinants of the value system in the individual concept of the pupil.

RESULTS

Description of the 1st part of "Education as a Value" research

In the first part of our research, we focused on the quantitative perspective on the status of the educational value in the value preferences of pupils from a different cultural background, on their educational aspirations and on the reasons behind their education. A questionnaire survey from second grade pupils at elementary schools in selected locations in the Czech Republic gave us insight into how education is perceived as a value. We then compared the resulting data with the results of pupils from the majority population to obtain valuable data.

Research sample

The research was carried out among a selected set of youth (pupils from sixth to ninth grade) and the research sample was subject to predetermined criteria:

First sample group:

- Anglophone pupils (pupils with knowledge of Czech and English at a native level)

Second sample group:

- A comparative sample from the majority population

Figure 1: Graph of Educational Aspiration – Comparison

- - majority pupils in the Czech Republic
- - anglophone pupils in the Czech Republic

ZŠ – primary school, SŠ (bez maturity) – practical school, SŠ (s maturitou) – high school, VOŠ – college, VŠ - University

[Figure 1] describes educational aspirations of Anglophone pupils classified by the type of achieved education. The resulting data show that 84% of the children wish to obtain university or college education, and confirm the

fact apparent from the table of comparison of value preferences, where this specific group of students prefers education and personal development and places them to the first two positions. This may be influenced by the fact that such pupils often attend international schools or bilingual classes in “ordinary” elementary schools, where the value of education is stressed since the beginning of study as a very important feature. The survey suggests that the parents of such children have a university or college degree in most cases. Only 10% of respondents aspire to achieve high school education with the school-leaving examination (baccalaureate). Only 2.5% of children wish to obtain secondary education in the form of apprenticeship.

Value	Sequence	Sequence
	Anglophone pupils	Majority pupils
Education	1	6
Development of my own personality	2	13
Freedom	3	7
Health	4	1
Friendship	5	4
To have enough money	6	8
Interesting job	7	11
Truth	8	9
Happy family and children	9	3
Life partner	10	5
Life in peace	11	10
Environment	12	15
Love	13	2
Usefulness to others	14	14
God (faith)	15	12

Table 1: Comparison of Value Preference and Anglophone Pupils and Majority Pupils.

[Table 1] shows comparison of the importance attributed to education by the two monitored groups of pupils. Their task was to make an order of preference of fifteen values and to assign a position to each value, whereas 1 = the most important, to 15 = the least important. The results show that for the group of Anglophone pupils, the values of education and personal development clearly occupy the first two positions unlike the results of the majority population students. If we make a comprehensive comparison of value preferences, we can see that the majority children have a different system of value preferences than Anglophone pupils, who hold education and development of their own personality in high esteem, followed by freedom, health and interesting job. On the other hand, the values connected with love, life partner, family and children are given very low preference.

CONCLUSION

The aim of this contribution was to outline the individual steps of the project which monitors the perception of the educational value through the prism of pupils from another cultural environment. The first published data show that the value of education occupies a different position in the value systems of pupils who come from another cultural background. Thus, our assumption of the importance of socio-cultural influences in the process of formation of the personal value system has been confirmed. In our further work, we shall examine these determining factors in more detail and we shall try to capture the reasons and motivation to learn and educate oneself in these selected groups of pupils we shall analyze their views and attitudes toward education as well as describe the perception of education by children and their parents.

Effect of Collaborative Concept Mapping on University Students' Learning Achievement

Blizak DJANETTE

Faculty of sciences, University of Boumerdes, Algeria
bdmeriem@yahoo.fr

ABSTRACT

In recent years collaborative concept mapping (CCM) has become a very useful didactic teaching tool for teaching and learning about different topics. It engages the student in active learning and helps him to organize his ideas. The main objective of this study was to investigate the effect of using CCM on university students' learning achievement in two subjects: ethical principles and deontology in university (EPDU) and Physics. 64 students from faculty of sciences participated in this research. All students in our sample took courses in EPDU and physics, at formal situation. Students were randomly divided into two groups; experimental and control groups. The students in the experimental groups constructed CCM at the end of each lesson. Meanwhile, the control groups were taught by just traditional teaching strategies. All groups took multiple choice learning achievement tests. No significant difference was found between groups which took courses on EPDU. While, a significant difference in favour of the experimental group, where CCM after conventional teaching methods was applied to learn physics, has been observed.

The results support that when students are constructed CCM in a scientific subject like physics, they achieve the best scores.

Keywords: Collaborative learning, concept mapping, achievement.

INTRODUCTION

Concept mapping (CM) has been suggested to be an effective learning tool through the process of map construction which has been developed by David Novak and colleagues. This technique, which based on the cognitive theories of assimilation of David Ausubel and the constructivism, shows how the student's conceptions are structured (Novak, 1990). The cartographic representation of students' concepts with links and labels is very gainful for conceptual change: "The most important single factor influencing learning is what the learner already knows" (Ausubel, 1968, p. 18).

That is why; CM has been used at almost all levels of education in a variety of ways. In science education, CM has not only been found useful in promoting students' understanding of science concepts (Cheema & Mirza, 2013), it also facilitates pupils' abilities to solve problems (Zimmerman et. al, 2011). It has been used to observe change in students' understanding of concepts over time and to help them to build and organize their knowledge base in a given discipline or on a given topic (Ling & Boo, 2007). Concept mapping has helped pupils elaborate the conceptual understanding theory they already possess, and especially to recognize and modify those knowledge structures that contains misconceptions, alternative conceptions or framework (Novak & Gowin, 1984).

The importance of collaborative learning has been raised by several researchers (Vygotsky, 1978; Anderson et al., 1995; Roschelle & Teasley, 1995; Hwang et al., 2011). Roschelle and Teasley (1995) define collaboration learning as a process of construction and maintaining a shared concept of the problem. According to Vygotsky (1978), students' knowledge can be constructed through interactions with their peers. This allows them to build knowledge and to develop reflective thinking (Hwang et al., 2011). In this theory of knowledge-building, elaborated by Bereiter (2002), the discussions between pairs around conceptual artefacts (ideas, methods, models) includes questioning, proposition, justification, criticism, clarification, negotiation, challenge.... The interactions between peer in collaborative learning, promotes the externalization of learner's prior knowledge and the emergence of sociocognitive conflicts, thus stimulating the elaboration of new cognitive structures and facilitating their integration into existing structures (Anderson et al., 1995).

If the individual building of concept maps makes it possible to develop a meaningful learning in particular by clarifies, schematics and hierarchies in knowledge, developed in a group, a CM (CCM) conducting effective

discussions on concepts, and thus enhances significant learning. Students who have developed CCM gained better knowledge than students working individually (Okebukola, et al., 1994).

The issue of the possible use of CCM strategy in enhancing achievement at university level in two topics (physics and EPDU), was addressed in the present study. Therefore, this study aimed at testing the effect as used the effect of CCM on students' achievement in Physics) (Technical and applied sciences) and ethics and deontology (Humanities and Social Sciences).

RESEARCH QUESTIONS

Our research questions, in this study, are:

- Will the use of CCM with university students have significantly different effects on students with physics achievement test (Physic-AT) than students who taught just traditional courses?
- Will the use of CCM with university students have significantly different effects on students with EPDU achievement test (EPDU-AT) than students who taught just traditional courses?
- Will the use of CCM with university students have significantly different effects on students with different achievement levels in physics and EPDU?

METHOD

SAMPLE

Purposive sampling technique was used for the present investigation. Department of physics in the faculty of sciences in Boumerdes University was selected for this purpose. 64 students from faculty of sciences participated in this research. 53% of them were female. The average age of the students was 22.45 years with a standard deviation of 2.63 years.

DESIGN AND PROCEDURE

All students in our sample took courses of 3 hours a week in physics (biophysics courses) in the first semester of 2016/2017 University year. In the second semester of the same university year, they were taught one hour and 30 minutes per week of EPDU courses, at formal situation.

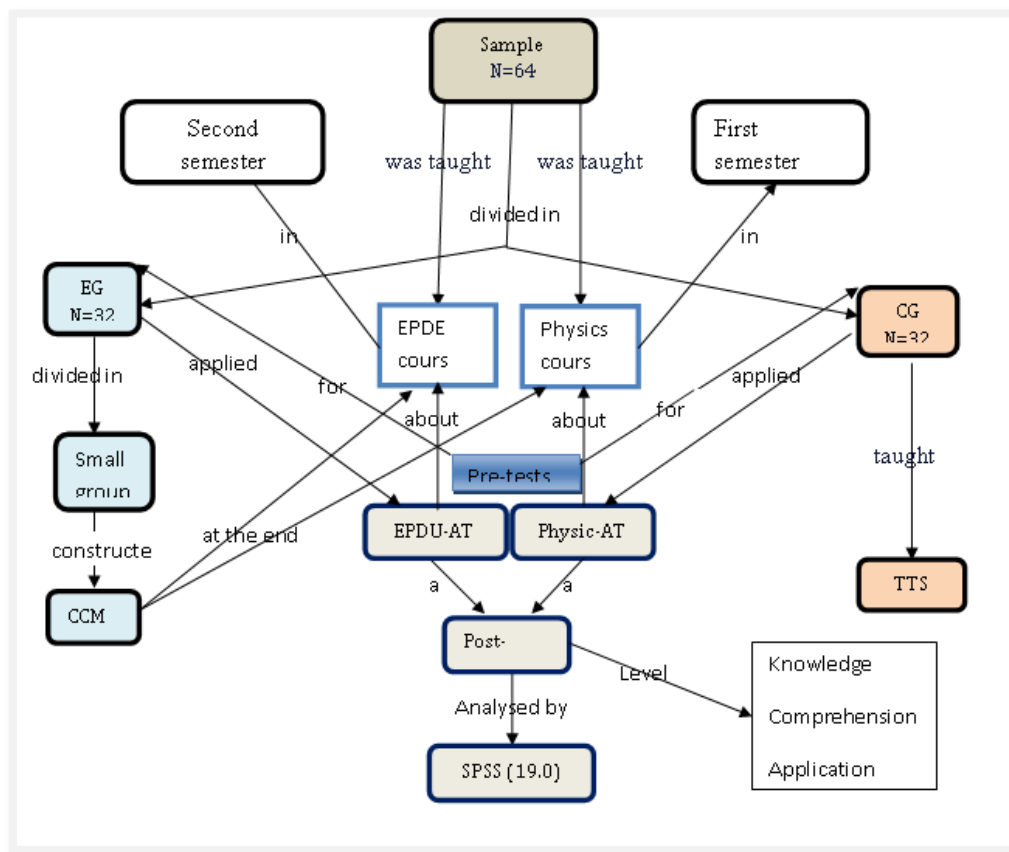

Figure 1. Concept map representing the design of the study

[Figure 1. Concept map representing the design of the study.png](#)

At the beginning of each semester, before beginning the courses, the students were tested, in order to know their knowledge and their misconceptions in physics and EPDU. These official tests were considered in our study as pre-test. The sample was randomly divided into one experimental group (EG) and one control group (CG) having 32 students in each group. All students, in both groups, were taught in formal classes under the same conditions. However, EG students are divided into small groups (SG) of three members. At the end of each course, the teacher asked students in each SG to construct a CCM, while control groups were taught only by traditional teaching strategies (TTS). All students had academic achievement tests as post-test. The design of this study is given by concept maps showed in figure 1.

Figure 2 shows two examples of concept mapping given by students in SG concerning physics and EPDU.

The physics achievement test (Physic-AT) and the ethical principles and deontology in university (EPDU-AT) was developed as data collection scales and the items were at three levels of Blooms taxonomy (knowledge, comprehension and application). Both tests were prepared by the contribution of three teachers in the faculty of sciences at Boumerdes University and author. The maximum score in both tests is 20. in Physic-AT and EPDU-AT is 20 points (Table 1).

To determine the internal consistency reliability of Physic-AT and EPDU-AT, Cronbach alpha coefficient was calculated. We have found $\alpha=0.72$ for Physic-AT and found $\alpha=0.69$ for EPDU-AT. Both values of found α are considered to be acceptable.

Physic-AT was administered under standard conditions as post test to the CG and EG at the end of first semester. However, EPDU-AT was administered to both groups at the end of second semester. The achievement tests were done in the language of instruction (French).

All data were compiled and analysed using SPSS 20 statistical analysis programs for Windows computer software. The results of the analysis were used to answer the research questions, by using average and t-test. The significance level was taken as 0.05.

Table 1: Scores in Physic and EPDU achievement tests

Bloom level	Physic-AT		EPDU-AT	
	Number of items	maximum score	Number of items	maximum score
knowledge	8	7	8	8
comprehension	6	5	6	6
Application	4	8	6	6
Total		20		20

FINDINGS

At the beginning of the first semester we compared the averages of the students to the pre-test in physics. A t-test for independent samples showed that there were no significant differences between EG and CG ($t = 2.88$, $p > 0.05$). At the second semester, before starting teaching, a t-test was carried out on the pre test data for EPDU. It was shows that there were no significant differences between EG and CG ($t = 1.28$, $p > 0.05$).

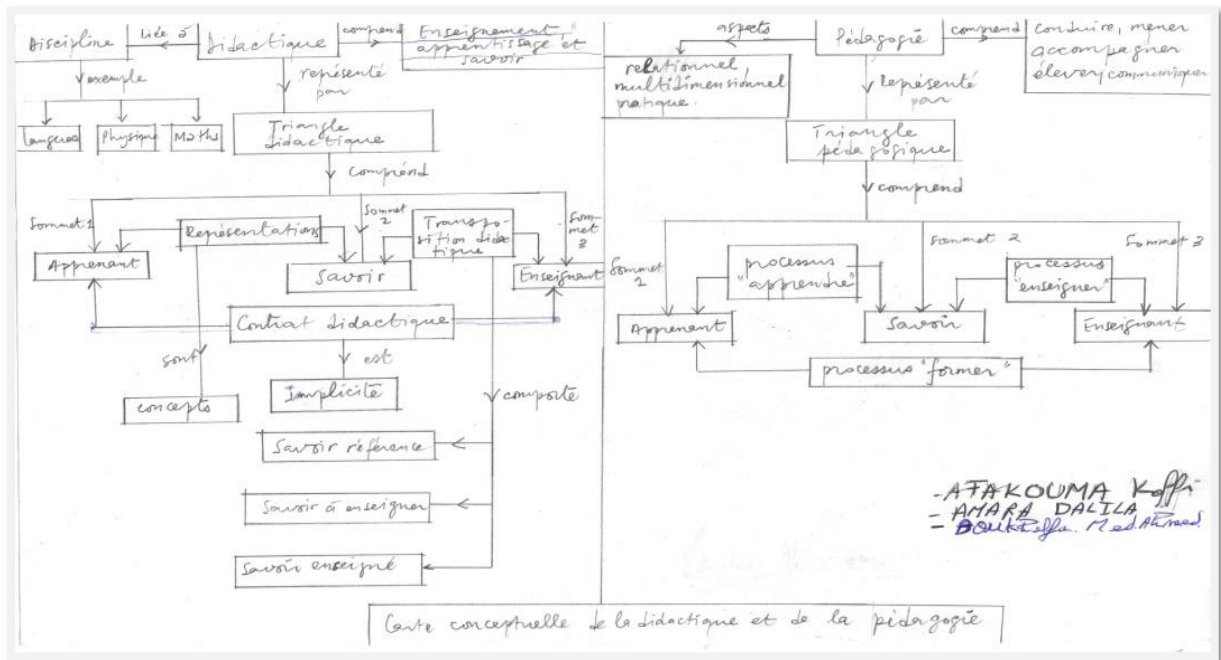

Figure 2a: Example of CCM about EPDU done by Students in EG

Figure2 a. Example of CCM about EPDU done by Students in EG.jpg

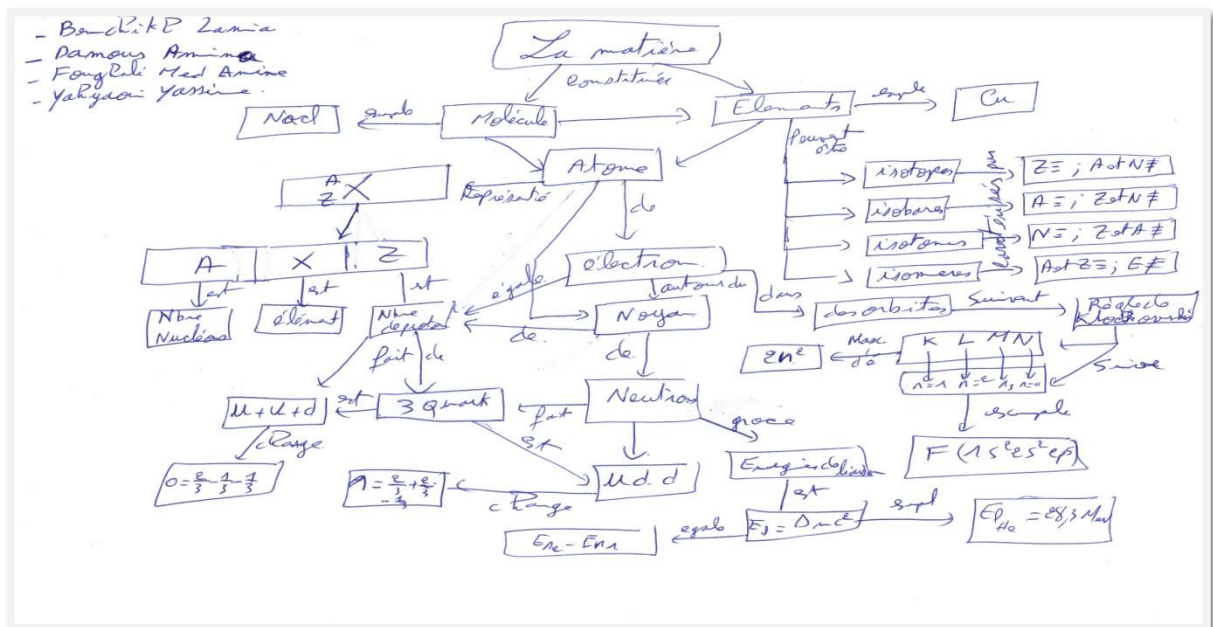

Figure 2b: Example of CCM about physics done by Students in EG

Figure 2b. Example of CCM about Physics done by Students in EG.jpg

The effect of CCM that were done by the GE students (see Figure 2) was tested by the application of a post test. This test was used to answer the research questions related to the in Physic achievement test main purpose of the research.

A post test means scores of the students in EG and CG in terms of students' achievement of physic were used. The results were shown in Table 2.

Tableau 2 : Scores in Physic achievement test

Group	EG			CG			Samples t-test		
	N	Mean	SD	N	Mean	SD	t	DF	P
Knowl- Physic-AT	32	4,5000	1,19137	32	4,0000	1,41421	1,530	62	,131
Comp-Physic-AT	32	3,3750	1,31370	32	2,6250	1,09985	2,476	62	,016
Appl-Physic-AT	32	3,4688	1,50235	32	2,2813	1,48616	3,179	62	,002
Physic-AT (total)	32	11,3438	3,32740	32	8,9063	3,21648	2,979	62	,004

The post physics-AT total means scores were compared using independent samples t test to found whether there was a statistically significant mean difference between EG and CG in the case of physics. As shown in table 2, there was a statistically significant mean difference between the EG (M =11.34, Sd=3.33) and CG (M = 8.91, Sd =3.22) totals scores in favour of the experimental group [t (62)=2.98, p <0.05].

Also, the effectiveness of CCM tools was explored with respect to mean differences in post physics-AT for both the groups at different cognitive abilities of knowledge, comprehension and application. The value of independent sample “t” is 2.48 and 3.18 for comprehension and application levels respectively; which were found to be significant at 0.05 level for the degree of freedom 62 in favour of EG. However, t-test result (see Table 2.) showed that there were no significant differences between the two groups in knowledge level (t = 1.53, p > 0.05).

Regarding the research questions to be answered related to the main purpose of the research, a post test mean scores of the students in EG and CG in terms of students’ achievement of ethical principles and deontology in university (EPDU) were used. The results were shown in Table 3. In post EPDU-AT, the EG total mean score (M=12.61, Sd=06.79) was slightly higher, comprehension and application than CG [M=12.62, Sd=3.03; t (62) =1.77, p=0.08], with no significant difference (see table 3).

Tableau 3 : Scores in EPDU achievement test

Group	EG			CG			Samples t-test		
	N	Mean	SD	N	Mean	SD	t	DF	P
Knowl-EPDU-AT	32	5,2500	1,52400	32	4,9688	1,63597	,712	62	,479
Comp-EPDU-AT	32	3,8125	,99798	32	3,5626	,80071	1,105	62	,273
Appl-EPDU-AT	32	3,5625	1,16224	32	2,9688	1,03127	2,162	62	,035
EPDU-AT (total)	32	12,6250	3,03475	32	11,3125	2,88978	1,772	62	,081

The effect of CCM tools on different cognitive abilities of knowledge, comprehension and application levels related to EPDU was also explored. The value of independent sample “t” is 0.71 and 1.10 for knowledge and comprehension levels respectively; which were found to be no significant at 0.05 level for the degree of freedom 62. However, t-test result showed that there was a significant difference between the two groups in application level (t = 1.53, p > 0.05) in favor of EG.

DISCUSSION OF RESULTS

The study sets out to investigate the effect of the use of CCM to the university students’ achievement towards learning physics and ethical principles and deontology. The results showed that the students who learned with CCM (EG) performed better than students who leaned only with traditional instruction in the case of physics.

This confirms the results obtained by many studies in science education, concerning the non effectiveness of the use of traditional teaching strategies alone (Elcin and Sezer 2014).and the efficiency of the use of the CCM for meaningful learning. The results of the study of Czerniak and Haney (1998), conducted with preserves teachers, indicate that CCM could increase physical achievement. In chemistry the positive effect of concept mapping on achievement has been confirmed by Özmen, and al. (2009). Even in Economics, The score achievement of the group exposed to CMM was significantly higher than to group taught by conventional method (Sharma, M., & Singh, G., 2016).

From the meta-analysis of many studies using concept mapping as an instructional strategy, Horton and al. (1993) confirm that concept mapping had positive effects on students' overall achievement in sciences.

Also, we noted that students in EG have a high cognitive abilities in learning physics compared to the students taught by traditional teaching method only. The active involvement of the students during the discussion and the sharing of concepts among themselves, favored by CCM, helps them to correct their misconceptions. The confrontation of students' ideas could facilitate conceptual change and having an impact on comprehension and application levels. This finding is in agreement with Afamasaga-Fuata'i (2007). study, which found that concept maps help raise the level of comprehension.

Consequently, CCM learning improves the academic performance of students in sciences. It helps to exploit the abilities of the students of a single group, integrating them into one outcome that benefits all members of the group, and the desire of everyone in the group to manage the discussion, to ask questions and answer the questions of their peers actively in a cooperative atmosphere within one group and competitive with the other groups. When students are in traditional education, they are more dependent on the teacher and explain, and this is a factor in the superiority of the experimental group members in total achievement.

In the case of EPDU, the use of CCM has no effect on achievement. No significant differences between experiment group and control group on the post EPDU achievement test for comprehension and knowledge levels were found. However, the finding indicates a significant difference in mean scores of application level in favor of the experimental group. Despite that a very high number of studies have shown the efficiency of the concept mapping, some research results have shown that in some topics such financial accounting, the CCM has no effect (Leauby et al., 2010).

CONCLUSION

As a conclusion of this research paper, the following items summarize the findings after comparing the results of the experimental groups and the control groups at Physic-AT and EPDU-AT

- The students in experimental group that was exposed to concept mapping method, performed significantly better than the control group on physic achievement test.
- The experimental group involved in concept mapping was found to have significantly high cognitive abilities than control group in physics
- The CCM has no significant effect on students' achievement learning in the case of EPDU.

From our findings, it can be concluded that that CCM strategies is more effective than traditional methods of teaching in increasing student's achievement in Physic. We think that in general, CCM learning is better for science education than social science education. For the reason that many science concepts are very difficult to understand, CCM as learning tools can facilitate the conceptual change and the understanding concepts. Finally, CCM learning has a significant impact on increasing the level of achievement of students in the university because of the mechanism of learning from peers in the groups, and what it allows students to share and interact with each other to gain knowledge and understand concepts.

Following this research, several perspectives are possible to develop teaching strategies integrating the CCM in order to improve student cognitive abilities and conceptual change.

ABSTRACT

In this study, the effectiveness of visual multimedia supported conceptual change texts (VMMSCTexts) on overcoming senior high school students' misconception about boiling concept has been studied. Two students' misconception about boiling concept addressing in this study, that is: 1) Boiling is identic with high temperatures, and 2) At the time of boiling, the fastest rate of water convection. VMMSCText was designed based on students' misconceptions by following six-phase Conceptual Change Model (CCM) synthesized by Stepan. Visual multimedia used in these texts included image (photo), virtual simulation and Video. These texts were tried out on senior high school students at one high school in Bandung district. A quasi-experiment method with design one control group (n=36) and one experimental group (n=36) were used. Experiment group were given the VMMSCText, whereas the control group were given CCText. Data were collected by two item conceptual test in the three tier test format concerning boiling concept. When the results of the study were examined as to the quantity of student whose misconceptions are remediated and who have consistency of scientific conceptions in the two groups, it was found that the number of students whose misconceptions are remediated and who have consistency of scientific conceptions in the VMMSCText group was higher than that of the CCText group. It is believed that these visual multimedia used in these texts can be concretize concepts that represent abstract phenomena enable to show many processes to students which are imposible to show; thus, it becomes possible to remove students' misconceptions and prevent any possible misconceptions.

Keywords: VMMSCText, Remedial teaching, Misconception, Boiling Concept.

1. INTRODUCTION

During the past few years, much effort has been put on studies of student's misconceptions in various physical subject matters. students may find that some physical concepts such as electricity, magnetism and heat are abstract, difficult, confusing and complicated. Some research were based on misconceptions of some physical concepts: the concept of simple electric circuit (Kucukozer and Kocakulah, 2007), force and motion concept (Fadaei and Mora, 2015), heat and temperature concept (Kartal et al., 2011), heat transfer mechanisms and elementary kinetic theory

concept (Pathare & Pradhan, 2010), refraction concept (Kaewkhong et al., 2010), gas concept (Aslan and Demircioglu, 2014), and electricity and magnetism (Demircioglu and Cirkinoglu, 2004).

Two students' misconception about boiling concept found in the phase transition of matter that are: 1) Boiling is synonymous with high temperatures, and 2) At the time of boiling, the rate of water convection is highest. The occurrence of these misconceptions is caused by at least two things; First, their experience in daily life, where almost every day they observe that water boils at a high temperature, almost 100°C; Second, the teacher's classroom learning is not so clear explaining that the boiling point of water is influenced by environmental stresses, the greater the environmental pressure the higher the boiling point of water. The teacher never asserts that if the environmental stresses can be lowered to a very small value then the water can boil at a low temperature, for example at room temperature (27°C).

Misconceptions are resistant to change with scientific ones and students may reject accepting new ideas (Hynd et al., 2015) and they are obstacles for students in learning and to make meaningful understanding of some concepts in science. So the state of misconception that occurs in students should not be left and must be remediated so as not to resist students in achieving a sound understanding of physical concepts.

Researches including various activities based on conceptual change approach have been regulated to provide conceptual change. Commonly used conceptual change technique based on activities are; analogies (Choi & Chang, 2004; Cosgrove, 1995), Conceptual Change Text (CCText) (Chambers & Andre, 1997; Çakir, Uzuntiryaki & Geban, 2002; Alparslan, Tekkaya & Geban, 2003), Computer Supported Instruction Material (CSIM) (Windschitl, 2001; Talib, Matthews & Secombe, 2005); Dual Situated learning model (She, 2004; She, 2005, Samsudin et al., 2016).

Conceptual change texts (CCText) were firstly developed by Wang and Andre (1991). After that, many researchers developed and continued to use these methods, primarily (Chambers and Andre, 1997). With CCText it is aimed to remove students' misconceptions or to rearrange their pre-knowledge. CCText is prepared to provide students to feel that their existing knowledge is insufficient in explanation of some topics. In conceptual change texts, firstly students are ensured to be aware of their misconceptions. After that, the reasons of these misconceptions are explained through examples and reasons. Students feel that their knowledge is insufficient in explaining new situations that they meet and conceptual change is ensured by showing them the concepts that are scientifically correct (Guzzetti et al., 1993).

Until today, there have been different researches on the effect of conceptual change texts on removing misconceptions. In some researches, effects of conceptual change texts and traditional texts on teaching concepts and removing misconceptions were compared (Mikkila, 2001). At the end of these researches, it was determined that conceptual change texts are more effective than traditional texts in teaching concept and removing misconceptions. On the other hand, in their study, Diakidoy, Kendeou and Ioannides compared the effects of conceptual change texts and traditional method on conceptual learning (Diakidoy et al., 2003). As a result of their study, conceptual change texts were more effective than traditional methods in terms of conceptual success. Yılmaz made a similar study and found out that conceptual change texts were more effective than traditional method in removing misconceptions (Yılmaz, 2010).

To give student understanding on the physical contents that contain microscopic or abstract phenomena phenomena required a teaching media that can visualize the phenomenon. One of the media that can be used is a virtual simulation of microscopic physics phenomena (Wibowo, et al., 2017). Because of the virtual simulation media microscopic phenomenon can only run on the computer, then CCText and virtual media must be integratedly packaged in computer format. CCText supported by visual multimedia is then given the term Visual Multimedia Supported Conceptual Change Text (VMMSCCCText). In the VMMSCCCText can also be enriched with other visual impressions such as video phenomena. Hua & Hong (2012) state that "Application of multimedia courseware in teaching physics to make up traditional teaching not only saves the time, meeting teaching requirements, but makes abstract physical content more visual and intuitive via combination of video and audio means. In addition to shorter teaching time and higher teaching density, the teaching efficiency and quality is greatly improved, so as to accommodate and promote combination of university students with their ability".

One of the physical content that contains microscopic objects is the phase transition content. One of the concepts covered in phase transition content is the concept of boiling. Boiling is the process of loosening the bonds of H₂O molecules from the entire volume of water when the water reaches a certain temperature called boiling point. Water molecules (H₂O) are microscopic objects that misconceptions to students.

In this study, development and test of VMMSCCCText related to boiling concept has been done. VMMSCCCText was designed based on students' misconceptions by following six-steps Conceptual Change Model (CCM) synthesized by Stepan, consisting of: The first step aims at helping learners become aware of their own thinking in order to help them commit to a problem or challenge and make predictions to an outcome before starting any activity. The second step aims at helping learners expose their beliefs and share ideas with classmates before testing these ideas. The

third step aims at helping learners confront their existing ideas by testing them in small groups. The fourth step aims at helping learners benefit from class discussions to accommodate the new concept and resolve any existing conflicts. The fifth step aims at helping learners extend the concept by making connections between the concept they have learned in class and other related concepts and ideas. Finally, the sixth step aims at helping learners go beyond the concept through pursuing new ideas related to the concept they have learned in class (Stepans, 2011). To control the effect of presence of visual multimedia usage on VMMSCText, then in the implementation test of VMMSCText used control treatment in the form of CCText without supported by visual multimedia. This article describes the results of VMMSCText development related to the boiling concept and its implementation in the remedial teaching of phase transition content in senior high school students.

2. EXPERIMENTAL METHOD

The method used in this research is the quasi-experiment method with design one control group (n=36) and one experimental group (n=36). Experimental group were given the VMMSCText, whereas the control group were given CCText as shown in Figure 1.

Class	Pretest (Integrated in 1st part of VMMSCText /CCText)	Treatment	Posttest (Integrated in 4nd part of VMMSCText /CCText)	Delayed posttest
Experiment	O	X ₁	O	O
Control	O	X ₂	O	O

Fig. 1. The research design used in this study

Here, O is a conception test of the boiling concept, X₁ is a remedial teaching treatment using VMMSCText and X₂ is a remedial teaching treatment using CCText. This experimental research was conducted at one senior high school in Bandung district. The sample was chosen purposely. Because of the VMMSCText and CCText is used in remedial teaching, then as a sample selected students who have followed the phase transition content learning regularly in their class. Duration of the one VMMSCText and CCText activity in the remedial teaching was 45-min periods. To assess students' conceptual change as effect of CSCCText activity, a Boiling Conceptual Test (BCT) consisting of two items, was developed based on the alternative conceptions in three-tier multiple choice test format. To identify the state of student conception before and after following VMMSCText and CCText activity based on conception test results used guidelines as proposed by Kaltacki and Didis has been used (Kaltacki and Didis, 2007).

The decrease in the number of students who have misconception as the effect of using VMMSCText and CCText in the remedial teaching about phase transition content is calculated from the difference between the number of high school students who have misconceptions in 4nd part of VMMSCText or CCText with the number of students who have misconception in 1st part of VMMSCText or CCText. While the number of students who have a consistency of scientific conception as a results of conception accommodation in VMMSCText or CCText activities is calculated from the difference in the number of students who have a scientific conception on the 4nd VMMSCText or CCText with the number of students who have a scientific conception at the delayed test.

In the first parth of VVMSCCText, students' pre-conception was diagnosed. In this section presented a picture of phenomena associated with the concept of boiling. Then the students are asked to express their conception about that presented phenomena. In addition, students are also asked to provide an explanation for their conceptions and the level of confidence in their concepts. At the 2nd parth of VMMSCText, a confrontation of conception takes place, students are asked to observe video about the boiling presented in VMMSCText. The student is asked to compare the conceptions he has had with the actual phenomenon that he has seen on the video, allowing for the occurrence of cognitive conflicts in their minds. At the 3rd parth of VMMSCText presented scientific explanation about boiling with explanation down to the microscopic level using various visual media such as virtual simulation, ficture of object and video. Interactively students asked to study the scientific explanation presented at VMMSCText until there is an accomodation process of new scientific conception to replace the old false conception. And at the 4rd parth of VMMSCText are presented reinforcement and enrichment of conception, students are required to observe and study other physical phenomena related to the boiling concepts shown in the video. After that they are faced

with conception tests related to the boiling concept to check the conception that students have after following VMMSCText activity (see Appendix).

3. RESULTS AND DISCUSSION

Table 1 and Table 2 shows a comparison of the percentage of high school students whose misconceptions are remediated between the VMMSCText class and the CCText class. In both classes the decrease in the number of students who have misconception is in the high category, indicating that the confrontation stage of conception beliefs presented in the 2nd part of VMMSCText and CCText has succeeded in causing a cognitive conflict situation in the students minds that causes dissatisfaction with their pre-conceptions so that their level of confidence to their pre-conception it has gradually decreased. A decrease in the number of students who have misconceptions also indicates the success of the scientific explanations stage presented in the 3rd part of VMMSCText and CCText in constructing a scientific conception about boiling concept in the minds of students. The new conceptions presented in this section are presented clearly, plausibly and fruitfulness, so that students can accommodate them to replace the old mistaken conception.

Table 1. Percentage of students whose misconceptions are remediated in the VMMSCText class

Concept Labels	Number of students who have misconception on 1st part of VMMSCText	Number of students who have misconception on 4nd part of VMMSCText	Percentage of Students whose misconceptions are remediated (%)	Category of decrease of the quantity of students who have misconception
CL1	19	0	100,0	High
CL2	22	2	90,9	High

Table 2. Percentage of students whose misconceptions are remediated in the CCText class

Concept Labels	Number of students who have misconception on 1 st part of CCText	Number of students who have misconception on 4nd part of CCText	Percentage of Students whose misconceptions are remediated (%)	Category of decrease of the quantity of students who have misconception
CL1	20	5	75,0	High
CL2	21	6	71,4	High

Based on the data in Table 1 and Table 2 the percentage of students whose misconceptions are remediated in the VMMSCText class is higher than the percentage of students whose misconceptions are mediated in the CCText class on both reviewed concept labels. This data shows that the use of VMMSCText in remedial teaching of phase transition content can further decrease the quantity of students who have misconception compared to the use of CCText. Its indicates that the use of VMMSCText in remedial teaching about phase transition content is more effective in reducing the number of students who have misconception than the use of CCText.

The effectiveness of VMMSCText in the remediation of misconceptions that occurred in the concept of boiling that are classified as an abstract concept can not be separated from the role of visualization media used in concretizing abstract phenomena to be real. Concretizing concepts that represent abstract issues is very important in order to understand them correctly. Computer assisted materials that are used to concretize concepts enable to show many processes to students which are impossible to show; thus, it becomes possible to remove students' misconceptions and prevent any possible misconceptions (Yumusak et al., 2015).

Table 3 and Table 4 show a comparison of the percentage of students who have consistency of scientific conception as a results of conceptions accommodation between the VMMSCText class and the CCText class.

Table 3. Percentage of students who have consistency of scientific conception as a results of conceptions accommodation in VMMSCText class

Concept Labels	The number of students who are in the category of scientific conception in 4nd part of VMMSCText	The number of students who are in the category of scientific conception on the delayed test	Percentage of students who have consistency of scientific conception (%)
CL1	20	19	95,0
CL2	21	19	90,5

Table 4. Percentage of students who have consistency of scientific conception as a results of conceptions accommodation in CCText class

Concept Labels	The number of students who are in the category of scientific conception in 4nd part of CCText	The number of students who are in the category of scientific conception on the delayed test	Percentage of students who have consistency of scientific conception (%)
CL1	15	10	66,7
CL2	16	12	75,0

Based on the data in Table 3 and Table 4 the percentage of students who have consistency of scientific conception as a result of conception accommodation in VMMSCText class is higher than the percentage of students who have consistency of scientific conception in CCText class on both concept labels. This data indicates that the use of VMMSCText in remedial teaching about phase transition content can further maintain the consistency of scientific conception in students' minds rather than the use of CCText. Its indicates that the use of VMMSCText in remedial teaching is more effective in maintaining the consistency of scientific conception than the use of CCText.

The presence of a variety of visual media at the stage of scientific explanations and the strengthening/enrichment stage of VMMSCText can assist students in achieving a sound understanding of physical concepts, so that the scientific conception that has been embedded in the minds of students of conception accommodation will not be easily reverted back to the old conceptions. According to Alrsa'i & Aldhamit (2014) the use of computer simulations can help understand students about physical concept. Meanwhile, Mirana (2016) states that the use of computer simulations in a constructivist approach can improve students' understanding of physics. In line with that Esquembre (2001) states that the use of computers in learning physics has a good potential in improving physics achievement.

4. COCLUSION

The VMMSCText related to boiling concept has been developed. The use of VMMSCText in remedial teaching about phase transition content can further reduce the number of students who have misconception and can further maintain consistency of students' scientific conceptions related to boiling concept compared to the use of CCText. It shows that the application of VMMSCText in remedial teaching about the phase transition content are more effective in remediate misconceptions and maintains the consistency of scientific conceptions about boiling concept that occur in senior high school students than the use of CCText.

1st part: Conception Disclosure	
<p>In daily life you must have the experience of seeing even feel splashed by the water being boiling. What do you see when the water is boiling? What do you feel when your body parts are splashed by boiling water?</p> <p>Now please You observe the images below showing the water that is boiling and the state of</p> <div style="display: flex; justify-content: space-around; margin-top: 20px;"> <div style="text-align: center;"> <p>Air sedang mendidih</p>  </div> <div style="text-align: center;"> <p>Kulit melepuh tersiram air panas</p>  </div> </div> <p>Questions:</p> <ol style="list-style-type: none"> 1. If someone now challenges you by asking a question, do you dare to soak in boiling water? What answer would you give to the person asking? 2. Do you answer "do not dare"? Why do you answer like that? Is the answer based on the idea that the boiling water temperature is so high so that when there are people soaking in it then surely the skin of his body will blister and it must feel very hot? Why do you have such thoughts? 3. Are you sure of the truth of your thinking? 4. If you do not have such thoughts then what kind of thoughts do you have about <div style="border: 1px solid black; padding: 10px; margin-top: 10px; text-align: center;"> <p>(Please answer all questions on the provided worksheets, according to the thoughts you have!)</p> </div>	

2nd part : Conceptions Confidence Confrontation

Click the images below, and then you observe phenomena that displayed and please you to answer the questions asked!

Video view shows it appears that the water in a glass that is inserted into the vacuum desiccator appears to boil when the desiccator space is exposed.

In the above process is there a water heating process?

What is the temperature of the water in a glass stored on the vacuum desiccator?

Is it close to 100°C?

Is the temperature near the room temperature (27°C)?

So boiling water occurs at what temperature?

Do you observe on video, same or different with the conception or thoughts you have so far about the temperature of boiling water?

If different, do you still believe in the truth of your conception or thought that you have so far?

Will you retain the conception you have or want to replace with a new conception that matches with phenomenon you observe?

(Please answer all questions on the provided worksheets, according to the thoughts you have!)

3rd part: Scientific Exploration

Please learn about the following exposure carefully!

As has been known before, that boiling is the evaporation process that occurs in all parts of the liquid (water). Microscopically boiling is the breaking process of bonding of H₂O molecules from the entire volume of water.

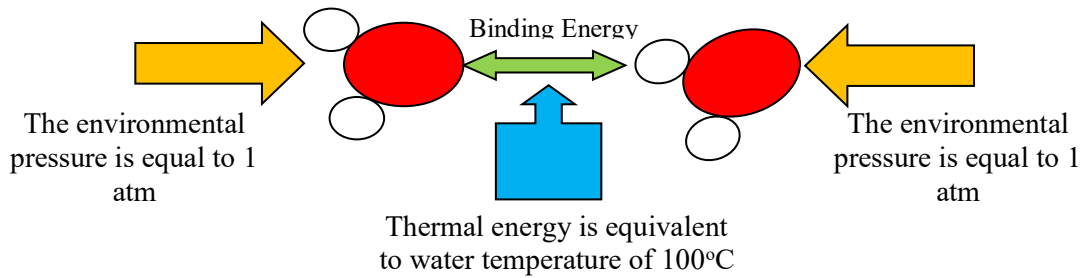

To break the bonds of H₂O molecules is certainly needed energy, one of which is in the form of thermal energy. The amount of energy required to break the bonds of the H₂O molecules depends on the bonding energy between the H₂O molecules and the external energy that holds the H₂O molecules together. This external energy is environmental pressure, it can be atmospheric pressure. The binding energy between H₂O molecules is of a certain size, whereas the amount of external energy can vary. So the given thermal energy must be able to overcome the binding energy of the H₂O molecule and this external energy so that the H₂O molecules can escape from the bonds that mark the boiling water. If external energy (environmental pressure) is large, it would require large thermal energy, but if the environmental pressure is small then the required thermal energy is not too large. The amount of thermal energy is usually represented by the water temperature.

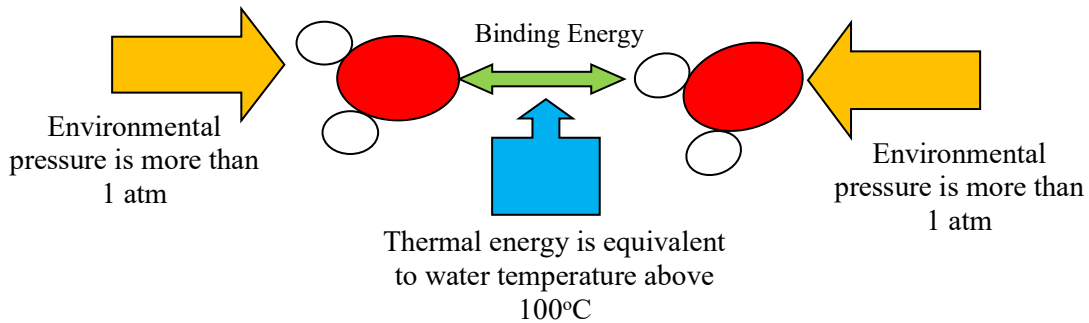

3rd part: Scientific Explanations

If the environmental pressure is at least 1 atm (average air pressure at sea level) then it needs considerable thermal energy that is equal to the temperature of 100°C water.

If the environmental pressure is greater than 1 atm (eg air pressure in the pressure cooker) then greater thermal energy is required that is equal to the water temperature above 100°C.

If the environmental stresses are less than 1 atm (eg air pressure in the vacuum desiccator) there is a smaller thermal energy equivalent to the water temperature below 100°C.

From the above explanation, what can you conclude about the temperature of boiling water? Can water boil at room temperature? When can it happen?

(Please answer all questions on the provided worksheets, according to the thoughts you have!)

4nd part: Reinforcement, Enrichment and Conceptions Disclosure

To reinforce your understanding of the boiling concept, now you click the image below and you observe and study the video presented!

What can you tell about the video show above?

(Please answer all questions on the provided worksheets, according to the thoughts you have!)

After reviewing the above explanation, Are you now going to change your conception that boiling water is identical to high water temperature (close to 100°C)?

(Please answer all questions on the provided worksheets, according to the thoughts you have!)

Now you answer the following questions!

If water is cooked in the mountains (highlands), at what temperature the water will boil?

- a. 100°C
- b. above 100°C
- c. below 100°C

Provide an explanation of the choice of answers you choose!

Are you sure of the truth of the answer you chose and the explanation you provided?

(Please answer all questions on the provided worksheets, according to the thoughts you have!)

Effects of the Story-Based Number Program on The Development of The Number Concept of 60-72 Month Old Children

ABSTRACT

The purpose of this study was to investigate the effect of the Story Based Number Program on the development of the concept of numbers of 60-72 month old preschoolers from low socioeconomic level. A total of 28 children, 14 experimental groups and 14 control groups, participated in the study using quasi-experimental design with pretest posttest control group. The Bracken Basic Concept Scale-III: Numbers / Counting subtest of the Receptive Form developed by Bracken (2006) and adapted by Angın, Arı, Deniz and Hamarta (2016) and "Counting Development Evaluation Tool" developed by Olgun, Fidan ve Babacan Özer (2013) were used to collect data. Mann Whitney U test and the Wilcoxon Signed Rank test were used to analyze the data. According to the results of the study, it was determined that there was a significant difference in favor of the experimental group between the posttest mean scores of Numbers / Counting subtest and Counting Development Assessment Tool. It was also found that there was no significant difference between and posttest and follow-up test measurements of the experiment group. According to these results, it can be said that the Story Based Number Program is effective on the development of the concept of number of 60-72 month old children.

Keywords: children's books, number development, low socioeconomic level, pre-school education

INTRODUCTION

Studies focusing on the use of storybooks to support children's learning have increased in recent years, mainly focusing on language development, vocabulary, and early literacy skills, as well as efforts to combine short storybooks with mathematics teaching, especially since the early 1990s (Blok, 1999; Hellwig, Monroe & Jacobs, 2000; Haury, 2001; Van den Heuvel-Panhuizen, Van den Boogaard & Doig, 2009; Binali, 2013; Flevares & Schiff, 2014). Linking storybooks with mathematical content helps to make mathematics more interesting, to develop a mathematical concept or skill, and to revise a mathematical concept or skills acquired (Welchman-Tischler, 1992; Whitin, 1992). According to Whitin and Wilde (1992), the integration of children's books with mathematics provides a way for children to understand how mathematics relates to daily life. Mathematical concepts can be presented visually through storybooks, so concepts become meaningful for children as they become concrete (Murphy, 1999, Callan, 2004, Goldstein 2007; Wilburne & Napoli, 2008; Marston, 2010). In addition, integrating mathematics into storybooks has also led to a reduction in anxiety towards mathematics and creates positive attitude towards mathematics (Jennings, Jennings, Richey & Dixon-Krauss, 1992; Hong, 1996; Keat & Wilburne 2009; Flevares & Schiff, 2014). According to Van den Heuvel-Panhuizen and Van den Boogaard (2008), the use of storybooks in teaching mathematics supports the use of three theoretical learning approaches, namely constructivist approach, context-based approach and interactive learning. That is to say, the value of using picture books in the teaching of mathematics is supported by three theoretical perspectives for learning: a constructivist approach to learning, the position of contextualized learning and the importance of learning by interaction which

is incorporated in the first two perspectives. All these three theoretical perspectives are important for the teaching and learning of mathematics (Elia, Van den Heuvel- Panhuizen & Georgiou, 2010). The National Association for the Education of Young Children and the National Council of Teachers of Mathematics (2002) supports the use of storybooks in mathematics teaching and notes that mathematics-related learning experiences should include sessions combined with various preschool activities. The integration of storybooks and mathematics facilitates teaching children how to interact with mathematical content (Van den Heuvel-Panhuizen et al., 2009), demonstrating how to relate mathematics, literature and critical thinking skills (Smith, 2013) and to personalize learning while filling gaps in the mathematical understanding of children (Goldstein 2007; Siebert & Draper, 2008). According to Caprora & Caprora (2006), teachers using storybooks in mathematics teaching have a more interactive learning environment.

When research that demonstrates the importance of the use of storybooks in mathematics education examined, it is seen that there is a lot of international research in relation with the standards of mathematics content and process designated by National Council of Teachers of Mathematics (2000) (Anderson, Anderson ,Shapiro, 2004; Anderson, Anderson, Shapiro, 2005; Casey, Erkut, Ceder, & Young, 2008; Van den Heuvel-Panhuizen & Van den Boogaard, 2008; Van den Heuvel-Panhuizen et al., 2009, Skoumpourdi & Mpakopoulou, 2011, Minetola, Serr & Nelson 2012). However, only a limited number of studies have focused on on the concept of number which is an important aspect of determining the mathematical content for preschoolers (Jennings et al., 1992; Hong, 1996; Young-Loveridge, 2004; Van den Heuvel-Panhuizen, Elia & Robitzsch, 2016). On the other hand, in Turkey, a study on the support of number development with a storybook-based program was not found but only one study by Öçal, Öçal and Şimşek (2015) overwiewed mathematical concepts and skills in storybooks. However, the concept of number is a universal skill (Smith, 2013) that is earned at early ages and is the milestone of mathematics programs (NCTM, 2000). Since early ages, children should be able to logically use number and number systems, count forward and backward, fluently perform basic addition and subtraction operations, read and write numbers, and calculate measurements reasonably. (Smith, 2013; MoNE, 2013). These skills are both a prerequisite for teaching advanced math skills (Charlesworth, 2012; Nguyen et al., 2016) as well as being the most important determinant of advanced mathematics skills (Demir-Lira, 2016). The contribution of number development to the acquisition of advanced mathematical concepts and skills requires examining the factors that influence number development. The socioeconomic level, the level of poverty in the child's income and the level of education of family members, is one of the factors affecting children's development of number concept (Jordan, Kaplan, Locuniak & Ramineni, 2007; Ramani & Siegler, 2008; Clements & Sarama, 2008; DeFlorio & Beliakoff, 2015). When the literature is examined, it is seen that the performance levels related to the numbers, which are key concepts in the acquisition of mathematical skills, are low in the children who come from low socioeconomic level in preschool period (Arnold & Doctoroff, 2003; Jordan, Kaplan, Olah & Locuniak, 2006; Unutkan, 2007; Starkey & Klein, 2008; Siegler 2009; Kandır & Koçak-Tümer 2013). From this point of view, it was aimed to investigate the effect of Story-based Number Program on the development of the number concept of 60-72 month old children from low socioeconomic level. To this end, the following sub-objectives were identified:

1. Is there a significant difference between the posttest scores of children in the experimental and control groups in terms of Numbers / Counting Test and Counting Development Evaluation Tool?
2. Is there a significant difference between the pretest and posttest scores of the children in the experimental group in terms of Numbers / Counting Test and Counting Development Evaluation Tool?
3. Is there a significant difference between the pretest and posttest scores of the children in the control group in terms of Numbers / Counting Test and Counting Development Evaluation Tool?
4. Is there a significant difference between the posttest and follow-up test scores of the children in the experiment group in terms of Numbers / Counting Test and Counting Development Evaluation Tool?

METHOD

Research Design

A quasi-experimental design with pretest-posttest control group was used to investigate the effect of the Story-based Number Program on the development of the number concept of 60-72 month old children from low socioeconomical level. Because it is difficult for children to be assigned to groups in a non-selective manner in the educational settings, semi-experimental designs are preferred, in which the groups present can be matched over certain variables (Gay, Mills & Airasian, 2005). The first factor of the 2x3 mixed experimental design used in the research identified the independent factor groups (experiment and control) as the second factor showed repeated measures (pretest-posttest-follow-up) for the dependent variables.

In the direction of this design, Numbers / Counting Test and Counting Development Evaluation Tool were administered to the children in the experimental and control groups as a pretest before the process. Following the pretest measurements, children in the experimental group were administered the Story-based Number Program twice a week for 12 weeks. In this process, no action was taken on the control group. After the completion of the experimental process, the children in the experimental and control groups were given Numbers / Counting Test and Counting Development Evaluation Tool as posttests. Four weeks after the posttests were given, the same tests were administered as follow-up tests to the children in the experimental group.

Participants

The population of the study was composed of the 60-72 month old children who were attending preschool sections of elementary schools affiliated to Aydın-Turkey Provincial Directorate of National Education and showing normal development. The study group was created using analogous sampling method amongst the purposive sampling methods. In this sampling method, the sample is composed of a similar subgroup in the context of the research problem (Yıldırım & Şimşek, 2004). Initially, a list of the preschool centers in which the children of the low socioeconomic level families were attending was obtained of the working group, from the Provincial Directorate of National Education.

Obtained lists were examined by the researchers, they interviewed with school administrators and preschool teachers to find out whether a special education program was implemented in any developmental area in that educational setting. Accordingly, two classes consisting of children from low-socioeconomic level families and had not been included in any education program were identified and these two classes were assigned as the experiment and the control groups. It is stated that the neighborhood where the preschool was located, which was determined as the study group in the master thesis work done by Şahin (2008), has been heavily emigrated from the eastern and southeastern Anatolian cities such as Siirt, Bitlis and Muş after 1980 and could be considered as a shanty town located in the city center. In the aforementioned study, involving 300 people in the neighborhood, it was seen that 13% of them did not work, 8% worked in a government agency, 46% construction workers and 34% temporary workers. In economic data, 37% of the people living in the neighborhood stated that they earned 500 TL or less, 46% got between 500-1000 TL while 18% earned 1000 TL or more. For 2008, the official amount of minimum wage per month for workers was 638.70 TL (MLSS, 2017). In the strategic plan 2011-2015 of the school to which the selected group of children were attending, it was clearly stated that "the school was located in the suburban area and the socio-economic level of the school environment was low". Considering the employment status and economic income level and strategic plan data, it can be said that the parents of the children in the working group did not have a permanent job and a regular income, so they were in low economic level.

When the distribution of the children in the study group by gender were examined, it was determined that 6 of the children in the experimental group were female, 8 were male, while 7 of the children in the control group were male and 7 of them were female. In order to test the effectiveness of the method / treatment in experimental studies, it is necessary to determine whether there is a significant difference in the effect of the groups before the implementation of the treatment (Heppner, Wampold & Kivlighan 2008). For this purpose, Mann Whitney U Test was used to determine whether there was a significant difference between pretest score distributions of children in the experiment and control groups obtained through the Numbers / Counting Test and Counting Development Evaluation Tool before the implementation and the results are presented in Table 1.

Table 1: Mann Whitney U Test Results Regarding the Experiment and Control Group Children's Pretest Scores From Numbers / Counting Test and Counting Development Test

<i>Tests Used</i>	<i>Group</i>	<i>n</i>	\bar{X}	<i>Sd</i>	<i>Mean Rank</i>	<i>Rank Sum</i>	<i>MWU U</i>	<i>p</i>
Numbers / Counting Test	Experiment	14	15.2	5.02	16.4	230.5	70.5	.569
	Control	14	13.1	5.15	13.6	175.5		
Counting Development Evaluation Tool	Experiment	14	11.4	3.87	15.3	215.0	86.0	.177
	Control	14	10.6	4.30	12.5	191.0		

According to Table 1, pre- test scores of the children in the experimental and control groups were not significantly different in terms of Numbers / Counting Test ($U=70.5$, $p>.05$) and Counting Development Evaluation Tool ($U=86.0$, $p>.05$). Therefore, it can be said that at the beginning of the implementation, the experiment and control group have similar characteristics in terms of number concept development.

Data Collection Tools

The Number / Counting Subtest of School Readiness Composite of Bracken Basic Concept Scale-III: Recipient Form and Counting Development Evaluation Tool were used as the data collection tools in the study.

The Number / Counting Subtest of School Readiness Composite of Bracken Basic Concept Scale-III:

Recipient Form: Numbers / Counting subtest is a subtest of the School Readiness Composite of Bracken Basic Concept Scale-III: Recipient Form (BBCS-III: A) which was developed by Bracken (1984) and reviewed again for the third time in 2006. The Numbers / Counting subtest is composed of 18 items and contains odd and even numbers and counting them. Content validity, criterion-referenced validity and the Kuder-Richardson (KR20) analyzes were performed for the Bracken Basic Concept Scale-III: Recipient Form, School Readiness Composite by Angin, Arı, Deniz and Hamarta (2016). In terms of reliability, the coefficient for Numbers / Counting subtest was found out to be .94.

Counting Development Evaluation Tool: The evaluation tool was developed by Olkun, Fidan and Babacan Özer (2013) in the direction of the questions used in the study of Sophian (1987) for the purpose of examining the situation the development of the counting principles in children between 5-7 years of age, the number counting knowledge levels of these ages and counting in different problem situations. Unlike the 14 items used in the Sophian's (1987) study, it was aimed to remove the possibility of choosing the one-to-one mapping path by moving the objects in the groups by using the situations shown in the picture on paper and concrete objects, especially in the items that measure the comparison of the object groups. The KR-20 reliability coefficient was calculated as .64 in the validity and reliability study of the Number Development Evaluation Tool on 74 children aged 5-7 years in 5 different regions of a large province in Central Anatolia Region of Turkey (Olkun, Fidan & Babacan Özer, 2013).

Story-based Number Program: The Story Based Number Program developed by the researchers is a program based on supporting the development of the number concept of children aged 60-72 months. In the course of program development, initially books, studies and illustrated children's books with the concept of number were investigated regarding the development of number concept and use of children's books to support mathematical skills. As a result of literature review, eight children's books related to the number concept were identified and the content of the program was arranged in such a way that the program included identification of numbers from 1 to 20, the comparison of numerical quantities, the invariant sequence principle, one-to-one matching and cardinal value principle.

For the Story-based Number Program, children's books named *The Cheerios Counting Book*, *Sayabilirim (I Can Count)*, *Sonbahar ve Sayılar (Autumn and Numbers)*, *Küçük Prens ile Sayıları Öğreniyorum (I am Learning Numbers with Little Prince)*, *Mini Mini Mualla (Tiny Mini Mualla)*, *Spinderella, Eğlenceli Matematik Masalları*

(*Fun Math Tales*), *Daha Eğlenceli Matematik Masalları* (*More Fun Math Tales*) were selected, and the activities were planned accordingly to the content of these books from easy to difficult (numbers from 1 to 10, and numbers from 1 to 20). *The Cheerios Counting Book* did not have a translated version of the children's book. However, because the content of the book was of one sentence under each illustrations of the numbers from 1 to 20, the content was translated into Turkish by the researchers and the texts written on the small papers were pasted under the relevant page.

The preparation of the content of the program was based on the achievements and indicators included in the Early Childhood Education Program (2013) of the Turkish Ministry of National Education (MoNE), along with literature review and selected book content. The program included integrated activities that focus on the individual interests and developmental characteristics of the children, as well as the interests and needs of the children and the characteristics of the environment in line with the determined achievements and indicators. Attention had been given to the fact that the activities were interesting and that they are of a quality that will make them learn while they entertain the children. In addition, concrete visual materials had been drawn up that can make a difference in the educational environment and attract attention to facilitate children's participation in the activities.

The activity plans consisted of individual, small and large group activities and the preparation of Turkish, mathematics, music, drama, art and emergent literacy activities in an integrated manner. The selected children's books were placed in the book center for children's access and told to the children through different story telling techniques (puppets, story cards, slides, etc.). Questions related to descriptive, affective, achievement and connection to life were prepared in the direction of MoNE Early Childhood Education Program (2013) so that children can clearly express their thoughts for evaluation stage after the activity. The Story-based Number Program contains a total of 24 integrated events for two days a week in a total of 12-week period. The duration of the event is planned to be 60-90 minutes per day.

After the program was developed, it was presented to five field experts. Experts were asked to evaluate the training program as "appropriate", "partially appropriate", "not appropriate" taking into consideration such criteria as the content of the selected books, the appropriateness of the selected achievements and indicators for the purpose of the program, the adequacy of learning processes, the appropriateness and adequacy of the materials used and the clarity of the instructions and explain their thoughts and suggestions in a written format. Based on the criticisms and suggestions made by the experts on the training program, necessary amendments were made and the final version of the Story-based Number Program was given.

Implementation of Story-based Number Program and Collection of Data

After the pretests were administered by the researchers, Story-based Number Program was initialized to be implemented on the experimental group children by their own teacher. The children in the experiment group were trained by their own teachers, just like the children in the control group, and they all felt safe. Thus, the difference between the experiment and the control group in terms of implementer (teacher-researcher) was ignored practically. Before the Story-based Number Program was introduced, the researchers presented detailed information and training to the volunteer teacher who was assigned in the experimental group regarding the characteristics of the program to be implemented, achievements and indicators, organization of the training environment, methods and techniques to be used and learning and evaluation processes in the program. In addition, the activities planned for the scheduled days (Wednesdays-Fridays) were explained by the researchers one stage before the teacher in the experiment group and the researchers had a preliminary trial about the activity so that the teacher would be more effective in the activities. The same situation was repeated for each week for 12 weeks by the researchers in the Story-based Number Program. In the control group, the current program was followed by their own preschool teacher in the natural course. After the implementation of the program was completed, the Numbers / Counting Test and Counting Development Evaluation Tool was administered as a posttest to the children in the experimental and control groups. Four weeks after the posttest were given, the tests were given again by the researchers to the children in the experimental group as a follow-up test to test the permanency of the treatment.

Analysis of Data

In experimental studies, the fact that the number of subjects in the groups is less than 30, which is not a definite rule for the size of the appropriate sample size, leads to the weakness of the parametric statistic to be applied (Büyüköztürk Kılıç-Çakmak, Akgün, Karadeniz & Demirel, 2014). Non-parametric tests were used because of the fact that the number of children in the groups was less than 30 and the normality test Shapiro-Wilk test showed no normal distribution of the data. Mann Whitney U test was used to test whether the difference between the groups was significant while Wilcoxon Signed Ranks test was used to test whether the difference between the measurements was significant in this respect. The significance level was set at .05 by the researchers.

FINDINGS

In this section, the findings obtained from the research to examine the effect of the Story-based Number Program on the development of the number concept of children aged 60-72 months are presented in tabular form.

Table 2: Mann Whitney U Test Results Regarding the Posttest Scores of Experimental and Control Group Children from Numbers / Counting Test and Counting Development Evaluation Tool

<i>Tests Used</i>	<i>Group</i>	<i>n</i>	\bar{X}	<i>Sd</i>	<i>Mean Rank</i>	<i>Sum of Ranks</i>	<i>U</i>	<i>p</i>
Numbers / Counting Test	Experiment	14	17.5	2.00	19.75	276.50	24.50	.000*
	Control	14	14.2	3.59	9.25	129.50		
Counting Development Evaluation Tool	Experiment	14	13.2	1.60	17.61	246.50	54.50	.029*
	Control	14	11.2	3.49	11.39	159.50		

*p<.05

According to Table 2, the results indicated that the posttest scores of Numbers / Counting Test ($U=24.50$, $p < .05$) and Counting Development Evaluation Tool ($U=54.50$, $p < .05$) showed significant differences in favor of experimental group. When the mean ranks were taken into consideration, it was seen that the scores of the children of the experimental group in which the Story-based Number Program was implemented were higher than the scores of the children in the control group from the Number / Counting Test and the Counting Development Evaluation Tool. The findings showed that the Story-based Number Program was effective on the development of the concept of numbers.

Table 3: Wilcoxon Signed Ranks Test Results Regarding Pretest-Posttest Test Scores of of the Children in the Experiment Group from the Numbers / Counting Test and Counting Development Evaluation Tool

<i>Tests Used</i>	<i>Posttest-Pretest</i>	<i>n</i>	<i>Mean Rank</i>	<i>Sum of Ranks</i>	<i>Z</i>	<i>p</i>
Numbers / Counting Test	Negative Ranks	0	.00	.00	-2.03	.043*
	Positive Ranks	7	3.00	15.00		
	Ties	14				
Counting Development Evaluation Tool	Negative Ranks	0	.00	.00	-2.38	.017*
	Positive Ranks	5	4.00	28.00		
	Ties	14				

*p<.05 ** Based on negative ranks

As seen in Table 3, the differences between pretest-posttest scores of the children in the experimental group from Numbers / Counting Test ($Z = -2.03$, $p < 0.05$) and Counting Development Evaluation Tool ($Z = -2.38$, $p < 0.05$) were significant. When the sum of ranks of the difference scores for the test and evaluation tool were examined, it was determined that this difference was in favor of the posttest scores. According to these results, it can be said that the Story-based Number Program is an important effect of children in the development of number concept.

Table 4: Wilcoxon Signed Ranks Test Results Regarding Pretest-Posttest Test Scores of the Children in the Control Group from the Numbers / Counting Test and Counting Development Evaluation Tool

<i>Tests Used</i>	<i>Posttest-Pretest</i>	<i>n</i>	<i>Mean Rank</i>	<i>Sum of Ranks</i>	<i>Z</i>	<i>p</i>
Numbers / Counting Test	Negative Ranks	5	4.20	21.00	-1.07	.282
	Pozitive Ranks	6	7.50	45.00		
	Ties	3				
Counting Development Evaluation Tool	Negative Ranks	3	4.00	12.00	-1.64	.101
	Pozitive Ranks	7	6.14	43.00		
	Ties	4				

*Based on negative ranks

According to Table 4, it was found that the difference between pretest-posttest scores obtained by the children in the control group from Numbers / Counting Test ($Z = -1.07$, $p > 0.05$) and Counting Development Evaluation Tool ($Z = -1.64$, $p > 0.05$) was not significant.

Table 5: Wilcoxon Signed Ranks Test Results Regarding Posttest-Follow-up Test Scores of the Children in the Experiment Group from the Numbers / Counting Test and Counting Development Evaluation Tool

<i>Tests Used</i>	<i>Posttest-Pretest</i>	<i>n</i>	<i>Mean Rank</i>	<i>Sum of Ranks</i>	<i>Z</i>	<i>p</i>
Numbers / Counting Test	Negative Ranks	1	1.00	1.00	-1.00	.317
	Pozitive Ranks	0	.00	.00		
	Ties	13				
Counting Development Evaluation Tool	Negative Ranks	1	2.00	2.00	-5.77	.564
	Pozitive Ranks	2	2.00	4.00		
	Ties	11				

*Based on negative ranks

The results of the analysis in Table 5 indicated that there was no significant difference between the posttest scores and the follow-up test scores of the children in the experimental group by means of Numbers / Counting Test and Counting Development Evaluation Tool ($Z = -2.619$, $p > 0.05$). In this respect, the effectiveness of the Story-based Number Program on the development of the number concept was preserved in the screening measures administered four weeks later.

DISCUSSION AND CONCLUSION

In this study, the effect of the Story-based Number Program on the development of the number concept of 60-72 month old preschoolers' from low socioeconomic level was investigated. As a result of this study, it was found out that the children of the experimental group in which the Story-based Number Program was implemented had an increase in number concept development and that this effect was preserved in the follow up measurements made after four weeks. In addition, the posttest scores of the children in the experimental and control groups were compared by means of the Numbers / Counting Test and the Counting Development Evaluation Tool, and it was determined that there was a significant difference in favor of the experimental group. These results support the sub-objectives of this research. In this case, it can be said that the Story-based Number Program is an effective program in the development of the number concept. These results for the development of the number concept are consistent with the results of other studies in the literature (Jennings et al., 1992; Hong, 1996; Young-Loveridge, 2004; Van den Heuvel-Panhuizen et al., 2016).

In the experimental study conducted by Young-Loveridge (2004), it was reported that the treatment program including number books and number games was very effective on the number development of the children of five years of age at low socioeconomic level. In another experimental study on the effect of children's books, it was

found out that storybook-based education programs provided positive attitudes to mathematics and increase mathematical skills based on number and number concepts on preschoolers from low socioeconomic level (Jennings et al., 1992). Hong (1996) found that children participating in a treatment program based on storybooks showed more progress not only in number development but also in classification skills, and that they were more successful in tasks related to shapes as well. In a study carried out by Van den Heuvel-Panhuizen et al (2016), the researchers tested the effect of reading children's books aloud on the mathematical understanding of preschoolers' using the pretest-posttest control group experimental design. In their study involving a large group (384 children - 199 in the control, 185 in the experiment group), children in the experimental group were not given any programs as a treatment but only short story books containing three important mathematical subjects (number, measurement and geometry) were read. As a result of their study, it was found that the children in the experimental group had higher scores on the PICO test including items about number, measurement and geometry, but not statistically significant, than the children in the control group. This study, which has similar results to the research findings mentioned in the literature, showed that the picture storybooks can be used to support the development of number concepts in preschool period and once again emphasized the importance of integrating children's books and mathematics.

In this study, it is necessary to consider the limitations of this research while it claims to reveal important findings regarding the effect of the story books on the development of the number concept. In this respect, the presence of 28 children and the presence of children only from low socioeconomic levels can be considered as a limitation to this study. Working with a larger sample may contribute to the validity of the results obtained in this study. Another limitation of the study is that the follow-up test was performed only once. For this reason, it is possible to test long term efficacy of the treatment given by administering follow-up tests at different periods. It is also thought that prospective studies on using story books for different mathematical content and standards will contribute to the literature.

Effects of Writing an Argument Language with Contextual Approach to Unveil Critical Thinking Skills

Aceng Hasani

University of Sultan Ageng Tirtayasa

aceng.hasani@untirta.ac.id

ABSTRACT

This study is aimed to explain the facilitate writing an argument Indonesian language with the contextual approach to unveil critical thinking skills students. Competence Indonesian appropriate curriculum includes components of language skills and skill to compose covering aspects of listening, speaking, reading, and writing. The argument is one of a kind development in the writing paragraphs written with the aim of convincing. The sample totalled 107 students, consisting of four classes with samples taken by multistage random sampling. Based on this finding, the researcher concluded that critical thinking skill and contextual learning approach has significant influence toward argumentative writing skill.

Keywords: Contextual Approach, Writing Argument, Indonesian Language, and Critical Thinking Skills

INTRODUCTION

Language skill has four components: listening, speaking, reading, and writing. The four components of language skills stretch closely related to one another. Language skills aimed by a regular order. Early childhood learning to listen, if learn to speak, after learning to read, and then learn to write. Fourth-speaking skill basically a unity that cannot be separated from one another. Indonesian competence in implementation is often overlooked. Competence Indonesian appropriate curriculum includes components of language skills and skill to compose covering aspects of listening, speaking, reading, and writing. Competence is what should be obtained learners of Indonesian subjects. Writing skills is one aspect of language skills in expressing ideas, ideas in the form of writing (Bueno, 2010). Writing is an integral part in the whole process of learning experienced by students during their studies at school. Writing requires skills for necessary exercises ongoing and continuous, especially in the subjects of Indonesian4.

The main role of the faculty in the process of learning to write that lecturers are required to motivate students to write a paragraph in the learning process in class. Writing is a process of the human mind to be supporting soul to others, or to themselves in writing. Activity fabricate this is a conscious human activity and trending, have work or mechanics that need attention so that arrangements work well. Work These include activities at the confirmation stage ideas and activities at this stage of essay writing (Hidi and Boscolo, 2007).

Capabilities such language would need to be trained so that skilled human language. In connection with that, the skill of writing is the most complex language skills compared to other language skills, the skills of listening, speaking, and reading. Several factors must be owned by a person in order to skilled writing, among others (1) acquisition of indirect communication, (2) mastering the rules of the language used, (3) mastery of the technique of writing, and (4) mastering the skill to express ideas into written form.

Writing skills that are complex causes a person to feel hard when writing. Many people have ideas, but it's difficult to express ideas in writing. This happens because of difficulties such as lack of exercise to write down ideas. Someone often find it easy to put ideas orally compared to express their ideas in writing. Verbally express the idea may be helped by gestures or other cues. In addition, a person's condition at the time of expressing ideas verbally assists the speaker in conveying the message. Meanwhile, the idea of a written submission cannot be helped by gestures or situations immediately (Newell et al, 2011). Therefore, the authors reveal possible sentences incomplete, unclear, which in the spoken language can be clarified through the use of cue point (Hamed, 2014).

Thoughts, feelings, hopes, wishful thinking, or whatever expression must be submitted in written form clearly and completely through the use of written language obey rules so that the edict to be captured properly by the reader (Qin, and Karabacak, 2010). That being said effective writing; one thinks something is written in accordance with his mind, and was captured by a reader in accordance with the message that comes to mind, and also in accordance with the author's intended. Thus, the level of thought a writer will determine the success of delivering a message to the reader. Someone who thinks regularly will be able to express ideas on a regular basis anyway, whereas someone who thinks less regularly it would be difficult to convey the message written in an orderly and systematic (Puengpipattrakul, 2014).

Regularity thinking in writing activities must be trained to someone in order to form as a habit. In this context, a regular habit of thinking will facilitate the person in conveying the message, ideas, and feelings regularly, including in writing activities. Thus, in the teaching of writing, writing practices rather than theory primacy of writing a better way to train students to be skilled writing. Learning to write is more directed at the theoretical aspects will lead to students less active and less productive writing though aspects of the theory and techniques of writing have been mastered. That many graduates majoring in linguistics and literature unproductive write prove mastery of theory writing does not guarantee the production of paper.

A scholar or a student is required to be able to pour the ideas and thoughts into written form in accordance with the rules speak Indonesian well and correctly. On this basis, a person writing skills must be based on critical thinking skills. Critical thinking skills a person can be obtained by various means, including by the many searching for information through books, the Internet, and other media publications. Based on the above problems, the formulation of the problem to be studied in this research is how facilitating Indonesian writing skills through contextual approach to improve students' critical thinking.

THE STUDY

Basic writing argumentative nature is critical and logical thinking. Thus, the necessary facts and accurate data, which can lead to a logical narrative and to the conclusions that can be accounted for. Based on these facts, before talking about the argumentative writing, will be raised about the important basis on which the argument (Ferretti, et al, 2009). The basics are:

a. Proposition

When talking about the literary form of the argument, there is an important thing which is called reasoning. Definition of reasoning was Reasoning is a thought process that tried to link the facts or evidence of evidence of which is known to lead to a conclusion⁶. Reasoning is not only can be done by using the facts are still shaped plain, but can also use the facts that have been formulated in sentences in the form of opinions or conclusions. Based on the above understanding, the sentence in the form of opinions or conclusions in relation to the process of thinking is called a proposition. Thus, the proposition defined as statements that can be verified or can be rejected because of errors contained therein. A statement can be justified if there are materials or facts to prove it. Conversely, a statement or proposition can disprove or rejected if there are facts that oppose it. Proposition always form a sentence that is declarative sentences.

b. Inference and Implications

The fact is whatever there is, good deeds done and the events that happened or something that exists in nature¹¹. The fact is that there was no notice or questioning how the people think about it. On the contrary, the opinion was the conclusion (inference) assessment, judgment, and beliefs about the facts. Inference is a conclusion derived from what is or from the facts that exist, while the implication is a summary, which is a considered there because it has been summarized in a fact or evidence of itself (Newell, et al, 2011).

c. Form of evidence of

The most important element in the debate is evidence of writing. In essence, is the evidence of all the facts, all the testimonies, all of the information, authority, and so on are linked to prove the truth. In its capacity as evidence of the facts should not be confused with what is known as a statement or assertion. They form the least evidence of it in the form of data or information (Nimehchisalem, 2011).

METHOD

In this research was conducted in the fourth semester students of the Department of Indonesia Language and Literature Education, University of Sultan Ageng Tirtayasa, Indonesia. This study was conducted during one semester with the number 16 times face to face meeting. The sample totalled 107 students, consisting of four (4) classes with samples of this study were drawn from a population with a multistage random sampling.

According to the independent variables, namely the learning approach (X) consisting of contextual learning approach (X) and the skill to think critically (Y) which consists of the skill to think critically high (Y1) and the skill to think critically low (Y2). Approach constellation of problems can be described as follows.

Variable Treatment		Contextual Approach (X)
Variable Attributes		
Critical thinking skill (Y)	High (Y1)	XY1
	Low (Y2)	XY2

Figure 1. Approach Constellation

Information:

Treatment (A): Learning Approach

X1: Contextual

X2: Contextual

Attribute (B): Critical Thinking Skill

Y1: High

Y2: Low

This approach is used to see the effect of treatment with checking the critical thinking skills of students first. Experiments treatment is contextual learning approach and learning approach contextual teaching materials written arguments.

Researchers took four classes to be tested for the skill to think critically. Retrieved 13 students who think critically high IVA of the semester and 13 students who think critically low IVB of the semester. Both of these classes to trial as a class experiment. Retrieved 13 students who think critically high of IVC semesters and 13 students who think critically lower than half of IVD. Class IVC and IVD as the control class. Research in the experimental class using contextual learning approach and grade control using approach contextual. Data critical thinking skills obtained by performing tests covering the following aspects: (1) contrasted the knowledge consists of the skill: (a) draw up a list, (b) establish a table, and (c) identify, (2) the skill to express thoughts in open free and consists of: (a) the skill to quote the opinion that pro and (b) cites the opinion of the cons, (3) the skill understand views of the authors consist of: (a) explained, (b) summarizes his own, and (c) establish, (4) skill to analyse consist of: (a) compare, (b) contrast, (5) The skill to draw up the synthesis that combines the results of the analysis of each item into conclusions, and (6) the skill to evaluate arguments

Before the critical thinking instruments are used in research, first tested on 20 students to determine the validity and reskill. Test the validity of the instrument's skill to think critically item statement made by the excel program by entering the formula Pearson product moment into the program. The criteria used to test the validity of statements that are considered eligible if the validity is the correlation $r_{\text{count}} > r_{\text{table}}$ at the level of $\alpha = 0.05$. Based on an analysis using product moment formula above, turned out of the 30 items that were distributed to 20 students, obtained 26 items accepted or 86.67% were declared valid (accepted) and 4 items or 13.33% were declared invalid.

The calculation of the reskill coefficient is done by using Cronbach alpha formula. Criteria used to determine the reskill of the instrument is indicated by coefficient alpha.

Based on the analysis, it turns out of 26 grains of critical thinking instruments that were distributed to 20 student obtained the reskill of 0.91.

FINDINGS

The results of the group's argument writing skills critical thinking skills high learning approach contextual (XY1). From the data writing skills of argument group of high critical thinking skills by learning approach contextual overall, the results obtained with the range of scores from 50 to 78. The average score of the skill of writing the argument is 74.54, with a standard deviation of 11.39 and 4 People (30.77%) got the skill to write arguments below average, 4 people at an average grade (30.77%), and 5 people (38.46%) above the mean Avg. Here are presented the data writing skills scores argument group of high critical thinking skills by learning approach contextual in the form of a histogram.

Figure 2. Histogram Results argument group writing skills critical thinking skills high learning approach contextual (XY1)

The results of the group's argument writing skills critical thinking skills by learning approach contextual lower (XY2). Data writing skills of argumentation groups critical thinking skills by learning approach contextual lower overall, the results obtained with the range of scores from 60 to 85. The average score was 70.46 written arguments skills, with a standard deviation of 6.54 and 6 people (46.15%) got the skill to write arguments, 4 people at an average grade (30.77%), and 3 people (23.07%) above the mean Avg. Here are presented the data writing skills scores argumentation groups with low critical thinking skills contextual learning approach in the form of a histogram.

Figure 3. Histogram Results argument writing skills to think critically low capability group learning approach Contextual (XY2)

Based on fig.3 Testing the assumption in this study was conducted using analysis of variance (Anova) in both directions. For that data have been collected prior to analysis first tested the requirements, which include tests for normality by using Liliefors test and homogeneity test using the test Barlett.

Normality test is done to score written arguments skill from each treatment group. Therefore, there are eight sets of data will be tested for normality of distribution using Liliefors test at significance level $\alpha = 0.05$.

- a. The calculation result of normality test group contextual learning approach critical thinking skills high (XY1) with $n = 13$ obtained by $L_h = 0.149$ and $L_t = 0.234$. Thus, for L_h is smaller than L_t it can be concluded that the approach group contextual learning critical thinking skills high overall population sample derived from normal distribution.

- b. The calculation result of normality test group learning approach contextual skill to think critically low (XY2) with $n = 13$ obtained by $L_h = 0.163$ and $L_t = 0.234$. Thus because $L_t L_h$ is smaller than it can be concluded that the approach group learning critical thinking skills contextual low overall population sample derived from normal distribution.
- c. The calculation result of normality test contextual learning groups (X) with $n = 26$ obtained by $L_h = 0.096$ and $L_t = 0.174$. Thus because $L_t L_h$ is smaller than it can be concluded that the group as a whole contextual learning approach samples come from populations with normal distribution.

Test of homogeneity of variance on four groups of cells to design experiments in question is the homogeneity test score data writing skills of argument between the group's skill to think critically high with contextual learning approach, the group's skill to think critically high learning approach contextual, the Group's skill to think critically low with contextual learning approach, and the group's skill to think critically low learning approach contextual.

Value $\chi^2_{\text{count}} 4.08$ at which is small compared with $\chi^2_{\text{table}} 7.18$ or $\chi^2_{\text{count}} < \chi^2_{\text{table}}$ at significant level $\alpha = 0.05$. Thus assumption accepted. This means that the data group writing skills tested argument is homogeneous.

Furthermore, based on the results of the test requirements, the test for normality and homogeneity tests and proven to meet the requirements, the test of the assumption have been fulfilled and to do. Research assumption testing is done by using Anova in both directions. Furthermore, if there is an interaction analysis used is by Tukey's test. The reason a further test using Tukey's test because the data owned by the same group number. Two-way analysis of variance was used to test the main influence (main effect) and interaction (interaction effect) independent variable approach's of learning and critical thinking skills to the dependent variable, namely the writing skills of argumentation.

Based on the calculation of variance analysis of the interaction between the learning approach and skill to think critically about the writing skills of argument, as a whole. Evident that there is an interaction between the learning approach and critical thinking skills, which gained 5.54 Fh price that was much larger from Ft amounted to 4.030 with dk numerator $V_1 (a-1)(b-1) = 1$, dk denominator $V_2 ab (n-1) = 2 \times 2 (1-1) = 48$. It means that the null assumption that states there are interaction between the learning approach and critical thinking skills in their influence on the writing skills of argument was accepted, meaning that the research assumption is accepted. In other words, it can be stated that the achievement level of writing skill argument is influenced by the interaction between the learning approach and critical thinking skills.

Based on research data obtained an average score writing skills of argument which has a high critical thinking skills are trained with a contextual learning approach is at 82.15 and having the skill to think critically low is at 74.54. For an average score writing skills of argument that has the skill to think critically high approach learning trained with contextual amounted to 66.77 and has the skill to think critically low is at 70.46.

Thus the second assumption test results proved that there effectiveness the learning approach and skill to think critically about the writing skills of argumentation. It can be concluded that there is interaction between the learning approach and critical thinking skills. To further clarify the interaction between the learning approach and skill to think critically about the writing skills of argument can be seen in Figure 4.

Figure 4. Interaction Approach of learning contextual and critical thinking skills

Based on fig 4. Writing Skills Argument Contextual Learning Approach with Contextual Owns High Critical Thinking Skills. Based on the calculation of variance stage further by testing Tukey the writing skills of argument between contextual approaches for those who have the critical thinking skills of high and low. Proven that there is a difference for the group that has the skill to think critically high and low between contextual learning. In the group XY1 calculate the Q_{value} (Q_h) = 14.14 is greater than Q_{table} (Q_t) = 2.79 or $Q_h > Q_t$ at significance level of 0.05. Thus the null assumption is rejected it means that the results of the writing skills of argument with contextual learning is higher than the writing skills of argument = 82,15.

Writing Skills Argument Between Contextual Learning Approach with contextual Who Have Low Critical Thinking Skills Based on the results of variance calculation stage further by Tukey test the contextual approach and the approach for those who have the skill to think critically low.

CONCLUSION

Based on these findings we can conclude that the results of learning writing skills besides arguments determined by the use of the learning approach effectiveness supported by students' critical thinking skills. Learning to write arguments using appropriate learning approach will provide better learning outcomes (Monte, and Sano, 2013). For students who have a high critical thinking skills can use contextual approach.

Elementary School Teacher'S Concept of Child Aspirations

Eva Mrázková

emrazkova@me.com

ABSTRACT

This text focuses on elementary school students' aspiration level in relation to learning as seen by an elementary school teacher. The purpose of the study is to analyse these teachers' concepts of elementary school pupils' aspirations in the light of known aspirations of their respective parents. The data collection method used was in-depth interviews with elementary school teachers.

INTRODUCTION

ELEMENTARY EDUCATION IN THE CZECH REPUBLIC

The first stage of education includes the first 5 years of school attendance and is the subject of the present study of the elementary school teachers' concept of pupils' aspirations. Compulsory school attendance in the Czech Republic starts at the age of 6, at which time students must be officially enrolled in order to attend. Last year there were 4115 schools in the Czech Republic; these are owned by municipalities, the state, churches or private entities. Schools serve their catchment areas and are obliged to admit children from their catchment area, but parents can choose any school for their children, including out-of-school education facilities, subject to availability. Elementary school teachers must be graduates of Master's programs.

LIFELONG EDUCATION

Aspiration is considered a cornerstone of lifelong education; hence, attention to aspirations of pupils from an early age is vital to educational success. Indeed, educational aspiration is currently a popular subject of research, particularly among secondary school students. According to Švarcová and Gabrhel (2012), out of a sample of 854 secondary school students, one fifth of the respondents had no idea as to what their educational aspirations even were and lacked any specific, concrete focus for their future education and/or professional career. How can this deficiency be prevented? In early childhood, the family and its approach to the child's intellectual development takes a primary role in formation of the child's self-concept. After compulsory school attendance commences, this role is taken over by the school, the teacher and the class in which the child acquires its first education. Focusing on the teacher, relevant considerations include awareness and vigilance in his/her work with his/her pupils' aspirations, as well as his/her ability to diagnose and work with these aspirations systematically.

PERSONALITY OF ELEMENTARY SCHOOL TEACHER

The role of the teacher, according to Franclová (2013), involves creation of a safe environment for the pupils, getting to know the pupils and their families, development of appropriate strategies, assistance in relationship building among classmates, and cultivation of feelings of belonging within the group or class. The teacher deals with the intellectual and emotional impacts of school assessment on the pupil and teaches his/her pupils how to adopt the right attitude with respect to errors, success or failures. Development of these skills is connected with the pupil's present and future aspirations and aspiration level; thus, the teacher should become a sensitive and perceptive guide for the students, able to recognise what is happening in the child's mind and to identify and address the causes of potential problems as needed. Further, the teacher must inspire parents to help their own children on their way to education acquisition, to notice the child's trouble and mediate, when necessary the rules of school life. "The teacher motivates his/her pupils not only to learning but also to attending and staying at school" (Franclová, 2013, p. 22). Attentiveness and recognition on the part of the teacher is important as well, and the teacher should provide socio-intellectual space for the child to boast of its success and achieved objectives.

ASPIRATION AND ASPIRATION LEVELS

According to Hart (2009, p. 58) aspiration is the 'level and structure of objectives man sets for himself and strives to achieve. Man assesses objective achievement according to the difference between expectations and

achieved results, whereas while success increases the level of aspiration, failure decreases it". As further stated by Hart (2016), assumptions concerning our capabilities may be affected by social conventions; cultural or other capital; social relations and other people; and power relations or social context. Aspirations without origin and setting in local conditions and period mean little and are difficult to interpret alone, out of any context.

A simple definition of aspiration level is offered by Mareš (2013, p. 270): "Aspiration level is the level of objectives the individual defines for himself and expects to achieve". Approaches to objective and aspiration level allocation are accompanied by two-sided emotions, with fear of failure on one side and idea of success on the other. According to Mareš (2013, p. 373) "the individual draws from experience in himself and previous successful task fulfilment". This awareness is especially important in school work, pupil assessment by the school and feedback about its abilities, as these identify what is and what is not correct and the nature of or conditions for task fulfilment and objective achievement.

Aspiration is dynamic, not static; therefore, its level as a relative evaluation must be constantly considered and revised. As defined by Mareš (2013, p. 373), "aspiration is a set of individual expectations of oneself and the level of personal objectives set by the individual for himself. The individual keeps comparing his expectations and his actual performance, with the result of the comparison pointing to either success or failure" (Mareš, 2013, p. 373). Mareš considers the main problem contributing to aspirational deficiency to be the inability of the pupil to foresee for what its skills will be sufficient or insufficient. What is important in this context is consideration of current skills, which may be affected by a number of variables-- for example, by health conditions or developmental tasks experienced by the student in the course of the educational process. According to Mareš (2013) in practice there are pupils who overestimate themselves, meaning that the pupil sets objectives for itself that cannot be achieved in order to garner prestige and the envy of classmates. Conversely, there are students who underestimate themselves, setting objectives which fall short of their real capabilities present no foreseeable challenges to success; the main motivation for this is avoidance of failure. In this case of the latter, teacher encouragement, positive incentives, and enumeration and allocation of partial or incremental tasks for the pupil to fulfil are important mechanisms in allaying the student's fears of failure and making intimidating tasks more manageable. Equally important is the teacher's own understanding of the concept of aspiration and its meaning and importance within the educational construct. This understanding manifests in the quality of the instructor's diagnostic abilities and, subsequently, their efficacy in supporting students' setting of-- and achieving-- realistic objectives corresponding to their abilities.

According to Straková (et al. 2006) research had shown that the family environment greatly impacts the educational aspirations of pupils in the Czech Republic. Further, level of aspiration was found to vary with significant consistency along gender lines as well, with girls showing higher educational aspiration levels than boys. Unlike the previously presented understandings of the concept, which identified such factors as formation of educational aspirations the socio-economic status of the family, the shared family talents and values and quality of the attended school as decisive in the formation of educational aspiration, ,decisive factors in Matějů (2007) makes the claim that aspiration formation is further affected by: "the structure of the educational system, the level of its stratification, orientation on professional education, permeability and link to the job market". This is the structural level, while the socio-economic status of the family plus the other aforementioned factors are on the individual level. According to Katrňák (2004) educational aspirations in the Czech Republic are mainly affected by demographic characteristics, employment status of the student's parents, educational and cultural sources, values of the family and measurable capabilities of the pupil.

(<http://www.soc.cas.cz/publikace/educational-aspirations-comparative-perspective-role-individual-contextual-and-stuctual>)

WHAT IS THE RELATION OF ASPIRATION TO OTHER NOTIONS?

Aspiration is closely connected to motivation. According to Franclová (2013, p. 55) it is a "system of driving forces inspiring, directing and maintaining human activity ". Aspiration is further related to the psychological notion of attribution, a notion explaining from the psychological point of view the causes to which pupils ascribe to their successes or failures. Important considerations here include is trust in one's own capabilities, motivation, and the method of and reason for setting individual objectives in relation to the pupil's aspirations. The teacher's feedback and belief in the pupil's success or failure is also important, in that it affects the teacher's approach to

the student in terms of support and attention. Aspiration level is further connected with the pupil's self-concept, which must be formed systematically by its educators. Self-concept consists of self-understanding, self-feeling, self-assessment and self-fulfilment. According to Franclová (2013) a key role is performed by the student's assessment of its own capability or insufficiency, its awareness of popularity in class, reactions to success or failure, orientation towards optimism or pessimism and overall development of the child's personality. According to Online Research Cardiff (2014), differences in pupils' aspirations are relevant for and manifest in relation to the results of their education. Cardiff (2014) notes that even students coming from socially disadvantaged environments set high-level educational goals and that there is a difference between the feasibility of the objective and the actual potential for achieving it.

IMPORTANT FACTORS SUPPORTING EDUCATION AND PROFESSIONAL GROWTH

According to Šed'ová (2014, p. 27) there are important family-originating factors affecting child's aspirations and objectives, including reading books, engagement in after-school activities (sensible time management) and their degree of variety, family interactions, pressure on success (reflecting parents' aspirations and expectations), language use (opportunities to develop various levels of linguistic expression), academic leadership (assistance in school preparation, explanations of the incomprehensible), family activities (leisure-time activities outside school), intellectual level (opportunities to think and develop imagination in everyday activities), and work habits (regularity and space and time organisation). According to Matějček & Klégrová (2011) inadequate parental aspirations are one of the most frequent causes of low aspirations among students. Excessive stress, overwork, or high demand of parents may result in appositve outcomes on the part of the pupil. The child may develop indifference to education as a defensive reaction to stress, leading to the development of dissonance between the parents' and the child's aspiration levels.

THE SCHOOL AND THE FAMILY - INTERCONNECTED ENVIRONMENTS

The family and the school are the two main socialisation factors acting on the child in first grade elementary education. Indeed, the fact that, when the child starts its school attendance, the influence of the family retreats to the background and is taken over by the school has long been widely accepted among educational researchers. The role of the school in the child's socialisation, education and upbringing gains importance over time, and the teacher's actions and personality are a major influence in this process. However, the teacher (and parents, incidentally) can only motivate the pupil effectively if they are well acquainted with the child's positive and negative personality features. As confirmed by Šulová (2014), knowledge of the aspiration level and cognitive maturity of the child by its teacher and parent demonstrates respect for the objectives the child itself defines for its own achievement. The school is oriented towards education and achievement of the defined educational objectives, formally organised and managed according to a set of discrete and explicit plans; education at school is provided by teachers and supervised by public authorities. Work with pupils at school is systematic and implemented on the basis of binding educational documents. Students' educational results are assessed according to pre-defined standards and binding rules. While the family is the site of primary socialisation, the school is the site of secondary socialisation.

The school and the family can be opposed environments. A current trend is to eliminate this opposition and make the two environments cooperate in pursuit of a common objective. Family environment is typically considered an informal environment, while school is a formal institution with its own subcultural traditions and folkways. The ideal resolution would be unification of these two institutions, in which they would be complementary to one another and collaborating toward the achievement of mutually recognized goals. In the ideal, when the family has reservations or deficiencies with respect to a given process in goal achievement, the school may partly step in and perform functions the family does not or cannot fulfil. Simply, school results often direct the further educational orientation and professional career of the child, but are nonetheless affected by a wide range of factors in combination. According to Havlík, Kota (2007) school influence is absolutely necessary for the individual and his social and cultural evolution. School is the environment cultivating the pupil, helping it acquire cultural knowledge and skills for future life. The child comes from its family to school with some basic idea of its capabilities, accustomed to praise and support for certain behaviours depending on the family's values. The child may be brought up with freedom and excessive praise or high demand on performance with minimum praise, with innumerable combinations of such therein. With little exaggeration, twenty students in

class represent twenty family approaches to upbringing. The students' subsequent upbringing is taken over, to varying degrees, by the teacher, who is expected to follow the family standards despite significant variability; hence, the importance of his/her knowledge of the pupils cannot be understated. There are big differences between pupils; some pre-school children already attend various activities and are directed towards certain orientations, while others have been largely homebound. If the child is provided with sufficient stimuli for versatile development, it will be positioned to experience feedback about its real capabilities. This helps form the first foundations for the aspiration level, which, after commencement of school attendance, affects all habits and activities of the child and determines motivation for school-task fulfilment. School also helps the student form ideas about its identity and which objectives it wishes to pursue. The pupil's conduct thus is directed towards acceptance and fulfilment of school requirements. Social or physical handicaps can make it difficult for the pupil to cope with school requirements, achieve, social integration, learn communication skills, develop and use language and acquire motivation for learning activities.

PARENT - SCHOOL RELATIONSHIP

Hartl and Hartl classify "parents and school" as the cornerstones of education. Student, teaching plan, teacher, group relations and parents, in many cases teachers can improve school results of their pupils only with the help of the pupils' parents." (Hartl, Hartl, 2009, p. 511) The assumptions of a good school-parent relationship include mutual openness, information and willingness for mutual communication. Indeed, my own four-year classroom experience has taught me that parents of active pupils are more active in communication with the class at-large, the teacher and the school. According to Průcha (2008, p. 203) a thriving parent-school relationship fosters "a significant social relation affecting success of the educational process, pupils' learning and personality development". The school is the main initiator of mutual communication with parents by publishing information about school activities, asking parents for cooperation, initiating parents in the school subculture, and development and cultivation of mutual relations with the school. Parents can actively participate in school life, attend courses, get involved in projects and contribute to school management in the parent council. (Průcha 2008)

The family and the school are the main sources of the child's socialisation, ideally in complementary cooperation. If the family has limitations, the school may partly replace the family in its functioning and create opportunities for remediation of such deficiencies. The family affects the way the child copes with school requirements, and the results of the child's school work as a collaborative product, in turn, determine the future life of the child.

METHODOLOGY

Qualitative methodology with data collection through in-depth semi-structured interview was selected. Teachers from 5 elementary schools in Zlín were contacted by email. The main respondent selection criteria were occupation as elementary school teacher and willingness to cooperate. Just 2 teachers were willing to cooperate and contribute to research on their concept of pupil aspirations. Both teachers worked with 4th grade elementary school students and possessed more than 13 years of experience in elementary school teaching.

Data Collection and Processing Methods

In-depth interview was chosen because of the need to grasp this phenomenon in its complexity, the possibility to ask open-ended questions which provide respondent an opportunity to more fully express his/her feelings, experience and knowledge. For this purpose, semi-structured interview was chosen with pre-formulated questions. Two interviews were conducted, recorded on a dictaphone and transcribed, a process which, according to Švaříček and Šedřová (2014), was appropriate both from the temporal point of view and for the possibility for the data visualisation necessary for later data coding.

Research Limitations

We are aware of the low number of respondents, attributing the unwillingness to cooperate to the part of the school year in which the research was implemented, this being two months before the school year's end when the teachers are at their busiest. We do not present these results as suggestive of generalizations; rather, we only analyse the approaches of two teachers in the context of their experiences with their current class.

Research Results

The teacher's concept of the pupil's aspirations is one of the key parts of pedagogic diagnostics. Effective work with aspirations can help lead the student, cultivating its self-concept and self-defined objectives.

Figure 1 How do teachers understand the notion of aspiration?

Aspiration

- Effort
- Goal settings
- Pathway toward objective achievement
- Self-confidence
- Awareness of one's own capabilities

Figure 2 Characteristic aspirations of 4th grade elementary school pupil

Characteristic

- No exact idea of aspirations
- Strong effect of parental upbringing
- Sport-oriented pupils set higher objectives
- A trend towards lower objective-setting in comparison to past years
- Poor tolerance of failure

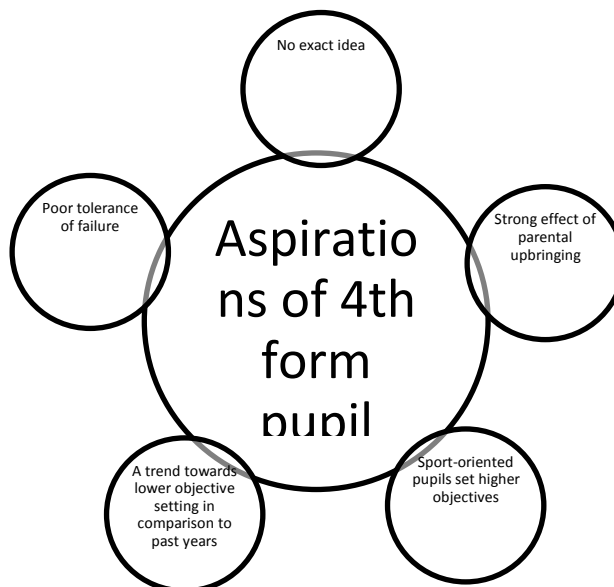

Figure 3 Careful parental support

Support

- Greater support = higher pupil aspirations
- The pupil follows the average of the class
- Indifferent parent = indifferent pupil
- Younger children = higher aspirations
- Parent - school cooperation = significant for the child

Figure 4 What happens when the child fails?

Consequences of child's fails

- Nervousness
- Stress
- Quiet talking
- Shame when appearing in front of a group
- Resignation
- Anger

Figure 5 What are pupil's parents like?

Pupils parents

- Ambitious
- Controlling of the pupil
- Trying hard despite social drawbacks
- Little care for the child
- Missing positive support
- Excessive emphasis on school marks

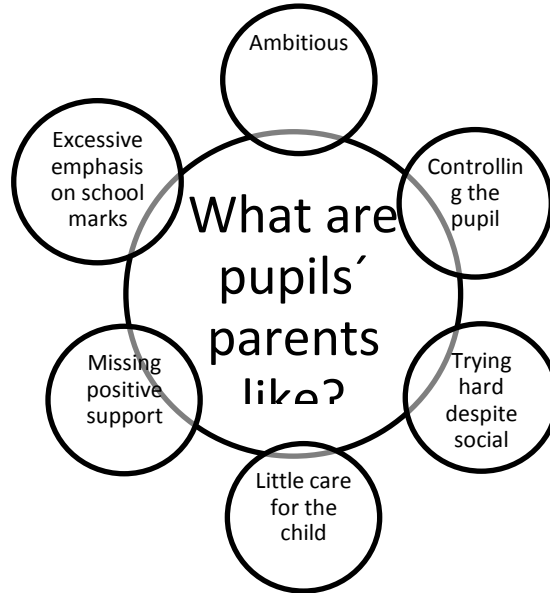

Figure 6 Teacher's approach to a child with low aspiration level

Teachers approach

- Rational explanation
- Personal story of the teacher
- Talks about human desires
- Talks about the role of hobbies
- Individual work
- Cooperation with parents
- Examples of successful people
- Encouragement (incentives)

Figure 7 Ambitious parent

Ambitious parent

- Overstressed child, lack of praise
- Enormous number of after-school activities
- Tutoring
- The parent underestimates class influence
- The parent reflects his/her unfulfilled aims into the child
- The parent sees the fault on the side of the teacher
- Perfectionism = making the child feel it is not good enough

Figure 8 Class effect on pupil's aspirations

Class effect

- Comparisons
- Effort to catch up with classmates
- Fear and passiveness
- Pupil grouping by aspiration
- Less motivated classmates demotivate others
- Social control
- Learning from others

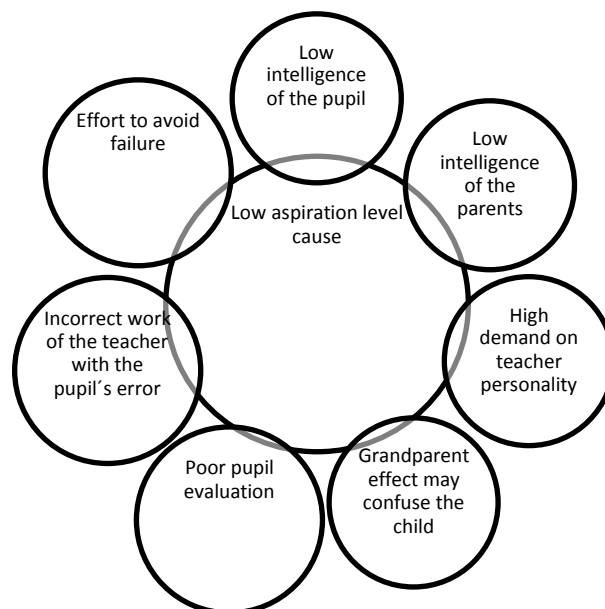

Figure 9 Low aspiration level cause

Causes

- Low intelligence of the pupil
- Low intelligence of the parents
- High demand on teacher personality
- Grandparent effect may confuse the child
- Poor pupil evaluation
- Incorrect work of the teacher with the pupil's error
- Effort to avoid failure

CONCLUSION

It does seem teachers have a variety of how to understand the notion of aspiration, characteristic of 4th grade elementary school pupil has a lot of options. Every child is unique and manifestation of their aspirations differently also parents show several attitudes to how to support their children. It is not a finding of this research because it was not the aim, but parent's support has significant influence on child's aspirations. Pupils' aspirations are projected to the children's reactions when they are failing at school tasks. We consider parent's cooperation with teacher and child necessary.

ABSTRACT

Purpose and Motivation: Engineering plays a key role in supporting the growth and development of a country's economy as well as in improving the quality of life for citizens. Most of developed countries witnessed economic growth with the contribution of women in engineering field. In developing countries like India women remained under-utilized resource. Women in engineering are probably the single best investment that can be made in the developing world. There is clearly room for improvement – not only in recruiting women into engineering, but also in retaining and promoting those women who wish and do enter the profession. This study was designed to investigate a perception and determination of undergraduate women towards accessing Engineering Education. The study has highlighted women's perceptions and experiences on accessing engineering education through institute's Marketing Mix strategies which enables women to take up strategic positions to enjoy success in engineering education and career. Findings of this study revealed that women students in engineering are better satisfied and act of referring services/program to others is higher than men students in terms of numbers for a particular set of marketing mix applied to gender.

Research Methodology: A qualitative research survey through a structured questionnaire for the students who are studying or have recently completed their engineering education from reputed engineering institutes affiliated to the North Maharashtra University, Jalgaon was conducted.

Findings: The study discloses women's approach to engineering education in terms of marketing mix; program, price, place, promotion, people, physical evidence and process. Women tended to rate most the marketing criteria as having a higher level of importance than men. Women needed more communal support while making decision making of selection of engineering education.

Research Limitations: The survey is delimited to the engineering education belonging to North Maharashtra University, Jalgaon and Khandesh region, a rural part of India.

Practical Implications: Findings of the study will be useful for the institutes and direct and indirect service providers of engineering education in developing a communication program and should be utilized and integrated into all aspects of the marketing program to attract women in engineering.

Key words: Gender, Women, Engineering Education, Selection, Marketing Services.

INTRODUCTION

By educating a woman, we educate the whole family and directly or indirectly, we educate nation. Given that a woman has the responsibility of the whole family on herself, several studies proved that an educated woman is better capable of taking care of the health, nutrition and education of her children and family. Gender refers to the socially constructed roles, behaviors, activities and attributes that a given society considers appropriate for men and women [1]. In virtually all but a handful of countries, there are severe constraints on women's entry into higher levels of education and their work in senior professional and managerial jobs [2]. The status of women in India has been subject to many great changes over the past few millennia [3]. With a decline in their status from the ancient to medieval times, to the promotion of equal rights by many reformers, the history of women in India has been eventful [4][5]. Women in India now participate fully in areas such as education, sports, politics, media, art and culture, service sectors, science and technology, etc. [5]. Families of engineering students provide exceptional levels of support to their children.

For women in engineering, this support is crucial from the pre-college level onward. In particular, female engineers' parents tend to raise their daughters with fewer gender stereotypes and place greater weight on education and learning [6]. Education of girls is vital not only on grounds of social justice but also because it accelerates social transformation and human resource development of the nation. Studies have indicated that there is a strong correlation between female education and several developmental indicators such as increased economic productivity, improvement in health, increased political participation and effective investments in the next generation. There is also evidence that lower gender disparity in educational attainment for a developing country correlates with lower overall income disparity within society [7]. Negative cultural and societal attitudes, different standards- roles for boys and girls, competing demands on the girls time, economic reasons like; lack of resources, distance from college, lack of facilities for girls, lack of female teachers, lack of security both in and outside the college, curriculum not relevant and flexible, gender stereotyping in curriculum, gender unfriendly classroom environment, early marriage and child bearing, absence of women role models, fear of deterioration of social structure are the most frequently quoted stumbling blocks to female education [8]. Which leads to a very limited presence of females in higher education and the high-wage labor market. Although women are given high respect in Indian society [9], women working outside the home have been looked down upon. Reference [10], found that traditional and cultural inhibitions acquired by women from childhood, nurtured by parents, and reinforced by their socialization was the key hurdle that inhibited their urge to be in an executive or leadership position. This is further supplemented by a lack of self-direction, independence and self-motivation to enter the male-dominated world. However, those who have reached higher echelons of organizations are seen as determined to stay, confront the barriers and secure the requisite familial support and personal drive [11]. Results of senior secondary school examinations regularly show the outstanding performance of girl students with many of them topping the merit list [12], which is a good mark for the graduation of women. As per the article published in Times of India, girls' candidates carried a tradition of surpassed boys in the Higher Secondary Certificate (HSC) examination over the last few years [13]. One notable success came in 2013, when the first two girls ever scored in the top 10 ranks of the entrance exam to the Indian Institutes of Technology (IITs) [14]. Unfortunately, due to a combination of factors including limited exposure and opportunities and lack of encouragement from role models and mentors, many qualified and talented young women do not consider a nontraditional career choice such as engineering.

WOMEN IN ENGINEERING

Engineering plays a key role in ensuring the growth and development of a country's economy as well as in improving the quality of life for citizens within the country. There is an important link between a country's engineering capacity and its economic development [15]. Engineering is viewed in the public sphere as masculine, competitive, objective, impersonal qualities that are at odds with our images of what women are. Because engineering is a traditionally male-dominated field, women may be less confident about their abilities, even when performing equally [16]. Countries like; Myanmar (65%), Tunisia (42%) and Honduras (41%) lead the world in gender parity among engineers, according to latest data on female engineering graduates from the United Nations Educational, Scientific and Cultural Organization (UNESCO) [15], followed by Denmark (35%), India (30%) and Sweden (29%). Women only make up 22% of engineering graduates in the UK. with Switzerland 14% and Japan 12%. As per 2011 Censuses of India, sex ratio was 943 females per 1000 male; female 48% of total population [17]. In India, reservation for women cuts across all classes and communities and is a horizontal and not vertical reservation and counts 33.33% [18] in the state of Maharashtra and Gujrat. As per the report 2015- of All India Survey for Higher Education, out of 42.28 lakh students enrolled in Engineering and Technology, the share of female participation in this sector was relatively low; 11.84 lakh, 28% only [19]. As per the statistics available on the website of All India Council for Technical Education (AICTE dashboard), female enrollment in Engineering and Technology undergraduate program during 2012-13, 2013-15, 2014-15 and 2015-16 was 33.83%, 27.77%, 27.71% and 28.28% respectively, which shows decline interest of women in engineering [20]. Women have contributed to the diverse fields of engineering in modern and historical times. Women are often under-represented in the fields of engineering, both in academia and in the profession of engineering.

A number of organizations and programs have been created to understand and overcome this tradition of gender disparity [21]. In India, women's presence is known to range between a high of 5.8 per cent [10] to a low of roughly 3 per cent [22] of all administrative positions. They can be seen mainly in HR, IT and servicing activities.

As per the report of [23], India Hiring Intent Survey found that employment gender ratio is still at 71:29. The report further said that by providing an impactful training program to hire fresher female candidates and shape them into the high performing executives of tomorrow, the future might be completely different from today's reality' [23]. The report further emphasized that despite of number of political and industrial forums, mandated Government Policies and widespread discussion in the media, the issue of gender diversity continues to remain largely unresolved. Indeed, men's and women's jobs differ greatly, whether across sectors, industries, occupations, types of jobs, or types of firms [23]. As per the report, women constitute more than 50% of the workforce in sectors like E-commerce and Retail, however, manufacturing and engineering have less than 25% of females in their workforce, whereas, for sectors like BFSI, BFS, BPO and ITES this percentage is restricted to 25. The report further observed gender pay gap favoring full-time working men over full-time working women with the reasons like; seniority & work experience, salary negotiations, breaks in employment. Surprisingly, report noted 7% rise in employment of women compared to last year. There is good sign that the differences in employability percentage of gender is going minimum in every year passed which the report said as a good sign for India [23].

MARKETING MIX AND WOMEN'S ACCESS TO ENGINEERING EDUCATION

Boys and girls differ in how they are involved in education and choice processes, illustrating changing forms of young people's gendered identities and subjectivity [24]. There has also been research focusing on gender differences in decision-making processes [25]. Reference [26] found evidence to suggest that the attributes important in determining self-esteem for women and men are different. Due to biological factors, women and men show different behaviors in terms of mood, personality or natural inclination for some skills [27]. In the decision-making process, women have a tendency to rely on emotion that can be presented by harmony, affiliation, and betterment of self and others [28]. Marketing mix is a set of controllable marketing tools that an Institutes uses to produce the responses it wants from its various target markets [29]. Reference [29] & [30] had discussed 7P approach in order to satisfy the needs of the service provider's customers: product (program), price, place, promotion, people, physical facilities and processes are discussed below.

Program (Product):

When it comes to educational offers, Kotler firstly refers to curricula and services [30]. Technical educational program like engineering, pharmacy etc. are the products/services of the technical educational institutes. The program and curriculum must be appropriately developed and adapted to meet the needs of the students [29]. Brooks proposes that a career must be perceived as both attainable and attractive before a woman will be motivated to choose it [31]. In adapting Vroom's (1964) [32] expectancy model of motivation to women's career choices, Brooks first describes three components of expectancy: career self-efficacy, perceived structure of opportunity and perceived social support. It is not only the course content which discourages women from doing engineering but also the selection criteria which is used to screen prospective students [33].

Men prefer practical, physical or managerial occupations while women prefer supportive, clerical, and socially oriented occupations [34]. Reference [35] hypothesized that women at the college age perceive nontraditional fields to be incompatible with having a family. Indeed, women in nontraditional programs (like engineering) expect more difficulties than women in traditional programs [34]. Reference [36] found that there is a lack of Pre-College Experience and Knowledge in Engineering due to the absence of engineering awareness from the K-12 curriculum. A lack of interest was a factor for women not choosing careers in engineering or science [37]. For women, having highly educated parents, a strong desire for control, prestige and influence and a desire for positive interaction with others are primary influencers on nontraditional occupational choice [38]. Another construct commonly used to explain women's discomfort in engineering has been "math anxiety," a profound fear of mathematics and the belief that only white men succeed in math [39].

Findings of [40] suggest that women may be more likely than men to view education as a means to influence social change and improve race relations. Reference [40] also indicated that women tend to be more satisfied than men with their college courses and instruction. In a finding of reference [41], female students appear to be slightly more interested than male students in the overall reputation of the school and its degrees and what both can do for them after graduation. Studies of engineering students have also shown that women rate their abilities lower than men, despite higher GPAs [42]. Some researchers have found that the lack of self confidence among female engineering students stems partly from their lack of technological experience and expertise, qualities deemed especially important in the engineering “culture of technical knowhow” [43].

Price:

The price element of the services marketing mix is dominated by what is being charged for the degree or tuition fees that are required [29]. Tuition fee, fee concessions, scholarships, educational loan, cost of education, fee installments offered by the service providers (institutes) for the service delivered to the service receiver (students) includes in this category of service mix.

Because of social and economic reasons, parents may be unwilling to spend on education as well as the dowries of their daughters [8]. Parents of female students are less likely to save for college. This may be one reason why, once in school, freshman women were more likely than male freshman to report major concern about financing their education and were more likely to indicate low tuition was an important factor for them when selecting a college [44].

Place:

Place is a measured in terms of accessibility, acceptability and convenience. This refers location of institutes & distance of institute from the targeted future students native place. The location can refer to the place where the institute is. Then, it can refer to the characteristics of the area in which the institute is located. Location can also have a relative meaning, i.e. it can be viewed in relation to where current and future students and high school students live [30].

In the rural areas, the girl child is made to perform household and agricultural chores. This is one of the many factors limiting girls' education. Physical safety of the girls, especially when they have to travel a long distance to school is the other reasons that impede girls' education [8]. Two studies, reference [45] and reference [46] have measured differences in this college selection criterion between college men and women, the results, college women believed location was more important as a selection criterion than college men.

Promotion:

Promotion encompasses all the tools that institute can use to provide the market with information on its offerings: advertising, publicity, public relations and sales promotional efforts [29]. Promotion is a process of communication between an institute and service user with an aim to create a positive attitude on products and services, leading to their favoring in the process of purchase on the market [30]. As per the reference [47], most educational institutions use public relations, marketing publications and to a lesser extent, advertising. The communication is made through presentations, print & visual advertisements, digital marketing, displays, internet & social media [47].

Women engage in a more complex information search process than men [48]. Many studies have suggested that as a result of socialization pressures, the feminine personality emerges in terms of communion with others [49] and as a result, women see relationships as more important in their lives than men do [50]. Women appear to be more strongly motivated by affiliation needs [51] and tend to express a higher degree of interest in person-oriented professions [52]. Studies have also shown that women who enter engineering hold its extrinsic (i.e., social) value in higher regard than men do [53]. Social value is sought when individuals seek to shape the response of others [54]. For instance, when it comes to advertising on the web, males were found to have a more positive attitude than females [55]. In online purchases, word of mouth is a more influential tool for women than for men in terms of reducing perceived risk and increasing willingness [56].

People:

People is a key instrument in educational process. Because most services are provided by the people and experienced by the people by their motivation and behavioral characteristics, they make a huge difference in customer satisfaction [57]. As per reference [58], Previous Teachers, Alumni, Current-Students, Parents, Siblings, Relatives, Management People and Prospective students themselves affect the decision of selection in technical education.

Career “modeling and mentoring” is essential for girls and women of all ages and races and at every developmental stage of the life span [58]. Girls in engineering perceive that they receive more parental support than their peers in any other discipline [59]. Studies have found that girls are advantaged in both non-academic areas such as parental, peer and teacher expectations and non-cognitive skills such as organization, self-discipline, attentiveness, dependability and seeking help from others [60]. Social cues can also easily discredit women and dissuade them from pursuing a degree in a field where they are underrepresented [61]. Women view their professors as advisors and role models [62] and look to them to help them understand engineering. Some have found that institutional proportionality (a large percentage of women in faculty and administrative positions) may have a greater effect on women’s persistence in a major than peer group proportionality (a large percentage of female peers) [63]. An awareness of others’ feelings is a trait exhibited more strongly by women than men [64]. In case of girls, parents generally take the decision regarding the academic stream to be pursued [8]. As per focus group discussions made by [40], The lack of female faculty members was discouraging to many of the young women. However, they wanted to find supportive, strong faculty advisors, regardless of gender. Parents were highly influential in students’ decisions about the major, with others who influenced students were likely to be engineers or high school math or science teachers [40]. Women are more likely than men to feel that their faculty provide them with personal and professional support, thus accounting for women’s greater satisfaction with faculty, curriculum, and the overall sense of community on campus [40].

Process & Physical Evidence:

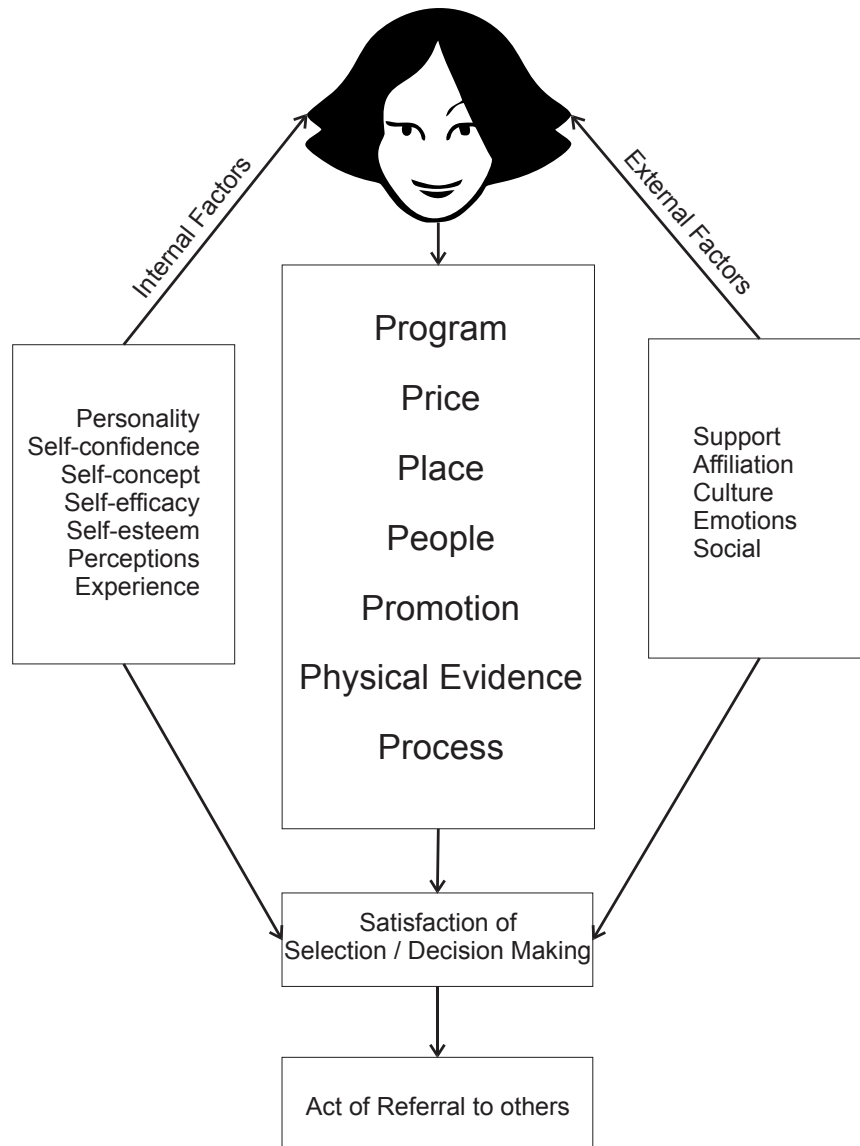

Educational services are personal and characterized by intensive, intellectual, emotional and/or physical participation of students in a service process. Services are often realized in a number of steps, which, basically, constitute the very service process. There are numerous other processes that need to be implemented concurrently (with the finance system, accommodation, time tabling and the library) to ensure the highest level of student satisfaction [29]. Reference [65] discussed several processes and physical evidence in the form of services to be delivered which includes; Operating Services like: Infrastructure & Technology, Faculty & Teaching Learning Methods, Library & Computational Facilities, Research Activities, Supporting Service like: Students Amenities & Recreation, Campus Placements, Industry Interactions & Tie-Ups, Co & Extra-Curricular Activities, Safety, Security & Medical Facilities, Gradation, Accreditation & Recognition, Alumni Interaction, Soft Skills & Technical Skills, Sports & Cultural Activities, Finance & Scholarships, and Extension Services like Campus & Social Life.

Women tend to be influenced by service quality more strongly than men [65]. At college entry, women place more value than men on the educational benefits of college, a differential that predicts women’s greater interest in social activism and to their stronger commitment to promoting racial understanding [40]. In another notable study, there is evidence to suggest that women display somewhat higher levels of computer anxiety [66]. Women from social categories are the most affected by the stratification of disciplines, programs and institutions [8]. Women lag men in extracurricular engineering experiences [36]. However, boys more often engage in play activity that tends to exercise their spatial-visual skills, whereas girls tend to exercise their verbal skills [67]. As per the focus group discussions conducted by reference [36], a heavy workload, a restrictive curriculum, and the practice of grading on a curve were discouraging to many of the women. Who participated in social enrichment activities—were less likely to leave engineering [36]. The survey also found that Campus Life/ Climate and Policies are directly affiliated with the encouragement and satisfaction of women students. Participation in support activities is vital to women undergraduates, who need to feel that they are part of a larger caring community in engineering. Community allows

students to build networks and to feel that their presence in engineering is important to others and valued. Networking can counteract the isolation that women feel—providing them with information, support, and the knowledge that they're not alone in the challenges they face [36]. The survey also found that different kinds of activities influence women's persistence differentially—those that promote social enrichment are most closely linked to women's persistence in engineering. Time is an important variable to use the Internet in which men use the Internet more frequently and for long hours while women are in the categories of moderate user [68]. Females perceived Internet as a tool of maintaining social values. There is a slight variation in the usage pattern at home between men and women due to the influence of gender role [68].

Conceptual Framework:

Figure 1: Women's access on marketing mix of engineering education (Own creation through literature review)

RESEARCH METHODOLOGY

A qualitative research through a survey was made which comprised of a structured questionnaire sent through e-mail to the current-students enrolled and recently passed-out students belonging engineering education affiliated to North Maharashtra University. Sample size (n) was calculated at 95% Confidence Level for which Standard Normal Variate (Z) is 1.96 & at Standard Error (e) of 0.03 by $n = Z^2 (p)(1-p)/e^2$; where n = Sample Size to be used for this study, N = unknown population, p = Estimated Portion of Population N. For p = 90%, 'n' comes out to be 550. Sample size of 550 was selected by quota sampling from technical institutes offering program in engineering and various students based on their location of native place and gender. The google form with questionnaire was sent through E-mail to the respondents which comprised structured and closed ended questions measuring importance, perception and experience on market mix activities of the institutes; program, price, place, promotion, people, physical evidence and process. To measure significance and impact made by marketing mix, respondents were asked to weight on a scale ranging from 0 to 5 on their perceptions / experience on the act of marketing mix. Mean of responses received gender-wise on each marketing mix activity was calculated by statistical software MiniTab 17. To measure level of satisfaction respondents were asked to weight on a scale ranging from 0 to 5, on question 'Are you satisfied with your decision to take admission in this Institute/College?' Value zero is low weightage and value five is high weightage. To find out the act of referral the respondents were asked 'Will you refer your college to other students for admissions?'. The responses obtained were 'yes' or 'no' type. The characteristics of the sample is described as below;

By Gender: Male: 361; Female: 189

By Native Place: District: 131; Taluka: 243; Village: 176

DATA INTERPRETATION & OBSERVATIONS

1.1 Women's perception on program:

To find out women's perception on program, gender-wise mean of responses on the importance of program, their perception on benefits of program, reason for joining the program and age of institute i.e. age of program offered by the institute were obtained and are presented in figure 2.

(Figure 2: Perception on program)

[1]	Program					
				Gender	St. Dev	Mean
1	Importance of Program					
				Female	0.89	↑ 4.22
				Male	1.03	↓ 4.08
2	Age of Institute/Program					
				Female	1.69	↑ 3.1
				Male	1.67	↓ 3
3	Reasons for joining Program					
A	Job Prospectus and Career					
				Female	1.6	↑ 3.54
				Male	1.55	↓ 3.45
B	Better quality of life					
				Female	1.55	↑ 3.58
				Male	1.57	↓ 3.56
C	Talent & Strength					
				Female	1.57	↓ 3.46
				Male	1.54	↑ 3.47
D	Entrepreneurship					
				Female	1.73	↓ 2.45
				Male	1.67	↑ 2.9

Women students (mean=4.22) have perceived more importance of engineering program than men students. Women weighted high on the age of institute i.e age of program. Women considers Job Prospectus (mean=3.54), Better quality of life (mean=3.58) are the main benefits that they perceived by joining the engineering program. On the other hand, women thought they have marginally less talent and strength than the men students. Women (mean=2.45) are less interested in the entrepreneurship than men (mean=2.9).

1.2 Women's perception on place:

To find out women's perception on place, gender-wise mean of responses on weightage given by the gender on distance of engineering institute from their native place while selecting an engineering institute were obtained and are presented in figure 3.

(Figure 3: Perception on place)

[2]	Place					
				Gender	St. Dev	Mean
	Distance from Native Place			Female	1.82	↑ 2.8
				Male	1.86	↓ 2.62

Women students (mean=2.8) have perceived more importance for a place/location of institute while selecting an engineering institute than men students (mean=2.62).

2) Women's perception on price:

(Figure 4: Perception on price)

Price						
				Gender	St. Dev	Mean
	Cost of Education					
				Female	1.77	↑ 2.66
				Male	1.83	↓ 2.51

To find out women's perception on price, gender-wise mean of responses on weightage given by the gender on cost of engineering education while selecting an engineering institute were obtained and are presented in figure 3. Women students (mean=2.66) have perceived more importance for cost of education while selecting an engineering institute than men students (mean=2.51).

2. Women's perception on people:

(Figure 5: Perception on people)

[3]	People					
				Gender	St. Dev	Mean
	1 Parents					
				Female	1.74	↑ 3.36
				Male	1.82	↓ 2.95
	2 Siblings					
				Female	1.89	↑ 2.63
				Male	1.89	↓ 2.19
	3 Friends & Peer					
				Female	1.77	↓ 2.33
				Male	1.82	↑ 2.34
	4 Current Students					
				Female	1.8	↑ 2.31
				Male	1.86	↓ 2.03
	5 Alumni					
				Female	1.73	↑ 2.08
				Male	1.82	↓ 1.95
	6 Previous Teachers					
				Female	1.82	↑ 1.77
				Male	1.81	↓ 1.74
	7 Staff of Institute					
				Female	1.92	↑ 2.39
				Male	1.88	↓ 2.19
	8 Management People					
				Female	1.58	↑ 3.55
				Male	1.72	↓ 3.16
	9 Yourself					
				Female	1.55	↑ 3.6
				Male	1.66	↑ 3.6

Women students have taken support from all possible people resources while selecting an engineering institute. Their decision of selection is mostly supported by Parents (mean=3.36), Management People (mean=3.55) and Women themselves (mean=3.6).

5.3 Women's perception on promotion:

(Figure 6: Perception on promotion)

[5]	Promotion	Gender	St. Dev	Mean
1	Advertisement (Print, Visual & Air)	Female	1.86	↑ 2.35
		Male	1.73	↓ 2.12
2	Banners / Hoardings	Female	1.81	↑ 2.48
		Male	1.75	↓ 2.22
3	Institute Website	Female	1.71	↑ 3.15
		Male	1.77	↓ 2.39
4	Social Networking Site	Female	1.68	↑ 3.05
		Male	1.82	↓ 2.45
5	Face-to-Face counselling	Female	1.89	↑ 2.5
		Male	1.86	↓ 2.24
6	Educational Fairs	Female	1.82	↑ 2.54
		Male	1.83	↓ 2.32
7	Leaflet / Brochure	Female	1.76	↑ 2.89
		Male	1.72	↓ 2.54
8	Sponsorship	Female	1.81	↑ 2.52
		Male	1.85	↓ 2.29
9	Publicity	Female	1.79	↑ 2.85
		Male	1.84	↓ 2.57

Like the 'people' marketing mix, women students have collected information from all sources of institute's promotional activities. They perceived all such activities are important in making their decision of selecting engineering institute. Their selection is mostly supported by Social Networking Site (mean=3.05), Institute Website (mean=3.15), Leaflet / Brochures (mean=2.89) and Publicity (mean=2.85).

5.4 Women's perception and experience on process and physical evidence:

(Figure 7: Perception on process and physical evidence)

[6]	Process & Physical Evidence						
					<i>Gender</i>	<i>St. Dev</i>	<i>Mean</i>
	1	Infrastructure & Technology					
					<i>Female</i>	1.66	↑ 3.72
					<i>Male</i>	1.55	↓ 3.4
	2	Faculty & Teaching Learning Method					
					<i>Female</i>	1.66	↑ 3.6
					<i>Male</i>	1.59	↓ 3.49
	3	Amenities & Recreation					
					<i>Female</i>	1.64	↑ 3.32
					<i>Male</i>	1.6	↓ 3.1
	4	Placement Activities					
					<i>Female</i>	1.7	↑ 3.4
					<i>Male</i>	1.67	↓ 3.01
	5	Industry Interactions & Tie-up					
					<i>Female</i>	1.73	↑ 3.02
					<i>Male</i>	1.66	↓ 2.83
	6	Library & Computational Facilities					
					<i>Female</i>	1.57	↑ 3.5
					<i>Male</i>	1.65	↓ 3.2
	7	Co & Extra Curricular Activities					
					<i>Female</i>	1.67	↑ 3.2
					<i>Male</i>	1.72	↓ 2.85
	8	Safety, Security & Medical Facilities					
					<i>Female</i>	1.72	↑ 3.1
					<i>Male</i>	1.73	↓ 2.88
	9	Gradation, Accreditation & Recognition					
					<i>Female</i>	1.63	↑ 3.31
					<i>Male</i>	1.66	↓ 3.04
	10	Alumni Interaction services					
					<i>Female</i>	1.71	↑ 3.34
					<i>Male</i>	1.67	↓ 2.94
	11	Soft & Technical Skill services					
					<i>Female</i>	1.68	↑ 3.54
					<i>Male</i>	1.61	↓ 3.37
	12	Sports & Cultural Activities					
					<i>Female</i>	1.76	↑ 2.94
					<i>Male</i>	1.8	↓ 2.67
	13	Research Activities					
					<i>Female</i>	1.69	↑ 2.96
					<i>Male</i>	1.74	↓ 2.56
	14	Finance & Scholarship Services					
					<i>Female</i>	1.7	↑ 3.04
					<i>Male</i>	1.74	↓ 2.91
	15	Campus Life & Discipline					
					<i>Female</i>	1.7	↑ 3.6
					<i>Male</i>	1.74	↓ 3.3

To find out women's perception and experience on process and physical evidence i.e services offered by the institute in which they are enrolled in or studied, gender-wise mean of responses on infrastructural facilities, operating services, supporting services and extension services of the institutes were obtained and their perceptions and experiences are presented in figure 7.

Women students have weighted more, on the services of institute experienced by them than men students. They believed that Infrastructure and Technology (mean=3.72), Faculty and Teaching Methodology (mean=3.6), Campus Life and Discipline (mean=3.6), Soft and Technical Skill service (mean=3.54), Library and Computational Facilities (mean=3.5), Placement Activities (mean=3.4), Alumni Interaction Program (mean=3.34), Accreditation, recognition and Affiliation (mean=3.31) and Amenities and Recreation (mean=3.32) are the better facilities and services of institutes offered to them. On the other hand, Institutes are lagging in services like Sports and Cultural activities (mean=2.94) and Research Activities (mean=2.94).

5.6 Women's satisfaction on the decision of selection of engineering institute and act of referral to others for admission:

Gender-wise responses collected from the sample of 550 students on their satisfaction of decision of selection of engineering institute and their act of referring others for the engineering admission in an institute where they graduated or doing engineering are presented in Table 1 & 2 respectively.

Gender	Completely Satisfied	Some-what Satisfied	Some-what Dis-satisfied	Completely Dis-satisfied
Female	133 (70.4%)	45 (23.8%)	10 (5.3%)	1 (0.5%)
Male	173 (47.92%)	154 (42.66%)	27 (7.47%)	7 (1.95%)

(Table 1: Gender-wise satisfaction on the decision of selection)

Gender	Will prefer for admission	Can't say	Will not prefer for admission
Female	169 (89.41%)	15 (7.94%)	5 (2.65%)
Male	230 (63.71%)	116 (32.14%)	15 (4.15%)

(Table 2: Gender-wise responses on the act of referring others for admission)

The research study revealed that for the same input of marketing mix activities of an engineering institute, 70.4% of women students are completely satisfied while 47.92% men students are completely satisfied. Also, dis-satisfaction level for the same marketing activities is higher ($7.47+1.95=9.42\%$) for male students than women students ($5.3+0.5=5.8\%$). 89.41% of female will refer others for the admission while 63.71% of male students have shown their desire of referring their institute to others for admission.

EMPIRICAL FINDINGS AND DISCUSSIONS

Challenges and Opportunities of marketing: This research study finds that females tended to rate the majority of the criteria as having a higher level of importance than did males while accessing marketing mix strategies of engineering institutes. Practitioners should be aware that males and females look for differing levels of detail.

While accessing engineering marketing mix; program, place, price, promotion and people, women have rated high importance which indicates broader, intense and integrated marketing approach is needed to attract women. On the other hand, for the same strategies provided to gender, women perceived and experienced better services provided by institutes than men students for the services; physical evidence and process.

In terms of satisfaction, women are completely satisfied (70.4%) on their decision of selection of engineering institute than male students (47.92%) which is greater by 46.9% in terms of numbers, for the same marketing approaches. This shows, if one male student is satisfied, 1.47 women students will be satisfied for the same marketing approach. Similarly, 89.41% women students and 63.71% male students will refer others for the admission to their respective engineering institute, which is greater by 40.34% in terms of numbers. If one male

student act as a referral then, 1.40 women student will refer others for admission on the same marketing services of institute.

THE ROAD MAP TO WOMEN'S INCLUSIVITY TO ENGINEERING

Understanding the facts that women do have a more diverse set of responsibilities and often need to wear multiple hats should not compromise their chances of success or progress in any of the worlds in which they operate, the transformation process for gender inclusivity requires mapping the journey. Below is the proposal of what this will look like:

Phase 1	Phase 2	Phase 3
Pre-student Life (School Education)	Student Life (Engineering Education)	Post-student Life (On Job)
Marketing Mix (Program, Place, People, Promotion)	Marketing Mix (Program, Price, Place, People, Process & Physical Evidence)	Marketing Mix (Process, People, Place, Promotion)
Knowledge, Awareness And creating importance	Gendered infrastructure, amenities and services	Social connectivity, Memberships
Involving Role Models	Retention and building confidence	Flexible work schedule or Time concession
Career Counselling	Engaging women staff with women students	Safe and secured transportation and residence nearby work location.
Family and social support	Financial support in terms of fee concession and scholarships	Awards and Rewards
Proposals/Offer	Safe and secured residential facility	Adequate Reservation
Equal treatments	Social activities	Grievance Management and lawful policies
Active Participation	Special coaching classes and training	Ensure gender mix in top management
Self-actualization	Adequate Reservation	Cross cultural exposure
	Grievance Management and lawful policies	
Family, Schools, Society, Government	Institutions, Society, Government	Industry, Society, Government
↑ SUPPORT ↑		

An ideal state in a process of inclusion is one where minorities are totally empowered. In this case, it means that women are empowered to make choices in all spheres of life and that the same opportunities available to anyone else (especially men) are available to them. This is different from saying they are equal, for it is time to move away from the original claim of the equality movement and towards one that recognizes differences and tailors responses relevant to those differences. The success of this roadmap is dependent on increased levels of awareness, acceptance and partnership from both sexes, the government and the society. Therefore, at many levels and in many ways, both men and women need to recalibrate their roles and expectations for this to happen.

CONCLUSION

Equity does not just mean an equal number of women and men; it means equal chances of success and career development; average women will succeed as much as average men. The Indian governments initiatives like National Program for Education of Girls at Elementary Level (NPEGEL), Rashtriya Mahilakosh (RMK), Kasturba Gandhi Balika Vidyalaya (KGBV), Working Women Hostels, National Mission for Empowerment of Women (NMEW), Sarva Shiksha Abhiyan shall be extended and oriented further more towards engineering education for the dream come true of Digital India and Smart Cities with more encouragement of women in engineering. The strategic marketing aim must be to 'normalize' engineering as a career choice for women, so that people inside and outside of engineering no longer presume that 'the engineer' will be men. Marketing efforts to recruit more women into engineering must avoid appealing to gender which associate men and masculinity with 'things technical' and women with 'things social'. In sum, we must broaden the image and vision of engineering work from technical to techno-social if we are to attract and keep talented women in engineering. Engineering has room for diverse 'types' of people because it incorporates a wide variety of jobs and roles. Women engineering education is a multi-dimensional phenomenon; marketing efforts to attract women in engineering shall not be limited to the institutes/service providers, but it shall be responsibility of the government, NGOs and community as a whole, for India to be Super Power. If engineering education is a signifier of development, it should incorporate a gender perspective to it. Perhaps then, we will see more women enjoying success and fully participating in engineering education.

ABSTRACT

The aim of this study is to identify the problems encountered in English learning-teaching, and to reveal the differences of opinions on these problems based on the opinions of English teachers. Descriptive research method in the general screening model was used in the study. The study group includes 143 middle and high school English teachers working in Sultanbeyli district in Istanbul. The following findings were obtained at the end of the study: 1- According to the English teachers, the factor mostly affecting failure in learning and teaching English is the lack of English laboratories in schools while the factor least affecting is that teachers do not find themselves adequate in teaching English. 2- There is no significant difference in the English teachers' opinions on the problems encountered in English teaching in terms of gender, age, educational status, graduated program, institution of employment performed, seniority and marital status variables.

Key words: Teacher, Language Teaching, Foreign Language, English, Teaching.

INTRODUCTION

The proliferation of languages is the increase in the number of speakers, language diversity and speech functions, exceeding the boundaries of the society in which they arise and are used (Cooper, 1989). Nowadays, the lifestyle and value judgments of countries with political, economic and technological power have begun to be adopted by other societies as a result of the inter-country transfer of increasing economy, technology and culture (Alptekin, 1989). For example, English is the first word that comes to mind when it comes to foreign language education in many countries whose official languages are not English (Shohammy, 2006). In this context, despite the general differences between countries, English has a privileged position among other languages. 90% of the students of all European Union member countries learn English as a compulsory foreign language (Trim, 1998). This widespread of English language, which can be portrayed as the most successful language expansion (Wardhaugh, 1987), draws attention and is regarded as a development of which reasons should be questioned. Many different factors such as political, political and military are shown to cause to this widespread (Pennycook, 1995). This widening has gained an international dimension, affecting almost all countries in the world.

Globalization, which is the most basic concept of the 21st century, is deepening its influence and affecting many areas of our lives (Tezcan, 1996). All fields of human being such as science, technology, communication, industry, education, medicine, art, architecture reflect the effects of globalization and this situation is increasing day by day (Oral, 2003). After the 1950s, especially in the field of communication, there have been great developments, and then people from all over the world have become able to communicate easily with each other as a natural consequence. With the effect of globalization, this process has resulted in the formation of social structures in which cultures and tongues are intertwined. Thus, it became difficult for societies to communicate with their own language, and knowing foreign languages became indispensable (Cangil, 2004). Thus, English has become a language of international economy, tourism and higher education (Teevno, 2011). This phenomenon has been affected as it should be in Turkey. Knowing a foreign language has become important both in terms of education and training as well as in post-training employment, which has led individuals to feel the need to learn at least one foreign language (Paker, 2007). In this context, teaching-learning arrangements, program development studies, textbooks and material arrangements have been made permanent by spreading foreign language teaching to all school levels i during this historical process of foreign language teaching in Turkey. However, despite all these studies, the desired level of foreign language teaching has not been achieved. In Turkey, the English proficiency level of students studying English is well below expectations (Fareh, 2010).

In the studies on the causes of this situation, the problems faced in teaching English (Çelik ve Kocaman, 2016) can be listed as: professional inadequacy of teachers, teacher-centered English lessons, lack of motivation of learners and lack of English, lack of instruction on four basic skills development, inadequacy of textbooks, inaccuracies in evaluation process and absence of environments to be exposed to English. In his work on the problems faced in teaching English, Soner (2007) stated that such factors as the lack of sufficient number of teachers, the lack of tools and equipment, the fact that the teachers are not well educated, the classes are

crowded, the students are not interested in the classes, the contemporary methods are not used are the reasons for not fulfilling the desire in language teaching. Similarly, Güneş (2009) points out that the most basic problems in qualified English teaching are the lack of English teaching, the inadequacy of physical conditions in teaching foreign languages and the inability to meet the material needs. Haznedar (2010) shows the crowded classes, inadequate physical conditions and distress in teacher education, the language policies in our national education system and approaches to foreign language teaching as the reasons for failure in language teaching. Aribaş and Tok (2004) also point the inadequacy of the textbooks used, inadequacy of contemporary teaching methods in the lessons, inadequacy of weekly lecture hours in public schools, not using alternative assessment tools, not being used appropriately of homework and exercises, and absence of branch teachers in public schools as the basic reasons for problems in learning and teaching English.

The main problem of this study, unlike the above mentioned research results, is to reveal the reasons of this failure in learning and teaching English in Turkey according to English teachers who are the most basic subjects of the subject. In line with this main goal, the opinions of English teachers regarding the problems encountered in the English learning-teaching process were examined according to gender, age, education level, graduated institution, institution of employment, professional seniority and marital status variables. It is thought that the findings of the study will contribute to the overall interest and field in in the foreign language teaching in general, and in the increasing the effectiveness of the learning-teaching processes in private.

METHOD

In the research, descriptive research method in the general screening model was used. The population of the research is composed of 143 English teachers who are working in the middle schools and high schools in Istanbul Sultanbeyli. A sample was not assigned for the reason of low number of teachers. All of the population was tried to be reached and 126 English teachers were involved in the research. As the data collection tool in the research, the “English Teaching-Learning Problem Questionnaire” developed by researchers was used. While preparing this questionnaire, Doğan (2009), Şahin (2013) and Altundiş (2006)'s survey items were benefited based on the expert opinions. The Cronbach Alpha (α) value of this questionnaire was found to be 0,889.

FINDINGS

1- Findings related to the Research Problem: What is the Problem Encountered in English Learning-Teaching according to English Teachers?

Table 1: Percentage and Averages of English Teachers' Response to Questionnaire Items

		Strongly disagree		Disagree		Undecided		Agree		Strongly Agree		\bar{X}
		N	%	N	%	N	%	N	%	N	%	
A1	The Curriculum is inadequate in the successful implementation of English language teaching.	3	2,4	10	7,9	8	6,3	44	34,9	61	48,4	4,19
A2	Textbooks are far from attracting the attention of students.	3	2,4	15	11,9	9	7,1	47	37,3	52	41,3	4,03
A3	Textbooks are not enough to meet the learning needs of students.	3	2,4	12	9,5	11	8,7	50	39,7	50	39,7	4,04
A4	The activities in the textbooks are insufficient.	3	2,4	13	10,3	7	5,6	58	46,0	45	35,7	4,02
A5	Subject densities are too high in textbooks.	6	4,8	21	16,7	14	11,1	38	30,2	47	37,3	3,78
A6	The activities in the textbooks are not suitable for student level.	2	1,6	29	23,0	19	15,1	42	33,3	34	27,0	3,61
A7	The words in the textbooks are not suitable for the level of students.	2	1,6	40	31,7	15	11,9	44	34,9	25	19,8	3,39
A8	The language used in the textbooks is far from the real life.	4	3,2	42	33,3	17	13,5	38	30,2	25	19,8	3,30

A9	Four skills are not equally included in the textbooks.	2	1,6	30	23,8	18	14,3	43	34,1	33	26,2	3,59
A10	Textbooks are not suitable for the language levels (A1, A2, B1 ...) specified in the common framework program for teaching European languages.	2	1,6	25	19,8	21	16,7	49	38,9	29	23,0	3,61
A11	Every student cannot reach the supporting resources for teaching English.	0	0	17	13,5	6	4,8	56	44,4	47	37,3	4,05
B12	Class sizes are too high.	8	6,3	34	27,0	9	7,1	32	25,4	43	34,1	3,53
B13	There are no English laboratories in schools.	2	1,6	3	2,4	3	2,4	30	23,8	88	69,8	4,57

According to Table 1, English teachers see the 13th item “There are no English laboratories at school.” (\bar{X} : 4,57) as the most influential factor in learning and teaching English.

According to English teachers, the items that have the greatest impact on the failure of learning and teaching English are listed from highest to lowest as follows: 15th item “There are no English Libraries in schools.” (\bar{X} : 4,51); 34th item “Students do not use English in daily life.” (\bar{X} : 4,43); 33rd item “Students do not revise enough.” (\bar{X} : 4,26); 1st item “The Curriculum is inadequate in the successful implementation of English language teaching.” (\bar{X} : 4,19); 14th item “There are insufficient technological resources to support teaching English to schools.” (\bar{X} : 4,16); 32nd item “Students come to the class without adequate preliminary preparation.” (\bar{X} : 4,15); 17th item “Weekly course hours are insufficient for teaching English.” (\bar{X} : 4,06); 11th item “Every student can not reach the supporting resources for teaching English.” (\bar{X} : 4,05); 44th item “The presentations and solutions of the Ministry of National Education on English teaching are not enough.” (\bar{X} : 4,05); 3rd item “Textbooks are not enough to meet the learning needs of students.” (\bar{X} : 4,04) and 2nd item “Textbooks are far from attracting the attention of students.” (\bar{X} : 4,03).

According to the English teachers, the least effective factor in failure to learn and teach English is item 18, “I do not see myself in teaching English full adequate.” (\bar{X} : 1,71).

In addition, according to English teachers, the items that have the least impact on the failure to learn and teach English are listed from highest to lowest as follows: 22nd item “I cannot provide student participation in my courses.” (\bar{X} : 2,11); 27th item “I cannot always keep up with innovations.” (\bar{X} : 2,41); 41st item “Administrators are opposed to using additional resources in lessons.” (\bar{X} : 2,46); 19th item “I cannot apply different teaching methods.” (\bar{X} : 2,52); 21st item “I cannot use two-person or group work.” (\bar{X} : 2,54); 39th item “School administrators do not care enough about teaching English.” (\bar{X} : 2,68); 40th item “School administrators do not help me with the material supply that meets the innovations in English teaching.” (\bar{X} : 2,70); 26th item “I cannot reach the literature about English teaching.” (\bar{X} : 2,78); 20th item “I usually focus on accuracy rather than fluency.” (\bar{X} : 2,84); 16th item “The number of branches and the number of hours I have weekly is too high.” (\bar{X} : 2,88) and 23rd item “I cannot use alternative types of assessment (self / peer assessment, portfolio and project) in my courses.” (\bar{X} : 2,93).

2- Findings related to the Sub-Problems:

2.1- Is there a significant difference between the problems faced by English teachers in English learning and teaching in terms of gender variable?

Table 2: t-test results related to the problems faced by English teachers in English learning and teaching in terms of gender variable

Gender	n	X	df	t	p
Female	95	3,5209	,46577	,146	,703
Male	31	3,4413	,45448		

According to Table 2, there is no significant difference between the English teachers’ opinions on the problems faced in English learning and teaching in terms of gender variable ($p>0.05$).

2.2- Is there a significant difference between the problems faced by English teachers in English learning and teaching in terms of age variable?

Table 3: ANOVA results related to the problems faced by English teachers in English learning and teaching in terms of age variable

Age	n	X	df	F	p
21-30	58	3,5275	,47069	,686	,562
31-40	55	3,4596	,47457		
41-50	11	3,5010	,30632		
50+	2	3,8936	,75224		

According to Table 3, there is no significant difference between the English teachers' opinions on the problems faced in English learning and teaching in terms of age variable ($p>0.05$).

2.3- Is there a significant difference between the problems faced by English teachers in English learning and teaching in terms of educational status variable?

Table 4: ANOVA results related to the problems faced by English teachers in English learning and teaching in terms of educational status variable

Educational Status	n	X	df	F	p
Graduate	120	3,4846	,45220	1,856	,161
Master	5	3,7872	,63652		
Ph.D.	1	4,0851			

According to Table 4, there is no significant difference between the English teachers' opinions on the problems faced in English learning and teaching in terms of educational status variable ($p>0.05$).

2.4- Is there a significant difference between the problems faced by English teachers in English learning and teaching in terms of graduated program variable?

Table 5: ANOVA results related to the problems faced by English teachers in English learning and teaching in terms of graduated program variable

Graduated Program	n	X	df	F	p
English Language Teaching	92	3,4618	,40565	,893	,550
English Language and Literature	23	3,6207	,48529		
Others	11	3,4043			

According to Table 5, there is no significant difference between the English teachers' opinions on the problems faced in English learning and teaching in terms of graduated program variable ($p>0.05$).

2.5- Is there a significant difference between the problems faced by English teachers in English learning and teaching in terms of institution performed variable?

Table 6: ANOVA results related to the problems faced by English teachers in English learning and teaching in terms of institution performed variable

Institution Performed	n	X	df	F	p
Secondary school	74	3,5403	,46749	1,754	,160
Private Secondary School	2	2,9149	,06018		
High school	46	3,4880	,45777		
Private high school	4	3,2287	,28565		

According to Table 6, there is no significant difference between the English teachers' opinions on the problems faced in English learning and teaching in terms of institution performed variable ($p>0.05$).

2.6- Is there a significant difference between the problems faced by English teachers in English learning and teaching in terms of professional seniority variable?

Table 7: ANOVA results related to the problems faced by English teachers in English learning and teaching in terms of professional seniority variable

Professional Seniority	n	X	df	F	p
0-1 year	6	3,3688	,41096	,431	,786
1-3 years	18	3,4752	,43218		
3-5 years	22	3,6054	,54176		
5-10 years	39	3,4981	,48471		
Over 10 years	41	3,4795	,42575		

According to Table 7, there is no significant difference between the English teachers' opinions on the problems faced in English learning and teaching in terms of professional seniority variable ($p>0.05$).

2.7- Is there a significant difference between the problems faced by English teachers in English learning and teaching in terms of marital status variable?

Table 8: ANOVA results related to the problems faced by English teachers in English learning and teaching in terms of marital status variable

Marital Status	n	X	df	F	p
Married	82	3,5161	,42408	3,467	,065
Single	44	3,4739	,53088		

According to Table 8, there is no significant difference between the English teachers' opinions on the problems faced in English learning and teaching in terms of marital status variable ($p>0.05$).

CONCLUSION

In this study, which was conducted in order to determine the opinions of English teachers on the problems they encounter in learning and teaching English, the most important item affecting the English learning-teaching process is "There are no English laboratories in schools." while the lowest one is found as "I do not see myself full adequate in teaching English.". These results are consistent with some research results in the literature (Ergüç, 2004; Akkuş, 2009; Gök Çatal, 2015). Accordingly, it can be said that Inadequate technologically and physically equipped classes or learning environments not suitable for being a foreign language class affect learning and teaching processes in English negatively.

The other findings of this study are similar to some of the study findings in the literature. For example, according to the research findings of Çelik and Kocaman (2016), that English is not used in everyday life is a disadvantage for English development. In the studies of Aküzel (2006), Doğan (2009) and Yılmaz (2005), English teaching programs are inadequate for maintenance of successful English teaching. According to Aküzel (2006) and Doğan (2009), textbooks are insufficient to meet the needs and expectations of students. These results show that the problems encountered in English learning-teaching livings are experienced in a similar way by all stakeholders without school or group distinction.

According to the research results, there are no significant differences between the English teachers' opinions on the problems faced in English learning and teaching in terms of gender, age, educational status, graduated program, institution performed, professional seniority and marital status variables. This shows that English teachers are on equal terms in English learning-teaching processes and have similar experiences. The followings can be suggested for research results and future research: 1- Special English classes should be created at schools. 2- English curricula should be revised; in this direction, related content, teaching methods, tools, resources and materials should be created. 3- Studies should be conducted on school administrators, academicians and parents about English learning and teaching. 4. Comparative studies with other countries should be conducted on English learning-teaching, and the results should be adapted to Turkey.

P.S. This study was produced from the master's thesis made at Sakarya University Institute of Educational Sciences.

ABSTRACT

Objective: This study was carried out as a descriptive study, aiming to reveal the environmental awareness and knowledge levels of the students studying at Karadeniz Technical University Health Services Vocational School.

Method: The study was conducted with KTU HSVS students (n=184) in the 2016-2017 academic year. The data of the study were collected with "environmental awareness" and "environmental behavior" scales. Each of the scales was prepared with 13 items and 5 likert types. The significance level $\alpha = .05$ was taken as the basis for the intergroup significance tests. SPSS-17 program was used for the analysis of the data. Data, descriptive statistics and unrelated samples were analyzed by t-test technique.

Findings: According to the results of the research, it was found that the students opinions were "totally agree" on the environmental awareness scale and "mostly" on the environmental behavior scale. In comparison by genders, the mean score of the environmental awareness scale was found to be significantly different in favor of female students. There was no statistically significant difference between the mean scores of the two scales by classification of class. When the results of all variables were examined in the study, it was found that the students had higher arithmetic average scores of environmental consciousness scale.

Results: It has been determined from the data that students have difficulties in turning their thoughts into behavior. In this context, a sense of education should be developed that relies on educating students, saving them from memorization and developing brainpower, self-evaluating, balanced and productive people.

Keywords: Students, Environmental Education, Environmental Awareness

INTRODUCTION

Environment is defined as "all of the biotic and abiotic (social, cultural, physical, climatic, physical) factors that affect a living organism or a living community during its lifetime". The environment is a setting that has existed since the first living creature on earth. For many living creature, especially for humans, living in harmony with the environment has not been a problem. However, when the two main functions of life (nutrition and reproduction) were threatened by environmental conditions; environmental problems have arisen and therefore ecological science has gained importance. The main reason for the rapidly growing environmental pollution that leads to the deterioration of the human-nature balance is undoubtedly the industry which started in the 17th century and developed rapidly in the 19th century. This phenomenon led to rapid change of the natural environment in the 20th century and the emergence of a new social environment. The reason for this huge change has been production and technological development for the masses, two important features of the industry. When we look at today's conditions, the population is increasing rapidly. With the rapid increase of the population ratio, technological development has been increasing in parallel with industrialization and urbanization; and therefore the amount of solid wastes perched in the environment is rapidly increasing in terms of kinds and quantity. Many problems have arisen resulting from the unconscious and horny use of the

environment. The pollution of the nature has been accelerated and could not be avoided as a result of the rapidly increasing world population, distorted mantle, sludge scattering of wastes, waste of natural resources such as air, soil and water, nuclear tests, natural disasters, wars, greenhouse effect, ozone layer penetration and lack of education. (Morgil, Oskay and Göktaş (2005).

Humans living in the environment, where the disaster is prepared by humans' own hands, are affected negatively by this pollution, just like other living species. Today, air, water and soil are polluted, most of the plant and animal species are depleted and their energy resources are decreasing and disappearing. Thirst, drought and desertification is in an inevitable dimension. People are unhealthy, unhappy and hopeless of the future. Moreover, these problems affect not only one country and the people living there, but all the people living in any part of the world; regardless of language, religion, race discrimination. In this sense, the pollution of nature, the environmental problems become a rather international problem rather than a national one. All countries in the world are trying to do all they can to overcome or reduce these problems, to create common solutions, to bring out researches; "their biggest share in budget is to provide solutions to environmental problems and to leave the environment they live in to be able to live in the next generation". (Yiğit, E., Kıyıcı, F., Çetinkaya, G. 2014).

Acquiring environmental awareness means learning to stand against the environmental problems and the threats posed by these problems. Environmental pollution is at the beginning of environmental problems. Environmental pollution is the involvement of all kinds of matter or energetics in a quantity that is above the natural accumulation (Kıyıcı et al, 2005). With this substance or energies it is "the natural structure of the environment and its composition deteriorating, changing and thus affecting people negatively".

Environmental pollution emerges as pollution of air, water, soil, noise and radioactive matters (Çevre ve insan, 2001). Developed countries that have become aware of their responsibilities to be sensitive to the environment and to gain environmental awareness to all individuals have started to make their first attempts in this field in the 70s. It was for the first time in the United Nations Conference held in Stockholm in 1972, when environmental problems were brought to the agenda (Yasar, Ş., Gultekin, M., Kose, N., Girmen, P. & Anagun, S, 2005). Even the holistic view of environmental education, called "Agenda 21", was adopted by 175 countries at the first United Nations World Summit in Rio de Janeiro (Talero, 2004). For the first time in the world, countries that couldn't come together in most of the issues have reached a common decision on the environment; this puts the importance of the problem and the necessity of urgent solution proposals (Morgül et al, 2005). The aim of environmental education programs is to inform all sectors of the society about the environment, to raise awareness, to bring positive and lasting behavior changes and to provide active participation of individuals in solving problems. In line with this aim, a society that is sensitive to the environment will be established, it will be able to cope easily with existing environmental problems and prevent new problems from occurring, thus providing important benefits in terms of economy and time in solving problems. Environmental awareness has intellectual, emotional and behavioral dimensions. In other words, environmental awareness is made up of various thoughts, principles, opinions about the environment, thoughts that include comments, behaviors of these thoughts that are passed on to life. The development of such a comprehensive concept is undoubtedly not a simple process. This process of accelerating with the introduction of interaction with the environment of human beings continues throughout life. In line the development of the environment conscious personality, it develops through mutual interaction of various factors. These three dimensions have not always developed in the same proportion. For example, there may be individuals who are concerned about the environment and can not turn it into behavior, as well as those who are worried about the pollution of the environment but do not behave in a way that protects it.

For this purpose, this study was planned in order to determine the availability of high education students to certain terms in the environment. The results will reveal whether an environmental phenomenon had occurred among students.

This study was conducted with the aim of determining environmental awareness and behavior of Higher Education students. To achieve this goal, following problems were examined.

- 1) What are the environmental awareness and behaviors of higher education students?
- 2) Is there a statistically significant difference between the environmental consciousness and behavior according to the genders of higher education students?
- 3) Is there a statistically significant difference between environmental awareness and behavior according to the programs the higher education students' school type?

Method

Model of Study

This research was carried out to investigate the consciousness and behaviors of higher education students towards environmental awareness and consciousness level in terms of some variables. It is a descriptive study with screening model. The screening model is a research approach aimed at describing the past or present as it exists. By this model, the main subject of research is tried to be defined as an event, an individual or an object within its own conditions. No effort is made to alter or influence them (Karasar, 2005: 77).

Universe and Sampling

The universe of the research consists of students studying at Karadeniz Technical University Health Services Vocational School in 2016-2017 academic year. The research sample consisted of 184 persons who completed the measurement instrument among Medical Imaging and Techniques (MIT), Medical Documentation and Secretariat (MDS), Medical Laboratory (ML) and First Aid and Emergency (FAE) Program students. The demographic characteristics of the students participating in the survey are given in the table below.

Table 1. Distribution of Students by Demographic Characteristics

Variables	f	%
Gender		
Female	104	56.52
Male	80	43.48
Program		
MIT	52	28.26
MDS	48	26.09
ML	42	22.83
FAE	42	22.83

Data Collection Tools

The data used in the research were collected by environmental awareness and environmental behavior scales. Each of the scales consists of 13 items and is prepared as a 5-point likert type. While the environmental consciousness scale was rated as; - Totally Agree, -Agree, -Indecisive, -Disagree and -Totally Disagree; the environmental behavior scale was graded as -Always, -Mostly, -Sometimes, -Barely and -Never.

The cronbach alpha internal consistency coefficient of the environmental awareness scale was 0.82; whereas the cronbach alpha internal consistency coefficient of the environmental behavior scale was 0.78.

Table 2. Limitations Considered in Assessing Measurement Tool Data

Degrees	Value Range
Totally agree	4.20-5.00
Always	
Agree	3.40-4.19
Mostly	
Indecisive	2.60-3.39
Sometimes	
Disagree	1.80-2.59
Barely	
Totally disagree	1.00-1.79
Never	

Analysis of Data

Data were analyzed using SPSS-17 program. Besides the descriptive statistics, independent samples t-test technique was used in analysis of data.

FINDINGS

The scores obtained from the environmental awareness and behavior scales of the students were analyzed by descriptive statistics technique for question 1 and by t-test technique for questions 2 and 3, and arithmetic mean and standard deviation distributions were tabulated.

Table3. Environmental Awareness and Behavior Scales - Descriptive Statistical Data

Scale Type	N	Minimal	Maximal	X	SS
Environmental Consciousnes					
184		1,00	5,00	4,81	0,53
Environmental Behaviour	184	1,00	5,00	3,97	0,54

The scores of the 184 students participating in the survey are given in Table 3. The arithmetic mean of the scores obtained from the environmental consciousness scale was $X = 4.81$, while the arithmetic mean of the scores obtained from the environmental behavior scale was $X = 3.97$.

Table 4. T-Test Results of Environmental Consciousness Scale By Gender of Students

Gender	N	X	SS	t	SD	p
Female	104	4,68	0,71			
2,03					48	0,04*
Male	80	4,42	0,94			

* $p < 0,05$

When Table 4 is examined, it could be concluded that chemistry teacher candidates according to their gender have a statistically significant difference in favor of female students between the average points of environmental consciousness scale [$t(48) = -2,03$; $p < 0.05$]. The mean score of the environmental consciousness scale of female students was $X = 4.68$, while the average of male students was $X = 4.42$.

Table 5. T-Test Results of Students' Behavioral Scale by Gender

Gender	N	X	SS	t	SD	p
Female	104	3,64	0,54			
-1,51					48	0,18
Male	80	3,81	0,52			

When Table 5 is examined, it could be concluded that there is no statistically significant difference between the average scores of the behavior scale scores of the students according to their gender [$t(48) = -1,51$; $p > 0.05$]. The average score of female students 'environmental behavior scale is $X = 3.64$ while the average of male students' score is $X = 3.81$.

Table 6. T-Test Results of Environmental Consciousness Scale By Students' School Type

School Type	N	X	SS	t	SD	p
MIT	52	5,06	0,54			
MDS	48	4,35	0,53			
				0,08	48	0,82
ML	42	4,34	0,51			
FAE	42	4,31	0,52			

When Table 6 is examined, it could be concluded that there is no statistically significant difference between the average scores of environmental consciousness scale of students according to the programs [$t(48) = -0,08$; $p > 0.05$]. MIT Program students' average environmental awareness scale score was $X = 5.06$, MDS Program students' environmental awareness scale score was $X = 4.35$, ML Program students' environmental awareness scale score was $X = 4.34$ and FAE Program students' environmental awareness scale was $X = 4.31$.

Table 7. T-Test Results of Environmental Behaviour Scale By Students' School Type

Program	N	X	SS	t	SD	p
MIT	52	4,17	0,36			
MDS	48	3,65	0,33			
				0,46	48	0,66
ML	42	3,69	0,31			
FAE	42	3,72	0,28			

When Table 7 is examined, it could be concluded that there is no statistically significant difference between the average scores of environmental behavior scale of students according to the programs [$t(48) = -0,46$; $p > 0.05$]. MIT Program students' average environmental behavior scale score was $X = 4,17$, MDS Program students' environmental behavior scale score average was $X = 3,65$, ML Program students' environmental behavior scale score average was $X = 3,69$ and FAE Program students' environmental behavior scale was $X = 3.72$.

DISCUSSION AND RESULTS

Investigating the consciousness and behaviors of higher education students, this study found out that the average level of environmental consciousness and behavior scores of the students was generally high. The lowest score in the scales is 1.00; while the highest average score is 5.00. These findings indicate that the average scores of the students participating in the survey are -totally agree for the environmental awareness scale and -mostly for the environmental behavior scale.

When the environmental awareness scale was examined as content, the students expressed the opinion that they should be educated and educated through media. It has been found that they are supporting the units working on environmental protection, increasing the production of recycled materials, replicating energy-saving products, producing and using environmentally friendly products, having chute units for all kinds of chemical wastes and using natural gas. However, it has been argued that car exhaust inspection is not so important and communication technology such as mobile phone does not heavily harm the environment. This situation is thought to be caused by the lack of information and misconceptions of the students. It is very well known that the lack of information on environmental issues causes many environmental problems (Karpudewan et al., 2007).

When the environmental behavior scale is analyzed as a content, the students stated that they did not follow the publications related to the environment, they did not spend time on the topic, they saved energy and they shared some of their old products with others instead of throwing them away. However, they pointed out that most of the recycled products they use are not delivered to the relevant units and that they use products that are known to be harmful to the environment. However, besides the use of chemical substances, it is seen that they are in favor of the use of natural substances when the use of natural substances is possible. This situation reveals the necessity of environmental practices for students as both consciousness and behavior.

It was found that there was no statistically significant difference between the average scores of environmental behavior scale scores of students according to their gender, and statistically significant difference was found between mean scores of environmental awareness scale in favor of female students.

It is thought that the reason for the favor of the girl students may be the result of the ideal image uploaded to the role of women in almost all societies (Sadık & Çakan, 2010). According to Kagıtcıbaşı (1990), women are generally expected to behave warmly, empathically, sensitively, tolerant, compassionate, thoughtful, orderly and responsible. It is thought that society expects these roles to lead women to be more sensitive in communication (akt, Sadık and Sari, 2010; Çimen, Yılmaz & Çimen, 2001). Gama (2003) stated that this result could be evaluated positively in terms of the female students' being a candidate for mother.

There was no statistically significant difference between the environmental consciousness scale and the environmental behavior scale average of the students according to the school type. In addition, it was observed that the average scores of MIT students were higher in both scales. As a result, the education they received was parallel to the students' perceptions of the environment, even at a low level, and this consciousness turned into behavior. However, this data also shows that students are not at a desirable level to show their environmental awareness in their behaviors. It could be argued that this is caused by the lack of adequate training in practice. As the first step to creating a sustainable environment, to obtain safe, green products and to design green operations; our current and future students will be educated more in the environmental field. Because education serves as a bridge between knowledge and actions.

ABSTRACT

This research studies the environmental attitudes and behaviors of Libyan students studying in the basic and primary Schools in Libya. The main purpose of this thesis is to analyze how environmental education at basic and primary schools in Libya and what effect it has on pupils. Additionally, thesis aims to describe environmental education relevance to our society and confronting challenges it has to deal with.

The study aims to get information about the relationship between these attitudes and behaviors of the students and the classes they study in, and to make a general evaluation about efficiency and effectiveness of the environmental education in Libya. The participants are 400 Libyan students studying in basic and primary schools in the 2016 academic year. This study, in which quantitative research method and relational screening model were used, was done by getting answers from the students to questions of the survey, which was used as a tool for collecting information.

While gathering the data, environmental knowledge test, survey of attitude and behavior were used. The data obtained from the results of the survey were evaluated by using SPSS 20 program. Frequencies and percentages were utilized while analyzing the efficiency of Libyan students' environmental education.

As a result, it has been noted that students are not as aware of environmental issues as they should have been expected. Of course, the identification and elimination of environmental problems is possible only if they are recognized. However, it is unlikely that individuals who are unaware of the problems are expected them to be sensitive to these problems and change their behavior to avoid the course of in conveniences. From this point of view, it is considered that determining and increasing the level of awareness of the individuals about environment as a whole is one of the preconditions for coping with environmental problems.

Keywords: Environment, Environmental Education, Environmental Protection, Attitude, Behavior.

INTRODUCTION

Environment is the total of water, air, sound and land interrelationships furthermore with the individual, other living creatures and property. It incorporates physical, natural, social, social and practical components which constitute the surroundings of individual, who is both the maker and disintegrate of the earth (Pillai, 2012).

Human beings from their 35 start of life dependably have been attempted to get profits by nature to accommodate their requirements, and environment has been utilized to enhance their personal satisfaction. As a result of over employments of regular assets the characteristic parity has been separated and in this manner significant issue happened, which called ecological issues. Those issues have increased universal

degree as a consequence of mechanical advancement and industrialization that has been accomplished in the late decades (Gulgan et al., 2008).

To energize significant open support and environment, it is important to make mindfulness about environment contamination and related unfriendly impacts. Any Government at its own particular level can't accomplish the objective of environment preservation, until general society has a participatory part in it. Hence, there is an incredible need to ensure and safeguard our surroundings by expanding the level of mindfulness among general society and in addition the understudies, who are the eventual fate of a country. The part of understudies would go far in accomplishing such wanted objectives. So as to speedier their mindfulness towards environment, it is important to recognize what levels of mindfulness they have in these zones. For raising open mindfulness and upgrading the defensive states of mind towards the ecological issue, natural training is a standout amongst the best system or part. In the event that the people groups' observation, learning, mindfulness and demeanor toward ecological issues are high, it implies that the general population's natural proficiency rate is likewise high. Expanding ecological proficiency will prompt an adjustment in conduct or activity. Deciding, what individuals think about the earth, how they feel about it, and what moves they make that may help or mischief nature is required to building up the supportability of a group and to ensure the earth. Ecological instruction rate will be high when individuals' origination, learning, cognizance and conduct toward natural issues will be high. About environment, legitimate information for keeping up the earth, activities of the people groups about environment (Thapa, 2001., Stapp, 1969).

Ecological instruction is gone for delivering a citizenry that is educated concerning the biophysical environment and its related issues, to mindful of how to assistance to take care of these issues and to persuade to work towards their answer (Kumar, 2011).

The 1972 Stockholm meeting may have set the phase for more noteworthy attention to the need to progress Environmental Education globally however two consequent gatherings still stand today as the fundamental occasions for Environmental Education on the world stage. The International Workshop on Environmental Education, held in Belgrade, Yugoslavia in October of 1975 brought about what got to be distinctly known as The Belgrade Charter. The Belgrade Charter based on the structure of Stockholm and depicted the objectives, goals, crowds, and managing standards of Environmental Education and proposed what has turned into the most broadly acknowledged meaning of , Environmental instruction is a procedure went for building up a total populace that knows about and worried about the aggregate environment and its related issues, and which has the learning, mentalities, inspirations, duties, and abilities to work separately and all things considered toward arrangements of current issues and the avoidance of new ones (UNESCO-UNEP,1976) But the authoritative codification of Environmental Education as a global venture at last left the world's first Intergovernmental Conference on Environmental Education held in Tbilisi, Georgia, USSR in October of 1977. The report now known as The Tbilisi Declaration was figured amid this meeting and in many quarters remains the complete explanation on, what is Environmental Education and what should be. To these objectives give the establishment to quite a bit of what has been done in the field since 1978: To cultivate clear attention to, and worry about, financial, social, political and biological relationship in urban and rustic regions;

To furnish each individual with chances to secure the information, values, mentalities, responsibility and abilities expected to ensure and enhance the earth;

To make new examples of conduct of people, gatherings and society in general towards the earth (UNESCO, 1978) But while Environmental Education was picking up force universally, the same couldn't be said of Environmental Education back here in the USA (Bora, 2010).

METHODS

Research Model

In the study conducted to determine environmental education at basic and primary school levels in Libya and effects on pupils. More precisely, aims to describe environmental education in our society and challenges in general education system. The study is based on a field work carried out in Tripoli district, Libya in 2016. In order to make study more reliably, methods that were applied in experimental part of research were qualitative such as questionnaire, participating observation, focus groups, and informal talks. the data involved in study of textbooks, and curriculums, books, articles, internet sources, reports and studies of environmental education.

Scan researches are conducted with the aim to gather the date about significant aspects of a group (Büyükoztürk, 2009). According to Karasar (1999), scan models are the research approaches aiming to describe a situation, in the past or still happening, as the way it is.

Participants and Sample

The population of this study 400 students at basic and primary schools students in Libya academic year 2016, The sample were from the city of Tripoli, where four schools for boys and girls in the city of Tripoli the questionnaire was distributed on all classes in basic and primary schools.

Table 1: The Status of The Participants

Participants	No. of The Students
Boys	215
Girls	185
Total	400

Data Gathering Tools

In this research, the "Personal Information", "Environmental Attitudes – Behavior Scale Test" and "Environmental Knowledge and Information Test" was used as the data collection tool.

Scoring Scale Classification of The Substance

The levels of Basic And Primary School students participating in this research about environmental education were revealed and interpreted in regards to the survey questions.

Analyses That Was Performed

The data obtained from the surveys were evaluated in computer environment by using SPSS 20.0 program. While determining whether their awareness level change according to their genders about the attitude and behaviors of environmental protection of the students from Libya in this study, the questions of the scale for environmental protection have been created based on expert opinion and literature review. Then, analysis by descriptive method research

Research Ethics

The research to be valid and reliable, and science throughout the process research ethics has been considered. of the people interviewed thought is given to direct quotations. This excerpts are presented at the bottom of the issues managed in research. Researchers have endeavored to demonstrate an objective attitude during negotiations and to influence participants were required to exhibit works behavior.

FINDINGS AND COMMENTS

Whether or not there is a significant difference in test results applied to determine consciousness, attitudes and behaviours of the participants is given in the following:

Table 2. Do You Recycle or Your Parents Recycle?

Answers	Frequency	Percent
Yes	104	26,0
No	296	74,0
Total	400	100,0

Considering Table 2, the participants forming the exemplary answered as %26 “yes” and %74 “no” the question “Do You Recycle or Your Parents Recycle?”. Considering the answers given by the participants, we can see that they are mostly “no” with 70%. This answer demonstrates that the participants forming the sampling have knowledge about recycling.

Table3. Briefly Answer Why Do You Recycle or Don’t Recycle Waste?

Answers	Frequency	Percent (%)
To preserve environment	116	29,0
To reduce waste	143	35,8
We do not have places to recycle waste	141	35,3
Total	400	100,0

Considering Table 3, in relation to the question *Briefly Answer Why Do You Recycle or Don’t Recycle Waste?*, 29% of the participants forming the exemplary answered “to preserve environment”, %35,8 “to reduce waste”, and %35,3 “we do not have places to recycle waste. Considering the answers given by the participants, we can see the majority in “to reduce waste” with %35,8. This answer shows that the participants forming the exemplary have environmental awareness.

Table4. Have You Chosen Extra Curricular Activity At School / Outside School?

Answers	Frequency	Percent
Yes, if yes, what kind is this activity	90	22,5
No	310	77,5
Total	400	100,0

As it can be seen in Table 4, regarding the question *Have You Chosen Extra Curricular Activity At School or Outside?*, out of the participants forming the exemplary 22,5% answered as *yes if yes, what kind is this activity*, and %77,5 as “no”. Considering the answers given by the participants, we can see mostly the option “no” with 77,5%, namely they do not participate in any activity outside school. We can say that some of the participants are weak in participating in activities considering this answer.

Table5. How in Your Opinion Could Libya Help to Take Care More of Natural Environment?

Answers	Frequency	Percent
The government responsible	153	38,3
The ministry of agriculture	110	27,5
The ministry of education	137	34,3
Total	400	100,0

Considering Table 5, in relation to the question “How in Your Opinion Could Help Libya To Take Care More of Nature Environment?” out of the participants forming the exemplary 38,3% answered as “the government responsible”, 27,5% “the ministry of agriculture”, 34,3% “the ministry of education”. We can see that “the government responsible” option constitutes the majority with 38,3% considering the answers of participants. This answer shows that participants have knowledge about protecting the environment, but they say that protection of the environment is the responsibility of the government.

Table6. Distribution of the Participants According to Their Answers for Consciousness Questions

Grades	Questions	Answers	Number of Students	Percent (%)
Basic	Do You or Your Parents Recycle?	No	296	74,0
Primary	Briefly Answer Why Do You Recycle or Don't Recycle Waste?	To Reduce Waste	143	35,8
Basic	Have You Chosen Extra Curricular Activity At School / Outside School?	No	310	77,5
Primary	How in Your Opinion Could Libya Help to Take Care More of Natural Environment?	The Government Responsible	153	38,3

We can see in Table 6 that students who attend preschool education say “No” mostly considering their answers for consciousness questions. This result shows that preschool students do not have sufficient consciousness.

Nevertheless, considering the answers given by students attending preschool education for the consciousness questions, the participants expressed their opinions by answering the questions as “*The Reduce Waste*” and “*The government Responsible*”. Considering these results, we can say that students attending preschool education have knowledge.

Table7. Have You Picked Litter from the Public Place?

Answers	Frequency	Percent
Sometimes	199	49,8
Always	84	21,0
Often	51	12,8
Never	66	16,5
Total	400	100,0

Considering Table 7, for the question “*Have You Picked Litter From The Public Place?*”, out of the participants forming the exemplary 49,8% answered as “*sometimes*”, 21% “*always*”, 12,8% “*often*”, 16,5% “*never*”. Considering the answers given by the participants, we can see the majority in “*sometimes*” with 49,8%. For this answer, we can say that participants have environmental consciousness, but they sometimes may have to throw their litters into the ground when there is no litter basket in open areas.

Table8. Briefly Answer Why Do You or Do Not You Buy Water in Plastic Bottles?

Answers	Frequency	Percent
To keep clean my town	221	55,3
I am not responsible	179	44,7
Total	400	100,0

Considering Table 8, for the question “*Briefly Answer Why Do You or Do Not You Buy Water in Plastic Bottles?*”, out of the participants forming the exemplary 55,3% answered as “*to keep clean my town*” and 44,7% “*I am not responsible*”. Considering the answers given by the participants, we can see the majority in “*to keep clean my town*” with 55,3%. This answer shows that the participants have environmental awareness.

Table9. Do You Use Bags for Shopping?

Answers	Frequency	Percent
Yes, I use plastic bags	121	30,3
Yes, I use fabric bags	37	9,3
Yes, I use paper bags	28	7,0
No, I buy new one every time	214	53,5
Total	400	100,0

Considering Table 9, for the question “*Do You Reuse Bags for Shopping?*”, out of the participants forming the exemplary 30,3% answered as “*Yes, I reuse plastic bags*”, 9,3% “*Yes, I reuse fabric bags*”, 7% “*Yes, I*

reuse paper bags”, 53,5% “No, I buy new one every time”. Considering the answers given by the participants, we can see the majority in “No, I buy new one every time” with 53,5%. This answer shows that the participants have environmental knowledge but do not care about it.

Table10. How Often Do You Use Bicycle?

Answers	Frequency	Percent
Everyday	46	11,5
Once a week	25	6,3
Few times a month	38	9,5
Few times a year	65	16,3
Only in summer time	74	18,5
I don't use a bike	152	38,0
Total	400	100,0

Considering Table 10, for the question “How Often Do You Use Bicycle?”, out of the participants forming the exemplary 11,5% answered as “everyday”, 6,5% “few times a month”, 16,3% “few times a year”, 18,5% “only in summer time”, 38% “I don't use a bike”. Considering the answers given by the participants, we can see the majority in “I don't use a bike” with 38%. This answer shows us that the participants want to use bike but they cannot use it. We can show the reason as the roads are not convenient for using bike.

Table 11. For What Purpose Do You Use Bicycle?

Answers	Frequency	Percent
Play	115	28,8
Sport	111	27,8
As Transport	61	15,6
Bicycle	113	27,8
Total	400	100,0

Considering Table 11, for the question “For What Purpose Do You Use Bicycle?”, out of the participants forming the exemplary 28,8% answered as “play”, 27,8% “sport”, 15,6% “as transport”, 27,8% “bicycle”. Considering the answers given by the participants, we can see the majority in “play” with 28,8%. This answer shows us that the participants use bike only for fun due to the fact that there is no convenient road for using bike.

Table12. From Which of Those Sources You Know about Nature?

Answers	Frequency	Percent
Most important	256	64,0
Important	128	32,0
Less important	16	4,0
Total	400	100,0

Considering Table 12, for the question “From Which of Those Sources You Know about Nature?”, out of the participants forming the exemplary 64% answered as “most important”, 32% “important”, 4% “less important”. Considering the answers given by the participants, we can see the majority in “most important” with 64%. Considering this answer, we can say that participants have very important information about the nature.

Table 13. Comparison of Students' Attitudes Attending Pre-school and Kindergarten Education.

Grades	Questions	Answers	Number of Students	Percent (%)
Primary	Have you picked litter from the public place?	Sometimes	199	49,8
Primary	Briefly answer why do you buy or do not buy water in plastic bottles?	To keep clean my town	221	55,3
Basic	Do you use bags for the shopping?	No, I buy new one every time	214	53,5
Basic	How often do you use bicycle?	I don't use a bike Play	152	38,0
Basic	For what purpose do you use bicycle?	Most important	115	28,8
Primary	From Which of Those Sources You Know about Nature?		256	64,0

Considering Table 13 and when we compare environmental attitudes of students attending kindergarten education, we can see that they are higher than the attitudes of students attending preschool education.

Table14. Write From Which Sources Do You Mostly Get Information about Nature, Ecology?

Answers	Frequency	Percent
Geographic	225	56,3
Sciences	175	43,8
Total	400	100,0

As it can be seen in Table 14, for the question “*Write From Which Sources Do You Mostly Get Information about Nature, Ecology?*”, out of the participants forming the exemplary 56,3% answered as “*geographic*”, and 43,8% “*sciences*”. Considering the answers given by the participants, we can see the majority in “*geographic*” with 56,3%. Considering this result, we can say that they obtained such information about the nature and ecology from their geography books.

Table15. Do You Attend Ecological / Environmental Events?

Answers	Frequency	Percent
Sometimes	178	44,5
Always	58	14,5
Often	36	9,0
No	128	32,0
Total	400	100,0

Considering Table 15, for the question “*Do You Attend Ecological / Environmental Events?*”, out of the participants forming the exemplary 44,5% answered as “*sometimes*”, 14,5% “*always*”, 9% “*often*”, 32% “*no*”. Considering the answers given by the participants, we can see the majority in “*sometimes*” with 44,5%. Considering this answer, we can say that the participants take part in activities arranged for the environment.

Table 16. Rank Those Ecological Issues

Answers	Frequency	Percent
No answer	7	1,8
Deforestation	368	92,0
The depletion of ozone layer	25	6,3
Total	400	100,0

As it can be seen in Table 16, for the question “*Rank Those Ecological Issues*”, out of the participants forming the exemplary 1,8% answered as “*no answer*”, 92% “*deforestation*”, 6,3% “*the depletion of zone layer*”. Considering the answers given by the participants, we can see the majority in “*deforestation*” with 92%. Considering the question about the issue, we can see that participants specify as one of the reasons of environmental problems to be deforestation. This answer shows that the participants have environmental awareness.

Table17. List Local and Global Ecological Issues You Know

Answers	Frequency	Percent
I don't know	127	31,8
Climate change and etc.	128	32,0
We don't learn yet	135	33,8
Save energy	10	2,5
Total	400	100,0

Considering Table 17, for the question “*List Local and Global Ecological Issues You Know*”, out of the participants forming the exemplary 31,8% answered as “*I don't know*”, 32% “*climate change and etc.*”, 33,8% “*we don't learn yet*”, 2,5% “*save energy*”. Considering the answers given by the participants, we can see the majority in “*we don't learn yet*” with 33,8%. Considering these answers, we can see that participants have not yet learned about global environmental problems.

Table18. Sign Most Interesting Topics with (+) and Least interesting Topics with (-) ?

Answers	Frequency	Percent
Most interesting topics	207	51,8
Least interesting topics	85	21,3
Close	108	27,0
Total	400	100,0

Considering Table 18, for the question “*Sign Most Interesting Topics with (+) and Least Interesting Topics with (-)*”, out of the participants forming the exemplary 51,8% answered as “*most interesting topics*”, 21,3% “*least interesting topics*”, 27% “*we do not have places to recycle waste*”. We can see that the answers of participants are mostly “*most interesting topics*” with 51,8%.

Table19. Have You Used Advices from School in Your Daily Life at Home?

Answers	Frequency	Percent
Yes, many advices	123	30,8
Yes, some advices	194	48,5
No, there are no conditions for this	25	6,3
No	58	14,5
Total	400	100,0

Considering Table 19, for the question “*Have You Used Advices from School in Your Daily Life at Home*”, out of the participants forming the exemplary 30,8% answered as “*yes, many advices*”, 48,5% “*yes, some advices*”, 6,3% “*no, there are no conditions for this*”, 14,5% “*no*”. Considering the answers given by the participants, we can see the majority in “*some advices*” with 48,5%. Considering these answers, we can

see that the participants apply the information about the environment they learn at school to their daily life too.

Table20. If You Answered Yes, Please Write What Exactly You Use in Your Daily Life?

Answers	Frequency	Percent
Waste Sorting	110	27,5
Healthy Food	117	29,3
Control Natural	173	43,2
Total	400	100,0

Considering Table 20, for the question “*If You Answered Yes, Please Write What Exactly You Use in Your Daily Life*”, out of the participants forming the exemplary 27,5% answered as “*waste sorting*”, 29,3% “*healthy food*”, 43,2% “*control natural*”. Considering the answers given by the participants, we can see the majority in “*control natural*” with 43,2%. Considering these answers, we can see that participants care much about keeping the environment clean.

Table21. Briefly Answer Why Do You Buy or Do Not Buy Water in Plastic Bottles?

Answers	Frequency	Percent
Because the plastic bottle is so clean	53	13,3
I can buy it from any shop	84	21,0
I do not like buy the water from out side	263	65,8
Total	400	100,0

Considering Table 21, for the question “*Briefly Answer Why Do You Buy or Do Not Buy Water in Plastic Bottles*”, out of the participants forming the exemplary 13,3% answered as “*because the plastic bottle is so clean*”, 21% “*I can buy it from any shop*”, 65,8% “*I do not like buy the water from outside*”. Considering the answers given by the participants, we can see the majority in “*to reduce waste*” with 65,8%. Considering these answers, we can say that participants have environmental knowledge.

Table22. How Often Do You Use Public Transport (Bus, Train and Other)?

Answers	Frequency	Percent
Everyday	123	30,8
Once a week	48	12,0
Once a month	33	8,3
Few times a year	78	19,5
I don't use public transport	118	29,5
Total	400	100,0

Considering Table 22, for the question “*How Often Do You Use Public Transport (Bus, Train And Other)?*”, out of the participants forming the exemplary 30,8% answered as “*everyday*”, 12% “*once a week*”, 8,3% “*once a month*”, 19,5% “*few times a year*”, 29,5% “*I don't use public transport*”. Considering the answers given by the participants, we can see the majority in “*everyday*” with 30,8%. Considering these answers, we can say that participants use bus, train in their daily life in order to prevent environmental problems.

Table23. Do You Often Buy Mineral Water in Plastic Bottles?

Answers	Frequency	Percent
Yes	273	68,3
No	127	30,7
Total	400	100,0

Considering Table 23, for the question “*Do You Often Buy Mineral Water in Plastic Bottles?*”, out of the participants forming the exemplary 68,3% answered as “yes” and 30,7% “no”. Considering the answers given by the participants, we can see the majority in “yes” with 68,3%. Considering these answers, we can see that participants mostly use plastic bottles because they do not know that they are very harmful to the environment.

Table 24. Comparison of Behavioural Levels of Students’ Attending Pre-school and Kindergarten Education According to Grade

Grades		Questions	Answers	Number of Students	Percent (%)
Behaviour	Basic	Have you used advices from school in your daily life at home?	Yes, some advices	194	48,5
	Basic	If you answered yes, please write what exactly you use in your daily life?	Control natural	173	43,2
	Primary	Briefly answer why do you buy or do not buy water in plastic bottles?	I do not like buy the water from out side	263	65,8
	Basic	How often do you use public transport (bus, train and other)?			
		Do you often buy mineral water in plastic bottles?	Everyday	123	30,8
	Primary		Yes	273	68,3
Attitude	Primary	Have you picked litter from the public place?	Sometimes	199	49,7
	Primary	Briefly answer why do you take or do not take other litters?	To keep clean my town	221	55,3
	Primary	Do you reuse bags for the shopping?	No, I buy new one every time	214	53,4
	Basic	How often do you use bicycle?	I don’t use a bike	152	38,0
	Primary	Have you chosen extra-curricular activity at school / outside school?	No	310	77,5
	Primary	From which of those sources you know about nature?	Most important	256	64,0
	Basic	Who in your opinion, could help and/or promote Libya to take care nature/ more of environment?	The government responsible	153	38,3

Considering Table 24, we can see that there are differences when environmental behaviours of both students attending kindergarten education and students attending preschool education are compared. Considering environmental awareness, we can see that there is little difference on environmental awareness of both students attending kindergarten education and students attending preschool education.

When behaviour and awareness levels of participants are compared separately according to grades, we can see that students attending kindergarten education have less than students attending preschool education.

Table25. Comparison of Behavioural Levels of Students' Attending Pre-school and Kindergarten Education According to Age

Age		Questions	Answers	Number of Students	Percent (%)
Behaviour	Basic	Have you used advices from school in your daily life at home?	Never	66	16,5
	Primary	If you answered yes, please write what exactly you use in your daily life?	Waste Sorting	110	27,5
	Basic	Briefly answer why do you buy or do not buy water in plastic bottles?	Because the plastic bottle is so clean	53	13,3
	Basic	How often do you use public transport (bus, train and other)?	Once a month	33	8,3
	Basic	Do you often buy mineral water in plastic bottles?	No	127	31,7
	Primary				
Attitude	Basic	Have you picked litter from the public place?	Often	51	12,8
	Primary	Briefly answer why do you take or do not take other litters?	I am not responsible	179	44,7
	Basic	Do you reuse bags for the shopping?	Yes, I reuse paper bags	28	7,0
	Basic	How often do you use bicycle?	As Transport	61	15,6
	Primary	Have you chosen extra-curricular activity at school / outside school?	Yes if yes, what kind is this activity	90	22,5
	Basic	From which of those sources you know about nature?	Less important	16	4,0
	Primary	Who in your opinion, could help and/or promote Libya to take care more of nature/ environment?	The ministry of agriculture	110	27,5

Considering Table 25, we can see that there are differences when environmental behaviours of both students attending kindergarten education and students attending preschool education are compared according to age. We can say that environmental behaviours of students attending kindergarten education are more outstanding than students attending preschool education.

When environmental awareness levels of participants are compared, we can say again students attending kindergarten education have more difference levels than students attending preschool education.

Table26. Comparison of Behavioural Levels of Students' Attending Pre-school and Kindergarten Education According to Gender

Gender		Questions	Answers	Number of Students	Percent (%)
Behaviour	Primary	If you answered yes, please write what exactly you use in your daily life?	Waste Sorting	110	27,5
	Basic	Briefly answer why do you buy or do not buy water in plastic bottles?	Because the plastic bottle is so clean	53	13,3
	Primary	Do you often buy mineral water in plastic bottles?	No	127	31,7
Attitude	Basic	Have you picked litter from the public place?	Often	51	12,8
	Primary	Briefly answer why do you take or do not take other litters?	I am not responsible	179	44,7
	Primary	Have you chosen extra-curricular activity at school / outside school?	Yes if yes, what kind is this activity	90	22.5
	Primary	Who in your opinion, could help and/or promote Libya to take care more of nature/environment?	The ministry of agriculture	110	27,5

Considering Table 26, we can see that both environmental behaviours and difference levels of preschool students are higher than kindergarten students when their environmental behaviours and awareness levels are compared according to gender.

Table27. Distribution of Pre-school and Kindergarten Students According to Their Knowledge Levels on Environmental Behaviours and Awareness

Questions	Answers	Number of Students	Percent (%)
Do you recycle or your parents recycle?	No	296	74,0
Write from which sources do you mostly get information about nature, ecology?	Geographic	225	56.3
Do you attend ecological / environmental events?	Sometimes	178	44.5
Rank those ecological issues	Deforestation	368	92,0
List local and global ecological issues you know	Climate change and etc	128	32,0
Briefly answer why do you or don't you recycle waste?	We do not have places to recycle waste	296	74,0
Sign most interesting topics with (+) and least interesting topics with (-)	Most interesting topics	264	66,0

Considering Table 27, the rates of answers obtained from participants with regard to the following questions are: 74,0% for “Do you recycle or your parents recycle?” “No”, 56,3% for “Write from which sources do you mostly get information about nature, ecology?” “geographic”, 44,5% for “Do you attend ecological / environmental events?” “Sometimes”, 92% for “Rank those ecological issues” “Deforestation”, 32% for “List local and global ecological issues you know?” “Climate change and etc.”, 74% for “Briefly answer why you recycle or don't recycle waste?” “We do not have places to recycle waste”, 66% for “Sign most interesting topics with (+) and least interesting topics with (-)” “Most interesting topics”. Considering these results, we can say that students have sufficient knowledge about environmental behaviour and awareness.

Table28. Difference of Knowledge Levels of Pre-school and Kindergarten Students on Environmental Behaviours and Awareness According to Gender

	Sex	N	Article Number	Average	SS	p
Environmental Awareness	Male	215	7	15,82	5,43	.003
	Female	185		17,53	4,46	p<0,05
	Total	400		19,63	5,07	
Environmental Behaviour	Male	215	5	13,43	4,27	.000
	Female	185		11,67	3,72	p<0,05
	Total	400		15,36	4,27	

In Table 28, it is clear that there is a significant difference between genders of students attending pre-school and kindergarten education when their total scores on environmental awareness and environmental behaviours are evaluated ($p<0,05$).

According to the results obtained about the knowledge, attitude and behaviour of Libyan students at basic and primary schools towards the environmental education there was highly significant difference between the two levels and there should be an educational training with regard to this issue.

CONCLUSION

There are differences when environmental behaviours of both students attending kindergarten and preschool education are compared. Considering environmental awareness, we can see that there is little difference on environmental awareness of both students attending kindergarten education and students attending preschool education. When behaviour and awareness levels of participants are compared separately according to grades, we can see that students attending kindergarten education have less than students attending preschool education. The results of studies conducted on different exemplary groups both at home and abroad demonstrate that awareness regarding the environment and environmental issues are below the desired level which is similar to the results of this study (Shobeiri, Omidvar&Prahallada, 2007; Hassan, Juahir&Jamaludin, 2009; Ahuja, 2010; Hassan, Noordin and Sulaiman, 2010; Larijani, 2010; Aminrad, Zakaria&Hadi, 2011).

We can see in the research that there are differences when environmental behaviours of both students attending kindergarten education and students attending preschool education are compared according to age. We can say that environmental behaviours of students attending kindergarten education are more outstanding than students attending preschool education. When environmental awareness levels of participants are compared, we can say again students attending kindergarten education have more difference levels than students attending preschool education. Uzun (2007) also obtained the same result in his study.

It is clear that there is a significant difference between genders of students attending pre-school and kindergarten education when their total scores on environmental awareness and environmental behaviours are evaluated. This result shows parallelism with the results of the studies conducted by Kaya, Akıllı ve Sezek (2009)., Çabuk ve Karacaoğlu (2003)., Gündüz, Dağlı ve Aslanova (2015)., Kesicioğlu ve Alisinanoğlu (2009).

When environmental behaviours and awareness levels of pre-school and kindergarten students were compared, significant differences were found. Considering these results, we can say that students have sufficient knowledge about environmental behaviour and awareness. In some environmental researches that were conducted by many researchers before, similar values to this result were obtained (Altınöz, 2010; Kışoğlu, 2009; Kibert, 2000; Karatekin, 2011; Gündüz et al, 2015).

As a consequence, it was detected that students are not well aware of the issues regarding the environment as expected. Surely, it will be possible to identify environmental problems and resolve them by only being aware of them. Because it is not possible to expect such individuals to be aware of environmental problems, to be sensitive against such problems and to change their behaviours that may cause problems. That is why it is thought to be one of the prerequisites of dealing with environmental problems to determine and increase awareness levels of individuals about the environment and environmental problems.

RECOMMENDATION

The following suggestions are made in light of the data obtained from the research;

- Education seminars can be arranged and made available for teachers regarding “Environmental Education Program” and the use of materials in pre-school educational institutions. The participation of students to scientific students should be ensured and the issues like environmentally harmful chemical substances, benefits of public transport vehicles in terms of environment, classification of litters and recycling bins firstly should be included in these studies.
- Environmental education should be included in formal education programs. At least teachers and administrators should be informed about air, water, ecological balance and especially soil pollution, and scientific activities regarding environmental sensitivity should be provided in accordance with all education levels.
- Certain researches investigating the relationship between environmental awareness of pre-school children and educational environment provided at home and attitudes regarding environment based skills of their parents can be conducted.

- Accordingly, “projects for environment-based educational situations” supporting environmental awareness can be prepared and conducted with pre-school children.
- Due to the fact that environmental education has an aspect comprising every segment of society, it can be ensured to be integrated in all types and levels of education. Environmental education should be carried out in a mentality to direct applied activities as well as theoretical knowledge on environmental education for contributing the formation of knowledge, skills, attitudes and values in individuals towards environment. The sensitivity of children and their families on this issue should be supported by arranging activities and studies about ecology from young ages. Furthermore, collaboration should be made with civil society institutions in developing environmental sensitivity.
- Approaches like family education, family participation, school-family cooperation should be included in environmental education studies in pre-school periods. Longitudinal studies where the results of environmental education programs to be given to little children are monitored in a wide time interval should be conducted.
- Environmentalist preschools should be increased and school concept having environmentalist perspective should be spread and encouraged by various applications.
- One of the important points is that we should do more research about environmental education at basic school in English research because there is a few especially in Libya.
- To be successful, we need to apply the basic and primary school into the environmental education more in that to transfer their knowledge by positive action in the lifestyle.

Essentials of Governance and Educational Reform in Morocco: A Critical Discourse Analysis Approach

Najib SLIMANI

*Faculty of Letters and Human Sciences Cadi Ayyad University,
Marrakech, Morocco
najslimani@gmail.com*

ABSTRACT

This paper is an attempt to sift the reality of the Moroccan university as an institution which is supposed to be a nursery for future professionals and decision-makers. To be up to this target, the Moroccan university is called for to work out suitable governance-bound policies that can ease its production of marketable human assets on national and international scales. In this Critical Discourse Analysis (CDA) account, I begin with a theoretical background about governance as an evolving concept that has been circumscribed with various definitions. The managerial styles and official guidelines at the Moroccan university level are given keen consideration with particular reference to the National Charter of Education and Training. Against this background, I conduct an analysis of His Majesty King Mohammed VI's speech on the occasion of the Revolution of the King and the People (August 20th, 2013)- a cornerstone and far-sighted speech wherein His Majesty capitalizes on some strengths of the Moroccan educational system and, more importantly, warns against executive dysfunctions which hamper the implementation of solid, competitive and productive educational practices, especially in higher education. Ultimately, I provide some suggestions to rethink some governance-bound endeavors so as to come up with a dynamic, fruitful university governance style. Within this realm, this paper seeks to come up with answers to the following research questions: (i) What is the status quo of the Moroccan higher educational system? (ii) What governance-related guidelines can be gleaned from the historic 2013 Royal speech? The emerging findings of these questions will upgrade the critical cycles of analysis to conduct more accurate probing of (iii) What has been achieved so far? And what about the road ahead? As a theoretical framework, the CDA approach is the major underpinning of this analytic enterprise.

Keywords: Higher education; Morocco; Governance; Critical Discourse Analysis; Recommendations

INTRODUCTION

In recent years, the issue of educational governance has gained widespread attention among scholars from around the world (Altbach 2005; Amaral et. al. 2002; Johnson 1997; Shattock 2006; Joshua 2010). The bulk of work done internationally is geared towards offering operational suggestions and road maps that can ensure the accountability and pre-eminence of western educational institutions. In tune with this reform-oriented trend, the issue of educational governance in Morocco has been subject to utmost consideration of intellectuals, politicians and opinion leaders.

This paper examines the reality and the future prospects of governance linked to Moroccan tertiary education. Several Moroccan researchers (Chetoui 2005; Chtouki 2006; Echoundi 2006; El Moussaoui 2004; Gherib 2010; Harakat 2011) have tackled the issue of educational governance in Morocco. While these researchers have addressed the issue of governance in idiosyncratic ways and from diverse angles, they seem to have reached a tacit consensus that educational, and particularly higher education, governance in Morocco constitutes a real challenge for the years to come. This is due to the fact that the Moroccan university is supposed to be a stepping stone towards the achievement of durable, sustainable national progress. The university is not just a place where academic learning takes place; it is rather a genuine nursery for future leaders, managers, professionals and decision-makers. To be up to this target, the Moroccan university has to be endowed with appropriate governance styles.

In Morocco, there seems to be a hard-to-dislodge conviction among the elite circles about the urgent need for proficient governance styles that can help elevate the quality of the educational system to international eminence. In his speeches, His Majesty King Mohammed VI has time and again accentuated the central role of education in the process of development. In his 2003 Throne ceremony speech, King Mohammed VI made it clear that the issue of education in Morocco ranks second after the primordial territorial integrity issue. In a recent speech on the occasion of “Tawrat Al Malik Wa Chaab” “The Revolution of the King and the People” (20 August, 2013), King Mohammed VI devoted a very large portion to diagnose the ills of the educational domain in Morocco stressing the urgent need for appropriate, collaborative and efficient governance.

The questions remain, however, to what extent have the recurrent governmental policies managed to keep up with the royal aspirations? Can we safely state that governance in Moroccan tertiary education is on the right path? If not, what governance measures should be taken to ensure the future competitiveness of our universities on regional and international scales? These questions will constitute the body of this contribution through which we aim at exploring avenues that can unpack the working of governance at the Moroccan university level and possible ways for making this governance all the more dynamic and fruitful.

On The Concept Of Governance

For sure, the concept of governance has been subject to consecutive re-definitions ever since its appearance in late 1980s. At the outset, governance referred to conscientious, rational public affairs management in all fields, be they political, social, economic or whatsoever. Johnson (1997: 1) uses the term “Remodelling public management” (Remodelage de gestion publique” to put into focus the fact that embryonic definitions of governance were basically related to the way public, government-specific policies were supposed to be implemented in terms of managing economic and social resources.

This traditional view of governance as a ruling elite-bound concept has been contested by several international institutions, namely the United Nations, the European Union and the World Bank (See these institutions reports on governance). According to these institutions, effective governance is a top-down as well as a bottom-up process that calls for interactive, participatory involvement of all citizens, institutions and organizations. In this respect, Chetoui (2007: 13) states that governance is a wholistic, three-layered process that includes the following axes:

- 1- The means by which rulers and decision-makers are chosen and supervised.
- 2- The government effective resource management and policies’ implementation.
- 3- Citizens and rulers mutual co-management of the institutions in charge of the economic and social endeavors.
- 4-

The United Nations programme for development along with the World Bank recommend the intricate and overlapping interrelationship between political, economic and social governance. The European Union has gone a step further by emphasizing, in addition to the above tenets, democracy and human rights as cornerstones of effective and efficient governance.

It seems that the concept of governance as a uni-directional, government-related process is now considered as a sheer fallacy. The ordinary individual citizen and the ruling elite are supposed to work hand in hand to bring about sustainable development at the local as well as the national levels. Differently put, the view of every citizen as a potential capital for sustainable development is now a matter of international consent.

Accordingly, the concept of governance is an evolving process that can be adopted and adapted to the fields and circumstances in point. Several countries, Morocco is no exception, have started to set governance policies which respond to international norms and recommendations. In this regard, we need to acknowledge the existence of idiosyncrasies since every country models its governance styles around available human and capital resources.

In Morocco, the issue of governance in education has always been a primordial issue in the academic and political spheres. As early as 1999, the Special Committee for Education and Training saw light having as a purpose the visualization of a road map that can lead to substantial reforms in the Moroccan educational orientations and policies. The corollary of the concentrated work done by this committee of experts gave birth to the National Charter for Education and Training “Al Mitak Al watani Li Tarbiya Wa Takwin”- a charter that gained wide popular support given the pertinent, realistic guidelines and recommendations it came up with, which targeted grass-root reforms in educational governance in Morocco.

Higher Education Governance in Morocco: Toward a bureaucracy-free perspective

In the last decade, the higher education system in Morocco has witnessed remarkable modifications with a view to revitalize the governance of universities and higher institutions. Gharib (2006: 372) specifies that the new governance system in Moroccan higher education constitutes a real step away from traditional, bureaucratic modes of governance. According to Gharib (2006), there is a quest for a higher education sector that can serve as a locomotive for the empowerment of parallel sectors, particularly the economic sector. This is, indeed, a rational aspiration given that days when higher education was dissociated from the socio-economic sphere should definitely belong to the past. In light of the Charter of Education and Training, university affairs are to be rationally and collaboratively managed by actors from within the higher education field and, most importantly, by potential socio-economic actors who do not necessarily belong to higher education.

Governance in Moroccan Higher Education: Official guidelines

The official charter of education and training, especially in the fifth and the sixth recommendations, claims the key importance of rational management based on participative and fund-based approaches. In this respect, the charter has specified a three-fold orientation of the Moroccan university. First, the Moroccan university should be an integral entity having total financial independence and a distinguished academic profile (statement 150/1). Additionally, the university is solicited to be a well-structured entity based on common core levels, bridges and project-based orientations, especially projects which can yield additional, financial revenues. These latter have to be invested and distributed among the university affiliated schools and institutions in the most equitable and rational way possible. Relatedly, the university is supposed to benefit from governmental funding, which needs to be allocated following strict, public criteria. In addition to financial resources, the above statement dwells on the need for effective, logical investment of the human resources deemed as priceless assets of the university. Second, the charter advocates the creation of a national council in charge of boosting cooperation between universities and related institutions on a nationwide scale (statement 151/1). Of course, this is to be achieved within absolute respect not only of each university’s autonomy but also in total abidance by the guidelines and orientations of the national higher education system.

Third, the charter accentuates the need for participative approaches regarding “the managerialism” of universities (statement 152/1). In line with this statement, the universities are to be managed by a board of university presidents, deans and higher institute directors, representatives of the teaching staff (faculty), representatives of students and eminent personalities in the economic and socio-cultural sectors.

It seems that the official guidelines in Morocco clearly advocate generic principles and recommendations in support of shared governance and cooperative decision-making. In contrast to traditional management styles, the university is assigned more freedom in terms of implementing new governance structures in tune with the culture of change outlined in the National Charter of Education and Training. Overall, the university is bound to open up to its surrounding and be committed to develop a profile that responds to the needs of individual citizens and communities. Nevertheless, the outcome of the recent consecutive policies in higher education have been subject to outspoken criticism concerning the way Moroccan university managerial structures have been operating so far.

The Royal perspective: An educational governance that leaves to be desired

As mentioned earlier, His Majesty King Mohammed VI has always voiced his concern for the field of education as a basic cornerstone underpinning national development within and across sectors. In reference to His Majesty's last speech on the 60th memorial of the Revolution of the King and the People issued on August 20th, 2013, I will provide a succinct discursive analysis of the speech and pin down how it calls for rethinking educational policies in Morocco.

At the outset of the speech, His Majesty capitalizes on the historical ongoing of the king and peoples' revolution stating that "it is a continuous revolution which calls for the mobilization of everyone. It requires that everyone invests strongly in the workshops of development so as to fulfill current and future challenges and to concretize the legitimate aspirations of our citizens" (Translation is henceforth mine). Importantly enough, this excerpt shows that no genuine current or future development can take place without the actual involvement of every single individual- an idea that reflects the royal full awareness of the uselessness of any single-handed attempt to bring about sustainable progress.

Labeling youth's potential as "our national renewable richness", His Majesty goes on to focalize on the absolute necessity for Moroccan youth to be an integral part of the change process. However, His Majesty stresses the need for "sane" good education as a gateway to procreating young citizens capable of facing "the innovations of the modern times".

While outlining the positive education-related points realized so far, such as the availability of the basic infrastructures and the increase of schooling of female citizens, His Majesty emphasizes that the road ahead is still strenuous:

However, the road to go is still long and tough for this sector [education] to assume its role of a locomotive for social and economic development. For, indeed, the actual question which continues to be posed is the following: How come that a portion of our youth do not manage to realize their legitimate aspirations at the professional, material and social levels?

His Majesty, thus, assumes that the educational sector in Morocco needs to refine its standards and structures to produce marketable brains.

While praising the work done in the domains of professional, technical and artifact training as educational factions "which offer to graduates more chances for direct and quick access to employment and insertion opportunities in professional life", His Majesty warns that this is not the case for "university graduates in some options, notwithstanding the praiseworthy efforts deployed by university professors. These [universities] should not be factories for the unemployed, especially in some outdated disciplines".

The importance of student-related assets are also considered primordial in the success of higher education governance. As a component of the corporate structure of tertiary education, the student remains a priceless human capital that needs to be invested in the right way. As a case in point, His Majesty puts forth the Moroccan students' natural propensity towards opening up to others and their desire to know about foreign cultures and languages, which is a positive distinguishing aspect of Moroccan students:

It is mandatory to consolidate this [university] training by a judicious exploitation of a virtue that characterizes the Moroccan citizen, namely his/her natural tendency for opening up and his/her willingness to know foreign cultures and languages.

His Majesty elaborates on foreign language learning as a complementary parameter that can raise chances of employability in various domains. Simultaneously, national official languages are also to be ascribed due importance in His Majesty's viewpoint..

As an actor within the Moroccan university circle, I believe that in the global world of today, learning foreign languages is an urgent must. Every university is supposed to invest more in this issue by encouraging linguistic sojourns in native countries, by supporting the creation of international university students' communities and by providing the material logistics, such as professional computer language laboratories, to get students to work on their language skills in favorable conditions. By having this governance orientation, we can surely boost students' chances' for employment at the national and international scales.

At a later stage of the speech, His Majesty refers to the National Charter of Education and Training which, in the words of His Majesty, was "adopted in the frame of large, participative national approach." Past governments, according to His Majesty, made good and concentrated efforts to ensure the success of the emergency plan, which was devised to save the national education from further recession. Faithful to this tradition, the current government, in His Majesty's viewpoint, is urged "to capitalize on the strengths and achievements of the last government which did its best to, although under strict time constraints, implement the guidelines of the national charter". Thus, the achievement of a national, fruitful and dynamic educational governance is a long, ongoing and, more importantly, cooperative process.

In addition to these corrective measures, His Majesty brings forth a serious issue that hampers the implementation of highly efficient, cooperative educational governance. The field of education should not be an object for "political auction and rivalry". Here, indeed, lies one of the serious dysfunctions of the educational sector in Morocco. Every newly-elected government brings along new plans and governance measures which, in stead of dovetailing with and reinforcing previous ones, cast doubt on their predecessors. In this way, the element of continuity as a key of success is not accounted for and the ills of the educational system worsen.

All in all, the royal assessment of the governance styles in the Moroccan educational system is so critical and insightful. If we want to incorporate an educational system that guarantees young graduates' insertion in the national and international job market, we certainly need to work hand-in-hand and put the nation's interests on top of personal, secular or political coveting and greed.

Governance in Moroccan Universities: The road ahead

Several researchers from around the world have analyzed the status quo of universities in an attempt to put forth refined models of how universities could be more effectively managed. Altbach (2005: 16) specifies that although models of university governance may differ, they still have things in common. Similarly, Coldrake, Stedman and Little (2003: 3-5) underscore the fact that universities worldwide have a common heritage. Therefore, the alternative governance measures they uphold could be applied to all universities; Moroccan universities are, needless to say, no exception.

In the last decades, universities have been asked to display more human-oriented inclinations, more involvement in the developmental process and more logical resource management. Mc Master (2007: 1-5) emphasizes the fact that universities are under tight pressures to rethink "administrative work at all levels". According to several other researchers, it is of key significance to have new and updated managerial skills within and across departments, such as the marketing department, HR department, finance department, accounting, students affairs, syllabus development, to cite just a few departments (For further details see Shattock, 2006 and Joshua, 2010).

In line with this perspective, I believe that the Moroccan university is recommended more than ever before to invest in two overlapping assets, namely the human asset and the material/financial one. For methodological constraints, I will limit myself to the human side while another future work could be devoted to diagnosing financial practices within Moroccan universities. At the human level, the students, the teaching staff as well as the administrative faculty are the treasures of the university- treasures that should be concretely bucked up to do their best for the success and eminence of the university.

At the student level:

The student is, for sure, a major constituent in the governing process of the university life. Gone should be the days when the student was considered the weakest ring in the governing body of the university. I believe that the western hierarchy according to which the student is at the top line of the academic pyramid is a logical and beneficial concept. Students are leaders and professionals of tomorrow. As such, we need to get them involved in the management of university life by taking their opinions about new projects and ways to make their university life quite productive and rewarding. By doing so, we can surely find out that the students can generate priceless benefits to the university.

At the teaching staff level:

The university professor is definitely an instrumental component of the university governance process. I believe that any attempt to correct the Moroccan university's governing operations should definitely take into account the key and substantial contribution of the teaching staff. It is true that in the National Charter of Education and Training, there is an official admittance of the fact that no educational progress can take place without a genuine involvement of the professor. However, in order to move from the realm of words to that of deeds, I think that the university professors' criticisms and future plans should be deeply considered. For instance, the university professors should enjoy the absolute freedom and right to implement new learning programmes and subjects

which they think would enhance the academic profile of the Moroccan university. Hence, the university professor can turn from an executor of dictated policies to a suggestive force which can have a say in the governance of the university at all levels. Additionally, the Moroccan university is supposed to invest in the teaching staff given their strategic position within the higher educational system. In this regard, I suggest that the university teaching staff needs to be allocated more sizeable funds so they can create projects and enhance their academic profile by getting engaged in various international academic endeavors.

At the administrative staff level:

The governing body of the university is made of several players each of which has got a role to perform in order to elevate the quality of the Moroccan university governance. Gone should be the days when the administration used to take decisions single-handedly. A participative approach whereby all the participants affected by the decision contribute in taking it is an urgent must. It is true that the university administration is in a position to draw the overall road map of the university operations. However, it is more beneficial to get all the university actors, students' unions, professors and their unions involved in the governing styles and operations of the university.

Nevertheless, the role of the administrative staff remains significant because the administration, regardless of its entity, assumes the role of a coordinator between the different actors who are eligible to suggest practical measures to ensure the success of the governing practices at the university. Here, it is vital to specify that getting administration staff to update their skills and governance knowledge is mandatory for the Moroccan university. In fact, having a qualified administration that has a clear vision of the governing strategies and targets of the university will be conducive to a governing style capable of ensuring dynamic, sustainable and efficient future higher education in Morocco.

Thus, it is a chain relationship wherein every element affects and is affected by the rest of the chain constituents. Of course, the elements tackled above are part of the solution to work out a fruitful, dynamic governance system that not only boosts the reputation of the Moroccan university but also, and most importantly, guarantees the marketability of our students at national and international scales. Achieving dynamic governance at the university level, let us reiterate, is an ongoing process that requires long, collective and time-consuming efforts. However, let us not forget that "the longest journey begins with a single step" as the Chinese proverb goes.

CONCLUSION

Realizing that there exists little data in English about the issue of governance in non-western contexts, I try to explore different facets related to governance in general, and university governance in particular. The newness of this study lies in the fact that it takes the Moroccan university as a site of investigation. Adopting a researcher-bound analysis strategy, I start from a thorough examination of how the term governance has been defined and redefined by different scholars and international organizations. As explained in this paper, the concept of governance has evolved from a government-specific concept to a concept that claims the urgent need for collectivistic pro-activity wherein people from all walks of life and social positions contribute to wide-scale national development in the social, cultural, political and academic spheres.

In regard to higher education governance, I spotlight the working of tertiary education as a field that is supposed to serve as a locomotive for national durable progress. With particular focus on the Moroccan higher education system, I suggest some alternatives to make this sector all the more productive. In this respect, the elaboration of the National Charter of Education and Training stands out as a live example of how the elite circles in Morocco have tried to endow university governance with more dynamism and efficiency. Nonetheless, it seems that the aspirations of the charter-setters have not yet been met- a factual reality that can be clearly deduced from King Mohammed VI speech on the occasion of the Revolution of the King and the People (August 20th, 2013).

Taking this speech as data, I conduct a discursive analysis whereby I spotlight the implications of His Majesty's assessment of the flaws in the way the Moroccan higher education system has been operating. Accordingly, I find that king Mohammed VI is advocating a higher educational system that can boost the academic values of Moroccan universities, ensure the smooth insertion of university graduates in the job market and that constitutes a fertile site for collectivistic and continuous cooperation between governments regardless of how different their orientations and/or convictions might be. Through a discursive analysis of His Majesty's critical reading of the educational situation in Morocco, I put the accent on the idea that the existence of dynamic university governance is a primordial target for a large spectrum of the Moroccan population- a target that necessitates utmost consideration and active, collaborative efforts.

As a practitioner in the higher education sector in Morocco, I end my work with an opinion part in which I stress the need for more investment in the human capital at the university level. Of course, this does not necessarily mean that other corrective measures may be of minor importance. However, I believe that priority should be given to the following human assets: the student, the teaching personnel and the administrative staff. A real mutual involvement of these three components in the Moroccan university governance system would definitely be a strong step away from bureaucratic governance whereby decisions are unidirectional and most often fruitless and short-lived.

The findings of this study seem to be insightful in the sense that they unpack important parameters related to governance in Moroccan tertiary education. The Moroccan university is to be seriously reckoned with as a precious national heritage that needs to be nurtured and protected. Every single actor within the Moroccan university is in front of a historic moment in which she/he is invited to contribute so far may be possible in the implementation of a cooperative, dynamic and productive governance style.

The Corpus: Retrieved at Morocco World News.com

Except from King Mohamed VI Speech, The Revolution of the King and the People 60th anniversary, 2013. Dear Citizens,

Considering the current state of the education and training sector, we need to pause, assess achievements and pinpoint shortcomings and inadequacies.

I wish to stress, in this respect, the importance of the National Charter for Education and Training, which was adopted through a broad-based national participatory approach.

Successive governments have all worked on the implementation of this charter, particularly the last one, which deployed all the necessary means and resources to implement the Emergency Programme. However, it only engaged in this process during the last three years of its mandate.

Unfortunately, the gains made since this programme's implementation was started have not been consolidated. On the contrary, some of its basic components, namely aspects related to syllabus change, primary school curriculum and high schools of excellence, have been dropped, without consulting or coordinating with the parties concerned.

In view of the above, the current government should have capitalised on the positive experience gained in the field of education and training, especially as this is a crucial project that will span several decades.

It hardly makes sense for each government to come with a new plan every five years, and disregard previous programmes, particularly as no government will ever have the time, during a single mandate, to fully implement its project.

The education sector should, therefore, not be included in the sphere of purely political matters, nor should its management be subjected to outbidding tactics or party politics. Rather, it should be part of a cultural, economic and social approach aimed at training and preparing human resources who can be incorporated into a dynamic development process, through an efficient education system.

Dear Citizens,

This frank diagnosis of the education and training system in our country, which is prompted by a keen sense of honesty and responsibility, and which may seem rather harsh, is that of a caring father who, like any father, loves his children deeply.

Admittedly, your Servant does not experience the same social or material difficulties as some segments of the population do, but we all, dear citizens, have the same concerns regarding our children's education and face the same problems in connection with the education system, as our children pursue their studies in the same education system and follow the same syllabi.

What is important in this regard is not money, status or social class, but the conscience that guides every one of us, and his or her patriotism and keenness to serve the best interests of the nation.

When I was Crown Prince, I studied in the Moroccan state school system and later went to the Law School at the Mohammed V University.

It is true that the Royal College has means that regrettably not all state schools have. Nevertheless, generations of national executive staff have actually been trained through state school curricula.

I am indeed sad to note that the state of education is worse now than it was twenty years ago.

As a result, and in spite of their limited resources, a large number of families are compelled to pay huge fees for their children to study in foreign schools or private education institutions in order to avoid the pitfalls of the state school and enrol their children in an efficient system.

In this regard, I refer you to the address I gave last year, on the same occasion, in which I laid down the guidelines for the reform of the education system and called for the implementation of the constitutional provisions regarding the Higher Council for Education, Training and Scientific Research.

I call on the government to speed up the adoption of the necessary legal texts relating to the new council.

In the meantime, I have decided to set in motion the Higher Council for Education with its current composition, in accordance with the transitional provisions stated in the Constitution, in order to carry out an evaluation of the achievements of the National Charter for Education and Training ten years after its launch and tackle this major national issue.

I am being frank with you on this issue, dear citizens, because of the responsibility I bear as your leader. I belong to no political party and take part in no election. The only party I proudly belong to, thank God, is Morocco.

To me, all Moroccans are equal. I make no distinction, be it on the basis of social status or affiliation. As far as I am concerned, there is no difference between a bank manager and a person who is unemployed, between a pilot, a farmer and a minister. They all are citizens with the same rights and the same obligations.

Therefore, we need a broad-based, constructive debate on all the major issues of concern to the nation, in order to achieve the tangible results Moroccans are looking forward to. What we do not need are sterile, disgraceful disputes which lead nowhere, except to settling scores, defamation and calumny. Such disputes only make problems more complex, instead of solving them.

Dear Citizens,

Celebrating the anniversary of the glorious Revolution of the King and the People together with my birthday, amid my extended family whose members are you, loyal citizens, is a unique opportunity to show our respect and high esteem for the martyrs of independence and national unity, including first and foremost my revered grandfather His Majesty King Mohammed V, and my venerable father His Majesty King Hassan II. May they rest in peace.

It is also an occasion that should inspire all of us to do more to keep the flame of the renewed revolution of the King and the people alight, with a strong sense of patriotism, in order to achieve further unity, progress and comprehensive development.

Wassalamu alaikum warahmatullah wabarakatuh.

ABSTRACT

In this study, third and fourth grade primary school students' performance of measurement estimation in real life situations was examined. Participants were third and fourth grade students. Totally 330 (130 third grades and 200 fourth grades) students in two primary schools located in Istanbul in a middle socioeconomic neighborhood attended. The data were collected with a measuring instrument consisting of six questions including linear measurements of real objects (classroom door, their desks and their mathematics course book). According to the results of the study, it can be concluded that except the one question in every questions more than half of the students could not estimate the measurements of the objects correctly. Both third and fourth grade students estimated the measurement of the height of the classroom door. The performance of the students in the other five questions seems to be low. Another result of the study that both groups have issues while estimating measurements of the real life situations

Key words: Estimation, measurement estimation, elementary school student

INTRODUCTION

There are many important mathematical skills students should have in elementary school. Estimation is one of the most important skills that used in many occasions of daily life and activities related to mathematics education. In such situations, for example if we are shopping or in a restaurant and there is no paper and pencil then we tried to estimate the money that we will pay or in solving a mathematical problem we sometimes estimate the results of problems as well. Estimation is a process rather than content knowledge in the mathematics curriculum, and it applies to several strands (Bana & Dolma, 2004). In many document importance of estimation skills are emphasized (NCTM, 2000; MEB, 2009; MEB, 2015). In estimating, students demonstrate their understanding of number magnitude, number relationships, and the meaning and effect of operations (Alajmi, 2009). Estimation serves as an important companion to computation. It provides a tool for judging the reasonableness of calculator, mental, and paper-and-pencil computations (NCTM, 2000).

There are different estimation types defined in the literature. Some researchers classified estimation as computational and measurement estimation (Segovia & Castro, 2009; Çilingir & Türnüklü, 2009). Some researchers divided estimation into three categories: numerosity, measurement, and computational estimation (Sowder, 1992; Hanson & Hogan, 2000). Hildreth (1983) indicated that because of the three reasons such as (1) Estimation practice helps students develop a mental frame of reference for the sizes of units of measure. (2) Estimation is a useful, practical skill and (3) Estimation is an activity that provides practice with basic proper ties of measurement, measurement estimation should be in the curriculum. The ability to estimate also provides a way to quickly judge the reasonableness of answers obtained by actual physical measurements or to assess the validity of a particular measurement method. Estimation also plays an important role in learning both the principles and procedures of measurement (Gooya et al., 2011).

Measurement estimation to judgments made about the value of a certain quantity or the result that would be found by taking a measurement (Segovia & Castro, 2009). Towers and Hunter (2010) defined measurement estimation as a complex domain, relying on teachers' and students' capacities to integrate measurement concepts and estimation capabilities. As cited in Gooya et al. (2011) measurement estimation can be described as making a measurement without using measurement tools. Sowder (1992) defined measurement estimation such as "measurement estimate can be made without using any arithmetic operations, although some simple ones are frequently involved".

Measurement estimation is an important real-life skill (Gooya et al. 2011). The conceptual prerequisites for measurement estimation fall into two categories: logical reasoning processes described by Piaget and knowledge of specific measurement concepts (Joram, Subrahmanyam & Gelman, 1998). For developing measurement estimation skills of students it is necessary to develop their logical reasoning and knowledge of measurement concepts. In NCTM (2000) it is indicated that estimation activities in prekindergarten through grade 2 should focus on helping children better understand the process of measuring and the role of the size of the unit. Elementary school and middle-grades students should have many opportunities to estimate measures by comparing them against some benchmark. According to Turkish National Mathematics curriculum (MEB, 2015) there are several requirements related with estimation in measurement for primary school students. At the end of the fourth grade, students are able to estimate a length using most appropriate measurement unit. Also, one of the general aims of Turkish national education is to develop students' estimation skills.

Measurement estimation requires the participant to provide estimates of length, height, weight, liquid capacity, and similar measures, usually for common objects in the environment. Typical items include estimates of the weight of a car or pencil, the height of a building, the length of a rope, and the perimeter of a field (Hogan & Brezinski, 2003). Length measurement is called also linear measurement. The estimation of linear measurement involves applying an imagined standard or non-standard length unit to mentally quantify a given segment, object, or path (Chang et al., 2011).

In this study, it was aimed to find out estimation performance of the third and fourth grade students about length and height measurements of classroom door, desk and math course book. In this context, the answers of following questions were examined.

- What are the third grade students' estimation performance related to length and height measurements of classroom door, desks and math course book?
- What are the fourth grade students' estimation performance related to length and height measurements of classroom door, desks and math course book?

THE STUDY

Method

Totally 330 (130 third grades and 200 fourth grades) students in two primary schools located in Istanbul in a middle socio-economic neighborhood attended in the study.

Data collection

Data were collected through a measurement estimation task consisting of six questions related to estimate length and height measurements of classroom door, desk and math course book. Before the data collection, expert opinions on questions were taken. The experts indicated that data collection instrument was appropriate for the third and fourth grade primary students. Data were collected by researchers with one lesson hour for each class in spring semester of 2016-2017 academic year. All students voluntarily agreed to participate this study.

Data analysis

All responses of students were listed and categorized. Responses to real measurements at 20% prediction interval were accepted as the correct estimate by researchers. This 20% prediction interval was determined by researchers. Frequency and percentage of responses were calculated and given as table.

FINDINGS

Responses of third grade students related to length and height measurements of classroom door, desks and math course book were given in Table 1.

Table 1. Responses of third grade students related to length and height measurements of classroom door, desks and math course book

Questions	Real Measurements	Approximately 20% estimation (cm)	f	%	Upper 20% estimation (cm)	f	%	Real response		Issue	
								f	%	f	%
1	195 cm: The height of the door	156-234	76	58.46	Less than 156 or more than 234	45	34.61	2	1.53	7	5.38
2	92 cm: The length of the door	73.6-110.4	44	33.84	Less than 73.6 or more than 110.4	68	52.30	-	-	18	13.84
3	107 cm: The height of the desk	85.6-128.4	29	22.30	Less than 85.6 or more than 128.4	41	31.53	-	-	60	46.15
4	45 cm: The length of the desk	36-54	21	16.15	Less than 36 or more than 54	83	63.84	-	-	26	20
5	27 cm: The height of the math course book	21.6-32.4	29	22.30	Less than 21.6 or more than 32.4	78	60	3	2.30	20	15.38
6	19 cm: The height of the math course book	15.2-22.8	22	16.92	Less than 15.2 or more than 22.8	67	51.53	4	3.07	37	28.46

Table 1 shows that very few third grade students could mention real measurements of the classroom door, desk and math course book. Among the six questions, the most correctly answered question (%58.46) was the first question including measurement estimation of the height of the door. Measurement estimation of the length of the desk question was least-answered (%16.15) question. Responses in the range of 20% greater than actual measurements were considered as no measurement estimation. Some of the responses did not reflect the measurement estimation for that reason those responses were coded as issue.

Responses of fourth grade students related to length and height measurements of classroom door, desk and math course book were given in Table 2.

Table 2. Responses of fourth grade students related to length and height measurements of classroom door, desks and math course books

Questions	Real measurements	Approximately 20% estimation (cm)	f	%	Upper 20% estimation (cm)	f	%	Real response		Issue	
								f	%	f	%
1	195 cm: The height of the door	156-234	127	63.5	Less than 156 or more than 234	49	24.5	15	7.5	9	4.5
2	92 cm: The length of	73.6-110.4	82	41	Less than 73.6 or more than	102	51	5	2.5	11	5.5

	the door				110.4								
3	107 cm: The height of the desk	85.6-128.4	90	45	Less than 85.6 or more than 128.4	77	38.5	7	3.5	26	13		
4	45 cm: The length of the desk	36-54	50	25	Less than 36 or more than 54	124	62	4	2	22	11		
5	27 cm: The height of the math coursebook	21.6-32.4	45	22.5	Less than 21.6 or more than 32.4	125	62.5	8	4	22	11		
6	19 cm: The height of the math coursebook	15.2-22.8	65	32.5	Less than 15.2 or more than 22.8	98	49	9	4.5	28	14		

As seen from the Table 2 very few fourth grade students could mention real measurements of the classroom door, desk and math course book. Among the six questions, the most correctly answered question (63.5%) was the first question including measurement estimation of the height of the door. Measurement estimation the height of the math coursebook question was least-answered (22.5%) question. Responses in the range of 20% greater than actual measurements were considered as no measurement estimation. Some of the responses did not reflect the measurement estimation for that reason those responses were coded as issue.

CONCLUSIONS

Being one of the most important skills that used in many occasions of daily life and activities related to mathematics education is measurement estimation. In NCTM (2000) it is recommended that “students should be encouraged to explain their thinking frequently as they estimate. Length measurement estimation ability provides a way to quickly judge the reasonableness of answers obtained by actual physical measurements. The main aim of this study was to assess the performance of third and fourth grade elementary school students in estimating in real life situations of classroom door, desk and their math course book.

As a result of the study it can be concluded that both third and fourth grade students estimated the measurement of the height of the classroom door. The performance of the students in the other five questions seems to be low. Another result of the study that both groups have issues while estimating measurements of the real life situations. There may be many reasons for that issue. It may be due to logical reasoning or knowledge of specific measurement concepts being of conceptual prerequisites for measurement estimation (Joram, Subrahmanyam & Gelman, 1998). As Towers & Hunter (2010) emphasized measurement estimation is a complex domain because it relies on teachers’ and students’ capacities to integrate measurement concepts and estimation capabilities. When comparing the classroom levels, third grade students have more issues than fourth grade students.

Much more measurement activities can be placed in elementary school mathematics curriculum. Moreover, what kind of strategies they preferred to use while estimating measurement of real objects should be investigated. Furthermore, students should be motivated to apply imagined standard or non-standard length unit to estimate measurements.

Evaluating the Effectiveness of a Bespoke Training Intervention in Neonatal Resuscitation Training in Zambia – Establishing Grounds For Further Rollout

Faith KAYEMBE

faith.kayembe@canterbury.ac.uk

BACKGROUND

Funding has been secured to support the evaluation of a model of neonatal resuscitation training in Zambia. This is preceded by a neonatal care scoping exercise which was undertaken in summer 2015. One of the suggestions made in the scoping report* was the need to improve staff knowledge and skills in neonatal resuscitation. Therefore, a bespoke programme was developed and delivered to 50 relevant health care professional in Zambia in summer 2016. This employed an outreach strategy and a train the trainer approach to enhance sustainability. It was also hoped that a rolling programme of neonatal resuscitation training would be created to ultimately contribute towards the improvement of neonatal morbidity and mortality rates which are among the highest globally (Central Statistical Office (CSO) 2015; Chisunka 2013). A review of immediate post training outcomes was overwhelmingly positive, as well as an average 20% increase in staff knowledge as measured by pre- and post training test scores*.

Aims:

The current focus of the project is to evaluate wider elements of the effectiveness of the educational intervention. Effectiveness in this context includes a range of pedagogical and continuing professional development outcomes including the following: evidence of further training undertaken by the trainers; more staff trained since the initial training; the quality and integrity of training has been maintained, as observed using an appropriate tool; positive impact on trainee knowledge as evidenced by pre- and post- training test results; that the goals set by the trainers to improve aspects of neonatal care provision in their respective clinical areas have been reasonably met*; and that there may be other evidence of positive change in clinical practice as a result of the training.

The project will therefore seek to answer the following questions:

- What further trainings have been undertaken beyond the initial, and how many more staff have been trained?
- How effective have these been in regards to impact on knowledge and skill attainment?
- How well has the quality of training been maintained?
- In what ways have the goals that were set by the trainers been achieved?
- Is there anything that has changed in practice as a result of the training?

METHODOLOGY:

Fundamentally an approach that evaluates outcomes of an intervention, considers a range of data including qualitative and quantitative, and seeks to answer cause and effect, whilst considering the unique individual context of the subject, will be considered. The latter, together with the opportunity for triangulation through multiple sources of evidence probably makes the case study (Cronin 2014) most suited for this work.

Methods:

The following methods will be used:

- Interviews – of trainers (to determine how much training has been delivered; consider progress towards achievement of goals); candidates at the training session will be asked about how the training has affected their knowledge and skills. Focus groups using a semi-structured questionnaire will be undertaken.
- Observation of training undertaken by the trainers (utilising an appropriate tool to determine the quality of training)
- Document review – records of training to review numbers of staff that have been trained and how much training has so far been delivered; records of pre and post- training knowledge test scores of staff that have been trained to determine effectiveness of training; and a review of the clinical practice reflective logs provided at initial training.

Data analysis

Qualitative elements of the data, for example interviews, will be analysed using thematic analysis drawing out key themes from the findings. The NVivo software will be considered for this process (Leech & Onwuegbuzie 2011).

Appropriate statistical tools will be used to analyse the numerical data to establish change between pre- and post-training test scores thus demonstrating in one way whether learning has occurred. Written consent will be obtained from participants and anonymity will be maintained (Cowan 2009).

Research Ethics

Ethical requirements to support this undertaking have been appropriately addressed.

ABSTRACT

The aim of this study is to present the results of the evaluating process confirming whether the proactive and preventive coping scales are both unidimensional constructs as measured by the Proactive Coping Inventory. The construct validity was empirically confirmed in part using an exploratory and confirmatory factor analysis with data from 125 graduate students from a medium-sized private university in the Southwestern United States. Moreover, item analysis and intercorrelations between the coping scales, social support, well-being and depression were carried out. The present study broadens our knowledge in the field of future-oriented behavior by which challenges are not appraised as negative threats. Instead, they are perceived positively and motivate people to overcome the stressful situations.

INTRODUCTION

Coping is traditionally seen as a set of reactive behaviors or strategies engaged subsequent to the experience of stress. However, more recently, the concept of coping has come to include behaviors undertaken prior to or in preparation for the stressful situation actually occurring. For its positive approach to dealing with stressors, positive promotion of health (Taylor et al., 2000) and creation of constructive habits for improving quality of life and preventing psychological pathology (Seligman & Csikszentmihalyi, 2000) proactive coping is being explored across various sectors and industries. In this time of widespread sociocultural dynamism, proactive coping has become an important strategy for responding to both familiar and unanticipated stressors.

Individuals of any age can benefit from proactive coping concerning study- or work-related stress or personal burnout. The target group consists of graduate students experiencing high demands and intense pressures as a result of their studies; specifically, students entering helping professions (social workers, healthcare workers, teachers, etc.), stand to benefit substantially from those proactive coping mechanisms which focus on quality-of-life management. Self-confident, optimistic individuals who believe in their own abilities and harbor a realistic and positive sense of self-worth may be more likely to practice conscientious health habits, (Aspinwall & Taylor, 1997; Greenglass, 2008) which can then be transposed into their job-related activities.

Proactive coping strategy is anticipatory and future-oriented because the stressful events have not occurred yet (Gan, Yang, Zhou, & Zhang, 2007). It draws on general emotional resources which facilitate promotion of self-directed goals and personal growth, perceiving difficult situations as challenges rather than potential sources of harm or loss. Moreover, proactive copers have a clear, concise vision of the stress experience, in which coping becomes a form of goal management (Greenglass, 2008). Additionally, proactive coping and preventive coping feature characteristics similar to one another, such as resource accumulation, interpersonal- and functional skill development, and long-term planning. However, concerns are more evident in preventive coping behavior than in proactive coping. Preventive coping may be defined as an anticipation of potential stressors, commencement of preparation, and risk management before these stressors – various unknown risks – develop fully.

In order to measure proactive and preventive coping, the Proactive Coping Inventory (PCI; Greenglass et al., 1999) was developed. This multidimensional coping inventory integrates utilization of social resources, self-regulatory goal attainment, strategic planning, emotional and instrumental support seeking, reflective coping and avoidance coping. Researchers have largely implemented PCI within various empirical settings and the latent structure of the whole instrument (Almássy, Pék, & Papp, 2014; Bhushan, Gautam, & Greenglass, 2010; Renard & Snelgar, 2014; Vaculíková, 2016) as well as its separate dimensions have been widely tested (Drummond & Brough, 2016; Sohl & Moyer, 2009).

In the case of proactive and preventive coping, some studies have recognized them together in a unidimensional factor structure (Gan et al., 2007; Greenglass, Schwarzer, & Taubert, 1999; Roesch et al., 2009), and others have recognized the two constructs being multidimensional (Lopez & Cunha, 2008). Although the same instrument measuring proactive and preventive coping was used the number and nature of items vary across studies. For example, Drummond and Brough (2016) reported evidence that in younger samples, proactive and preventive coping are distinct from each other, yet the conceptual distinctions may not be supported empirically in older and more educated samples. Therefore, possible reasons for these discrepancies, besides type of analyses used, might be related to the samples utilized in each study. Based on the mixed results on the dimensionality of the respective proactive and preventive coping and based, too, on the increasing use of these constructs in the current research, this study tests the hypothesis which questions their construct validity.

METHOD

Participants

The University Human Resources Ethics Committee and Institutional Review Board of the participating university issued permission to conduct research. All participating students were invited to participate individually on a voluntary basis and the data selection was conducted via online questionnaire.

The sample was comprised of 125 graduate students from a medium-sized private university in the Southwestern United States. Final questionnaires were selected for use from students aged 21 to 39 years ($M = 29.74$, $SD = 6$). 21 males with an average age of 29.6 years (age ranged from 23 to 39 years, $SD = 5.73$) and 87 females with an average age of 29.8 years (age ranged from 21 to 39 years, $SD = 6.09$) participated in the study. Approximately two thirds of respondents were full-time graduate students (72, 66.7%) and 36 (33.3%) of respondents were part-time graduate students in helping professions. 17 respondents did not identified gender or type of study.

Measures

Measure of proactive and preventive coping. The Proactive Coping Inventory (PCI; Greenglass et al., 1999), was implemented to measure proactive and preventive coping with referred Cronbach α 's ranging from .80 to .85 (proactive coping subscale), and between .79 and .83 (preventive coping subscale). Fourteen items within the proactive coping subscale include self-regulatory goal-attainment cognition and behavior (item examples: "I turn obstacles into positive experiences", or "If someone tells me I can't do something, you can be sure I will do it"). Ten items falling on the preventive coping subscale (item examples: "I plan for future eventualities", or "I think ahead to avoid dangerous situations") are directed toward a potential but uncertain threat in the future by drawing on existing experience, knowledge, or anticipation (Greenglass, 2008). A four-point Likert scale was used with point 1 assigned to "not at all true", 2 to "barely true", 3 to "somewhat true", and 4 to "completely true". There were three reversed items on the proactive coping subscale (i.e., "When I have a problem, I usually see myself in a no-win situation", "I often see myself failing so I don't get my hopes up too high", and "I try to let things work out on their own") that were recoded before conducting further analysis. A mean score was calculated to assess proactive coping and preventive coping behavior (ranging from 1 to 4).

Measure of social support. The MOS Social Support Survey (MOS; Sherbourne & Stewart, 1991) was used with a four-point scale ranging from 1 "none of the time" to 4 "most of the time". Items are spread across four dimensions

of social support, more precisely: emotional/informational support, tangible support, affectionate support, and positive social interaction with additional item of measuring support of an activity partner to provide mental distraction. The question asks how often each of these types of social support are available to respondents should the need arise, with higher scores indicating greater availability of support. An example item is “Someone to confide in or talk to about yourself or your problems”, or “Someone to help you if you were confined to bed”. The Cronbach’s alphas all exceeded .90 with the CFA model representing an adequate fit to the data (Robitaille, Orpana, & McIntosh, 2011). A mean score was calculated to assess social support (ranging from 1 to 4).

Measure of well-being. The Schwartz Outcomes Scale-10 (SOS-10; Blais et al., 1999) was used to measure psychological well-being over the past two weeks. A four-point scale ranging from 1 “never” to 4 “all or nearly all of the time” was employed with a higher score representing greater well-being. An example item is “I have confidence in my ability to sustain important relationships,” or “My life is progressing to my expectations.” The measure is suitable for respondents 17 years old and up and assesses five key areas, including life satisfaction, positive self-appraisal, optimism, interpersonal effectiveness, and the absence of psychiatric symptoms. A test-retest reliability of .86 and .87 and Cronbach’s alphas ranging from .84 to .96 were reported. A mean score was calculated to assess well-being (ranging from 1 to 4).

Measure of depression. The existence of symptoms of depression were measured with the 18-item Clinically Useful Depression Outcome Scale (CUDOS; Zimmerman, Chelminski, McGlinchey, & Posternak, 2008). The measure was studied under research conditions in more than 1,400 psychiatric outpatients and found that the scale had high internal consistency and test-retest reliability in evaluating the quality and efficiency of care in clinical practice. Included items assess all of the DSM-IV inclusion criteria for major depressive disorder and dysthymic disorders as well as psychosocial impairment and quality of life. A five-point Likert scale ranging from 1 “not at all true” to 5 “almost always true” was used. A mean score was calculated to assess depression (ranging from 1 to 5).

Research methodology

The main objective of the presented research is to verify construct validity and internal consistency of proactive and preventive coping behavior sets as measured by selected scales of the PCI. First, confirmatory factor analysis (CFA) was used to test the factor structure gleaned from prior research and theory (Greenglass et al., 1999). A good model fit was assessed by the χ^2 , the chi-square to degrees of freedom ratio (χ^2/df), and GOF indexes: the Root Mean-Square Residual (RMR), the Comparative Fit Index (CFI), the Goodness-of-fit Index (GFI), the Root Mean Square Error of Approximation (RMSEA), the Adjusted Goodness-of-fit Index (AGFI), and the p of Close Fit (PCLOSE). The cut-off levels of mentioned indexes were checked to determine the model fit (Schreiber, Stage, King, Nora, & Barlow, 2006).

Second, exploratory factor analysis (EFA) was used to explore the latent factor structure of the data that did not support the latent structure mentioned by the theory and research in the first step. The number of remaining factors was based on a visual inspection of the Catell’s scree plot and a combination of the Kaiser–Guttman criterion. The principal component analyses (PCA) with the Oblimin rotation were used. The decision to remove the item from the scale was based on: (1) item loadings below .40, and (2) cross-loadings on more than one factor above .40. The purpose of this setting is to make the orientation in the resulting structure more transparent by excluding values nonessential to interpretation of the factors. Stevens (2002) recommends setting a limit value of the item loadings of .40. A clear interpretation of the factors, although failing to display some lower statistically significant factor loadings, is desirable since the statistical significance of factor loadings is not decisive for the purpose of the factors’ interpretation.

RESULTS

Data preparation

Data cleaning indicated occurrence of invalid responses, missing values or errors created during transcription into the SPSS data matrix. The hypothesis that data are missing completely at random was satisfied prior to replacing missing values with Expectation Maximization (EM) imputation technique. The data had a non-significant Little's Missing Completely at Random (MCAR) test, clarifying the use of the EM algorithm to replace missing values with predicted values (Field, 2005). The discriminant validity was calculated by a correlation coefficient within a variables: subjective well-being, feelings of depression, and social support. Preliminary analyses were checked to ensure analysis assumptions. AMOS v. 21 and SPSS v. 22 were used.

Confirmatory factor analysis

The model fit was tested by CFA using a maximum likelihood method (see Figure 1). First, goodness-of-fit (GOF) statistics were calculated; $\chi^2(df = 251, p = .00) = 1831.3$, $\chi^2/df = 7.3$, RMR = .04, RMSEA = .22, CFI = .31, GFI = .67, AGFI = .61, and PCLOSE = .00 pointed out that the model was not fit with the expected level. Moreover, factor loading of each item from the proactive coping varied between .11 (item 8) to .75 (item 53), and .24 (item 11) to .73 (item 18) from the preventive coping.

In the next step, three error covariances were added between these items existing in the same factor (e16-e24, e6-e8, and e4-e12). Results of the second analyses, $\chi^2(df = 248, p = .00) = 1765.7$, $\chi^2/df = 7.12$, and their GOF indexes values RMR = .04, RMSEA = .22, CFI = .34, GFI = .69, AGFI = .63, PCLOSE = .00 pointed out that the model still was not fit with the expected level. Therefore, the third analyses was conducted after deleting item 8 and 11 for their very low factor loadings. Results of the analyses, $\chi^2(df = 206, p = .00) = 1652.5$, $\chi^2/df = 8.02$, and their GOF index values RMR = .04, RMSEA = .24, CFI = .34, GFI = .70, AGFI = .64, PCLOSE = .00 pointed out that the model still was not fit with the expected level. On this basis, exploratory approach in the following analyses was implemented to find out what was being measured by the PCI

Figure 1: Factor model of the proactive and preventive coping scales

Exploratory factor analysis

The internal consistency was calculated using Cronbach's alpha coefficient. Prior to performing PCA, the Kaiser-Meyer-Olkin Measure of Sampling Adequacy (KMO) value was checked. KMO of .72 exceeded the recommended value of .60 (Kaiser, 1960) and the Bartlett's Test of Sphericity reached statistical significance ($\chi^2(276) = 2372.13, p < .001$), supporting the factorability of the correlation matrix.

Computed PCA revealed the presence of seven components with eigenvalues exceeding 1, explaining 69% of the variance, ranging from 30% to 4%. However, an inspection of the scree plot revealed a clear break after the second component and the pattern matrix did not show an interpretable structure. On this basis, the Oblimin rotation was implemented, yielding an interpretable two-factor structure with items falling into the proactive coping or preventive coping factor. An exception was reversed item 35 (“When I have a problem, I usually see myself in a no-win situation”) and item 47 (“I plan strategies for what I hope will be the best possible outcome”) from preventive coping falling into proactive coping factor. However, both items deal with future threats by envisioning the situation and planning the next steps before the threat fully develops. Therefore, these might better correspond to the proactive coping factor, showing that respondents did not evaluate planning future actions as a preventive but rather as a proactive outcome that is deepening positive motivation.

The two-factor solution accounted for 41% of the variance, comprised of factors measuring proactive coping (12 items) and preventive coping (9 items). Moreover, item 15 (“After attaining a goal, I look for another, more challenging one”), item 8 (“I try to let things work out on their own” – reverse scored), and item 1 (“I am a “take charge” person”) did not load on any of the factors, resulting in their deletion. Discrepancies of the PCI items have been previously mentioned across a range of varied samples from different cultures (Gan et al., 2007; Lopez & Cunha, 2008; Roesh et al., 2009; Wu, Chen, & Yao, 2008). The factor loadings of the proactive coping (F1) and preventive coping (F2) factors and their descriptive characteristics are displayed in Table 1.

Table 1: Pattern Matrix for PCA with Oblimin Rotation on 2-factor Solution

No. Item*	F1	F2	h^2	$M (SD)$	$\alpha-i$
33. Despite numerous setbacks, I usually succeed in getting what I want.	.86		.68	3.54 (.50)	.88
35. When I have a problem, I usually see myself in a no-win situation. (r)	.83		.64	3.34 (.54)	.88
54. When I experience a problem, I take the initiative in resolving it.	.78		.61	3.47 (.52)	.88
41. I always try to find a way to work around obstacles; nothing really stops me.	.72		.51	3.24 (.60)	.88
51. I turn obstacles into positive experiences.	.67		.48	3.36 (.56)	.88
37. I try to pinpoint what I need to succeed.	.66		.49	3.50 (.55)	.88
22. I like challenges and beating the odds.	.57		.38	3.33 (.67)	.88
48. When I apply for a position, I imagine myself filling it.	.55		.35	3.61 (.56)	.88
55. I develop my job skills to protect myself against unemployment.	.52		.34	3.63 (.49)	.88
28. I visualise my dreams and try to achieve them.	.50		.36	3.45 (.62)	.88
53. If someone tells me I can't do something, you can be sure I will do it.	.43		.37	3.23 (.62)	.88
47. I plan strategies for what I hope will be the best possible outcome.	.42		.38	3.55 (.47)	.88
43. I think ahead to avoid dangerous situations.		.66	.57	3.50 (.58)	.88
18. I prepare for adverse events.		.66	.59	3.18 (.65)	.88
45. I often see myself failing so I don't get my hopes up too high.		.61	.50	3.38 (.62)	.88
4. I plan for future eventualities.		.58	.34	3.50 (.62)	.89
50. I try to manage my money well in order to avoid being destitute in old age.		.57	.31	3.31 (.70)	.89

30. I plan my strategies to change a situation before I act.	.55	.35	3.37 (.58)	.88
25. Before disaster strikes I am well-prepared for its consequences.	.51	.34	2.95 (.53)	.88
11. Rather than spending every cent I make, I like to save for a rainy day.	.50	.24	3.16 (.70)	.89
39. I make sure my family is well taken care of to protect them from adversity in the future.	.43	.42	3.44 (.58)	.88
Cronbach's alpha	.88	.81		.89
Number of items	12	9		21
<i>M (SD)</i>	3.41 (.37)	3.24 (.41)		
Eigenvalue	7.4	2.5		
Explained variance in %	31	10		

Note: * = presented numbers of the items correspond to the original order of the PCI; (r) = reversed items; h^2 = Communalities; *M* = Mean; *SD* = Standard deviation; α -*i* = Cronbach alpha if the item is deleted.

The best explained variability of the two factors was in variable 33 (“Despite numerous setbacks, I usually succeed in getting what I want”) and variable 35 (“When I have a problem, I usually see myself in a no-win situation” – reverse scored). Further inspection of the item-total correlations showed that measured items fit the meaning of the averaged measure, i.e. the correlation coefficients did not increase after deleting the items from the subscales.

Proactive coping and preventive coping can differentially enable students to perceive demanding situations in college life as personally challenging. According to the results, the central values of the proactive coping ($M = 3.41$, $SD = .37$) and preventive coping ($M = 3.24$, $SD = .41$) of the four-point scale used in the survey, ranging from not at all true (point 1) to completely true (point 4), lie above the midpoint of the scale. The differences in the mean values of the proactive and preventive coping are statistically significant, $z = -4.76$, $p < .001$, with a large effect size ($r = .43$). The result suggests that respondents are higher on proactive coping compared to preventive coping. Thus, on average students deal with future threats largely by employing these coping strategies.

Furthermore, reliability of the new 2-factor model fit reached a good internal consistency of $\alpha = .89$ covering 21 items. More specifically, proactive coping reached $\alpha = .88$ (12 items) and preventive coping $\alpha = .81$ (9 items). Taken together, EFA suggests that the general model representing students enrolled in the formal education system from the Southwestern United States with two factors covered by 21 items is a reasonable representation of the data.

Correlations

Discriminant validity of the proactive and preventive scale was further investigated by calculating the correlations between the coping scales and other psychological variables representing social support, well-being and signs of depression. First, positive relationship among the social support, well-being and revised coping scales was expected, as these measurements represent improved psychological outcomes. Conversely, negative relationship with the measured signs of perceived depression and positive outcomes of revised scales was highly anticipated.

Preliminary analysis using Shapiro-Wilk test ($p < .001$) and Kolmogorov-Smirnov test ($p < .001$) showed that the data are not normally distributed. Therefore, Spearman's ρ coefficient was calculated (see Table 2). The findings showed a large significant positive correlation between proactive and preventive coping ($r_{rho} = .50$, $p < .001$, $r^2 = 25\%$), as expected. Proactive coping also positively and significantly correlated with well-being ($r_{rho} = .29$, $p < .001$, $r^2 = 8\%$) and negatively correlated with depression; the latter, however, did not reach a statistically significant extent. Preventive coping was positively associated with mentioned well-being ($r_{rho} = .38$, $p < .001$, $r^2 = 14\%$) and also with social support ($r_{rho} = .25$, $p < .001$, $r^2 = 6\%$). Moreover, age of respondents did not reach statistical significance, showing relative independence of usage of coping strategies by respondents and their age.

Table 2: Intercorrelations between the Coping Subscales, Social Support, Well-Being, Depression, and Age

Variables	Measurement	<i>M (SD)</i>	Proactive coping	Preventive coping
Proactive coping	PCI	3.41 (.37)	(.88)	
Preventive coping	PCI	3.24 (.41)	.502**	(.81)
Social Support	MOS	2.26 (1.66)	.149	.248**
Well-being	SOS-10	2.24 (1.62)	.294**	.378**
Depression	CUDOS	1.18 (.94)	-.038	.152
Age	Age in years	29.74 (6)	.148	.018

Note: ** = $p < .01$. Alpha coefficients are presented on the diagonal.

DISCUSSION

Proactive and preventive coping are future-oriented constructs dealing with stressful events that are not yet present (Schwarzer & Taubert, 2002). While some studies have recognized uni-dimensional latent factor structure (Gan et al., 2007; Greenglass, Schwarzer, & Taubert, 1999; Roesch, Aldridge, Huff, Langner, Villodas, & Bradshaw, 2009), others have confirmed a multi-dimensional nature (Lopez & Cunha, 2008). Therefore, the primary purpose of this study was to examine the psychometric properties of the proactive and preventive coping scales as measured by PCI for a sample of American graduate students. The distinction of the proactive and preventive coping measured by the PCI (Greenglass et al., 1999) was tested using CFA and EFA. The presented results of the analyses are somewhat ambiguous.

The hypothesis that observed variables can be explained by two latent variables (factors) was investigated using CFA. Together, three CFAs were performed. Results of the analyses pointed out that the model was not fit with the expected level. On this basis, EFA was employed to find out what was measured by the PCI. Prior to performing PCA, the KMO value and the Bartlett's Test of Sphericity were checked supporting the factorability. The final two-factor solution covering proactive coping (12 items) and preventive coping (9 items) accounted for 41% of the variance. Moreover, item 1, item 8, and item 15 were deleted for their low factor loadings. Furthermore, reliability of the revised coping scales reached a good internal consistency of $\alpha = .89$. More specifically, proactive coping reached $\alpha = .88$ (12 items) and preventive coping $\alpha = .81$ (9 items). Taken together, EFA suggested that the general model representing students enrolled in the formal education system from the Southwestern United States with two distinct factors covered by 21 items is a reasonable representation of the data. However, this result was not supported by CFA in the previous steps.

Discriminant validity of the revised scales was further checked. Correlation coefficients between the coping scales and social support, well-being, and depression were calculated and the relationships between measured personality variables and coping scales were only partly confirmed. There, is however, contention in the literature regarding similar inconsistent correlations with personality and psychological strain across samples (Dunkel-Schetter, 1984; Gan, Hu, & Zhang, 2010; Greenglass & Fiksenbaum, 2009; Holland & Holahan, 2003). Those who employ coping strategies based on proactive and preventive skills more often perceive well-being and, in the case of preventive coping, also dispose of a wide social support. Surprisingly, revised coping scales were not associated with decreasing tendency of feelings of depression as mentioned otherwise (Almássy et al., 2014). Therefore, in this case, being proactive did not seem to influence perceived level of psychosocial impairment in the form of depression. The different findings may be due to respondents' sociodemographic differences, i.e. their lower age and a narrow study specialization in helping professions.

There are several limitations to the current study that should be acknowledged. First, the study privileged female respondents' input due to their majority representation in the population. Second, the current findings apply only to graduate students with similar demographic characteristics. Moreover, results might have been slightly different if there were no missing values with no valid imputation technique needed. Additionally, the PCI scales do not measure all dimensions of proactive coping and are dispositional. Therefore, specific external stressors can cause different responses (Roesch et al., 2009). Lastly, the sample size should be greater than 100 and 5 times the number

of items. However, even sample sizes on the order of 50 respondents can be taken as a reasonable absolute minimum (Winter, Dodou, & Wieringa, 2009). Employment of the CFA followed by the EFA is, in practice, less frequent. Since the latent nature of the presented data was not known, this procedure is seen as adequate.

Conclusions

This study contributes to the recent discussions on factorial structure and the unidimensionality of proactive and preventive coping as measured by the PCI. The mixed evidence in support of their independent factor structure is provided. Presented investigation of the psychometric properties of the PCI subscales suggests serious refinements of these two scales are in order. Future research involving large-sized samples with separate structure testing by influencing sociodemographic characteristics (such as gender, age, study specialization, etc.) could generate results elucidating what significantly differentiates the factor structure. Moreover, subsequent empirical verification of the constructs on the population may expand our knowledge of the theoretical and empirical distinction between the proactive and preventive coping strategies.

ABSTRACT

The current study aimed to evaluate the classroom teachers' opinions about in-service training process. Thus, the current study was designed as a descriptive case study. A total of 28 classroom teachers constituted the sample group of the research. The research process was carried out on the classroom teachers working in state elementary schools in the city of Muğla. A semi-structured interview form was used as the data collection tool in the research and the data were collected through focus group interviews. The results showed that teachers experienced significant problems related to in-service trainings and they found such trainings useful for their professional development. Moreover, the teachers made different suggestions for the improvement of these trainings.

Keywords: Classroom teachers, in-service training, teacher opinions

INTRODUCTION

It seems to be a must for individuals to update themselves according to developments and changing conditions during their professional lives as well as during their pre-service training to be able to adapt to the society and to perform a particular job. Institutions where individuals work are as important as their personal endeavor for their professional development. Individuals' in-job training is called in-service training. In-service training is the training given to individuals employed in workplaces belonging to private or legal organizations for them to acquire knowledge, skills and attitudes required by their duties (Taymaz, 1981). In-service training also aims to provide employees with the knowledge, skills and attitudes that will enable them to be more successful, productive and happy in their profession (Gültekin & Çubukçu, 2008). It will be possible to achieve the desired outcomes during the educational process by providing teachers who are the basic element of education with opportunities to constantly renovate themselves through in-service and professional development trainings to be scientifically organized and conducted (Erisen, 1998). In other words, the ability of teachers to do their jobs best can only be improved through in-service training programs. The in-service training programs to be applied to teachers also have a very important place in terms of their personal and professional development and the continuity of the education.

One of the most important elements that make an education system effective is teachers trained with quality education. Seen from this perspective, the effectiveness of the learning-teaching process seems to depend on the quality of in-service training as well as of pre-service training. However, it can be said that teachers in Turkey have had important problems in terms of their in-service professional development. In this regard, it can be said that the lack of cooperation between the Ministry of National Education (MNE) and higher education institutions is the most serious one. Another important problem is the inadequate resources allocated to education by the MNE. It has been determined that the budget allocated for in-service training from the budget of the Ministry of National Education is quite low (TED, 2009). In this sense, it is not possible for MEB to organize qualified and effective in-service training activities to meet teachers' needs with such low budget. It is stated that in-service training courses organized by the In-Service Training Department are directed to different areas and to the participation of a limited number of teachers. It is also emphasized that in-service training programs do not take into account regional and local differences, and that teachers from different schools and from different regions cannot make

adequate use of these programs (Kaya & Kartallıoğlu, 2010). In many studies on this field, it has been concluded that the in-service training activities of teachers are not functional enough (Aydoğan, 2002; Uçar, 2005; Durmuş, 2003; Önen, Mertoğlu, Saka, & Gürdal, 2009; Özen, 2004). Thus, it seems difficult to say that teachers' in-service training activities are effective enough.

The focus of the current study are classroom teachers working at elementary school level and this level of schooling includes a very important educational process in terms of laying the ground for the further levels of schooling and the personality development of children. It is possible to say that the quality of education in elementary school which plays an important role for the further stages of education is directly proportional to the quality of classroom teachers working here. Continuous in-service training is as important as pre-service training for teachers who take such a crucial role and deliver many courses in different areas and serve as role models for children to fulfill their instructional and educational duties effectively. In addition, given that classroom teachers come from different disciplines and that many people who did not receive any teacher formation training are still in office, it is necessary for classroom teachers to acquire the knowledge, skills, attitudes and behaviors required by the profession through in-service training programs, courses and seminars. Moreover, the development of new approaches and models in the education system with each day and the implementation of some of them have led to the change in the functions of educational institutions and the roles of the teachers working here. Seen from this perspective, it is imperative for teachers to be professionally developed because the knowledge and skills they have acquired during their pre-service training are not sufficient for effective teaching.

Determination of the training needs of teachers and provision of training in accordance with these needs can be seen as one of the most important duties of the Ministry of National Education, which is the institution responsible for schools and education. In fact, for schools to accomplish their services and functions effectively, teachers must be professionally developed and take an effective role (Boilen, 1988; Budak, 1999). In-service training programs to be organized for teachers will enable teachers to adapt to developing conditions while at the same time they will serve an important function for teachers to compensate for their pre-service weaknesses during the trainings (Karaküçük, 1987). However, for in-service training programs to accomplish their objectives, such programs should be prepared and conducted considering participants' needs and expectations (Gökdereler & Çepni, 2004). Although the Ministry of National Education has organized seminars in different fields and topics, it seems possible to say that the inadequacies in teachers' professional content knowledge still persist. One of the most important reasons for this is the fact that the in-service training programs organized for teachers are planned without taking into consideration the needs and these programs are applied without being subjected to an evaluation process. The purpose of evaluating in-service training programs is to judge the effectiveness of the training programs as well as to determine which elements of the programs problems and flows arise from so that necessary corrections can be made and new programs can be developed in light of these evaluations. In this regard, while in-service training programs are being prepared, it is first necessary to carry out needs analysis and to develop the programs in line with these needs. Taking teachers' views is one of the most objective ways not only to determine in-service training needs but also to evaluate in-service training programs (Retalick & Mithani, 2003). However, it seems very difficult to say that the in-service training programs prepared by the MNE are adequately evaluated or that the programs are prepared according to the needs analysis considering the program development principles. Thus, it is quite difficult to argue that the in-service training programs developed and evaluated without considering teachers' opinions can be successful. Therefore, it seems to be of great importance to evaluate the in-service teacher training programs applied to classroom teachers on the basis of their opinions. The current study is an attempt to evaluate in-service teacher training programs by seeking an answer to the question "What are classroom teachers' opinions about in-service teacher training programs? To this end, answers to the following sub-questions were sought?

1. What are the classroom teachers' opinions about the effect of the in-service training courses they have participated in on their professional development?
2. What are the classroom teachers' opinions about the planning and preparation of in-service training programs?
3. How do the classroom teachers evaluate the content of in-service training programs?
4. What are the problems the classroom teachers encounter in in-service training courses?
5. How much importance is attached to classroom teachers' needs while in-service training courses are being organized?

6. What are the solutions suggested by the classroom teachers for effective in-service training?

PURPOSE OF STUDY

The purpose of the current study is to determine the classroom teachers' opinions about in-service teacher training programs.

METHOD OF THE STUDY

This is a descriptive case study. The most commonly used data collection methods in case studies are interview, observation and document analysis. In the current study, the focus group interview technique was employed (Yıldırım & Şimşek, 2013). The focus group interview was adapted by Morgan (1992, 1996) and started to be used in different disciplines such as sociological, pedagogical, educational and political sciences. The focus group interview refers to a discussion conducted by an existing or newly constructed group in an atmosphere of an interactive communication about any topic within a given time period (Brotherson, 1994; Överlien, Aronsson & Hydén, 2005).

SAMPLE OF THE STUDY

The study group of the current research is comprised of 28 classroom teachers selected from five different schools with varying socio-economic levels in the city of Muğla. The teachers participated in the study on a volunteer basis. The data were collected by means of focus group interviews conducted in the spring term of 2016-2017 school year. Of the participant teachers, 15 are males and 13 are females. The ages of the teachers range from 34 to 57. The professional experience of the participants varies between 11 years and 35 years. Of the teachers, 13 hold an undergraduate degree and 8 hold an associate's degree in the field of classroom teacher education and 8 are graduates of different departments. All of the participants were found to have taken in-service training seminars in different periods.

Data Collection and Analysis

As a data collection tool in the study, a semi-structured interview form was used. For the development of the form, the relevant literature was reviewed and thus the interview items were constructed. In light of expert opinions, some changes were made on the items. Then the piloting of the form was performed and some questions were discarded and final form with 6 items was obtained. Yet, while conducting interviews, some probing questions were also asked on the basis of expressed opinions. The interview form included; besides questions to elicit personal information, questions asking whether they have participated in any in-service training program, whether the in-service program they participated in made some contributions to their professional development, whether in-service programs are sufficient, problems they experienced during in-service training and their suggestions for solutions to the problems experienced during in-service training. The interviews were conducted as a focus group during the seminar period in June 2016-2017 with teachers, either in classrooms or in the teachers' room. With the permission of the teachers, the interviews were tape-recorded. The data from the interviews were analyzed by two researchers through the content analysis. The data obtained from the interviews were first transferred to the computer environment using the Office program. The texts were read several times line by line and the coding for this was created. Concepts used during coding were derived from the data in connection with the literature. During the analyses, continuous comparison method was employed. The continuous comparison method allows the researcher to clearly and accurately present the data (Kvale, 1996). The codes were then grouped together to find common themes (categories) that would form the main lines of research findings. The codes under the determined themes are explained in relation to each other and interpreted and the results are put forward in line with the aim of the research (Maykut & Morehouse, 1994).

Validity and Reliability

Concepts such as credibility, transferability, verifiability and consistency are used instead of the concepts of validity and reliability in qualitative research. In the current study, the themes emerging from the analysis of the data were directly supported with quotations and thus transferability of the research was tried to be ensured. As for verifiability, it is recommended that the characteristics of the participants should be described in detail, the research process should be explained, and data collection and analysis processes should be explained clearly (Yıldırım & Şimşek, 2013). Great care was taken for the detailed explanation of these elements in the method and

findings section of the research. For the consistency of the study, help of another researcher was sought in the analysis of the data. Both researchers co-encoded the data together and reached a consensus on codes and themes.

FINDINGS

In the current study aiming at evaluating the in-service training programs on the basis of the opinions of the classroom teachers, some findings were obtained about the contribution of in-service training to the professional development of teachers, the problems experienced in in-service training programs and suggestions for solutions. Findings related to the problems expressed by the classroom teachers in relation to the planning of in-service training seminars are given in Table 1.

Table 1. *Findings related to the Classroom Teachers' Opinions about the Problems in the Planning of In-service Training Seminars*

Codes	f
There is no needs analysis	9
There is no planning and preparation	6
Teachers' opinions are not sought	3
The timing is bad	13
Teachers' needs are ignored	6
There is a lack of organization and seriousness	9

When Table 1 is examined, it is seen that the highest number of teachers complain about the bad timing of in-service trainings (f:13), which is followed by absence of needs analysis (f:9), lack of organization and seriousness (f:9), lack of planning and preparation for seminars (f:6), negligence of teachers' needs (f:6), and lack of attention to teachers' opinions (3). In this connection, some quotations from the teachers' statements are given below.

SÖ 6. "In-service training programs are organized for the sake of organizing."

SÖ12. "In-service training programs are offered due to procedural requirements."

SÖ17. "I believe that in-service training programs should be initially planned well. Planning them before the school opens between September 1 and 15 seems to be highly suitable. In-service training programs organized when the school opens is not very useful."

SÖ18. "Our opinions are not sought while in-service training programs are being planned."

SÖ22. "In-service training programs are not prepared considering our needs."

SÖ24. "I believe that in-service training programs are conducted very superficially; we cannot get the intended benefits."

SÖ26. "In-service training programs are inadequate; as they are planned without considering the real classroom environment, we cannot implement what we have learned in our classrooms. Classroom teachers' needs should be determined and the in-service training should be designed according to these needs."

SÖ27. "Our opinions are taken every year. But we see that these opinions are not considered while programs are being planned."

Table 2. *Findings related to the Classroom Teachers' Opinions about the Benefits of In-service Training Programs*

Codes	f
It did not meet my needs, did not make any contribution	12
It was beneficial	9
It was partially beneficial	7
The ones we voluntarily participated in were beneficial	9
The ones we were required to participate in were not beneficial	6
Those given outside the MNE were beneficial	4

As can be seen in Table 3, different opinions were reported about the benefits of the in-service training. While the highest number of teachers stated that it did not meet their needs (f:12), some others were of the opinion that it was partially beneficial (f:7); on the other hand, the number of those stating that it was beneficial is not small (f:9). The teachers also stated that whether the participation is required or voluntary is important in terms of finding the in-service training beneficial. In this connection, while some of the teachers stated that the seminars they voluntarily participated in were more beneficial, some others stated that they could not get any benefits from the seminars in which participation was required. Some participants stated that seminars organized outside the MNE were more beneficial (f:4).

SÖ 2 *“very few of the seminars I participated in were useful and these were organized by some other institutions apart from the MNE. They were very useful. For example, one of them was organized by ÖRAV.”*

SÖ 5 *“They were partially beneficial, we cannot say they accomplished their objectives. They made some contributions.”*

SÖ7. *“In-service training is not very efficient most of the time. Everybody wants to leave the training immediately after they have signed. The seminars organized by the Teacher Academy of Garanti Bank were wonderful. They were practice-based. The seminars of The Ministry of National Education are not so effective.”*

SÖ8. *“I think that in-service training programs are partially useful because while deciding on the topics of training, general topics concerning Turkey are selected.”*

SÖ 18. *“In-service training is useful. Timing can be bad sometimes. If they are within the term, we have to hurry to arrive on time after the class. If they were organized in better times, they could be more beneficial.”*

SÖ19. *“Some of them are unnecessary. Yet, there are also some useful ones.”*

SÖ21. *“In general they contributed to my professional development but there are some not conducive. Depending on the topic they focus on, this changed. I did not get much benefit from the ones in which participation was required. On the other hand, the ones I voluntarily participated were useful.”*

SÖ26. *“If in-service training programs are conducted in suitable time and place, then they will be beneficial.”*

SÖ28. *“Of course, in-service training seminars are useful, as long as they fit for purpose.”*

Table 3. Findings related to the Classroom Teachers' Opinions about the Content of In-service Training Seminars

Codes	f
Theory-based Content	9
Lack of practice	7
Limited content	4
Lack of emphasis on topics we want	6
Lack of emphasis on classroom application.	7
Inclusion of topics irrelevant to us.	6

As can be seen in Table 3, the classroom teachers are of the opinion that the content of in-service training programs mostly includes theory (f: 9), not enough emphasis is put on practice (f:7), classroom applications are not much included in the content (f:7), the content is limited (f:4) and topics irrelevant to them are also included in the content. Some quotations related to these findings are given below:

SÖ 6 *“The content of in-service training courses is somewhat empty.”*

SÖ 7 *“The titles seem to be wonderful but the content is very limited. I think one of the reasons for this is the limited time.”*

SÖ14. *“The time is very limited in in-service trainings. A lot of information is tried to be given in a very limited time period, and of course this is not good.”*

SÖ11. *“Regular in-service trainings are always focused on theory. Practice is lacking.”*

SÖ28. *“If we can meet our needs then they can be useful for; if we are presented with information that we won't use in the class, then it is useless. But in general, they are not suitable for our needs. Irrelevant topics are presented. If they present information about classroom applications and children, then they will be more useful.”*

Table 4. Findings as regards the Problems Encountered by the Teachers during the Implementation of In-service Training Seminars

Codes	f
Lack of practice	11
Use of traditional methods	19
Lack of teacher participation	5
Bad planning of time	16
Unsuitable places	12
Lack of equipments	8
Lack of instructors	14
Lack of seriousness in the organization	8
Transportation, food and beverage	3

As can be seen in Table 4, the most important problem experienced by the teachers during the in-service training seminars is the use of traditional methods (f:19) and it is followed by the bad timing because seminar are usually held when schools are open (f:16), lack of instructors giving in-service training (f:14), unsuitable places where in-service training is given (f:12), lack of seriousness in the organization and implementation of in-service training programs (f:8) and lack of teacher participation (f:5). Some quotations related to these findings are given below:

SÖ3 "Seminars are given in a very short time span; thus, in general they do not have any benefits."

SÖ5. "I find the timing and place unsuitable."

SÖ7. "When the place is unsuitable, teachers may perceive it as an unrespectful attitude towards them. This is very important because in many other professions such trainings are organized in hotels with a nice atmosphere. I do not mean we want this. But, this is the indication of respect shown to your profession, personality. We have never felt this respect. We are given in-service training in cold places while sitting on hard chairs."

SÖ8. "Instructors giving the in-service training should plan their training with an awareness of the fact that they are addressing teachers and what their levels are. This should not be done with ordinary techniques."

SÖ10. "When such courses are applied, they become more useful for me. If they are not so, they are not efficient."

SÖ11. "If in-service training courses became more practice-based and included more sample applications showing how teachers could be more useful for their students, then they would be more useful."

SÖ14. "Places are not very suitable. There is no practice; there is only pure lecturing and it is very boring".

" SÖ15. "When in-service training programs are held within the term, then we have to hurry to arrive on time. Sound systems are not good in places thus we cannot hear well."

SÖ24. "We are trained in small and airless halls. Therefore, trainings should be given in better places suitable for teachers."

SÖ26. "When starting their in-service training seminars, instructors tell that it would not be long, which kills our enthusiasm. They are in a hurry to finish their training."

SÖ27. "I think we are not motivated enough. We are not told why we should take this seminar."

Table 5. Findings related to the Teachers' Participation in the Planning Process of In-service Training Seminars

Codes	f
Our opinions are not taken	7
Our opinions are taken but not reflected into the application	18
Courses we want are not opened	6
Participation is required	7
Our opinions are taken	2

As can be seen in Table 5, many teachers stated that although their opinions are taken, they are not reflected into the application (f:18). Some of them are of the opinion that their opinions are not taken while in-service training programs are being prepared (f:7), some others stated that the courses they want are not opened (f:6). On the other hand, some teachers think that the courses they are required to participate in are not very useful (f:7).

SÖ 2. "Our opinions are taken. Some of them are put into practice. But, in general, they are overlooked."

SÖ 3. "Opinions are taken but more importance is attached to their own opinions while planning seminars."

SÖ 4. "Opinions are taken for in-service trainings. Then, some of these opinions are not taken into consideration."

SÖ5 "Initially, opinions are taken but then they do not find any reflections in practice."

SÖ9. "Our opinions are asked but the courses we want are not opened."

SÖ 12. *"In-service training courses we want are not opened. We do not willingly participate in courses organized by the Ministry of National Education as they do not much cater to our needs."*

SÖ15. *"The Ministry prepares a plan for a year. Our opinions are taken at the end of the school year through teacher committees. Yet, these are not taken into consideration most of the time."*

SÖ16. *"Sometimes our opinions are taken through questionnaires. Yet, most of the time, our opinions cannot find reflections in practice."*

SÖ22. *"We are generally reporting what kinds of in-service training we want through our teacher committees. Yet, as understood, they are not taken into consideration while trainings are being planned. Topics are presented in general, specific issues are not addressed. Therefore, we cannot get enough benefits."*

SÖ 24. *"Our opinions are not taken into consideration."*

Table 6. Findings related to the Solutions Suggested by the Classroom Teachers for In-service Training Seminars to be More Effective

Codes	f
Needs analysis	9
Instructors specialized in the field	15
Better timing	14
Attaching greater importance to the teacher	3
Motivating teachers	4
Building places for in-service training	5
More emphasis on practice	8
Taking teachers' opinions into consideration	5
Cooperation with universities and other institutions	8
Utilization of active methods	6
More suitable educational environments	14

As can be seen in Table 6, the teachers think that for better in-service training instructors should specialized in their field (f:15), timing of in-service trainings should be better planned (f:14), educational environments should be more suitable in terms of equipments, tools and sound systems (f:14), special places should be built for giving in-service trainings (f:4), greater importance should be attached to teachers (f:3), teachers who participate in seminars should be rewarded to increase their motivation (f:4), instead of lecturing and reading from slides, active methods promoting teacher participation should be used (f:6), cooperating with universities and other institutions while organizing in-service training programs should be encouraged (f:8), teachers' opinions should be taken into consideration while organizing in-service training programs and they should find reflection in practice (f:5) and needs analysis should be conducted to determine teachers' needs (f:9). Some quotations related to these findings are given below:

SÖ2 *"Instructors should be qualified, I think that it would be more beneficial to organize in-service trainings within the two weeks before the school opens and after it closes."*

SÖ4 *"It could be more effective to organize seminars in the summer holiday within June and September."*

SÖ5 *"Standardized in-service training centers should be built in each city. These centers should be well equipped so that we go there enthusiastically."*

SÖ6. *"We are people doing practice in the field. Therefore, such in-service training programs should be more practice-centered."*

SÖ8. *"If our opinions are taken into consideration through teacher committee meetings and end-of-term meetings, they can be more efficient."*

SÖ8 *"Cooperation can be established with universities."*

SÖ9 *"Practice-focused applications taking teachers' needs into consideration would be more useful."*

SÖ10 *"If instructors are more qualified and places are more comfortable, then in-service trainings will be more effective."*

SÖ12. *"They should be conducted in cooperation with universities. Especially education faculties should be involved and academicians specialized in their relative fields should prepare and give these training programs."*

SÖ14. *"The time of in-service training should be better planned and they must be applied. A very good preparation"*

needs to be done.”

SÖ16. “Teachers should not always be in the position of listeners, it would be better if they actively participated in.”

SÖ18. “If they are given in smaller groups, then they will be more effective.”

SÖ19. “Better planning of time, good places, qualified instructors will make in-service training more effective.”

SÖ20. “Extra points can be given to those participating in in-service trainings by the Ministry. Additional course fee should be given to those participating in weekend and evening seminars.”

SÖ22. “The needs of teachers should be precisely determined, and the trainings should be developed on the basis of these needs.”

SÖ23. “Teachers participating in seminars should be rewarded.”

SÖ24. “Participation should be on a volunteer basis not required. If teachers are called at the weekend, additional course fee should be paid to them. Points should be given to teachers participating in seminars.”

SÖ25. “I think larger budget should be allocated. Private sector is a good example of it because they allocate a really good budget.”

SÖ26. “Pre-interviews should be conducted for in-service trainings to be successful. If teachers’ problems and needs are determined and seminars are developed according to these, then they will be more effective.”

CONCLUSIONS

The interviews conducted with the classroom teachers revealed that there are some problems related to planning and implementation of in-service training programs. Regarding the planning, they pointed out that in-service trainings are carried out without conducting needs analysis, taking teachers’ opinions, without enough planning and preparation work. In the study conducted by Pepeler, Murat, and Akman (2016) on elementary school teachers, it was revealed that the teachers complained that their in-service training seminars were not well planned, they were not motivated in their work and that there was no co-operation. In the study conducted by Sıcak and Parmaksız (2016), they found that there was no role of teachers in the process of needs analysis within the context of professional development activities. As can be understood from the research results, while conducting in-service trainings, the first thing to be done is to conduct needs analysis; yet, this is not done and moreover, teachers’ opinions are also not taken into consideration while planning and implementing trainings and these are the most important factors affecting the effectiveness of in-service training programs. In fact, without determining the problems and needs of teachers, it seems to be not possible to develop in-service training programs that can have goals, content, learning processes and evaluation to meet teachers’ needs.

In the study conducted by Sıcak and Parmaksız (2016), it was determined that the contribution of developmental activities to the professional development of teachers was at the theoretical level, the methods and techniques used in in-service training programs were not appropriate and the evaluation process was inadequate.

Findings derived from the teachers' opinions show that in-service training is not as efficient as desired. In the same way, the opinions of the teachers indicating that the seminars they participated in on a volunteer basis were more effective than the required ones also show that seminars teachers willingly participate in are more functional than the required ones. Some of the classroom teachers stated that though they experience some problems arising from physical conditions, in-service trainings are useful in general. In a similar manner, Özen (2006) also reported that though elementary school teachers find in-service trainings useful, they experience problems arising from timing and physical conditions. In Madden’s (2003) study, it was concluded that in-service training activities can partially impart the intended knowledge to teachers; yet, they cannot make adequate use of this knowledge in their professional life; thus, such trainings do not increase teachers’ efficiency in work places at the desired level.

Regarding the content of in-service training, the classroom teachers mostly stated that the programs cover theoretical issues, that classroom practices are not adequately provided, that the content is very limited and that topics that are needed by them are not generally included in programs. As can be seen at the end of the current research, the organized in-service training seminars cover theoretical topics rather than the classroom-based content that the teachers need. In this regard, it seems to be quite difficult for teachers to carry what they have learned in the seminars into their classrooms. Similar to the research results, it has been found out that in-service training seminars are more theoretically structured, the application dimension is ignored, scheduling is inappropriate, places are not suitable and eating and drinking facilities are inadequate (Eroglu, 2005; Seferoğlu

2001; Özen, 2006).

As a result of the current research, it was seen that the classroom teachers encountered many problems during the application process. According to the teachers, these problems are mostly due to the fact that the theoretical issues in the implementation of the in-service training programs are explained by reading from the slide, the timing is not functional since the school is usually open, the places where the in-service training is given are inappropriate and the trainers providing in-service training are inadequate and teachers cannot actively participate in the process. In the study conducted by Özen (2006), it was determined that the in-service training programs are not serious in practice, the teachings are mostly about theory, there is very little practice, scheduling of programs is not appropriate and the physical and technological facilities are inadequate. In the literature, it has also been reported that teachers participating in in-service training programs sometimes make use of what they have learned in these programs. The reasons for not utilizing what they have learned are claimed to be lack of physical facilities at school, theoretical knowledge's not being functional in practice and crowded classroom (Kanlı & Yağbasan 2002; Tekin & Ayas, 2005).

According to the results of the current research, the vast majority of the classroom teachers stated that while their opinions are taken to plan in-service trainings, their opinions do not find enough reflection in practice and very few of the topics they want are included in programs.

The classroom teachers who participated in the research have made remarkable suggestions to make in-service training programs more effective. Some of these suggestions are as follows; instructors should be qualified in their fields, in-service training programs should be scheduled so that teachers can participate in when schools are closed, places where in-service trainings are organized should be made more suitable in terms of physical conditions, tools and equipments, places for in-service trainings to be organized should be built in cities, comfortable environments should be created for teachers to participate in in-service trainings, material and spiritual rewarding systems should be established to increase the motivation of teachers, active methods should be employed to encourage teachers to participate, cooperation should be developed with universities and other institutions while organizing in-service training seminars, teachers' opinions should taken into consideration while organizing in-service training programs and needs analysis should be conducted to determine teachers' needs. Günbayı and Taşdoğan (2012) found that teachers are positively affected by in-service training programs when the participation is voluntary, in-service trainings are qualified, they are given people specialized in their fields, they are applied, teachers participate actively, in-service training programs meet the classroom needs of teachers and in-service training programs have up-to-date and interesting topics. In the same study, it was determined that the most important expectation of teachers in terms of effectiveness of in-service training is the improvement of educational environments. On the basis the teachers' opinions, following suggestions can be made for more effective in-service training;

- In-service training programs should be designed on the basis of needs analysis and by taking teachers' opinions into consideration,
- Places and educational settings where in-service training programs are held and equipments and tools to be used should be organized in such a way as to allow effective learning,
- In-service training programs should be conducted as practice-centered and to allow teacher participation,
- In-service training programs should be organized when schools are closed so that more teachers can participate,
- Teachers participating in in-service training programs should be provided with different opportunities such as additional course fee, service points and promotion,
- Instructors who will give in-service trainings should be selected from among those specialized in their fields,
- Food, beverage and transportation should be provided for teachers who will participate in in-service trainings,
- More resources should be allocated to in-service training of teachers,
- Cooperation should be developed with universities and other institutions for in-service trainings.

Evaluation of School Quality

Süleyman GÖKSOY

ABSTRACT

The present research aims to determine the effectiveness of schools in the aspects of principals, teachers, students and parents and to investigate whether school efficacy has significant difference in terms of gender, age, branch, service period in the profession and service period in the school according to teacher perspectives. Scanning model was used in order to establish the current situation. Scale was used for collecting data. The data collected by using data collection tool was analyzed statistically with normality test first and data range was analyzed by using Kolmogorov-Smirnov and Shapiro-Wilk tests. Following the analyses, the data was analyzed and interpreted with Whitney-U and Kruskal Wallis-H tests from nonparametric statistical tests since the data did not demonstrate normal range. The study group consists of 1912 teacher from kindergartens, primary, secondary and high schools in Eregli district in Zonguldak in 2016-2017 academic year. The sampling consists of 340 teachers who were selected with case sampling method and they represent the research universe. The following results were obtained in the research: Teachers think that the quality of school environment and students is high. According to teachers, parents carry out their roles in school processes in medium level. It can be concluded that the gender (male teacher, female teacher) and the profession (branch) of the teachers do not have a meaningful impact on school efficacy according to teacher opinions. It can be inferred that teachers who have higher professional seniority regard the schools and school aspects more qualitative and effective than teachers who have lower seniority. It can be deduced that the service periods of the teachers in their current schools do not have a meaningful impact on school efficacy.

Key Words: Teachers, principals, students, school environment, parents

PROBLEM STATUS

School quality is formed with the effect of many factors such as respond to student differences, emphasis on active learning, educational program, different educational approaches, time management, evaluation, heterogeneous grouping, cooperative learning, technology and high expectations (Lunenburg, 1992). Edmonds (1986) defined the qualified and effective school as the school that involves effective leadership, humanistic environment, high expectations, necessary facilities, that monitors student improvement and that focuses on teaching important skills to the students (Lunenburg and Ornstein, 2013). In fact, experiences of a school cannot be directly implemented to the situation of other schools. The conditions of each school are unique and they require to implement unique combinations in terms of learning theories, materials and methods (Senge, Cambron, McCabe, Lucas, Smith, Dutton, Kleiner, 2012). Basaran (2000) states that management processes should be arranged in order to improve the effectiveness of the schools. In this context, Basaran (2000) puts the emphasis on planning, accomplishment of educational, organizational and managerial goals, provision of necessary inputs, setting the organizational structure, utilization of all strengths in line with the school mission, communication, effect of management and response of the subordinate, interaction, supervision and the process of implementation of the management plan while avoiding deviations.

There are some accepted indicators in determining the ideal and effective school criteria or the efficacy of a school. According the research findings carried out on this topic, some of the features of an effective school are as follows (Sisman, 2002a; Sisman and Turan, 2006; Lunenburg and Ornstein, 2013; Balci, 2013): School has clear aims and policies. It embodies successful academic and educational leadership. The school staff includes devoted, well-trained people who have good humanistic qualifications. School staff participates in educational activities continuously and improves themselves. They expect high levels of success from the students and believe that they can achieve it. There occurs academic volume in the school schedule and in all kinds of activities. Teachers spare a great deal of time to their professions and to the school. They guide the development of the students and monitor their improvement. They detect learning disabilities beforehand, take precautions accordingly and develop strategies. There is a positive

school environment and atmosphere. The school has a culture based on positive school climate and perfection. School-parent relationships are in the highest rank and parents contribute to the school both material and non material. The decisions made are school-based, teachers participate in activities and take responsibilities. Teacher develops different strategies in order to increase the motivation of the students. Also students are given the opportunity to participate and take responsibilities. Each student is given individual attention.

The current research aimed to determine the effectiveness levels of the schools. The following questions were sought:

- 1) According to teacher perceptions, to what extend are the schools effective in the aspects of principals, teachers, students and parents?
- 2) According to teacher perceptions, is there a significant difference in school effectiveness in terms of gender, age, branch, service period in teaching and service peroid in the school?

METHOD

Research Model

Scanning model (Karasar, 2006) was used in the research in order to detect the current situation. Data were collected by a scale in order to determine the school effectiveness. Suggestions were developed after interpreting the obtained findings.

Data collection Tool

A scale was used in order to collect data in line with the research objectives. Effective School Scale developed by Balci (2013) consists of five parts. The first part includes personal information about the research subjects. Other subparts consist of the aspects as principals (n=12), teachers (n=23), school environment (n=21), students (n=6) and parents (n=6). Alpha coefficients of the scale was calculated by Balci (2013) respectively as follows; principals (.88), teachers (.92), school environment (.94), students (.77) and parents (.87). In the present research, the scale alpha confidence results were recalculated and they were found as follows; principals (.88), teachers (.88), school environment, (.87), students (.88), parents (.91) and the general scale confidence value was calculated as (.85).

Data Analysis Method

In the statistical analysis of the data obtained via data collection tool of the research, a normality test was carried out primarily then the data distribution was examined with Kolmogotov-Smirnov and Shapiro-Wilk tests. Since the data did not demonstrate normal distribution, the data were analyzed by using Whitney-U and Kruskal Wallis-H tests from nonparametrical statistical techniques. In line with the quinary grading scale used in the study, score intervals were determined as 100- 1.79 (none), 1.80-2.29 (little), 1.60-3.39 (moderate), 3.40-4.19 (very much), 4.20-5.00 (completely)

Population and Sampling

The research consists of 1912 teachers who work in all kindergarten, primary, secondary and high schools placed in Zonguldak, Eregli in 2016-2017 academic year (Eregli Directorate of National Education 2016). The sampling consists of 340 teachers who were chosen with easily accessible case sampling method and who represent the population. The aim of implementing easily accessible case sampling is to provide objective selection of the participants, to give right to be selected to each individual in the population and to facilitate selection process by providing the participation of volunteer individuals. The distribution of teachers participated in the research was given in the tables below. The distribution of the teachers according to gender variable is given in Table 1.

Table 1. Frequency and Percent Values for Gender Variable

<i>Groups</i>	<i>f</i>	<i>%</i>	<i>%_{gec}</i>	<i>%_{yig}</i>
Male	127	37,4	37,4	37,4
Female	212	62,4	62,4	99,7
Total	340	100	100,0	

The research sampling consists of % 62,4 female and % 37,4 male teachers.

The distribution of the teachers participating in the research according to age variable is given in Table 2.

Table 2. Frequency and Percent Values for Age Variable

Groups	<i>f</i>	<i>%</i>	<i>%_{gec}</i>	<i>%_{yig}</i>
24 and below	30	8,8	8,8	8,8
25-29	72	21,2	21,2	30,0
30-34	79	23,2	23,2	53,2
35-39	77	22,6	22,6	75,9
40-44	35	10,3	10,3	86,2
45-49	31	9,1	9,1	95,3
50 and above	16	4,7	4,7	100,0
Total	340	100,0	100,0	

The majority of the teachers are between the ages of 25-39 and the minority consists of teachers at the age of 50 and above.

The distribution of the teachers participating in the research according to branch variable is given in Table 3.

Table 3. Frequency and Percent Values for Branch Variable

<i>Groups</i>	<i>f</i>	<i>%</i>	<i>%_{gec}</i>	<i>%_{yig}</i>
Social Sciences, Philosophy, History, Geography	25	7,4	7,4	7,4
Turkish-Literature	43	12,6	12,6	20,0
Mathematics	32	9,4	9,4	29,4
Fine Arts-Painting- Music-History of Art	23	6,8	6,8	36,2
Others	217	63,8	63,8	100,0
Total	340	100,0	100,0	

63.8 of the teachers participated in the research are from other branches. The majority of the teachers from other branches is from primary school teaching branch.

The distribution of the teachers participating in the research according to service period in teaching profession variable is given in Table 4.

Table 4. Frequency and Percent Values for Service Period in Teaching Profession Variable

<i>Groups</i>	<i>f</i>	<i>%</i>	<i>%_{gec}</i>	<i>%_{yig}</i>
1-5 Years	90	26,5	26,5	26,5
6-10 Years	72	21,2	21,2	47,6
11-15 Years	91	26,8	26,8	74,4
16-20 Years	42	12,4	12,4	86,8
21 and above	45	13,2	13,2	100,0
Total	340	100,0	100,0	

There are teachers who newly started their professional lives as well as teachers who have been teaching for 21 years and more in the research sampling.

The distribution of the teachers participating in the research according to service period in the school variable is given in Table 5.

Table 5. Frequency and Percent Values for Service Period in the School Variable

<i>Groups</i>	<i>f</i>	<i>%</i>	<i>%_{gec}</i>	<i>%_{yig}</i>
1-2 Years	131	38,5	38,5	38,5
3-4 Years	105	30,9	30,9	69,4
5-6 Years	34	10,0	10,0	79,4
7 Years and above	67	19,7	19,7	99,1
Total	340	100,0	100,0	

The majority of the teachers in the research sampling have been teaching in the same school for 1-2 or 3-4 years.

FINDINGS

1- Quality of schools according to teachers

Table 6 includes the distribution of effectiveness levels of the schools according to teachers participated in the research in terms of different values.

Table 6. Arithmetic Means and Standard Deviation Values of Effective School Scale Subdimensions

<i>Dimensions</i>	<i>N</i>	<i>\bar{x}</i>	<i>ss</i>
Principal	340	4,0336	,82912
Teachers	340	4,0257	,65443
School environment	340	3,9421	,71009
Students	340	3,5931	,86151
Parents	340	3,2392	1,03509
Total	340	3,7667	65625

When the table is examined, it can be seen that teachers' perspectives towards principals, teachers, school environment and students are high but their perspectives towards parents are at the moderate level. The average of teachers' opinions about the schools is high. The current findings demonstrate that teachers regard the quality of principals, teachers, school environment and students as high. Also teachers think that parents carry out their roles related to school operations at the moderate levels.

2- In terms of Gender Variable

Table 7 includes the distribution of effectiveness levels of the schools according to teachers opinions in terms of gender variable.

Table 7. Results of Mann Whitney-U Test carried out to determine whether effective school scale points differ according to gender variable

Groups	N	\bar{x}_{sira}	\sum_{sira}	U	z	p
Male	127	164,65	209,00	127,00	-,777	,437
Female	212	173,20	367,00			
Total	339					

Mann Whitney-U Test was carried out in order to determine whether effective school scale points differ according to gender variable. In the test results, there is not a statistically significant difference between the opinions of male teachers (Median 164,65) and of female teachers (Median 173,20). (U=127,00, p>0,05).

3- In terms of Age Variable

Table 8 includes the distribution of effectiveness levels of the schools according to teachers opinions in terms of age variable.

Table 8. Results of Kruskal Wallis-H Test carried out to determine whether effective school scale points differ according to age variable

Groups	N	\bar{x}_{sira}	x^2	sd	p	Difference
24 and below	30	94,98	34,60	6	,000	1-3,1-4,1-5,1-6,1-7
25-29	72	143,79				2-3, 2-4,2-5,2-6,2-7
30-34	79	170,97				
35-39	77	199,15				
40-44	35	189,76				
45-49	31	193,76				
50 and above	16	204,91				

Kruskal Wallis-H Test was carried out to determine whether effective school scale points differ according to age variable and a significant difference was observed in teacher opinions ($x^2=34,60$, p<0,05). In order to determine the group that the difference stems from, multiple comparisons were made with Mann Whitney U test. Multiple comparisons demonstrated that the difference have occurred between the following groups; 1 and 3, 1 and 4, 1 and 5, 1 and 6, 1 and 7, 2 and 3, 2 and 4, 2 and 5, 2 and 6, 2 and 7.

4- In terms of Profession (Branch) Variable

Table 9 includes the distribution of effectiveness levels of the schools according to teachers opinions in terms of branch variable.

Table 9. Results of Kruskal Wallis-H Test carried out to determine whether effective school scale points differ according to branch variable

Groups	N	\bar{x}_{sira}	x^2	sd	p
(1) Social sciences, Philosophy, History, Geography	25	178,64	9,29	4	,054
(2)Turkish-Literature	43	165,94			
(3)Mathematics	32	144,34			
(4) Fine Arts- Painting- Music- History of Art	23	124,39			
(6)Others	217	179,21			

Kruskal Wallis-H Test was carried out to determine whether effective school scale points differ according to branch variable. In the test results, no significant difference in teacher opinions about the branches was observed. ($x^2=9,29$, ($p>0,05$).

5- In terms of Professional Service Period Variable

Table 10 includes the distribution of effectiveness levels of the schools according to teachers opinions in terms of professional service period variable.

Table 10. Results of Kruskal Wallis-H Test carried out to determine whether effective school scale points differ according to professional service period variable

Groups	N	\bar{x}_{sira}	x^2	sd	p	Difference
1-5 Years	90	132,06	24,35	4	,000	1-3, 1-4,1-5
6-10 Years	72	161,23				2-3
11-15 Years	91	194,79				
16-20 Years	42	194,19				
21 and above	45	190,99				

Kruskal Wallis-H Test was carried out to determine whether effective school scale points differ according to professional service period variable. The results demonstrated a significant difference in teachers opinions about professional service period variable ($x^2=24,35$, $p<0,05$). Multiple comparisons was made with Mann Whitney-u Test in order to determine the group in which the difference has occurred. With the multiple comparisons, the difference was observed in the groups 1-3, 1-4, 1-5, 2-3.

6- In terms of Service Period in the School Variable

Table 11 includes the distribution of effectiveness levels of the schools according to teachers opinions in terms of service period in the school variable.

Table 11. Results of Kruskal Wallis-H Test carried out to determine whether effective school scale points differ according to service period in the school

Groups	N	\bar{x}_{sira}	x^2	sd	p
1-2 Years	131	167,26	4,04	3	,257
3-4 Years	105	159,04			
5-6 Years	34	166,66			
7 Years and above	67	189,20			

Kruskal Wallis-H test was carried out to determine whether effective school scale points differ according to service period in the school and no significant difference was observed in teacher opinions in the test results. ($x^2=4,04$, $p>0,05$). Therefore, it can be inferred that the service period of the participants in a particular school does not have a meaningful impact on their opinions about the school effectiveness.

RESULTS AND SUGGESTIONS

. The research aimed to determine the effectiveness levels of schools in the aspects of principals, teachers, students and parents according to teacher opinions. Also the research aimed to reveal whether school effectiveness depend on gender, age, branch, professional service period and service period in a particular school considering teacher opinions. The following results were obtained:

- 1) Teachers regard the quality of school environment and students as high. It can be stated that students think that schools are well managed by the principals, that teachers and students are successful above average and that the school environment is at good level. however, it is clear that although teachers have positive opinions about the schools, they do not think the same for the parents. According to teachers, the parents do not fulfil their responsibilities enough. They moderately respond to the needs of the school. Similarly, the research carried out by Balci (2013) demonstrates that parents roles in the school environment is provided in moderate or low levels and that the relationships between the school-environment and school-parents are not healthy. That the roles and responsibilities of the parents is not sufficient in the process of improving school quality is clear. It can be suggested that the roles and responsibilities of the parents should be increased and developed.
- 2) It can be stated that the gender of the teachers (male teachers, female teachers) does not have an effective impact on the improvement of the school effectiveness.
- 3) Significant difference between the opinions of teachers about the age variable was observed. According to current findings, teachers think that older teachers are regarded as more qualified than younger ones. Also younger teachers think that their schools are less qualified and less effective in comparison with the opinions of older teachers. this dissensus may stem from the fact that newly appointed and younger teachers have greater expectations about the school, school structure and school items and think that current structure and applications do not meet the requirements of an effective school. This may be the reason of the difference in the opinions of teachers from different age groups.
- 4) It can be inferred that the profession (branch) variable does not have any meaningful impact on teacher opinions towards school effectiveness.
- 5) In the analysis of the professional service period variable, it was observed that teachers with higher professional service periods think that the school aspects are more qualified and effective in comparison with the teachers who are newly appointed or who have shorter professional service periods. The current finding may indicate that younger teachers and older teachers do not think the same about the expectations and existing standards.
- 6) It can be interpreted that the service period of the teachers in a particular school does not have a meaningful impact on their opinions about the school effectiveness. According to teachers, there is no need for long period studies in

order to understand and examine the positive and negative situations in schools. They think that one or two year long studies may be sufficient to have an overall view about the effectiveness of the applications in schools.

ABSTRACT

The present study aimed to determine the impact of using the Peer Instruction Method in 7th grade Social Studies Course on the academic achievements of students, their attitudes towards the course and the retention of learning. Quasi-experimental design with pre-test, post-test, single experiment and single control group empirical research method was used in the study. The study was conducted in the 2014-2015 academic year spring semester with 7th grade students in a secondary school in Turkey. The data obtained in the study were analyzed with SPSS (Statistical Package for Social Sciences) 21.0 software. Descriptive statistical methods were used to assess the study data. Data analysis was conducted with t-test, ANOVA, Mann-Whitney U, and "between the groups and intra-group mixed analysis of variance" (Repeated Measure-ANOVA). Based on the study findings, it was determined that the achievements of the students in the study group where the Peer Instruction Method was used were higher when compared to that of the students in the control group ($F = 7,805, p < .05$). Based on the retention test results, no significant difference was found between the groups. Based on the attitude scale findings, it was observed that there was an upward tendency towards the end of the process between the pretest and posttest scores of the students in both the study group where peer instruction method was used and the control group where the instructions and activities listed in the curriculum was used. However, it was observed that there was no significant difference between the pretest and posttest attitude scale scores of the students in the study and control groups.

Keywords: Social studies education, peer instruction, academic achievement, attitude.

INTRODUCTION

For the students to acquire the desired behavior, it is necessary to conduct in-classroom activities in all levels of formal education institutions (Arslantaş, 2011, p.488). The question of how to make the students to acquire the content most effectively leads us to instruction methods. The path of instruction includes instructional approaches, instruction methods and instruction techniques.

Instruction method is a path of instruction where the techniques, the subject matter, tools, materials and resources should be organized and integrated and provided for the students (Aydın, 2001, p.55).

Today, interesting, attention-grabbing and student-oriented instruction methods that activate the students are preferred instead of conventional teacher-oriented instruction methods and techniques that bore the students. In a way, when using these approaches, the objective is to teach the student how to learn. Several studies demonstrated that the methods and techniques that enable active participation of the students render a more effective, quality and retained instruction. One of the methods that improve the quality of education and enable active student participation in the classroom is the method of Peer Instruction.

Peer instruction method, which is an interactive method, is also one of the most significant, highly effective methods and productive that could be applied in social studies courses due to high student participation and guidance towards democratic approaches, having both cognitive and emotional aspects, and ability to enable communication within the classroom.

THEORETICAL BACKGROUND AND PREVIOUS STUDIES

Peer instruction was first developed by Eric Mazur, a physicist, in its current applied form, which was scrutinized in the present study. Eric Mazur, who has been teaching physics courses with traditional methods for several years, has made certain changes in instruction techniques, aiming both to improve the positive attitude of the students towards the course and to provide a retained learning. After some trial and error, he finally developed a method known as Peer Instruction worldwide (Ünal, 2010, p.23). The main objective of peer instruction method is to focus the attention of the students to the basic concepts using the student interaction throughout the course. Instead of instructing the knowledge in the textbook or lecture notes in detail, it aims to conduct the course with classes where the key points are instructed in a series of presentations, followed by brief conceptual questions on the topic and focusing the attention of the students with discussions on the questions that enable high interaction among the students (Mazur, 1997, p.10). Mazur, who used this method effectively in the classroom thanks to technological advances in computer technology, asked every student to think about the question for a few minutes after the question is projected on the screen. The silence is maintained in the class during this period. Then everyone chooses one of the answer options using a little tool that looks like a remote control. These instruments, which communicate with the teacher's computer, transmit the response of each student to the computer. The answers of all the students are evaluated with the software installed on the computer, and after a few seconds, a bar graph depicting the a, b, c, d options appears on the screen. Everyone has the opportunity to see what percentage of the class chooses which choice. Since it is not clear who selected which choice, shy and hesitant students automatically overcome the fear of giving incorrect responses and their participation is ensured. Then, the students form small groups to discuss the question with their peers. They explain the reasons for their choices to each other and try to convince each other. During this activity, the teacher who walks around the classroom also participates in the discussions when it is necessary and requested by the students. Then they take the remotes and repeat the answering process. Usually, with the second answers provided after this step, the bar graph changes to favor the correct answer. Peers, then, attempt to assist other who are not yet persuaded. (Ünal, 2010, p.23) If most students have responded correctly to the concept test, a new topic is introduced. If the percentage of correct answers is too low, the topic is re-instructed in more detail and a new concept test is given.

Naturally, the peer instruction method has many advantages based on the findings of previous studies. This method breaks the inevitable monotony in static courses as a result of the persuasion efforts of the student towards her or his peer (Mazur, 1997, p.14). It provides permanent learning.

Several studies were conducted on peer instruction and the impact of peer instruction on individual's academic achievement and attitude towards the course, cooperation and collaboration between individuals, cognitive, affective and behavioral development of the individual was investigated in these studies. In these studies, it was observed that peer instruction method was effective on the abovementioned achievements (Eryılmaz, 2004; Tokgöz, 2007; Can, 2009; Demircioğlu & Şekercioğlu, 2009; Şen, 2010; Kavanoz & Yüksel, 2010; Şekercioğlu, 2011; Akay, 2011; Gök, 2012; Yavuz, 2014).

Trent (1996) investigated the effects of the peer instruction method on the performance of chemistry students. Further studies investigated the effects of peer instruction on physiology education (Rao&DiCarlo,2000), comprehension of the concepts of forces and movement by 9th grade students (Harvey, 2003), learning experiences of engineering students at a college in the UK (Nicol & Boyle, 2003), comprehension of biological concepts by the students in biology classes at University of Colorado (Smith et al., 2009) and English language instruction in Switzerland (Dumont, 2013). Thus, previous studies produced successful results.

The results of a ten years long study on peer instruction was reported by Crouch, Watkins, Fagen and Mazur (2007). Butchard, Handfield and Restall (2009) investigated the impact of peer instruction on philosophy and logic instruction and critical thinking skills of the students in a study they conducted. These studies reported that peer instruction yielded positive results as well.

When using peer instruction method in courses, the probable results of certain changes in the process were tested. For example, in a study by Lucas (2009), a peer instruction method where students used i-clickers, in

other words an electronic response system, when answering the questions instead of flash cards or response cards that are regularly used in peer instruction. It was observed that peer instruction with i-clicker had a significant impact on learning.

In a study by Perez, Strauss, Downey, Galbraith, Jeanne, & Cooper (2010), the effect of the type of implementation of the peer instruction method was tested. In that study, whether the second responses provided after the first discussion using i-clicker or the personal response system had bias was investigated.

Porter, Bailey-Lee, Simon & Zingaro (2011) also investigated the effect of the Peer Instruction method applied in computer courses on achievement. Particularly, it was observed that the success rate climbed to 85-90% with this method, which focused on discussion in the study.

In conclusion, several studies were conducted on the effectiveness of the Peer Instruction method and significant number of the previous studies reported that this method was effective. Although the method is called Peer Instruction in only a few of these studies, it was considered appropriate to include all since they focused on the role of the peer instruction in education despite the fact that they did not fully comply with the method developed by Eric Mazur (Perez, Strauss, Downey, Galbraith, Jeanne, & Cooper, 2010; Turpen, & Finkelstein, 2010; Allison, 2012).

METHOD

In this section, the research method, study group, data collection instruments, data collection process and analysis are discussed.

Research Method

The present study is a semi-experimental study based on the assignment of groups before the application and other features. Semi-experimental design is a research method where the participants are not randomly assigned to groups. This is preferred when the researcher is unable to artificially form a group for the experiment (Creswell, 2008, p.313). The most used design in semi-experimental research is "non-equivalent comparative group design". This design includes both experimental and comparison (control) groups. But the participants are not assigned to the groups randomly. The studies conducted with similar designs are called semi-experimental research. In other words, these studies are conducted without full compliance to internal and external validity, which are the criteria for the empirical status of a study.

Study Group

The study was conducted with primary school 2nd level, 2nd grade (7th grade) students attending a secondary school in Turkey during 2014-2015 academic year. The study groups were divided as experimental and control groups in the study.

Experimental Stage

Initially, a comprehensive literature review was conducted to determine peer instruction method applications in Turkey and worldwide. For this purpose, students that would be included in the study were determined with cluster sampling method based on the quasi-experimental design. Certain criteria were considered for the implementation of the cluster sampling. These were;

- 6th grade GPAs of the students
- 7th grade first semester GPAs of the students
- Similar female and male student distribution
- Pretest scores

Gender distribution among the experimental and control groups is as follows:

Table 1: Gender distribution among the experimental and control groups

Groups	Female		Male		Total
	N	%	N	%	N
Experiment	16	45	20	55	36
Control	19	53	17	47	36

Table 1 demonstrates a homogenous distribution between the experimental and control groups with respect to gender. The fact that the sizes of the groups were equal or similar was positive.

Table 2: t-test Results on Experiment and Control Group Term Averages

CLASS	N	\bar{X}	SS	Sd	t	p
6 th GRADE C	34	46,88	3,80	64	,375	,709
1 st SEM. E	32	46,50	4,48	64	1,63	,110
6 th GRADE C	34	48,18	2,62	64	1,44	,156
2nd SEM. E	32	46,78	4,13	64		
7 th GRADE C	34	47,52	2,78	64		
1 st SEM. E	32	46,31	3,95			

It was shown that the grade point averages in experimental and control groups were equal. In other words, the groups complied to group formation criteria based on the abovementioned predetermined criteria.

Table 3: t-test Results Based on Social Studies Course Average Grades in Experiment and Control Groups

CLASS	N	\bar{X}	SS	Sd	t	p
6 th GRADEC	34	4,53	,614	64	-,380	,705
1 st SEM. E	32	4,59	,756	64	1,464	,144
6 th GRADEC	34	4,91	,287	64	-,642	,523
2nd SEM. E	32	4,78	,420	64		
7 th GRADEC	34	4,70	,462	64		
1 st SEM. E	32	4,78	,490			

Table 3 demonstrates that experiment and control groups were equal based on social studies course average grades as well.

Comparison of Pre-Test Achievement Scores of Experiment and Control Groups

Table 4: Descriptive Statistics Results for Pre-Test Academic Point Averages of Experiment and Control Groups

Group	N	\bar{X}	SS	Skewness	Kurtosis
Experiment	36	70,86	14,89	-,817	,373
Control	36	72,71	11,70	-,207	,437

Table 5: ANOVA Results for Pre-Test Academic Point Averages of Experiment and Control Groups

	Degree of Freedom	F	P	Effect Size	Observed Power
GROUP	1	,343	,560	,005	,343
ERROR	70				

Table 5 demonstrates that there was no significant difference between the pre-test scores of the experimental and control groups ($F(1,70) = .343$, $p = 0.560$, Partial Eta-Square = 0.05, Power = 0.343). As a result, the null hypothesis cannot be rejected; thus, we can assume that the experimental and control groups were equal based on the pre-test achievement scores.

Comparison of Experiment and Control Groups' Pre-Test Attitude Scores.

Table 6: Descriptive Statistics Results for Pre-Test Attitude Scores of Experiment and Control Groups

Group	N	\bar{X}	SS	Skewness	Kurtosis
Experiment	33	2,47	,25	,276	1,313
Control	32	2,58	,20	-,552	-,296

Table 7: ANOVA Results for Pre-Test Attitude Scores of Experiment and Control Groups

	Degree of Freedom	F	p	Effect Size	Observed Power
GROUP	1	3,350	,072	,050	,438
ERROR	70				

Table 7 demonstrates that there was no significant difference between the pre-test scores of the experimental and control groups ($F(1,70) = 3.35$, $p = 0.072$, Partial Eta-Square = .050, Power = 0.438). As a result, the null hypothesis cannot be rejected; thus, we can assume that the experimental and control groups were equal based on pre-test attitude scores.

Data Collection Instruments

For the purposes of the present study, the achievement test (pretest, posttest and retention test) that was designed based on the 7th grade social studies curriculum "Economy and Social Life" unit content and Social Studies course attitude scale were used as the data collection tools. This section includes information on the acquisition, development and data collection process conducted with data collection instruments.

FINDINGS

In this section, the findings on the topic of the present study; the impact of the use of peer instruction method in the social studies course on academic achievements of the individual, the individual's attitude towards the course and the retention of the knowledge, are presented.

Academic Achievement Test Findings

Table 8: Descriptive Statistics Results for Pretest – Posttest and Retention Test Academic Achievement Point Average Scores of Experiment and Control Groups

Group	N	Pretest		Posttest		Retention Test	
		\bar{X}	S	\bar{X}	S	\bar{X}	S
Experiment	36	71	14,89	85,29	12,42	83,60	12,55
Control	36	73	11,69	78,77	10,33	82,27	8,52

Table 8 demonstrates that the mean academic achievement pre-test, post-test and retention test scores differentiated among the groups. There was a difference of about 6 points favoring the experimental group in the posttest. Whether or not this difference was statistically significant would be seen as the result of the ANOVA. In other words, whether this difference could be generalized for the population would be revealed by inferential statistics.

Table 9: Covariance Matrix Analysis for Pretest – Posttest and Retention Test Academic Achievement Point Average Scores of Experiment and Control Groups

Box's Test of Equality of Covariance Matrices ^a	
Box's M	7,945
F	1,262
df1	6
df2	35501,887
Sig.	,271

There should be no difference between the covariance of the groups for aired combinations of measurement groups (Can, 2015: 252). Box test conducted to test this condition demonstrated that there was no significant difference between the covariance of the groups as shown in Table 9 ($p > 0.050$).

Table 10: Sphericity Mauchly Test Results

Within Subjects Effect	Approx.		Chi- df	Sig.	Epsilon ^a		
	Mauchly's W	Square			Greenhouse- Geisser	Huynh-Feldt	Lower-bound
Time	,962	2,682	2	,262	,963	1,000	,500

Sphericity Mauchly test results shown in Table 10 demonstrated that the significance of the “Mauchly’s test of sphericity” that tested the null hypothesis “there is no difference between the variance of the differences between the measurements” was greater than 0.005, thus the sphericity condition was met ($p = .963$).

Table 11: Repeated Measure ANOVA Results for Pretest – Posttest Academic Achievement Point Average Scores of Experiment and Control Groups

Source of Variance		Sum Squares	of Sd	Mean Squares F		p	Partial Squared	Eta
Measurement	Sphericity Assumed	5530.384	2	2765.192	32.284	,000	0.316	
Measurement *Sphericity GROUP	Assumed	642.004	2	321,002	3.748	,026	,051	

Table 11 demonstrates that the difference between measurements and groups was significant. In other words, it was observed that the differences between the pre-test, post-test and retention tests and the groups were significant. When the effect size of the difference between measurements was examined, it was observed that the impact was also significant. On the other hand, when the measurement * group interaction was examined, it was observed that use of the Peer Instruction method in the experimental group had an impact on the academic achievements of the students. In other words, there was a significant difference between the experimental group ($\bar{X} = 85,29$) and the control group ($\bar{X} = 78,78$) favoring the experimental group. ($F = 7,805$, $p < .05$). The effect size also appeared to be significant (Cohen, 1988; cited by Tabachnick & Fidell, 2007, p.56).

Table 12: Levene Test Results on Group Pretest and Posttest Scores

	F	df1	df2	Sig.
Pretest	1,352	1	70	,249
Posttest	,418	1	70	,520
Retention test	4,928	1	70	,050

Table 12 demonstrates that the variance in pretest, posttest and retention test results of all groups was equal based on Levene test results ($p > .050$).

Figure 1: Pretest and Posttest Scores of the Groups

As shown in Figure 1, group averages that were close to each other in the first measurement differentiated favoring the experiment group in the second measurements.

That is, the achievement scores of both experimental and control groups in posttest were higher than the pretest scores. Thus, it could be observed that the achievements of both the experimental and the control groups increased. However, the achievement of the experimental group was significantly higher than that of the control group. In fact the increase in the achievement of the experimental group was significantly higher when compared to the

achievement of the control group (Partial Eta Square = 0.10).

“ATTITUDE TOWARDS THE SOCIAL STUDIES COURSE” SCALE FINDINGS

Table 13: Descriptive Statistics Results for Pretest – Posttest and Retention Test Attitude Scores of Experiment and Control Groups

Groups	Pretest			Posttest			Retention test		
	N	\bar{X}	S	N	\bar{X}	S	N	\bar{X}	S
Experiment	33	2,48	,254	33	2,53	,219	33	2,53	,236
Control	32	2,58	,201	32	2,59	,262	32	2,52	,195

Table 13 demonstrates that the attitude pre-test, post-test and retention test mean scores were similar. To determine whether the differences were statistically significant, between groups and in-group mixed analysis of variance (repeated measures) was used, and the findings were listed.

Table 14: Covariance Matrix Analysis for Pretest – Posttest and Retention Test Average Attitude Scores of Experiment and Control Groups

Box's Test of Equality of Covariance Matrices^a	
Box's M	5,087
F	,804
df1	6
df2	28679,57
Sig.	,567

For paired combinations of measurement groups, there should be no difference between the covariance of the groups (Can, 2015: 252). The box test conducted to test this condition demonstrated that there was no significant difference between the covariance of the groups as shown in Table 14 ($P > 0.050$).

In cases where more than two measurements are conducted for repeated measures, the variances of the differences between any two measurements should be equal. This most significant condition of the test is controlled by the Mauchly's Test of Sphericity, the results of which are presented in the table below.

Table 15: Mauchly's Test of Sphericity Results

Within Subjects Effect	Approx.			Epsilon ^a		
	Mauchly's W	Square	Chi-df	Sig.	Greenhouse-Geisser	Huynh-Feldt Lower-bound
Zaman	,999	,086	2	,958	,999	1,000 ,500

Since the significance value of "Mauchly's Test of Sphericity", which tests the null hypothesis "there is no difference between the variances of the differences between the measurements," was greater than 0.005 ($p = .958$), the sphericity condition was met based on the results presented in Table 1.

Table 16: Repeated Measure ANOVA Results for Pretest – Posttest and Retention Test Average Attitude Scores of Experiment and Control Groups

Source of the Variance	Sum of Squares	Sd	Mean Sq.	F	p	Effect Size	Obsrved Power
Between subjects	1932	64					
Group	,040	1	0,40	1,318	,255	,020	,204
Error	1,892	63	,030				
In-Subjects	4,802	130					
Measure (Pretest-Posttest-Retention)	-,038	2	,019	,561	,572	,009	,141
Group*Measure	,110	2	,055	1,613	,203	,025	3,226
Error	4,312	126	,034				

Table 16 demonstrates that there were no significant differences between the attitude scale scores of the students in experiment and control groups before and after the experiment. In other words, there was no evidence that the common effects of being in different groups and repeated measure factors on attitude scale scores were significant. Based on the mixed analysis of variance results conducted on three-step achievement test scores of the groups (pretest-posttest-retention), there was no evidence that the group effect [$F(1,63) = 1.318, p > 0.050$], the between the measures effect [$F(2,126) = .561, p > 0.050$], and the common effect (group * measure) [$F(2,126) = 1.613, p > 0.050$] were statistically significant.

Table 17: Levene test results on group pre-test, post-test and retention test scores

	F	df1	df2	Sig.
Pretest	,908	1	63	,344
Posttest	,143	1	63	,706
Retention Test	,261	1	63	,611

As seen in Table 17, the results of the Levene test findings indicated that the group variances were equal in the pre-tests ($F = .908$, $p > 0.050$), post-tests ($F = .143$, $p > 0.050$) and retention tests ($F = .261$, $p > 0.050$).

Figure 2: Variation in Group Average Attitude Scores with Pretest, Posttest and Retention Test results
Estimated Marginal Means of MEASURE_1

Examination of Figure 2 would demonstrate that the most striking finding was the higher experiment group average retention posttest score in the experiment group when compared to the average retention pretest score, while the average retention posttest score in the control group was lower than average retention pretest score. Furthermore, the highest increase between the pre-test and post-test scores was observed in the experiment group. Thus, although there was no evidence that there was a statistically significant difference between the experimental and control groups based on both the inter-measure and inter-group attitude scores, it could be argued that

there was a more prominent improvement in the experiment group based on the impact and observation power when the score intervals between the groups were examined.

DISCUSSION AND CONCLUSION

The study findings demonstrated that the Peer Instruction method tested in the Social Studies course had serious impact on the academic achievement attitudes towards the course and the retention of the learned knowledge of the individual. Since this method was developed by Eric Mazur, dozens of domestic and international experiments have been conducted and dozens of articles have been written on this method.

In every study that could be accessed since the Peer Instruction method was first applied, it was observed that the positive effects, the shortcomings and different elements related to the method were examined in detail. In previous studies conducted on peer instruction, its effects on academic achievements of the students and retention of knowledge, on the interest and attitudes of the students towards the course, their attitudes towards the administration, its role in the achievement of scientific process skills, its effect on comprehension levels,

conceptual learning, motivation and self-efficacy of the students were investigated and domestic studies revealed that it resulted in serious achievements although its effect size and rate differed from one study to another.

Previous studies conducted on Peer Instruction revealed that the findings were consistent with the results of the present thesis. Based on the literature reviewed within the context of the present study, the current thesis was the first in examining the peer instruction method in the field of social studies. The effect of using the Peer Instruction method in the social studies course was investigated based on the three dimensions of academic achievement of the individual, the individual's attitudes towards the course and the retention of learning. However, it was considered that peer instruction could have an impact on student development in several fields based on the subject matter, goals and achievements of the social studies course. It was predicted that the skills included in the Social Studies curriculum, which are expected to be acquired, developed and transferred to life in the learning process, were directly related to this method and that the peer instruction method would make a significant contribution for these skills. The effect of the Peer Instruction method on the individual's critical thinking skills was directly investigated and it was found that it contributed positively based on the pre-test and post-test results. Furthermore, based on previous studies, the characteristics of the method and the nature of social studies, it could be predicted that the method would have positive contributions for the skills such as communication skills, problem solving skills, decision making skills, information technology literacy skills, entrepreneurship skills, good and effective use of Turkish language, social participation and empathy skills, which are the target skills of the social studies curriculum. It was also anticipated that it would have positive contribution for the target values of social studies course such as scientific values, solidarity, tolerance, respect, responsibility and philanthropy.

In conclusion, a holistic assessment of Social Studies course and other studies conducted with Peer Instruction method would demonstrate that this method affects several student dimensions positively. Naturally, this does not mean that the method of Peer Instruction possesses no disadvantages. Thus, both the limitations and benefits of the method are listed below as determined both by the researcher and by previous studies.

Achievement Test Findings

The findings of the present study demonstrated that the student achievements increased in the experimental group where the instructions were conducted with the Peer Instruction method and in the control group where the current curriculum instruction and activities were utilized. However, the comparison between the groups showed that the experimental group was more successful when compared to the control group.

Based on the retention test applied after the predetermined period upon the completion of the instruction, it was observed that distant group averages in the posttest scores approached similar values in the retention test. This was due to the high increase in control group retention test scores when compared to posttest scores. Finally, the group averages were compared and no difference was determined.

Attitude Scale Findings

It was observed that in both the experimental group where the Peer Instruction method was used and in the control group where the instruction and activities were conducted based on the current curriculum, there was an upward trend between the pre-test and post-test scores, in other words, the attitude levels had slightly increased. However, it was observed that students' attitude scale scores in experiment and control groups did not demonstrate any significant difference between the pretest and posttest applications. In other words, there was no evidence that the common effects of different group membership and repeated measure factors on attitude scale scores were significant. It was observed that pre-test attitude scores were already high.

ABSTRACT

Culture includes many tangible and intangible elements that a society has shaped and possessed over the centuries. For example; elements like traditions, customs, folk architecture, anonymous folk literature products, traditional music, crafts and so on are in the scope of culture.

The study group consisted of 100 students from 9th grade from two schools under the Ministry of National Education of the TRNC. In order to gather the data, the students were asked to write a composition about culture revealing how they perceive cultural concepts and what they know about culture. At the same time, what needs to be done in order to ensure that cultures are not forgotten and maintained, was determined from the student's views. Percentage and content analysis were used in the analysis of the obtained data. As a result of the findings, it is seen that there is a little knowledge in the subjects related to culture like art works, traditions and customs, food, drinks, dishes and sweets-savouries, folk dances, language, historical artefacts, religious beliefs, clothes, festivals and it was also explored that they did not give information about a lot of values related to culture. Views were also gathered about the importance of books, magazines, television programs, films, festivals and theatres to learn about the forgotten values.

Keywords: Culture, concept, student, society, composition.

INTRODUCTION

It can only be possible with a culture that a society can turn into a nation, survive throughout history, and sustain its continuity. Thus, when a community life occurs at a place where various values have emerged, culture is formed. A society often depends on its tangible and intangible values which are brought from its past, but keeps its own cultures open to innovation and development, and allows them to be passed on to future generations. Güvenç says "Culture is learned, historical and continuing, social, ideal or idealized system of rules, satisfying and satisfies needs, integrative, changeable "(1994:101-104). From the point of view of Güvenç, we can say that culture belongs to community, it can be learned, it is formed and continues in the historical process, it emerges in the direction of a certain purpose, it is necessary to meet needs, it is an important element in ensuring unity and the unity of society.

According to Tylor, culture or civilization, as a member of society, is the knowledge, art, morality, tradition etc. that the human beings gain and it is a complexity that covers other abilities, skills and habits (1903:1). Ziya Gökalp states that religion, law, morality, tradition etc. which are the basis of value judgments form the intangible part of culture and work, knowledge, skills and the whole structure of the technology form the tangible part of the culture. In addition, Gökalp states that tangible and intangible cultural values cannot be considered separately and that it is possible to see some reflections and influences of intangible culture during the evaluation of tangible culture (Yüksel, 1987:29).

Erdentuğ sees culture as a system of symbols shared by people and transmitted to future generations (Erdentuğ, 1981:35). Tomlin also mentions that the culture word has two meanings that concern us. He claims that culture means growth or nurture and a cultural man means a nurtured man. Then he points out the ritual, ceremony etc. meanings of culture and that a life without ceremony is meaningless and that in developed cultures there must be

ceremonies for important events of life such as birth, death and marriage (Tomlin, 1959:31-32).

According to Saffet, culture is the spirit of a nation, an elixir of life; and is the biggest effect of salvation and ascension. Saffet also says that if a soulless body cannot survive, it is also impossible for a nation to survive forever without culture (Saffet, 1933:351).

Culture is the sum of all the language, science, art, philosophy, customs, customs which were created according to the conditions of civilization in nation (Ülken, 1948:7). In order to transfer all these values belonging to a nation to future generations and to keep them, it is necessary for new generations to have a broad knowledge about culture.

The aim of this study is to explore whether the students in the Turkish Republic of Northern Cyprus know cultural concepts like traditions and customs, language, religion, literature, arts, folk dances etc. or not, and to determine how much they know about their own culture. Another aim is to get feedback from these students about what can be done in order not to forget culture.

METHODOLOGY

Participants

The study group consists of 100 students from the 9th grade from the Ministry of National Education of the TRNC. 50 students from Turkish Maarif College and 50 students from the Hala Sultan Theology College, all originating from Turkey and North Cyprus, contributed to the study. During the selection of the students, random method was used. It is considered appropriate for the students to be selected from these classes because the culture issue is mostly taught in the 9th grade.

Collection of Data

In order to collect the data, a "Composition on Culture" was written by the students so their cultural knowledge was obtained. At the same time, "Student Interview Form" was applied to the students to get ideas from them about how to protect cultural values.

Analysis and Interpretation of Data

In this study, percentage analysis and content analysis were used to analyse the data obtained from the compositions. The collected data from the "Student Interview Form" was also analysed by using percentage and content analysis. In addition, several data sources were used in the selection of direct quotations and the data were analysed by separating them into certain categories.

RESULTS AND COMMENTS

The findings obtained from "Composition about Cultures" and "Student Interview Form" were examined under separate headings.

A. Findings Related to "A Composition about Culture" Written by Students

Table 1. Percent Results of Findings from Composition

Tangible and Intangible Values	%
Art Works	56
Traditions and Customs	54
Food, Drinks, Meals and Sweets-Savouries	51
Folk Dances	35
Language	30
Historical artefacts	28
Religious Beliefs	23
Clothes	19
Festivals	14
Law	3
Flag	2

1. Art Works

Table 1 clearly shows that the students mostly have knowledge of arts and crafts, in other words, fine arts and handicrafts of cultural values. 56% of the students reported their knowledge of fine arts and crafts. The works of art are examined under two headings:

a. Fine Arts

In the compositions, they gave information about literature, music, painting, theatre and sculpture from fine arts. Students, wrote about theatre, story, rhyme, poetry, myth, novel, folk song in literature; 'Al Yemeni Mor

Yemeni' (take the headscarf give the headscarf) folk song, Dillirga (a village name in North Cyprus) folk song, musical instruments, saz (a stringed instrument which somewhat resembles a lute), kamancha (a small violin played like cello); Karagöz and Hacivat (two famous characters in Turkish literature) in the theatre. Some examples of fine arts are:

"The song 'Al Yemeni Mor Yemeni' is a very beautiful example, which reflects Cyprus culture." (S13)

"Musical Instruments such as saz and kamancha, which belong to Turkish culture, are valuable to us." (S65)

"The folk products such as folk, rhyme etc. reveal the joys and sorrows of our ancestors." (S26)

"There is a myth in every society, but there are traces of our own culture in the myth of every society, and the Myth of the Five Finger Mountain in Cyprus has traces from us." (S71)

b. Handicrafts

Students revealed their knowledge of Lefkara Handicraft (a village handicraft), wood carvings, wicker basket, oven trays, baskets, rugs, pots and earth furnace. Examples of handicrafts are:

"The wicker basket is made of coloured wheat stalks and the basket is called 'sesta' ". (S52)

"Woven rugs carrying the characteristics of Turkish cultures are sold abroad to earn money." (S8)

"Furnaces made from earth are available in almost every home in Cyprus and are used to make bread, kup kebabs (meat cooked in furnace) etc." (S90)

2. Traditions and Customs

54% of the students referred to values in customs and traditions. The students gave information about the 40th day of infants (it is celebrated in Turkish culture), circumcision, weddings, bairams, festivals, wedding, marriage, military service, customs, hospitality, cooperation, not interrupting while older people are talking, kissing the elders' hands. Information on tradition and customs are:

"In our culture, the hands of the elders are absolutely kissed." (S82)

"In Cypriot culture, guests are welcomed with rose water, coffee, walnut confection, citrus confection." (S36)

"Religious Bairams vary from society to society, Bairams like Eid al-Fitr (Bayram of Sweets) and Eid al-Adha (Sacrifice Bayram) are the symbols of Turkish culture." (S15)

"It is one of our traditions and customs to take the bride from her house on a horse on the wedding day." (S7)

3. Food, Drinks, Dishes and Sweets-Savouries

It is seen in Table 1 that 51% of the students gave information about food, drinks, meals and Sweets-Savouries.

a. Food

The students wrote that they know about Cyprus halloumi, Cyprus cheese, olives, grapes, oranges, carob, green olive (cut green olive), carob molasses, which are grown in Cyprus and are unique to Cyprus.

"Harnup, olives and oranges are the most popular products in Cyprus, and it is possible to cultivate these products easily in Cyprus, which has a Mediterranean climate." (S89)

"The halloumi made by the Cypriot people is a kind of cheese that reveals our culture and is liked by all the countries of the world." (S94)

b. Drinks

The students gave information about coffee, rose syrup, zivaniya (a high alcoholic drink) and Cypriot cognac.

"Zivaniya is a drink that Cypriots cannot give up." (S12)

"When a guest arrives, service always starts with coffee, and when it is served, it is first given to the elder then the young and then to the host." (S71)

c. Meals

It is seen that students mostly referred to Cyprus, and at a lesser extent to Turkey. These include magarina bulli (chicken and pasta), molihya (a meal made from the leaves of a plant called molihya), bumbar (a kind of rice made in the intestines of a lamb), seftali kebab (a kind of meatball rolled in fat and barbequed), zucchini flower stuff, Kolokas (sweet potatoe), tarhana (a type of soup), potato meatballs, kuyu kebab (a kind of kebab roasted in furnace), anchovy rice, Adana kebab.

"The best example of the food culture of the Black Sea is anchovy rice." (S63)

"Seftali kebab, molihya, zucchini stuff is the food that Cypriots make and love the most." (S2)

d. Desserts-Savouries

The students also wrote about sweet and savouries, which is also unique to Cyprus and Turkey. They gave information about walnut confection, citrus confection, ekmek kadayıfı (a kind of desert made by cheese and cake), gullurikya (molasses dumplings), watermelon confection, sini katmeri (a kind of desert with syrup), tel kadayıfı (a kind of desert with syrup), tahinli (a desert made by sesame oil), hellimli (a kind of savoury made by

helloumi), künefe (a desert including cheese and peanuts).

"Gullurikya is made from molasses that grows a lot in Cyprus." (S50)

"Walnut confection and citrus confection are very difficult desserts made by Cypriots, but they are long lasting." (S44)

4. Folk Dances

Folk dances are kind of dances with traditional clothes belonging to that society and with a music that come from that community. 35% of the students mentioned folk dances like 'Zeybek, greeting, couch, handkerchief, millet, carpenter and sailors'.

"There is greeting, Zeybek and handkerchief from Turkish Cypriot folk dances." (S88)

"The local dances of Cyprus like Zeybek, duality, caravans etc. are staged at festivals both in Cyprus and in Turkey." (S100)

5. Language

Language is the most important tool in conveying cultural values to future generations. However, only 30% of the students think that language reflects many elements related to the culture, focusing on the concepts of Cypriot dialect, Turkish, common language and Cypriot dialect.

"Every society has a common language, and every society carries its culture through this common language." (S17)

"Cypriot dialect which is actually Turkish is different from the one used in Turkey. For example, grandchildren 'torun' word is 'angoni' in Cypriot dialect. This shows that we were influenced by the languages of other nations." (S65)

6. Historical Artefacts

Historical artefacts made by every nation for a certain purpose may show some differences visually and in terms of materials used. The students gave information about the historical buildings belonging to both our culture and other cultures. Also, the students have the knowledge of which cultural heritage they belong to. 28% of the students gave information about Kyrenia Castle, Great Khan, Salamis Ruins, St. Peter's Basilica, St. Hilarion Castle, Selimiye Mosque and Lala Mustafa Pasha Mosque.

"There are many historical monuments in Cyprus as it was conquered by many states. Selimiye Mosque, Büyük Khan and Kyrenia Castle are some of them. They reflect the cultures of every civilization." (S5)

"Khans and mosques were important for the Ottoman State, so when the Ottoman Empire conquered Cyprus, they built the Great Khan." (S46)

7. Religious Beliefs

People, who are members of a community, are connected with certain beliefs, and shape their lives in the direction of these beliefs. 23% of the students wrote the concepts of religion, which are Muslim, Islamic and Christian.

"Muslims understand the hungry when they fast during Ramadan. This is a symbol of a culture." (S17)

"Each religion's belief is different, for example Muslims believe in Prophet of Muhammad and Christians believe in the views of Jesus." (S10)

8. Clothing

Every nation has its own unique range of clothes. Even different colours, patterns, fabrics in different regions can be seen. It is also seen that the clothes have the features. Although these garments are often the same in purpose, the models vary considerably. 19% of the students gave information about folk dress costumes and costumes worn on the 40th day of babies.

"When the babies are forty days old, it is celebrated and on these customary days, children are dressed in special clothes." (S32)

"The folk dances of each region are different, and the clothes they wear in folk dances are different." (S74)

9. Festivals

Various festivals are organized in different regions of a country. Festivals are held and many values related to the folklore of that region are introduced. 14% of the students wrote about festivals held in Cyprus like Güzelyurt Orange Festival, Mehmetçik Grape Festival, Girne Olive Festival, Tatlısu Carob Festival and Yeşilirmak Strawberry Festival.

"The products that are grown in Cyprus, Cypriot folk dances and handicrafts are introduced in such festivals like Güzelyurt Orange Festival and Yeşilirmak Strawberry Festival." (S41)

"At the Tatlısu Carob Festival you can see many products made from carob." (S20)

10. Law

The peace and welfare of a nation are provided by law. However, every nation has a different understanding of law. It is also an irrefutable fact that the law has been shaped according to traditions and customs and has changed so far. 3% of the students referred to law.

"When we say culture, law can be associated too. For example, in our culture, when a person is prosecuted for rape, that person can be imprisoned and executed elsewhere." (S56)

11. Flag

The flag is used as a symbol of a nation and is shaped according to the character of that nation. 3% of the students gave information about the colour of the flag and the symbol on it.

"The Turkish flag is red, because it reminds us of our history. Many soldiers shed blood for this country so red color is used." (S28)

B. Findings related to 'Student Interview Form'

Views of the students on what should be done to ensure that the culture is kept and remembered, were taken. The views were divided into the following categories and they are listed as follows:

Table 2. Views of the Students on What Should be Done to Ensure that the Cultures are Kept and Remembered

Codes	Supportive Sentences	%
Books and Magazines	<i>"Our culture can be mentioned in works such as novels and stories." (S19)</i>	36
	<i>"There may be more cultural topics in textbooks." (S95)</i>	
	<i>"The meaningful sayings that our ancestors said years ago must be put in books." (S48)</i>	
	<i>"We have to leave permanent artefacts in order to transfer our culture from generation to generation and to keep it alive. Thus, it is important to be careful when writing books." (S6)</i>	
	<i>"Our food culture should take place in various magazines." (S64)</i>	
Charity Fairs	<i>"Schools can organize fairs to promote food related to Cyprus." (S12)</i>	25
	<i>"The food and drink made by villagers can be sold at fairs." (S37)</i>	
	<i>"To help, handicrafts such as Lefkara handicraft, rugs, oven trays linen can be sold, and with the help of these our culture is remembered." (S50)</i>	
Films and Television Programs	<i>Movies and Television Programs "Programs should be made on television to show customs and traditions." (S86)</i>	20
	<i>"Old people's lives should be filmed, because they know our culture better." (S73)</i>	
	<i>"Our culture can be taught to more people through films." (S54)</i>	
Festivals	<i>"These folk dances must be shown at festivals in order to ensure that folk dances are not forgotten." (S13)</i>	11
	<i>"All our cultural values can be promoted, with the help of festivals." (S82)</i>	
	<i>"General culture competitions must be held at festivals." (S35)</i>	
Theatres	<i>Theatres "We can teach our cultural values with the help of drama" (S28)</i>	8
	<i>"Materials used on the stage at the theatre must be unique to culture." (S9)</i>	
	<i>"The sorrows and joys that a society experienced in the past can be conveyed through the theatre, so people learn how their ancestors lived and their past." (S80)</i>	

In Table 2, the vast majority of our students claimed that it is possible to ensure that the culture is not forgotten and maintained mostly by books and magazines, then with the help of charity fairs, films, television programs, festivals and theatre's. 36% of the students supported books and magazines, 25% fairs, 20% films and television programs, 11% festivals and 8% theatre to promote cultures and transfer them to future generations.

CONCLUSIONS AND RECOMMENDATIONS

It can be argued that most of the learners have a little knowledge about cultural values and there is no information about most values yet. Although the students gave information about artworks, traditions and customs, food, drinks, meals and sweets-savouries, folk dances, language, historical artefacts, religious beliefs, clothes, festivals, law and flag, their knowledge is still not enough. It was found that the students mostly have knowledge about artworks, traditions and customs, food, drinks, meals and sweets-savouries among cultural

values. However, there are many values that students did not even mention. Some of these are the burial of death, prays; henna night, which is one of the wedding traditions and customs; dowry, pregnancy craving, to become pregnant, sacrificing which is one of the religious beliefs, dedication, curses and prays, folk medicine, fortune-telling; house shapes, names and nicknames used by the people and the names of villages, towns, neighbourhoods and streets.

The following suggestions obtained from students' views are useful to ensure that the culture is not forgotten and transferred to the next generation:

- The first thing to do is to undertake a wide range of identification, compilation and archiving studies related to culture of the country covering all settlement areas by the relevant departments of the Ministry of Culture.
- In this way, it becomes clear what can be used in education, in art, in cinema, in theatre, in literature, or in cultural terms.
- Of course, at the first stage of these studies, the most forgotten values can be explored and they should be shared with the public.
- More topics on culture can be placed in textbooks.
- In some lessons, information about forgotten children's games can be given and these games can be played.
- Students can research cultural values and discuss their findings in class.
- People who are interested in folklore (folklorists) as professionals or who are interested in folklore as amateurs (writers, poets, teachers etc.), can introduce cultural values by organizing conferences, panels etc. in schools.
- It is important to ensure that fairs and festivals are reflective of our culture.
- It may be noted that plays to be performed at schools are reflective of our culture.
- Various museums exhibiting products that reflect our culture, public knowledge and cultural values (e.g. Intangible Cultural Heritage museums) can be opened.

Examination of Picture Books in Terms of Illustration and Colour Harmony with Regards to Appropriateness for Children

Oya ABACI

Ataturk Faculty of Education

Marmara University

Turkey

oabaci@marmara.edu.tr

ABSTRACT

Picture books have a significant place in children's development and education with their properties of being informative, entertaining and being preparative for life. In picture books, the illustration particulars and colour harmony is as important as the story told, language and editing because of the fact that they reinforce the emotion that is aimed to be expressed and enhance the visual perception. If the visual language that is used in picture books starts the visual perception of child in early ages and supports it, the educational attainments we desire for children will be easier to achieve. If the picture books are prepared and printed as a result of a professional study by keeping the needs and expectations of the child, a significant step towards raising a generation that likes reading will be taken.

The purpose of this research is to examine the illustrations and pictures aimed at children, in children picture books in terms of appropriateness for development of visual perception and illustration and colour harmony.

The sample set of the research is 54 children's picture books that are originally written in Turkish, or translated into Turkish. The books are limited to the "picture books" that are chosen by the preschool teachers working Kadıköy district printed between the years of 2009 and 2014. The chosen picture books are also limited to the ones that are for 5-6 ages. The research method used is descriptive survey model used for qualitative research. The descriptive survey model is preferred because it consists of the interpretation of the data by scanning and evaluation of it within generalizations.

This research has been supported by Marmara University Research Project Committee under Project number EGT-D-120417-0231.

INTRODUCTION

Art is a field where humans make themselves valuable in the process of being human. Humans expressed their beings with art and interpreted their reason of existence by art; thought through it, criticised and explored; grasped the world with art. Without human, there would be no art. The creator and the consumer of art is again humans. Art is an integral part of modern education. In every stage of modern education, art is benefited from in terms of both artistic thought and critical thought in either independent art classes or art education related to different disciplines. Particularly children's education, their aesthetical development is valued as much as the art education to uncover and develop the artistic skills. Literature, being one of the fields of art, starts to get into an individual's life in early childhood. Children's literary products naturally have to be pictured because of the fact that they are produced for children who are illiterate and engage books visually and auditory. Books that are prepared for children that are between infancy and the age of 7 are named as "Picture Books" (Turla, Tür, 1999). Picture books are books that give less space to text than pictures (Gönen, 1998). Children's books are deemed to be one of the important factors that help children to "form a rich language environment" in the process of acquisition of linguistic skills starting from pre-school period (Sever, 2003). Nas, on the other hand emphasise on the stimulant effect of picture books for language being pictured on the development of the child (2002).

Picture books have an informative and entertaining side for children. The practices of life that are preparatory for children and given to them unaware have an important place in their development and education. In picture books, picturing features and the used colour harmony is as important as story, language and editing because they reinforce the emotion that is given and enhance the visual perception. The visual language used in picture books start the visual perception development of the child in early ages. Children develop their thinking skills with making use of their auditory and visual perceptions. They process the data acquired through perceptions and learning occurs. According to Arnheim, who states that without a perceptive component it would be impossible

for an individual to develop creative thought in any field (2007), there is no reason to not name the process “thinking” which occurs during the act of seeing. Because, thinking fundamentally is, perceptive. Hence, visual perception is thinking.

Reaching a child with the use of visual language should be done by experts who know child reality. Here, the notion of “appropriateness for children” rises. Bilgin (2011), defines this notion as “a work, product or thought revealed to call out to child’s world of thought, to watch out for the child’s language and grasping levels, to form the selected words, sentences and narrative techniques accordingly for the child. Here, the appropriateness for children notions should be looked upon within the extent of pictures. Drawing for children can be also stated as using figures that children can understand. Children show interest to pictures in pre-school ages. They learn the colours and draw simple figures. Hence, it is a natural outcome that children at that age to be interested in pictured books. Pictures drawn for a child should be simple enough for the child to understand, but creative enough to be thought-provoking. A simple figure may ensure a child imagine. Pictures that cover a full page that are drawn in order to tell the story are of no use, except for being a strain in the eyes. Whereas, when a simple picture that include figures also include hints, it becomes ideal for a child (Taşdemir, 2005). Child sees the narration in the picture as well as self-interpret using the hints. Features such as colours, space, perspective, and shadowing in the drawn picture, provides the child to correctly perceive the picture and form the connection between the story and the picture easier. Having said that, a picture drawn correctly and aesthetically becomes the start of a child’s art education.

Children prioritize their attention on to pictures in a book because of being illiterate in pre-school ages (Abacı, 2000). Therefore, use of colours is very important for children to comprehend the text as they examine the pictures in the books. Objects, events and situations taking place in text should be supported with colours. For example, colour harmony is very important with regards to describing the emphasized objects and still or dramatic events with pictures. Colour harmony is one of the best criteria for children to see the objects or understand the events correctly. Also, colour harmony is the most important criteria for expressing the emotion to the child. The harmony of the selected colours of the illustration corresponding to the emotion expressed in the text enhances the reality of the story. Thus, becomes easier for the children to understand the story as well as the value that is desired to be given to the child is given easier.

METHOD

Reading narratives and interpreting explanations are integral parts of qualitative research. Qualitative research aims to understand the actions, narrations and how these intersect (Glesne, 2012). Since reading the visual language is equal to narrations, qualitative research method is preferred in this study. The model used is survey model because the study is based on the examination of 54 picture books that are oriented at 5-6 year old children that are published between 2009-2014, in terms of illustration and colour harmony with regards to appropriateness for children. Survey model is a research approach that aims to define and portray a situation that happened in the past or that moment. In descriptive survey model, scientific studies such as monitoring, recording, identification of relationships between events generalisation upon controlled and constant relationships (Karasar, 2007). The survey model used in this research is descriptive survey model which is included in general survey model. It was deemed appropriate to use descriptive survey model because it includes examination of data and interpretation by generalisation. Descriptive survey model is the technique of gathering data by examination of existing records and documents. The practices of searching, finding, reading, examination and evaluation of all kinds of records, documents, materials or works that are related to subject are included in descriptive survey model (Taşdemir, 2000).

THE STUDY

Senior year students of Marmara University Department of Pre-School Teaching were assigned in the study group. Picture books that are preferred as teaching materials by pre-school teachers, who are working in pre-schools in Kadıköy district of İstanbul were determined. These books were sorted by publishers and writers, 54 picture books were randomly chosen from 29 publishers. Thirty six native and eighteen translated picture books were examined with regards to colour harmony characteristics seen in the illustrations. Of all these books, 38 of them belong to Turkish authors and painters and books that have foreign authors and painters were 16. There are

8 picture books among a total of 54 books which have same author and painter. The numerical data that has been formed as a result of examinations are calculated by percentage. The frequency results gathered are interpreted accordingly to descriptive survey model of qualitative research methods.

LIMITATIONS

The sample of the research is 54 picture books for children written either in Turkish or translated to Turkish.

The books are limited to the "picture books" chosen by teachers who teach at institutions belonging to Kadıköy district.

The books are chosen from books published between the years of 2009-2014

The chosen picture books are limited to books that are appropriate 5-6 year old children.

The chosen books are limited to only picture books.

FINDINGS

Table 1. Distribution of the examined books with regards to being native or translated

	f	%
Native Picture Books	36	66.6
Translated Picture Books	18	33.3
Total Picture Books	54	100

Table 1: Out of 54 picture books published between the years of 2009-2014, 36 of them were native picture books that are written, illustrated and published in Turkey. It can be seen that this is predominant with a ratio of 66.6%. Picture books that are translated into Turkish are 18 among the 54 and their ratio is 33.3%.

Table 2. Distribution of the examined books with regards to author and painter

	f	%
Picture books with Turkish author	38	70.33
Picture books with foreign author	16	29.66
Picture books with Turkish painter	38	70.33
Picture books with foreign painter	16	29.66
Author and the painter is same	8	14.80
Total book	54	100

Table 2: Picture books that are prepared and published in Turkey with a Turkish author are 38 with a ratio of 70.33%, while translated picture books that have foreign authors are 16 with the ratio of 29.66%. With the same numbers and ratios, Picture books that are prepared and published in Turkey with a Turkish painter are 38 with a ratio of 70.33%, while translated picture books that have foreign painters are 16 with the ratio of 29.66%. Among these pictured books, only 8 picture books have the author and the painter as the same person with a ratio of 14,80%.

Table3. Colour harmony characteristics of illustrations of picture books

	f	%	f	%
There is analogous colour harmony	51	94.44	3	5.56
Does analogous colour harmony match the text?	44	81.48	10	18.52
There is complementary colour harmony	41	75.92	12	24.08
Does complementary colour harmony match the text?	38	70.37	16	29.63
There is primary colour harmony	48	88.88	6	11.12
Does primary colour harmony match the text?	47	87.03	7	12.97

Table 3: When the illustrations of the pages of 54 picture books were examined in terms of analogous colour harmony, it was observed that analogous colour harmony was used by a ratio of 94.44% and it did not exist by a ratio of 5.56%. When the pages that contain analogous colour harmony was examined with regards to it matching the story narrated, it was seen that it does match with a ratio of 81.48%, and it does not match with a ratio of 18.52%.

When the illustrations of the pages of 54 picture books were examined in terms of complementary colour harmony, it was observed that analogous colour harmony was used by a ratio of 75.92% and it did not exist by a ratio of 24.08%. When the pages that contain analogous colour harmony was examined with regards to it matching the story narrated, it was seen that it does match with a ratio of 70.37 %, and it does not match with a ratio of 29.63%.

When the illustrations of the pages of 54 picture books were examined in terms of triadic colour harmony, it was observed that analogous colour harmony was used by a ratio of 88.88% and it did not exist by a ratio of 11.12%. When the pages that contain analogous colour harmony was examined with regards to it matching the story narrated, it was seen that it does match with a ratio of 87.03 %, and it does not match with a ratio of 12.97%.

CONSLUSIONS

Book illustrations are important with regards to illiterate children getting an idea about the text of the picture books through the illustrations and illustrations improving effect of visual perception on children. The colour harmony should be taken into consideration as much as illustration techniques. The main element that is examined in this study is the use of appropriate colour harmony of the illustration of text. Because, colour harmony is an effective component for subject to be understood and intended emotions to be created.

Analogous colour harmony, which is also defined as the harmony of similar colours, is the colour harmony that is applied by using accent colours which is also called mix colours and pastel tones. Analogous colour harmony is the colour harmony formed by the use of colours that does not strengthen each other's effects, rather the use of colours that would form a union.

Colours used in analogous colour harmony are the colour harmonies made by made by pairs of two (blue-purple, red-orange), or triple colour groups (such as purple-red-orange) and three mixtures of colour (orange-purple-green) side by side in colour wheel (Abacı, 2007). It is very effective for expressing emotions such as tranquillity, happiness, and peace. Compositions practicing analogous colour harmony create a more peaceful and calmer mood in the individual. In pictures that make use of analogous colour harmony, objects or events do not move ahead of each other and there are not prominent situations. Colours balance each other in analogous colour harmony and do not strain the eyes. It is appropriate to use this colour harmony especially in nature portrayals and chapters in which no object or story characters come into prominence. It was seen that the pages of the examined books were in line with these properties with a ratio of 94.44%. As for the ratio of text and illustrations harmonising was 81.48%. The highest ratio was seen in analogous colour harmony compared to other types of colour harmonies.

Complementary colours are the colours that stand in opposite sides of each other on the colour wheel. The accent colour, which is the mix of the two primary colours that stands on the opposite side of each primary colour, is the complementary colour of the chosen primary colour. These are red - green, yellow - purple, blue - orange. Complementary colours, when used together, enhance each other's chromatic effect; the dominant colour increases the intensity of the other (Abacı, 2007). It is used to draw attention to an element in a composition. For example, an orange bird flying in a deep blue sky would not go unnoticed as the red cardigan of a child playing in a verdant green meadow would immediately be spotted. Complementary colour harmony is important in children books with regards to children developing their visual perception and understanding the text correctly. For example, if the text mentions a red apple and this red apple is in predominant, a red apple on a green surface could be drawn in the illustration. In this way, the red apple could be the most striking object on the page. It is especially important to pay attention to this rule on the pages where the protagonist is illustrated. Otherwise, insignificant object or events may become predominant in the picture. In turn, making the story harder to

understand. It was seen that the pages of the examined books were in line with these properties with a ratio of 75.92%. As for the ratio of text and illustrations harmonising was 70.37%. This shows us that complementary colour harmony is used the least compared to other colour harmonies.

Primary colour harmony is at the same time the harmony of disparate colours. It is the colour harmony created by distant colours, generally three primary colours (red, blue, yellow) (Abacı, 2007). When two of the distant colours come together, a colour changes the type of the other one. For example, when red and blue come together, blue would push the red towards orange while red would push the blue towards green; thus it is possible to obtain vibrant colours by making use of fewer colours (Temizsoylu, 1987). Primary colour harmony adds dynamism to the picture. The primary colour harmony, in which all three primary colours are used, is a conscious choice for texts that contains chaos, action and enthusiasm. Primary colour harmony is used to illustrate subjects such as festivities, playgrounds, market-squares in order to emphasize the dynamic structure of the subject. It was seen that the pages of the examined books were in line with these properties with a ratio of 88.88%. As for the ratio of text and illustrations harmonising was 87.03%.

According to results, it can be seen that analogous colour harmony is preferred by painters while the ratio of it on the match between text subject and colour harmony being lower than all other colour harmonies shows us that painters do not take into consideration of colour harmony matching the subject. Primary colour harmony is the second choice of colour harmony. On top of that, the match between the text and the colour harmony is better compared to other colour harmonies. This suggests that the illustrations made for young children are drawn with the assumption that children love vibrant colours. It was seen that complementary colour harmony was the colour harmony that was least preferred while being the colour harmony that would contribute to development of visual perception.

It can be seen in Table 3 that all three colour harmonies were used in all 54 picture books. This indicates that painter did not take emotions that were desired to convey to the reader into consideration and used the colours independently from the emotion of the subject while just keeping in mind which colours children would like. It seems that the colour portrayals that adhere to the reality of the world we live in with and colourfulness that is considered to be liked by children were the priorities of the painters with regards to illustration of picture books. It is our opinion that many publishers that produce high quality children books in Turkey should take this subject into consideration, for the benefit of the children's ability with developing their visual perception.

ABSTRACT

Accounting education is given at multiple levels of education from high school to associate degrees, undergraduate studies and graduate studies. Graduate studies are usually geared towards academicians or future academicians. For this reason, content, similarities and differences become prominent. Because, ensuring a similar program for the education provided both domestically and internationally would become important in terms of using the same language. To this end, experience and skills required for the vocation were established with various regulations of the American Accounting Association (AAA), International Federation of Accountants (IFAC) and the European Union.

This study aims to look into existence, programs, characteristics, ECTS and AKTS statuses of the accounting courses provided for Business Management graduate programs in Turkey. This study also attempts to highlight the importance and necessity of accreditations. Main subject of examination of the study is the institutes of social sciences of the state and foundation (private) universities listed on the Turkish Institute of Higher Education (YÖK) website. For the assessments, syllabi of the accounting courses and other courses related to accounting provided in business management, accounting, accounting and financing, and accounting auditing graduate programs under the social sciences institutes of the universities were examined and these courses were evaluated.

Keywords: Graduate programs, Education Accreditation, Accounting Education

INTRODUCTION

The studies regarding accounting education has been done both in Turkey and in various countries of the world. One of these is the studies of the Education Committee established within the International Federation of Accountants (IFAC).

Education Committee has done studies in the line of expectations from accounting education in order to eliminate ongoing differences between practitioners and accounting educators, satisfy needs and improve quality (Zaif and Ayanoglu, 2007: 118).

Until today, a total of 8 International Education Standards (IES) have been published, some of them by IFAC Education Committee, some by IAESB.

International education standards include international recognition, admittance, and potentially applicable basic methods and techniques (archive.ismmmo.org.tr).

Positive expectations about the future in accounting education gain further importance each passing day. However, as in other areas, we are not alone in accounting education, and as well as a global economic system, an accounting education system that can satisfy both their and information users' request and needs of information is required to emerge. In this regard, the education committee established within the international federation of accountants attempts to improve the quality of accounting education by developing standards and guidelines (Ercan and Çelik: 1995)

When we look at the accounting history considering expectations and searches we see that the thought of arrangement of accounting practices, increase of quality, elimination of disarrangement by getting to their bottom, has gained further importance especially after international accounting standards became functional. The regulation of curriculum of accounting education, the continual protection and development of quality of education in terms of accounting education has become remarkable throughout the way of the arrangements of (IFAC) International Federation of Accountants (Öncü Semra, Aktaş Hüseyin:1992).

In this sense, international federation of accountants has defined the information as content of curriculum programs, and information is a part of accreditation from its aspect (Sayar et al., 2017:19).

Accreditation is a nongovernmental process that involves the review of an educational institution's ability of offering quality programs by those other than that educational institution and that is based on volunteerism principle. The reviews made in the scope of accreditation include self-evaluation, reckoning in colleague, committee's reviews and the development of detailed strategic plans. The mission of educational institutions, characteristics of faculty members, and course contents are examined in this process.

The international accreditation institution (AQAS) is a non-profit independent institution consisting of accreditation of training programs, quality assurance agency, academic associations and higher education institutions. The institution established in 2002 in Germany both assesses the accreditation of partner organizations and common and double diploma programs, and certifies its compliance with the European Standards and principles through its accreditation program.

The accreditation process in the field of business is carried out by The Association to Advance Collegiate Schools of Business (AACSB). AACSB Accreditation is a specialized and professional organization with international recognition for business and accounting programs at the undergraduate, graduate and doctorate levels.

AACSB accreditation guarantees to provide the highest quality education in business faculties. Accreditation also allows employers to be ready for business life from the first day they are employed. Moreover, the AACSB accreditation also benefits faculty members by attracting successful students, increasing their research opportunities and providing international recognition. As of December 2010, 607 institutions in 38 countries around the world have AACSB accreditation.

Istanbul University Faculty of Business Administration in Turkey was accredited by The Association to Advance Collegiate Schools of Business (AACSB), which is an important organization that accredits business faculties all over the world, a non-profit organization founded in 1916. Thus, it has been the first faculty that was accredited by AACSB among the business faculties of state universities in Turkey (.<http://isletme.istanbul.edu.tr>)

In the field of accounting, The Association to Advance Collegiate Schools of Business (AACSB) accredits undergraduate and graduate business and accounting programs. ([Http://www.egitimcaddesi.com/universitelerde-akreditasyon-nedir/](http://www.egitimcaddesi.com/universitelerde-akreditasyon-nedir/))

A STUDY ON ACCOUNTING COURSE CONTENTS TAUGHT IN GRADUATE PROGRAMS OF UNIVERSITIES AND ON AKTS FORMS

Purpose of Research

In this study, it is aimed to determine the existence of accounting courses taught in business graduate programs in Turkey and their characteristics, especially determination of AKTS situations.

Method of Research

Master and doctorate programs such as business administration, accounting, accounting audit, accounting finance etc. which were opened under the social science institutes of the public and foundation universities in Turkey were discussed in the study. The research was conducted between 01 and 31 May 2017.

Scope and Limits of the Study

The main body of this work consisted of 184 public and foundation universities in Turkey. As a sample, the oldest and largest 30 universities, involving 20 public and 10 foundation universities, were reviewed in the study.

The study range was consisted of the contents and AKTSs of accounting courses in graduate and doctorate education programs. First the credits and AKTSEs of graduate courses, and then those of doctorate programs were presented in tabular form. In this sense, while international federation of accountants defines the knowledge; the international accountant federation's emphasis in the direction of that curriculum programs and their inclusion should also be included in the programs was also taken into account.

CONCLUSION

The European Union uses the Erasmus action plan, which is a part of the Socrates program, to establish a standard in accounting education. Through these programs, many issues such as the establishment of ECTS and the development of the curriculum were discussed. It is important to establish standards on academic programs, course credits of educations provided in universities, in the line with the direction of the programs. The Erasmus program will open the way for not only EU countries but also candidate countries to be accredited so as to facilitate the review of education programs and application of credit transfer. As a candidate country to the EU; the graduate programs of the oldest and largest 20 public and 10 foundation universities among 184 universities in Turkey, were reviewed.

- It was determined that 36 courses, different from each other, were taught in graduate program.
- It was found that 32 courses were taught in doctorate program.
- It was seen that majority course group in both graduate and doctorate program were consisted of international accounting and auditing standards, cost and management accounting and cost analysis and reporting.
- These most remarkable courses were seen to be taught at both graduate and doctorate programs.
- It was found that although ECTS s of the courses taught in these programs were different from each other, their credit values were the same.
- When the credit values of courses taught in doctorate programs were reviewed, it was found that 4 courses were with 4 credits, and 28 courses were with 3 credits.
- It was found that only 1 course was with 2 credits, the rest 35 courses were with 3 credits in graduate program.
- It was found that although ECTSs ranges between 3 and 15 in both graduate and doctorate programs, they were mainly 6.

ABSTRACT

The objective of this investigation is to adapt Potential-Based Achievement Goals Scale into Turkish language. The research was applied to 411 university students. The model consisting of 6 items was well fit according to confirmatory factor analysis. The internal consistency analyses of the scale was .82 and that was reliable enough for the adaptation research. According to item discrimination and confirmatory factor analysis results, 2 factors structure the scale was found appropriate for Turkish sample ($\chi^2=30.07$, $sd=8$, $RMSEA=.082$, $AGFI=.94$). In this research, the scale was found valid and reliable instrument to examine the levels of approach and avoid potential in education process for Turkish sample group.

Key Words: Approach Potential, Avoid Potential, Achievement Orientation, Adaptation, Validity, Reliability.

INTRODUCTION

In the past couple of decades, achievement goals have been a fundamental research area of education domain (Dweck, 1986; Elliot and others, 2015; Nicholls, 1984). Achievement goals represent competence-relevant aims that students struggle for their success in an achievement setting (Elliot, 2005). In this investigation, lower parts of achievement goals have been concentrated to reveal that subset of achievement goals have various indicators such as past-based and potential based goals. While they can be assessed respectively, still pertain to the identical notional classification (Elliot et al., 2015). While the notion “achievement” symbolizes competence, the concept of “goals” stands for aims that leads and manages behaviour. Therefore the research of achievement goals can be taken into consideration as the investigation of competence – relevant aims that leads and manages behaviour (Elliot et al., 2015). Achievement goals point out to competence-relevant aims that students struggle for an aim in achievement environment (Elliot, 2005). According to widely accepted 2 x 2 achievement goal, achievement goals possess two main elements: definition and valence. There are four kinds of goals within the definition and valence elements results. These are mastery-approach, performance-approach, mastery-avoidance and performance-avoidance elements (Elliot & McGregor, 2001; Huang, 2012; Hulleman, Schrager, Bodmann, & Harackiewicz, 2010). Goal orientation theory developed as an essential academic point of view on individuals’ motivation in learning settings (Anderman & Wolters, 2006; Elliot, 2005; Meece, Anderman, & Anderman, 2006; Pintrich & Schunk, 2002; Kaplan and Maehr, 2007). Goal orientation created a widespread investigation framework about motivational orientations that promotes improvement of adaptive engagement in learning environment such as schools (Ames, 1992; Maehr & Midgley, 1991, 1996; Kaplan and Maehr, 2007). Goal orientations generally emphasizes why and how individuals are striving to achieve different aims and including the real intention of achievement behaviour rather than focusing on what learners struggling to achieve (Anderman & Maehr, 1994; Kaplan and Maehr, 2007). While mastery goals orientation presents the aim of developing competence, performance goals orientation stands for the aim of showing competence. It means that performance-oriented

learners concentrates on establishing an effect of high ability and avoiding to demonstrate low ability (Ames, 1992; Dweck, 1986; Kaplan and Maehr, 2007). The notion of motivation was described in the mid of last century to understand learners' engagement in learning (Elliot, 1999). The notion of a goal is absolutely based on a motivational setup. Investigators struggle to better explain students' achievement behaviour. It has been proposed that the goals should be taken into consideration which are followed and aimed by students or learners to understand the nature of achievement behaviour of individuals (Dweck, 1986; Nicholls, 1984). Achievement goals stand for learners' interpreting and reacting to the cases, and so creating grounds for learning behaviour (Dweck & Leggett, 1988)

METHOD

Study Group

Target population of the study comprises of students in Sakarya University. The sample of the research consists of random chosen 411 students in Education Faculty of Sakarya University. 287 female and 124 male in total 411 students are involved in this study.

Data Collection Tool

Potential-Based Achievement Goals Scale comprises of two sub-dimensions and 6 items. Scale was prepared in 5 Likert type and the items were graded from 1 (strongly disagree) to 5 (strongly agree).

FINDINGS

Item Analyses and Reliability

According to the results of analysis, the internal consistency of Potential-Based Achievement Goals Scale was found as .82 for the overall scale. Item analyses was performed to identify item discrimination strength of Potential-Based Achievement Goals Scale in undergraduate level. As a result of the analysis, corrected item total correlation of the scale ranged from .50 to .70. The findings are shown in Table 1.

Table 1: *Corrected Item Total Correlation of The Turkish version of the Scale Items*

Corrected Item Total Correlation of The Scale Items		(r_{jx})
1	Sınavlarda mümkün olduğunca yapılabileceklerimin en iyisini yapmayı amaçlarım.	.50
2	Sınavlarda yapabileceğimin en iyisini yapmayı amaçlarım.	.52
3	Sınavlarda kişisel performansımın en iyisini yapmayı amaçlarım.	.51
4	Sınavlarda bildiğime kıyasla en zayıf dereceyi yapmaktan çekinirim.	.67
5	Sınavlarda bildiğimden daha kötüsünü yapmaktan çekinirim.	.70
6	Sınavlarda kendi seviyemin en kötüsünü yapmaktan çekinirim.	.69

Structure Validity

The result of the exploratory factor analysis of the scale explains Kaiser-Meyer-Olkin Measure as .75 and total variance of structure as %80.

Table 2 : Explained Total Variance

	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	3,258	54,301	54,301	3,258	54,301	54,301
2	1,569	26,158	80,459	1,569	26,158	80,459

The results of confirmatory factor analysis for bidimensional model indicated that the fit indices values were found as ($\chi^2=30.07$, $sd=8$, $GFI=.98$, $RMSEA=.082$, $IFI=.99$, $NNFI=.97$, $SRMR=.044$, $AGFI=.94$, $NFI=.98$, $CFI=.99$). Factor loads of confirmatory factor analysis were shown in Figure 1. It consists of two parts as sub dimensions. These dimensions comprises of 1, 2, 3. items as approach potential and 4, 5, 6. items as avoid potential.

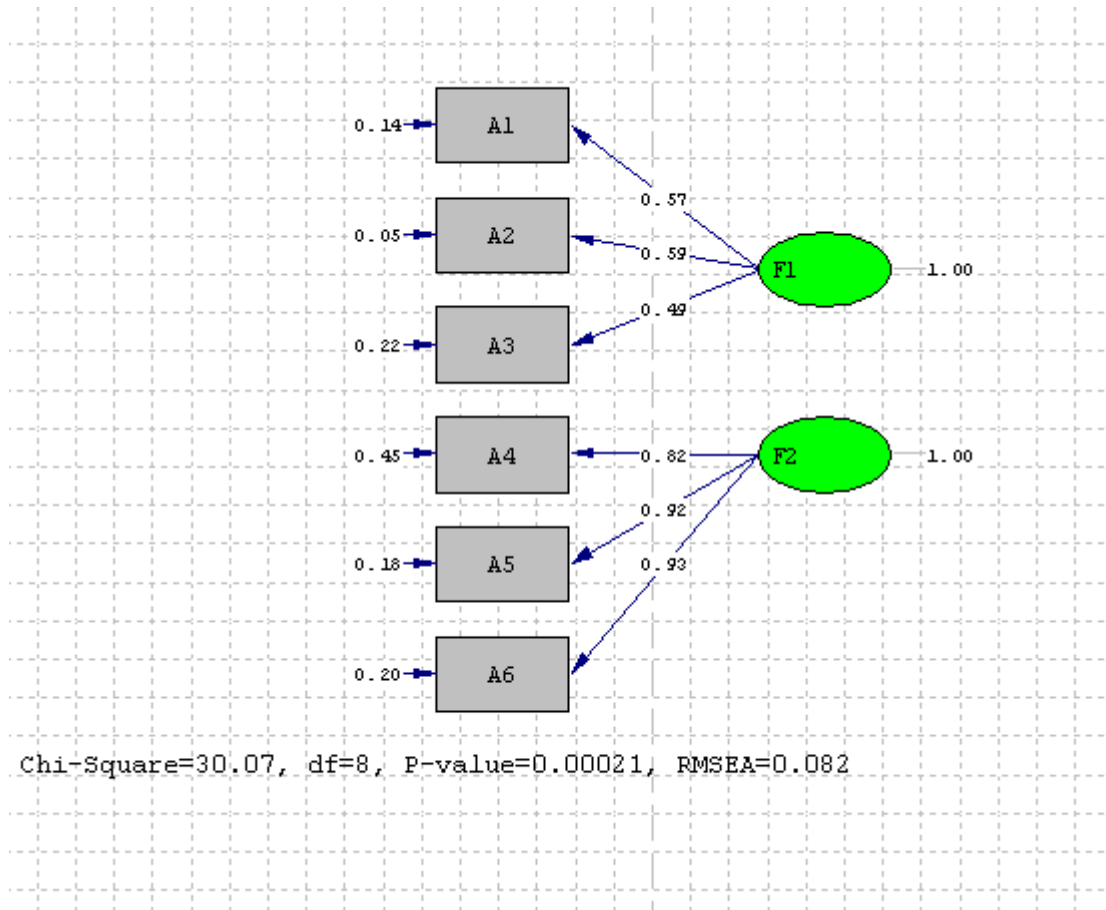

Figure 1. *Factor loads of confirmatory factor analysis*

DISCUSSION

In this study, the validity and reliability of Potential-based achievement goals scale developed by Elliot, Murayama, Kobeisy, ve Lichtenfeld, (2015) was investigated on a group of Turkish students. Firstly, CFA was performed to examine structure validity of the scale. CFA result showed that the factor structure was compatible with the original scale. According to confirmatory factor analysis, two factor original scale was confirmed by testing CFA. Compatibility values gathered from the results are $\chi^2=30.07$, $sd=8$, $RMSEA=.082$, $AGFI=.94$. According to compatibility values, χ^2/df rate and compatibility index indicate that the model is well fit (Bollen, 1989).

Cronbach Alfa internal consistency parameter was utilized to measure the reliability of the scale. Cronbach Alfa internal consistency value of the scale was found as .82. According to this findings, Potential-based achievement goals scale was defined as valid and reliable measurement instrument. Whether the present structure represented in this investigation is confirmed with different sample groups can be examined. New findings about the validity of the present scale can be reached by the way of associating achievement orientations and different variables. Some investigations can be performed to determine if the scale is appropriate for different education grades which were adapted for the university students.

ABSTRACT

The objective of this study is to examine the role of kinesthetic intelligence levels of child and young sporters aged 12 - 18 on determining problem solving skills. According to the study objective, the study group consisted of totally 363 licensed child and young sporters aged 12-18, who competed in clubs. 29,5% of participants were in the age group of 12-13 (n=107), 32,5,% in the age group of 14-15 (n=118) and 38% in the age group of 16-18 (n=138). Among the participants; 51% were female (n=185) and 49% male sporters (n=178). The study objective was achieved by using Problem Solving Scale, which was developed by Heppner and Peter'sen (1982) and was tested for validity and reliability by Sahin, Sahin and Heppner (1993), and Kinesthetic Intelligence Scale, which was adapted into Turkish by Saban (2002). The acquired data were analyzed by using SPSS 22.0 program. Data regarding both scales were analyzed via non-parametric analysis methods as they did not show a normal distribution. Kruskal Wallis H test was used in comparing the scale data according to the age groups of participants. Mann Whitney U test was used in determining the differences between the age groups in lower dimensions. Mann Whitney U test was used in comparing the scale data according to the gender of participants. Spearman Correlation Analysis was conducted for examining the relationship between the scores of Physical Intelligence Scale and Problem Solving Skills Scale. Examining the study findings; it was determined that there was no statistically significant finding between the kinesthetic intelligence levels and problem solving skills of sporters. As a consequence, it may be suggested that there is no systematic relationship between the kinesthetic intelligence level and problem solving skill within the scope of our study.

Keywords: Sport, kinesthetic intelligence, problem solving

INTRODUCTION

Recently, one of the focal points for researchers in the field of sport science seems to be problem-solving skills of children and teenagers and how to improve these skills (Siedentop & Van der Mars, 2004; Wright, Burrows & MacDonald, 2004; Mitchell, Oslin & Griffin, 2003). Undoubtedly, the main factor which motivates researchers to conduct such studies is to find a way to improve the problem-solving skill, which is one of the basic skills that children and teenagers should have. Also, exploring factors related to the problem-solving skill is in a very important position within the framework of this main purpose.

Gardner (1999) defines intelligence as the capacity to create a product which is valued in one or more cultures, the ability to come up with effective and efficient solutions for real life problems, and the ability to solve new and complex problems which need to be solved. According to the Multiple Intelligences Theory, human intelligence consists of different intelligence domains (Armstrong 2000). It is suggested that there are eight different intelligence types including the kinesthetic intelligence which differ in terms of learning style, problem-solving method, thinking style, specific tools, and characters (Kelly and Tangney 2003).

Body is beyond a simple machine similar to other artificial objects in the world. It is also an instrument that allows the individual to perceive himself, his most personal emotions and desires and an entirety which sparks different responses in others due to its unique traits (Gardner 1983).

Kinesthetic intelligence corresponds to the ability to use one's body to express ideas and emotions as an actor, athlete, or dancer or the ability to use one's hands as a sculptor, surgeon, or mechanic or create new things with one's hands. This domain of intelligence is one's capacity to use certain body organs (e.g. hands or fingers) to solve a problem, build a model, or create a product. This type of intelligence also covers some physical attributes such as coordination, balance, strength, flexibility, and speed and some specific kinetic skills which allow these attributes to work together. The best way to learn for individuals who are strong in this domain of intelligence is by doing, living, and moving (Bowling 1998, Maasjo 2002, Saban 2004).

Students with a strong bodily/kinesthetic intelligence have difficulty in focusing on the subject in class settings where the class is taught through classical verbal presentations and occupy themselves with something else during the learning process. As a result, those who drift away from the educational process most easily are usually students with strong bodily/kinesthetic intelligence (Eren Yavuz, 2004).

Gardner (1999) defines intelligence as the ability to produce effective and efficient solutions for problems. The relationship between kinesthetic intelligence, which is noted to develop with experience in athletes (Eren Yavuz, 2004), and the problem-solving skill is an object of curiosity. In this context, it is necessary to clarify concepts of problem and problem-solving.

Problem is defined as a situation which disrupts coping processes of the individual due to certain obstacles such as uncertainty, conflict, hesitation, inadequate performance skills, and lack of support resources. In general, problems arise from the difference between the existing situation and the desired situation. Problems may occur due to personal or environmental reasons, chronic or acute, as well as in the form of a series of time-limited, associated or similar events. Problem does not appear as a property of the individual or the environment on its own. They occur as a result of the mutual relationship between constantly changing environmental variables and the individual. While the concept of problem may be different for each individual, different individuals may respond differently to the same event. Therefore, a situation which may be described as a problem for a given individual may not be a problem for another (D'Zurilla, Nezu, and Maydeu-Olivares, 2004).

A positive psychological state may be ensured if the individual possess problem-solving skills. The problem-solving proficiency has a determining role in one's life struggle and self-actualization. Individuals with high problem-solving skill may set an example and encourage others with whom they are constantly in contact to have success in problem-solving. In development of societies, individuals with high problem-solving skill may be suggested to have the power to reach the masses (Gültekin, 2006).

Studies conducted with different variables show that the problem-solving skill influences many states of the individual. For example, studies on depression show that depressed individuals lack the ability to solve interpersonal or social problems effectively (Heppner and Petersen, 1982). Kiremitçi, Canpolat, and Yıldız (2014) reported a statistically significant relationship between kinesthetic intelligence and problem-solving. In another study on the same subject, Genç (2012) reported that kinesthetic intelligence was correlated with problem-solving subdimensions. In addition to these variables, the problem-solving skill is also affected by age (Akpınar, 2015), educational level (Enç, 1981; Gültekin, 2006; Kaya, 2005; Sesli, 2013), work experience (Demirtaş and Dönmez, 2008; Kaya, 2005; Şahin, 2015), educational level of parents (Akpınar, 2014; Demirtaş and Dönmez, 2008), professions of parents (Akpınar, 2014), having received training on problem-solving (Şahin, 2015), development and maturity level, privileges in skill level, motivation, and socio-cultural setting (Enç, 1981). Also, Heppner (2010b) noted that problem-solving was correlated with social adaptation, depression, despair, suicidal tendencies, anxiety, alcohol abuse, bad dietary habits, and childhood traumas.

It is believed that revealing the individual's skills will allow for commenting on his characteristics such as reasoning, critical-thinking, and problem-solving skills (Talu, 1999). Based on this opinion, the purpose of this

study is to find out about kinesthetic intelligence levels of school-age child and young athletes, investigate the relationship between kinesthetic intelligence, which is the priority of our study, and the problem-solving skills, and interpret the effect of kinesthetic intelligence on problem-solving.

METHOD

In this section, research group, measurement tools and statistical methods utilized in this research were exhibited.

Research Design

In this study, survey method (Büyüköztürk, Çakmak, Akgün, Karadeniz and Demirel, 2008; Karasar, 2009) and relational survey method were utilized (Büyüköztürk et al., 2008; Karasar, 2009; Büyüköztürk, 2014). According to Fraenkel and Wallen (2006), the purpose of relational researches is to investigate the relationships among two or more variables without interfering them. In the meantime, existence and degree of the relationships among dependent and independent variables were tried to be revealed based on the model (Crano and Brewer, 2002). Karasar (2009) describes purpose of relational survey models as determining existence and degree of relationships among two or more variables. On the other hand, survey model is the approach which tries to describe a past or present status as it is. Research subject, which could either be an event, a person or a subject, is tried to be defined within their unique conditions and as is (Karasar, 2009). In the present study, relational research, one of the quantitative research methods, was employed and this constitutes an example of a research conducted based on survey model.

Participants

In line with the purpose of the study, the research group consisted of 363 licensed child and young athletes in the 12-18 age group competing in clubs. 29.5% of the participants were in the 12-13 age group (n=107), 32.5% were in the 14-15 age group (n=118), and 38% were in the 16-18 age group (n=138). 51% of the participants were female (n=185) and 49% were male (n=178).

Measuring Instruments

For the purpose of the study, the Problem Solving Inventory (PSI) developed by Heppner and Petersen (1982) and tested for validity and reliability by Sahin, Sahin, and Heppner (1993) and the Kinesthetic Intelligence Inventory were used.

Problem Solving Inventory

The Problem Solving Inventory (PSI) was developed by Heppner and Petersen (1982) to measure self-perceived problem-solving skills and tested for validity and reliability by Sahin, Sahin, and Heppner (1993). It is a six point Likert-type scale consisting of 35 items. While “1” indicates strong agreement, “6” indicates strong disagreement. A low score obtained from the scale shows efficiency in problem-solving, a high score indicates inability to come up with effective solutions. Studies show that the Cronbach’s Alpha internal consistency coefficient for the overall scale is 0.90, whereas the coefficient for subscales varies from 0.72 to 0.85 (as cited in Savaşır and Sahin, 1997: 79). The Cronbach’s Alpha reliability value of the inventory was found to be .80 and the inventory was decided to be acceptable.

Kinesthetic Intelligence Scale

In order to determine levels of students in domains of multiple intelligence domains, the Multiple Intelligences Developmental Assessment Scale developed by Gardner and tested for Turkish validity and reliability ($\alpha=0.93$) by Saban (2002) was used in the study. The reliability coefficient was found to be $\alpha=0.85$ in the analysis performed to review the Self-Evaluation Inventory in Multiple Intelligence Fields for samples of the study. The items of the inventory are marked according to the following system: 0= Not at all like me, 1= A little like me, 2= Somewhat like me, 3= A lot like me, 4= Definitely like me. Scores obtained by each participant from eight sections of the inventory were summed to determine total scores in intelligence domains. Those with a total score of 33-40 in intelligence domains were categorized as highly developed, those with a total score of 25-32 were categorized as developed, those with a total score of 17-24 were categorized as moderately developed, those with a total score of 9-16 were categorized as average, and those with a total score of 0-8 were categorized as underdeveloped.

Data Analysis

SPSS 22.0 was used for data analysis. Since the data obtained from both measuring instruments did not show normal distribution, non-parametric analysis methods were used. The Kruskal-Wallis H test was used to compare inventory scores of the participants by age group. Mann-Whitney U test was used to determine which age group

caused the difference between subdimensions. Mann-Whitney U test was also used to compare inventory scores of the participants by gender. The relationship between the Kinesthetic Intelligence Scale scores and the Problem-solving Skills Scale scores of the participants was investigated using the Spearman Correlation analysis.

FINDINGS

Table 1. Frequency and Percent Distributions Regarding Demographic Information of The Participants

Variables	Age	f	%
Age Groups	12-13 age	107	29,5
	14-15 age	118	32,5
	16-18 age	138	38,0
Gender	Female	185	51,0
	Male	178	49,0

According to the study objective, the study group consisted of totally 363 licensed child and young sporters aged 12-18, who competed in clubs. 29,5% of participants were in the age group of 12-13 (n=107), 32,5,% in the age group of 14-15 (n=118) and 38% in the age group of 16-18 (n=138).

Table 2. Descriptive Statistics Regarding Problem-solving Scores of The Participants

Subscale	N	X	Ss
Problem-solving confidence	363	36,01	6,891
Approach-avoidance	363	53,25	7,970
Personal control	363	17,36	4,308
Problem-solving skill	363	106,62	12,284

The participants had moderate problem-solving confidence, approach-avoidance, personal control, and problem-solving skill levels.

Table 3. Comparison of Problem-solving Levels of The Participants by Age Groups

Subscale	Age	N	X	Ss	Sıra Ort.	X ²	P
Problem-solving confidence	12-13 age	107	35,96	7,127	177,29	1,622	,444
	14-15 age	118	36,57	5,966	192,09		
	16-18 age	138	35,58	7,438	177,03		
Approach-avoidance	12-13 age	107	52,36	8,326	169,43	20,125	,000
	14-15 age	118	51,21	7,358	157,24		
	16-18 age	138	55,68	7,602	212,92		
Personal control	12-13 age	107	17,19	4,558	176,97	10,499	,005
	14-15 age	118	16,54	4,150	161,61		
	16-18 age	138	18,18	4,119	203,34		
Problem-solving skill	12-13 age	107	105,50	13,235	173,44	10,977	,004
	14-15 age	118	104,32	11,317	163,19		
	16-18 age	138	109,44	11,844	204,71		

As shown in the Table 3, it was found that there was no statistically significant difference between the age groups in the problem-solving confidence factor ($p>0.05$), whereas statistically significant differences were found between the age groups in the approach-avoidance, personal control, and problem-solving skill factors ($p<0.05$). The difference between the age groups in approach-avoidance and problem-solving skill levels was found to arise from the higher problem-solving skill levels of participants in the 12-13 age group and the 14-15 age group compared to participants in the 16-18 age group. The difference between the age groups in the personal control factor was found to arise from the higher scores of participants in the 14-15 age group compared to participants in the 16-18 age group.

Table 4. Comparison of Problem-solving Levels of The Participants by Gender

	Gender	N	X	Ss	Sıra Ort.	Sıra top.	U	P
Problem-solving confidence	Female	185	35,23	7,107	169,80	31412,5	14207,5	,024
	Male	178	36,83	6,581	194,68	34653,5		
Approach-avoidance	Female	185	54,45	8,372	196,96	36438,0	13697,0	,006
	Male	178	51,99	7,344	166,45	29628,0		
Personal control factors	Female	185	17,79	4,425	191,87	35496,0	14639,0	,066
	Male	178	16,90	4,147	171,74	30570,0		
Problem-solving	Female	185	107,48	12,774	190,29	35203,0	14932,0	,125
	Male	178	105,72	11,723	173,39	30863,0		

As shown in the Table 4, it was found that there was no statistically significant difference between the genders in terms of problem-solving skill levels ($p>0.05$), whereas statistically significant differences were found between the genders in the problem-solving confidence, approach-avoidance, and personal control factors ($p<0.05$). Female participants were found to have a higher skill level compared to male participants in the problem-solving confidence factor, whereas male participants were found to have a higher skill level compared to female participants in approach-avoidance and personal control factors.

Table 5. Descriptive Statistics Regarding Kinesthetic Intelligence Scores of The Participants

Questinnnaire	N	X	Ss
Kinesthetic intelligence	363	27,09	5,971

As shown in the table 5, the participants had moderate kinesthetic intelligence levels.

Table 6. Comparison of Kinesthetic Intelligence Levels of The Participants by Age Groups

Age Groups	N	\bar{X}	Sd	Mean Rank	X^2	P
12-13 Age	107	26,58	6,703	177,79	2,256	,324
14-15 Age	118	27,84	5,879	193,80		
16-18 Age	138	26,86	5,401	175,17		

As shown in the table 6, there was no statistically significant difference between the age groups in terms of kinesthetic intelligence level ($p>0.05$).

Table 7. Comparison of Kinesthetic Intelligence Levels of The Participants by Gender

Gender	N	X	Sd	Mean Rank	Sum of Ranks	U	P
Female	185	26,91	6,176	179,57	33221,0	16016,0	,653
Male	178	27,28	5,761	184,52	32845,0		

As shown in the table, there was no statistically significant difference between the genders in terms of kinesthetic intelligence level ($p>0.05$).

Table 8. The Relationship between Kinesthetic Intelligence Levels and Problem-solving Skills of The Participants

	Correlation	problem-solvin	approach-avoidance	personal control factors	personal control factors
Kinesthetic intelligence	r	,035	-,090	-,082	-,096
	p	,504	,086	,118	,067
	n	363	363	363	363

As shown in the table 8, there was no statistically significant relationship between kinesthetic intelligence levels and problem-solving, approach-avoidance, personal control factors and problem-solving skill levels of the participants ($p<0.05$).

CONCLUSIONS

Information regarding physical education and exercise activities is mostly collected through studies designed in class settings or sport settings. Most studies focus on psychosocial and health benefits of sports and physical activities. Playing sports is known to contribute to physical and mental health. In line with this information, the purpose of this study is to investigate the relationship between kinesthetic intelligence levels and problem-solving skills of child and young athletes in the 12-18 age group. In this context, the main purpose of the study is to explore whether there is a correlation between kinesthetic intelligence levels and problem-solving skills of athletes.

It was found that there was no statistically significant difference between the age groups in the problem-solving confidence factor, whereas statistically significant differences were found between the age groups in the approach-avoidance, personal control, and problem-solving skill factors. The difference between the age groups in approach-avoidance and problem-solving skill levels was found to arise from the higher problem-solving skill levels of participants in the 12-13 age group and the 14-15 age group compared to participants in the 16-18 age group. This finding is consistent with D'Zurilla, Maydeu, and Kant's (1998) study which suggests that problem-solving skills of individuals improve as they move from youth to adulthood. The difference between the age groups in the personal control factor was found to arise from the higher scores of participants in the 14-15 age group compared to participants in the 16-18 age group. This finding is in contradiction with D'Zurilla, Maydeu, and Kant's (1998) study which suggests that problem-solving skills of individuals improve as they move from youth to adulthood.

It was found that there was no statistically significant difference between the genders in terms of problem-solving skill levels, whereas statistically significant differences were found between the genders in the problem-solving confidence, approach-avoidance, and personal control factors. Female participants were found to have a higher skill level compared to male participants in the problem-solving confidence factor, whereas male participants were found to have a higher skill level compared to female participants in approach-avoidance and personal control factors. In the light of this information, it can be said that findings obtained by Korkut (2002) support our study. There was no statistically significant difference between the genders in terms of kinesthetic intelligence level. In the light of this information, it can be said that findings obtained by Korkut et al. (2011) in their study with high school students support our findings. There was no statistically significant relationship between kinesthetic intelligence levels and problem-solving, approach-avoidance, personal control factors and problem-solving skill levels of the participants.

In conclusion, we were unable to find a statistically significant relationship between kinesthetic intelligence levels and problem-solving skills of athletes. Within the framework of our study, it can be said that kinesthetic intelligence level does not have a systematic association with problem-solving.

Authors' Disclosures of Potential Conflicts of Interest

The authors indicated no potential conflicts of interest.

Footnotes

This study was presented as a poster presentation in international conference on new horizons in education Congress (INTE), Berlin, Germany, 17-19 July, 2017.

ABSTRACT

The structural field of Civil Engineering is usually considered by undergraduate students as the hardest discipline. In Statics, the first structural course, students show learning problems, discouragement and anxiety to later courses. To improve this situation, it is necessary to identify those students who experience learning issues. This paper analyzes the expected academic performance from students enrolled in Statics. Four semesters of data have been analyzed, correlating the Cumulative Index and the Initial Course Performance with the Final Grade. Results show that Cumulative Index and Initial Course Performance correlate with Final Grade. However, the dispersion levels are not valid enough to make a prediction. Data shows that academic performance could be affected by the semester when the course is offered. Analyzed data shows that by establishing a relation between the Final Grade, the Cumulative Index and the Initial Course Performance, it is possible to group students and categorize their academic performance. This analysis would allow the implementation of more specific actions to enhance the students' academic performance.

INTRODUCTION

In the Civil Engineering Curriculum, the structural area is usually considered by many undergraduate students as the hardest throughout their major. Statics is the first area course where basic concepts are developed to learn subsequent courses. In this course, the student's experience must be highly positive to avoid generating negative attitude or anxiety, and facilitate true learning for future application. Each semester, a group of students enrolled in Statics at the University of Piura, experience learning issues. To improve this situation, it is necessary to identify those students so they can receive more attention from their professors and achieve satisfactory academic results. This identification requires a prediction.

The academic community has been interested in predicting the student's future academic performance for different purposes and using different mathematical models and predictor variables. Some authors (Touron 1982, Aboma 2009, Sembiring 2011, Dalziel & Peat 1998) are looking to discover the most impacting factors on academic performance to develop predictive models. Another example is Huang & Fang work, 2013, which not only focuses on predictors, but also evaluates a number of models determining the most appropriate for prediction.

On the other hand, unlike previous publications, other authors have used prediction with different purposes: to identify a specific group of students who might have unfavorable academic outcomes and try to improve their situation. Some researchers included in this group are: Snyder, Hackett, Stewart & Smith 2002; Rúa & González 2004; Rodríguez & Coello 2008; Ibarra & Medina 2011; De Winter & Dodou 2011.

This paper is aimed to study the academic performance expected from students enrolled in Statics at the University of Piura, analyzing two performance indicators: one prior to the course start (Cumulative Index) and the other during the early course weeks (Initial Course Performance). The performance study is the initial stage of a larger process looking to improve the student's academic results and avoid the loss of motivation to study and continue their career progress.

COURSE DESCRIPTION

Statics is a theoretical-practical course aimed to develop the student's ability to simply and logically analyze Engineering problems and the capacity to apply the basic principles of Mechanics, Vector Algebra and Mathematics, in the solution.

The Statics course grading system includes an entry exam (EE), biweekly tests (T), weekly quizzes (Q), one midterm exam (ME), one final exam (FE), and one optional additional exam to replace the lowest grade obtained in two previous exams. In addition, the student's attendance (A) and participation in extracurricular activities (EX) organized by the School of Engineering are also considered. Table 1 shows the final grade (FG) calculation for the semesters under study.

Table 1. Formulas for calculating the final grade of Statics.

Semester	Formulas for calculating the final grade
2012-II	$FG = [(EE \times 0.5 + T_1 + T_2 + T_3 + T_4 - T_{\min} + Q + EX + ME \times 3 + FE \times 3) / 9.5] - A$; if $EE \geq 11$
2013-II	$FG = [(T_1 + T_2 + T_3 + T_4 - T_{\min} + Q + EX + ME \times 3 + FE \times 3) / 9.0] - A$; if $EE < 11$
2013-I	$FG = [(EE \times 0.5 + T_1 + T_2 + T_3 + T_4 + T_5 - T_{\min} + Q + EX + ME \times 3 + FE \times 3) / 10.5] - A$; if $EE \geq 11$
2014-I	$FG = [(T_1 + T_2 + T_3 + T_4 + T_5 - T_{\min} + Q + EX + ME \times 3 + FE \times 3) / 10.5] - A$; if $EE < 11$

T_i: grades for the biweekly tests, i = 1, 2, 3, 4, 5. T_{min}: lowest grade of all the tests.

The course final grade, entry exam, tests and exams (midterm and final) are rounded to the nearest integer and can take values between 0 and 20, including limits. If the final grade is higher than or equal to 11, the student passes the course. If the final grade is less than 11, the student fails.

Additional points for quizzes (Q) and extracurricular activities (EX) can worth up to 3 points. Deduction for absences (A) can range from 1 to 9 points based on absences in the semester.

This paper analyzed the academic results of 369 students enrolled in the Statics Course during four semesters: 2012-II (93 students), 2013-I (114 students), 2013-II (92 students), and 2014 -I (70 students). The first semesters (2013-I and 2014-I) cover March to July and the second semesters (2012-II and 2013-II) cover August to December.

ANALYSIS AND RESULTS

ANALYSIS OF EXPECTED ACADEMIC PERFORMANCE BASED ON CUMULATIVE INDEX

Prior research outcomes (Tourón 1985; Dalziel & Peat 1998; Snyder, Hackett, Stewart & Smith 2002; Rodríguez & Coello 2008; De Winter & Dodou 2011), concluded that the Grade Point Average (GPA), is a prior performance indicator highly correlated to future performance. Based on this, a GPA-Equivalent parameter was used: the Cumulative Index (CI). The CI is an academic index that measures the student performance throughout his career. This represents the weighted grade average obtained in enrolled courses, taking course credits as a weighting factor.

The Cumulative Index - independent variable - was correlated to the Statics Reformulated Final Grade (RFG) achieved before taking the replacement exam - dependent variable. The Reformulated Final Grade (RFG) calculation was based on the Final Grade (NF) calculation formulas shown in Table 1, but without considering neither the extra participation points in extracurricular activities (EX), nor deductions for absences (A). The RFG has been expressed with a 2-decimal digit number for a higher correlation with variables. Students retaking the course were dropped from the sample considering only those taking the course for the first time. Hence, a more homogeneous and reduced data was analyzed.

In previous publications, a number of mathematical models have been used to correlate the students' academic performance starting from the simplest such as the linear regression (Dalziel & Peat 1998, De Winter & Dodou 2011) and multiple regression (Touren 1985; Aboma 2009) to the more complex models, such as logistic regression (Snyder, Hackett, Stewart & Smith 2002, Rúa & González 2004, and Rodríguez & Coello 2008), data mining techniques (Sembiring 2011, Ibarra & Medina 2011), and neuronal networks (Huang & Fang 2013). Research results show that a complex mathematical model does not guarantee high successful rates. Acceptable satisfactory grades can be achieved with simple models.

To analyze the relationship between the Cumulative Index and the Reformulated Final Grade, a mathematical model of simple linear regression was used, due to its low complexity and easy replicability (Angulo 2007). Based on corresponding measurements for the 2012-II, 2013-I, 2013-II and 2014-I semesters; it was determined the highly descriptive linear function of correlation between both variables. Resulting equations for each semester represent the Expected Performance calculation based on Cumulative Index.

The relation between the Cumulative Index (CI) and the Reformulated Final Grade is shown in Figure 1. The regression lines that best fit each semester data represent the Expected Performance based on CI (EP_{CI}). A

positive linear correlation between the Cumulative Index and the Expected Performance is observed. The P-values obtained were less than 0.05.

In second semesters' graphs, the regression lines fit data more appropriately; that is, less dispersion compared with the first semesters' graphs.

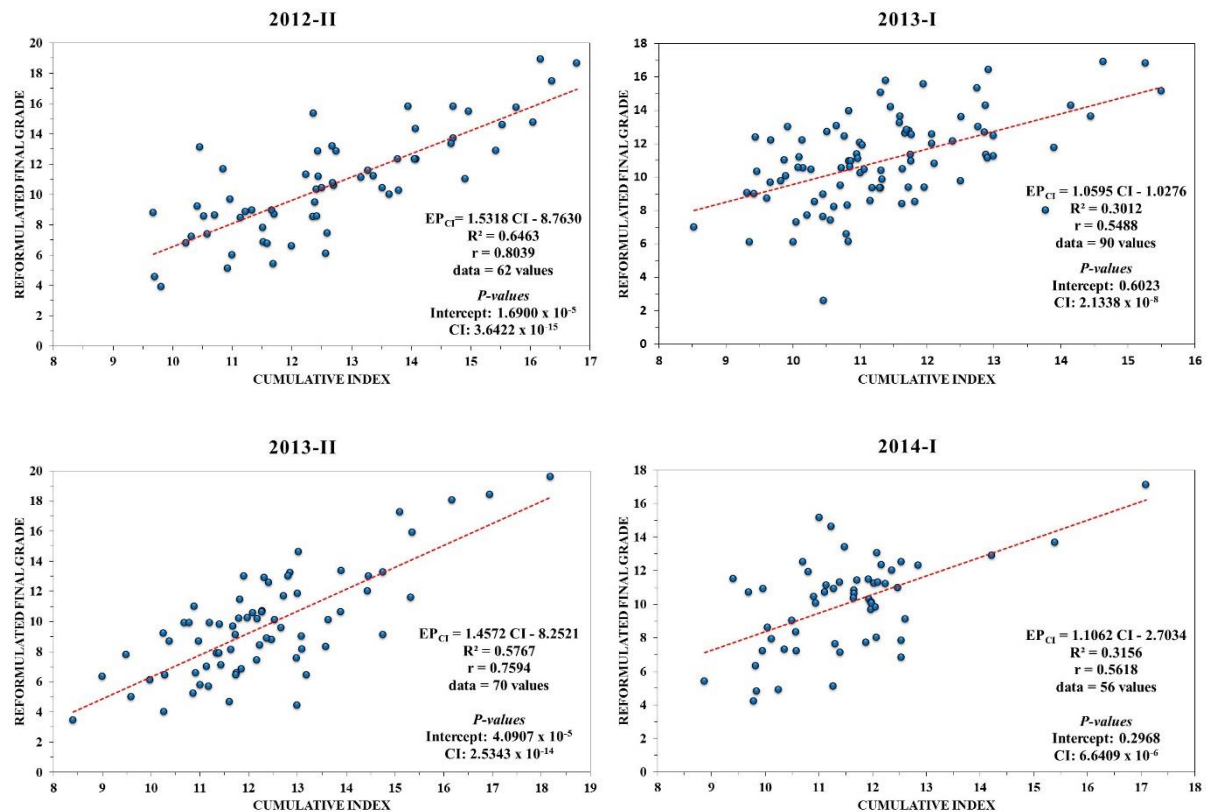

Figure 1. Cumulative Index vs. Reformulated Final Grade of students enrolled in Statics for the first time.

Figure 2 shows the highly fitted simple regression lines, obtained with equations displayed in Figure 1. These equations show the Expected Performance based on the Cumulative Index. There is a similarity between the lines corresponding to the second semesters, as well as the lines corresponding to those of first semesters.

Figure 2. Better fitted simple regression lines expressing Expected Performance based on Cumulative Index.

Figures 1 and 2 show a differential behavior between the semesters both in data dispersion and regression equations. Lines slopes in first semesters are smaller than those in second semesters, which means that the increase of Expected Performance with the increase of Cumulative Index is higher in second semesters. These differences could result from various factors, some associated to the semester under study and others to the student.

The break period before the classes start is not the same for every semester. For the first semesters break lasts approximately 2 months. For second semesters, break period lasts less than one month.

In second semesters, a general inter-school sports activity takes place at the University of Piura. In this event students voluntarily participate in competitions and contests throughout the semester. In first semesters, this kind of activities are not offered.

Students who took Statics for the first time in second semesters, have not had delay issues in their college admission. Students who took the course in first semesters, have had admission issues. The Cumulative Index median in second semesters (12.49) was higher compared to the first semester's median (11.42). This shows that second semester students group presented, on average, a better previous academic performance.

During the first semesters (2013-I and 2014-I) there is a displacement among regression lines, keeping similar slopes (see figure 2). This parallelism in the regression lines could be explained due to the professor that was not the same. In second semesters (2012-II and 2013-II), regression lines are very similar among each other. Unlike the first semesters, this time the course was taught by the same teacher. This behavior confirms the fact that the professor has an influence on the academic results.

Other factors that would affect the expected performance could be: student academic load, classroom comfort associated to seasonal weather conditions, teaching methodologies (based on each professor), family-related issues, non-academic activities (sports, music, and languages), working need to cover tuition, fatigue resulted from psychological issues, and diseases, among others.

The Cumulative Index has shown a relation with the Reformulated Final Grade, but this relationship does not guarantee that the Expected Performance determined by the CI, is close to the actual performance obtained at the end of the semester.

ANALYSIS OF EXPECTED ACADEMIC PERFORMANCE BASED ON COURSE PERFORMANCE

First examinations' grades measure the student's learning level for the first part of the course. These grades can be measured by an indicator that would represent the student's initial academic performance for the course first units' topics. This indicator called Initial Course Performance has been correlated to the Reformulated Final Grade.

The Initial Course Performance (ICP) is the weighted average of grades obtained in evaluations previous to the midterm (entry exam, tests 1 and 2), eliminating the lower of two tests and rounding the result to two-decimal digits. These evaluations have been used to characterize the student's academic performance in the initial stage of the course.

Quizzes administered throughout semesters have not been considered in the Initial Course Performance calculation due to their low impact on the Final Grade calculation and their poor grade gradualness.

Based on appropriate data measurements for the 2012-II, 2013-I, 2013-II and 2014-I semesters, the linear function that best describes the correlation between the Initial Course Performance and the Reformulated Final Grade has been determined, for those students enrolled in Statics for the first time. The resulting equations, for each semester, represent the Expected Performance determined based on the Initial Course Performance (EP_{ICP}).

Table 2 shows the statistical parameters of regression lines that relate Cumulative Index with Reformulated Final Grade, and Initial Course Performance with Reformulated Final Grade. Correlation (r) and determination coefficients (R^2) have been increased in second semesters only. In first semesters, both parameters have decreased when considering the ICP as an indicator of expected performance.

CI shows a greater correlation with the RFG in the first semesters. In second semesters, ICP is the indicator that mostly correlates with the RFG.

Figure 3 shows the relation between Initial Course Performance and Reformulated Final Grade. The regression lines more suitable to each semester data, represent the Expected Performance expressed based on the ICP. A positive linear relation is observed. P-values obtained were less than 0.05.

Table 2. Statistical results of linear regressions between Cumulative Index and Reformulated Final Grade and between Initial Course Performance and Reformulated Final Grade.

Sem.	Statistical Parameters	Cumulative Index versus Reformulated Final Grade	Initial Course Performance versus Reformulated Final Grade
2012 II	Sample Size	62	62
	Line Equation	$EP_{CI} = 1.5318 CI - 8.7630$	$EP_{ICP} = 0.8075 ICP + 0.2995$
	Determination Coefficient (R^2)	0.6463	0.6871
	Correlation Coefficient (r)	0.8039	0.8289
2013 I	Sample Size	90	90
	Line Equation	$EP_{CI} = 1.0595 CI - 1.0276$	$EP_{ICP} = 0.4258 ICP + 5.6654$
	Determination Coefficient (R^2)	0.3012	0.2721
	Correlation Coefficient (r)	0.5488	0.5216
2013 II	Sample Size	70	70
	Line Equation	$EP_{CI} = 1.4572 CI - 8.2521$	$EP_{ICP} = 0.7347 ICP + 2.3099$
	Determination Coefficient (R^2)	0.5767	0.6234
	Correlation Coefficient (r)	0.7594	0.7896
2014 I	Sample Size	56	56
	Line Equation	$EP_{CI} = 1.1062 CI - 2.7034$	$EP_{ICP} = 0.2917 ICP + 6.8156$
	Determination Coefficient (R^2)	0.3156	0.1067
	Correlation Coefficient (r)	0.5618	0.3266

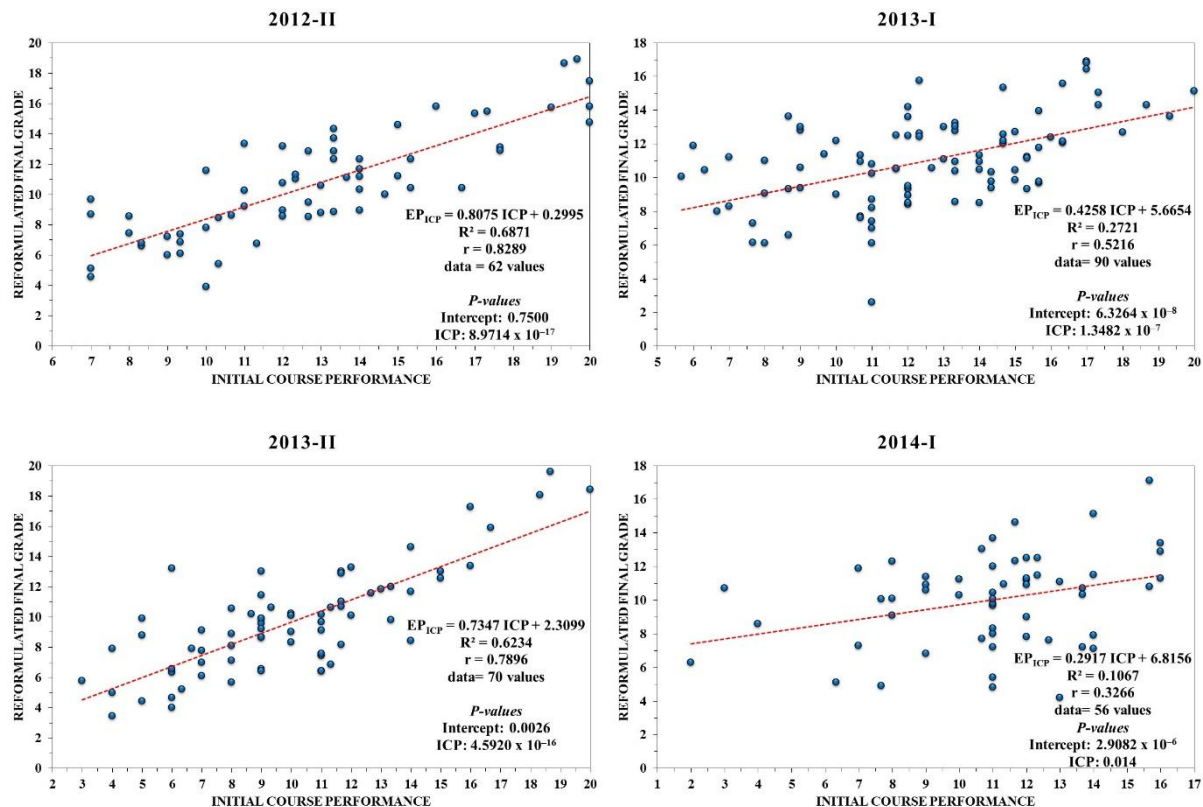

Figure 3. Initial Course Performance vs. Reformulated Final Grade of students enrolled in Statics for the first time.

In second semesters Graphs show a regression line more suitable to the sample points and larger dispersion in first semesters. This behavior is similar to the observed when Cumulative Index is related to Reformulated Final Grade.

Figure 4 shows more suitable simple regression lines obtained from equations included in Figure 3 which presents an Expected Performance based on Initial Course Performance. Lines are not the same, but there is a similarity between the lines corresponding to the first semesters, as well as the lines corresponding to those of second semesters.

Figure 4. Simple regression lines show Expected Performance based on Initial Course Performance.

Figure 3 and 4 show a differentiated behavior between semesters not only in data dispersion but also in regression equations. These differences may have resulted by factors that would be affecting the Expected Performance shown based on Cumulative Index: break period before classes' start, university sports activities, college admission delay, average previous academic performance of the class, and professors teaching the course, among others. Moreover, another factor could be added: examinations being administered in first semesters have different behavior than the one in second semesters (see figure 4). Therefore, the academic performance could be affected by the semester when the course is offered.

In figure 4 as well as in figure 2, first semesters' line slopes are smaller than those in second semesters. The increase of Expected Performance with the increase of Initial Course Performance is higher in second semesters.

ANALYSIS OF VARIATIONS BETWEEN REFORMULATED FINAL GRADE AND EXPECTED ACADEMIC PERFORMANCE

Figure 5 shows variations between Reformulated Final Grade and Expected Performance based on Cumulative Index and variations between Reformulated Final Grade and Expected Performance based on Initial Course Performance. The x axis represents the difference between RFG and EP_{CI} and the y axis represents the difference between RFG and EP_{ICP} . These differences measure the precision of the estimation, either using EP_{CI} or EP_{ICP} . A positive variation means that RFG is greater than the expected performances, and vice versa. Zones with similar academic behavior have been defined setting boundary lines which correspond to differences equal to ± 1 (see figure 5). Student percentage for each zone is indicated in figure 5.

Group 1, in Central Zone I (16% to 21% of sample), assemble students with consistent final grades very close to expected performance, which was determined using Cumulative Index and Initial Course Performance. Both indicators show to be good predictors for these students, since they allow predicting expected performances very close to the final grade.

Group 2, in Zones II and III (4% to 13% of sample), gather students who obtained final grades very similar to ones predicted using Cumulative Index to determine the expected performance. However, the expected final score calculated with the Initial Course Performance are not close enough compared to the final grade (varied by

more than one point). Students in Zone II had initial results that predicted lower expected performances than the final grade. During the semester, however, their performance improved. Students in Zone III had initial results that predicted expected higher performances than the final grade. During the semester, however, the performance declined. In both zones, Cumulative Index proved to be a good predictor.

Group 3, in Zones IV and V (2% to 20% of sample), assemble students who have obtained final grades very similar to ones predicted using Initial Course Performance to determine the expected performance. However, the expected final score calculated with the Cumulative Index are not close enough compared to the final grade (varied by more than one point). Students in Zone IV had cumulative indexes that predicted expected performances higher than the final grade, that is, they are students whose final grades are lower than the expected results based on their CI. Students in Zone V showed cumulative indexes predicting an expected performance lower than the final grade, that is, they are students whose final grades are higher than the expected results for their CI. In both areas, the Initial Course Performance proves to be a good predictor.

Group 4, in Zones VI, VII, VIII, and IX (18% to 27% of sample), gather students who obtained final grades that are not close enough (varied for more than one point) compared to the expected final score which were determined based on Cumulative Index or Initial Course Performance. In Zone VI, both EP_{CI} and EP_{ICP} , were smaller than the RFG; and in Zone VII, both performances were higher than the Reformulated Final Grade. Zones VIII and IX show a behavior similar to Zones VI and VII; with the difference that in Zone VIII, EP_{CI} was higher than RFG while EP_{ICP} was lower than RFG. Moreover, in Zone IX, EP_{CI} was lower than RFG while EP_{ICP} was higher than RFG. Neither of the two indicators prove to be a good predictor.

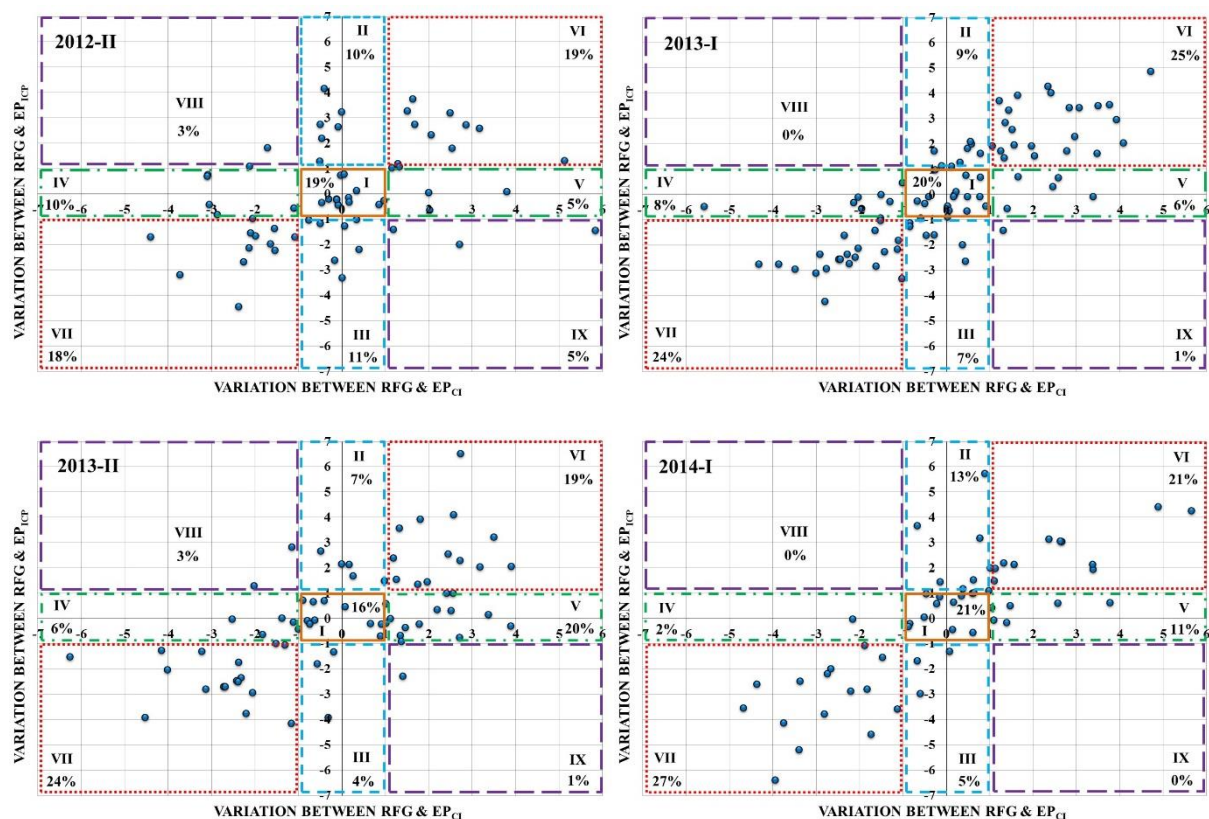

Figure 5. Variation relation between RFG and Expected Performance calculation based on CI & ICP. Student percentage for each zone is shown.

CONCLUSIONS

The Cumulative Index and the Initial Course Performance are correlated with the Reformulated Final Grade. However, the dispersion levels obtained with the Cumulative Index (R^2 never higher than 31% in first semesters and 61% in second semesters), are not good enough to make a prediction. Similar situation is evidenced with the Initial Course Performance, where the maximum R^2 reached was 19% in first semesters and 66% in second semesters.

Results show a differentiated behavior when comparing first and second semesters. However, during each semester, the expected performance shows similar behaviors. This conclusion is supported on two analyses: using Cumulative Index and Initial Course Performance as performance indicators. Therefore, the academic semester should be considered a variable in the performance prediction.

The analysis of expected academic performance allows to identify common behaviors in students taking the course:

- Group 1 students whose final grade could be predicted based on the Cumulative Index or Initial Course Performance. These students are characterized by presenting a consistent academic performance. That is, the initial performances in the course correspond to its Cumulative Index. This feature is what would be expected to make good predictions and be able to identify students requiring assistance. However, this group does not exceed a quarter of the sample in each semester. Eventually, these students could be identified as those whose correlation between the Cumulative Index and the Initial Course Performance is high.
- Group 2 students who's Cumulative Index predict performances close to the final grade. However, initial results don't establish performances close to the final grades. These are students whose initial performances in the course do not correspond to what is expected of them based on the Cumulative Index. Their initially expected performance is affected by some factors that act on a temporary basis, but then stop to influence their academic performance. These are students whose final grades are consistent with the Cumulative Index, regardless of what their initial performance is.
- Group 3 students who's Cumulative Index does not predict performances close to the final grade, but initial results establish performances close to the final grades. If the final grade is higher than the expected performance based on Cumulative Index, those would be students with good academic status who not necessarily always obtain good grades in previous courses; or students who have taken actions (continuing teacher meetings, more individual study hours, group study, and private lessons) to achieve favorable academic results. If final grade is lower than the expected performance based on Cumulative Index, those would be students who have obtained good grades in courses that do not develop the competences required for Statics or students who have had personal issues. These are students whose final grades are not the expected based on the Cumulative Index, but are consistent with their initial course performance.
- Group 4 students who are not easy to predict by any of the two performance indicators. This is a significant group: around half of students per semester. This rate would give an idea about the limitation of the prediction, that is, there would not be a significant number of students whose final performance could be reasonably predicted based on analyzed variables. As a consequence, the ability to identify students requiring assistance, would be affected. The academic performance of students in this group would be influenced by non-academic factors such as stress, demotivation, personal issues, and health problems, among others.

Although clustering is only possible at the end of the course, this classification serves to guide a more detailed investigation about the causes that would be the origin of the behavior of each student group. Particularly, group 4 would be interesting to analyze since the performance of this group is sensitive to non-academic factors. This study will help overcome the difficulties in predicting academic performance and, as a consequence, will facilitate the identification of students requiring assistance.

ABSTRACT

This study is to observe global citizenship of undergraduate students in a liberal arts course, Multicultural Society and Coexistence Humanities (MSCH), in 'I' university of Korea. MSCH provides a cooperative learning format to promote global citizenship which is required by multicultural society. Students were divided into teams of five-members and participated together in a role play. And their personal experiences were surveyed with open-ended questions and written in individual journals. Based on qualitative research method, Giorgi's phenomenological analysis, this study explored those students' experiences on global citizenship. As an analysis frame of global citizenship, those contents were extracted from previous studies by seven scholars and institutions. Finally, this study provided the implications for global citizenship education in Korea.

INTRODUCTION

As a liberal arts course, Multicultural Society and Coexistence Humanities (MSCH) was first opened in 2017 Spring Semester 2017 in 'I' University of Korea. The purpose of MSCH is to cultivate global citizenship for coexistence in multicultural society. As the MSCH accepts the blended and flipped learning format, this course is divided into two parts as follows: One part is a one-and-half hours online classroom, which provides theoretical and individualistic learning through lecture videos, documents, and slides. The other part is a one-and-half hours offline classroom, which provides practical and cooperative learning through team project. Thus, students had participated in three-hours class in a week. The online class' contents consist of the following four themes: conditions of coexistence, contexts of coexistence, width of coexistence, and practice of coexistence. And then, the offline class is designed to make students practice theoretical knowledge in online class by means of team project like ice-breaking, team-building, two kinds of role play. For this study, students formed teams with five members, prepared and performed together role plays. Especially, the first role play was dramatized about the four kinds of social interaction in everyday life, including competition, cooperation, conflict, and exchange. The second role play was about multicultural population in Korea. This study focuses on those students' experiences of the first role play.

Relatively recently, global citizenship (GC) or global citizenship education (GCED) was actively discussed and reflected in national curricula in South-Korea. Based on Merryfield (1998)'s conceptual framework on GCED, Mo and Lim (2014) analyzed the trends and issues of GCED in Korean social studies. The awareness of global issues and interdependence beyond national borderline was slightly reflected in public education since the first national curriculum (1954-1963). However, it is even after the seventh national curriculum (1997-2006) that interdependence in human history, intercultural competence, and prejudice reduction started to receive attention in public education. The reason why global citizenship was tardily reflected in Korean public education is the distinctive contexts of Korea as follows: geographical closure due to North Korea, pure-blood-ism, globalization as means, division of Korea into north and south, lack of human right awareness, and standardized system of education and evaluation (Sung, 2010).

Hence, being aware of the distinctiveness and the late start of GCED, Korean teachers and the Ministry of Education need to be more interested in developing GCED.

This study is expected to contribute to the improvement and development of GCED curriculum in Korea by exploring undergraduate students' global citizenship experiences in a liberal arts course. The research questions of this study are as follows: Q1. What were the global citizenship experiences by students? Q2. What were the meaning of their global citizenship experiences? Q3. What are this research's implications for GCED in Korea?

THEORETICAL BACKGROUND

Global Citizenship

As globalization has been accelerated and impacted on every sphere of society, global citizenship (GC) or global citizenship education (GCED) has received considerable attention in the education field around the world. As an institutional pioneer of GCED, UNESCO defines GC as follows: It is "a sense of belonging to a broader community and common humanity." As well, it emphasizes "political, economic, social, and cultural interdependency and interconnectedness between the local, the national, and the global" (UNESCO, 2015). As well, a Canadian scholar, Bringham defines GC in the three dimensions as follows: First, "a way of understanding how the world works, links between our own lives and those of people throughout the world"; Second, "a way of seeing social justice and equity, other people's reality, diversity, interconnectedness and the way that people can make a difference"; Third, "a way of acting - exercising political rights, critical thinking, and challenging injustice" (Bringham, 2011).

However, the biggest issue in studying GC or GCED is that there is no consensus about the conceptualization of GC or GCED (Maringe & Foskett, 2010; Johnson, 2010). Accordingly, the urgent issue is also to solve the conceptual ambiguity and lack of clarity. This study attempted to narrow down the core contents of GC or GCED in order that those contents will be used as a frame of analysis to discern GC from undergraduate students' experiences in the MSCH class.

In this sense, this study needs to review the primary discussion of GC or GCED from the following seven scholars and institutions around the world in this area. *First*, as an American scholar, Hans Schattle (2005) dealt with GC in public discourse beyond academic debate. Two overarching discourses were suggested as follows: Civic republican discourse considered GC as awareness, responsibility, participation, and cross-cultural empathy. However, libertarian discourse considered GC as international mobility and competitiveness. *Second*, a Dutch scholar, Wiel Veugelers (2011) interviewed school teachers on GCED and distinguished GC between three forms as follows: First, open GC is the knowledge of interdependency and open attitude of cultural diversity. Second, moral GC means diversity, the increasing of opportunity, the taking of responsibility, local component. Third, social-political GC are more interested in equality in relations for changing political power relations. Those teachers preferred moral aspects in GC more than political aspects. *Third* scholars are Morais and Ogden (2011). They developed three-dimensional conceptual model of GC. First dimension is interdependence and social concern to others, to society, and to environment. Its core assumptions are global justice and disparity, altruism and empathy, interconnectedness and personal responsibility. Second dimension is global competence which means the understanding one's own and other's cultural norms and expectation and the leveraging of this knowledge to interact, communicate, and work effectively outside one's environment. Its basic assumptions are self-awareness, intercultural communication, and global knowledge. Third dimension is civic engagement. It means the recognition of local, state, national, and global community issues and the response through actions such as volunteerism, political activism and community participation. It assumes involvement in the civic organization, political voice, and glocal civic activism. *Fourth* are British scholars, Oxley and Morris (2013). They developed a typology, based on two general forms of GC as follows: Cosmopolitan-based and advocacy-based GC. The former GC incorporates four dimensions such as political (democracy), moral (human rights), economic (international development), cultural (globalization on arts, media, languages, science and technologies). The latter GC incorporates the other dimensions like social (global civil society), critical (post-colonial agenda), environmental (sustainable development agenda), and spiritual (caring, loving, spiritual and emotional connections). *Fifth*, Oxfam (2015), as a pioneer institution of GCED in England, specifically suggested GCED curriculum as following three parts: knowledge and understanding (social justice and equity, identity and diversity, globalization and interdependence, sustainable development, peace and conflicts, human rights, power and

governance), skills (critical and creative thinking, empathy, self-awareness and reflection, communication, cooperation and conflict resolution, ability to manage complexity and uncertainty, informed and reflective action), and values and attitudes (sense of identify and self-esteem, commitment to social justice and equity, respect for people and human rights, value diversity, concern for the environment and commitment to sustainable development, commitment to participation and inclusion, belief that people can bring about change). *Sixth*, another pioneering institution of GC, UNESCO (2015) suggested core conceptual dimensions as follows: Cognitive (to acquire knowledge, understanding and critical thinking about global, regional, national and local issues and the interconnectedness and interdependency of different countries and populations), socio-emotional (to have a sense of belonging to a common humanity, sharing values and responsibilities, empathy, solidarity and respect for differences and diversity), and behavioral (to act effectively and responsibly at local, national and global levels for a more peaceful and sustainable world). *Seventh*, a Korean scholar, Hee-Jung Sim (2015) suggested 6 key features of GCED as follows: glocal interdependence and interconnectedness, a perspective of human dignity and peace: rights and responsibilities, cosmopolitanism and harmonizing identities, transformative learning process, diverse democratic decision through dialogue, plans of action to create positive change.

For this study, the aforementioned contents of GC or GCED needs to be narrowed down to common key contents. To this end, this study conducted contents analysis through frequency analysis of the above contents. Consequently, Table 1 shows the 10 most frequently mentioned contents. Those 10 contents will be utilized as the frame of criteria to discern global citizenship from the surveys and journals of students.

Table 1. Contents Analysis on GC/GCED

#	Contents	Frequency
1	Interdependence & interconnectedness	8
2	Responsibility	7
3	Human right, humanity, human dignity	6
4	Diversity	5
5	Local	5
6	Empathy	4
7	Equality & equity	4
8	Environmental	4
9	Culture	4
10	Sustainable	4

Cooperative Learning

Cooperative learning is defined as “the instructional use of small groups so that students work together to maximize their own and each other’s learning” (Johnson & Johnson). Cooperative learning has become a standard educational practice during the past decades. Because it guarantees an exceptional validity and generalizability in social sciences, cooperative learning can be used with considerable level of confidence at every grade and in every area (Johnson & Johnson, 1998). Cooperative learning is based on social interdependence theory. When individuals take action in a classroom, there are only three types of social interdependence: cooperative, competitive, and individualistic. And those types determine interactions between individuals, and outcomes. Consequently, positive (cooperative) interdependence produces three positive outcomes as follows: high effort to achieve, positive relationships, and psychological health. In contrast, negative (competitive) interdependence or absence of interdependence (individualistic action) causes negative outcomes. Basic elements of cooperation are as follows: positive interdependence, promotive interaction, individual accountability, the appropriate use of social skills, and group processing (Johnson & Johnson, 2002). Needless to say, the MSCH class as this study’s field is the cooperative learning, as this course makes students spend half of their class time in doing team project and focuses more on cooperation between team members.

Global Citizenship and Cooperative Learning

One of the important tasks in GCED is to foster global citizenship by means of experiential and empathic activities (Mo & Lim, 2014; Ok, 2014; Lee, 2014; Sung, 2010). Cooperative learning provides the educational method for GC's experiential practice. As aforementioned, cooperative learning and global citizenship education have such a common denominator as interdependence. In other words, interdependence is a theoretical foundation of cooperative learning as well as a core contents of global citizenship. Thus, cooperative learning is a means to foster global citizenship. In this sense, the liberal course MSCH provides cooperative learning as a format of instruction to foster GC in those students.

RESEARCH METHOD

Research Participants

Research participants were 31 undergraduate students who had took the liberal arts course, Multicultural Society and Coexistence Humanities (MSCH) during the Spring semester 2017. As this course was not a required course for a specific major, undergraduate students with a variety of majors registered this course, following their interests in this course. As well, when the 21 students were organized into 4 teams, their diversity was primarily considered. In other words, a team consisted of 5 or 6 members with a variety of age, gender, major, birth place, and so on. Thus, the 21 students in the liberal arts course formed 4 teams. Each team's members had experienced every step of role play like role assignment, script-writing, rehearsal, and real performance. And finally, they reported their own experiences of global citizenship education through survey and journal.

Qualitative Method

While quantitative research emphasizes statistical validity, overall tendency of events, and relationship between variables, qualitative research can capture individualistic distinctiveness and meanings of a particular phenomenon or situation. This study considers that analysis of meanings of individual experiences is more appropriate and significant for this research's purpose than quantitative measure of their experiences. Based on those students' responses shown in survey and journal, the meanings of their global citizenship experiences were explored and interpreted. Especially, this study follows Giorgi's phenomenological analysis with the following order (Kim et al., 1999): First, significant statements, which are natural meaning units according to Giorgi, were identified in relation to 10 themes, that is to say, the 10 global contents. Second, this study extracted focal meanings, which specify those statements in detail. Third, situated structural description was made by the integration of focal meanings and perspectives of students.

RESULTS

Over 140 significant statements about global citizenship were extracted from the surveys and journals by undergraduate students. Those statements were classified according to the 10 GC contents. Except for the fifth content (locality), 9 GC contents were found. Each meaning of GC content is as the following Table 1:

Table 2. Meaning of Global Citizenship

#	GC Contents	Meaning
1	Interdependence	Interdependence made positive change
2	Responsibility	Self-motivated responsibility due to common goal and role assignment
3	Human dignity	Common ground: We are not different
4	Diversity	Intentional encounter with unfamiliarity
5	Local	N.A.
6	Empathy	Internal attitude: empathy & authenticity
7	Equality	Condition to sustain coexistence
8	Environmental	Coexistence with nature, embedded in Korean tradition
9	Culture	Cultural relativism
10	Sustainable	Long-term relationship

Interdependence

The most noticeable meaning on interdependence is that interdependence made positive change. In other words, students evaluated interdependent experience like role play in this course as positive. They confessed their worries and uncomfortableness before starting the role play as cooperative learning. However, their thoughts were changed at the end of the team play. They considered the role play as rewarding and productive. For example, a student confesses as follows: “I have no longer distrust on team play or worries on members. But now, I have a rewarding feeling, as I achieve a goal with unfamiliar members” (student A3).

Responsibility

Common goal of students was to perform their own role play, and implicitly to get higher grade. Some students considered the cooperative learning itself as meaningful experience. As students agreed with fair assignment of responsibility in the role play, they prepared for his or her own role and task. There was no a free rider in the role play. Interestingly, their role performance was voluntary and self-motivated, as long as students have a common goal and the just assignment of role. Otherwise, that cooperative learning cannot be voluntary or self-motivated. A student says responsibility as follows: “With a common goal in mind, every member played faithfully each role and took care of others for friendly atmosphere” (student D5)

Human dignity

A part of this course material teaches human as a physical or social organism. This course reminded students of humanity or human dignity. Some students considered the understanding of human as an essence for coexistence. Other students looked back on their warm memories of foreign-born friends or housekeeper. Although there is difference between languages or cultures, everyone has a common ground that they are human. As long as they are human, they are worthy of being respected. The recognition of humanity is a means of growth. A student said as follows: “I can be mature, when I see and understand human as he or she is” (student B1).

Diversity

When teams were organized for the role play, diverse background was primarily considered. A team consisted of students with a variety of background in age, gender, major, and birthplace. Thus, some of teams made their own team’s name based on their diversity. Most students confessed that they had experienced various opinion in every phase of preparing their own role play. However, without intentional encounter with diversity, they cannot know each other during the semester. Some students were aware that the intentional encounter with unfamiliarity is meaningful to them. Although that encounter may not be a means to achieve other goal or a comfortable experience, itself was valuable to them. Students said as follows: “My focus is not on getting job or upgrading my market value, but on cultivating competency on communication with others” (student A2). “My motto is that I can get synergy from the encounter with unfamiliarity” (student D1).

Empathy

Students mentioned empathy from the role play experience or their past experiences. Empathy can open other’s heart. Empathy is a key for coexistence. A student said that his successful role play started from empathy. Empathy accompanies authenticity. Without internal authenticity, there is no empathy. Thus, internal attitude for global citizenship is empathy and authenticity. Related statement is as follows: “The most important attitude of mind is to understand and embrace one another. Especially, it should not be an external gesture, but an authentic understanding” (student A4).

Equality

Role and task of student in the role play is based on equality. Any other element like age and gender cannot surpass than equality. Thus, all of members can contribute to the role play and get the same grade. Furthermore, students connected their experience of equality to their past activities like voluntary service for disabled person, dating, and affinity group. Equality always follows the aforementioned GC contents like diversity and humanity. Without coexistence with others, there is no equality. And, equality is a condition to sustain coexistence. A student said as follows: “The reason why my team can sustain cooperation is equal distribution of grade” (student D6).

Environmental

After this role play, a student recalled his childhood with his grandmother. She often fed wild animal. And she bowed down toward heaven. At that time, this student could not understand her behavior. However, at this time, he can

interpret her behavior in light of coexistence with nature and environment. This is a philosophy, embedded in Korean tradition. The student statement is as follows: “My grandma’s behavior was one of sustainable development education in Korean old version” (student B2).

Culture

Students connected their role play experience to cultural relativism rather than ethnocentrism. Some students already had study-abroad experiences. They knew that people in other cultures have different perspectives, but they are not wrong. A specific culture cannot be absolute, cultures needs to be treated relatively, they said. A related statement is as follows: “We must understand others based on cultural relativism” (student A4).

Sustainable

Students didn’t simply consider the role play as one of assignments or a means of getting their grade. Noticeably, they considered their relationship between members as long-term and sustainable relationship. For example, a team took care of a sick member, and a student thought it as a guide of coexistence in the future. Furthermore, reflecting education system in Korea, a student seriously doubted if universities provide education for sustainable coexistence. A student’s statement is as follows: “We did not make a disposable relationship to solve the assignment alone. We developed sustainable human relationship” (student B3).

CONCLUSION & DISCUSSION

The course, Multicultural Society and Coexistence Humanities, was designed to help undergraduate students learn and practice global citizenship. This attempt is significant in the context of public education in Korea that global citizenship education is still at the early stage. Most of participant students have been taught in the competitive system, focusing only on college entrance examination. Thus, they didn’t yet experience cooperative learning. They didn’t yet think such a theme as global citizenship. In this sense, the course, especially the role play in the course, provided students a fresh and meaningful experience to open their eyes toward others and the world. As a qualitative research, this study shows that their initial worries, prejudice, and uncomfortableness were changed to unity between members, and fresh consideration toward otherness and cultures. Specifically, those students’ experiences were implicitly and explicitly related to the 9 contents of global citizenship among the 10 contents. Thus, this study suggests an example curriculum of GCED as liberal arts course in Korea and moreover the possibility of its positive and productive effect. Based on those statements of participant students, it is expected that GCED’s effect may be limited in theoretical learning format alone. In other words, global citizenship can be effectively cultivated not by theory alone, but by theory and practice. In this sense, blended learning or flipped learning, which was used by this course, is an appropriate format of learning and teaching on global citizenship. However, a variety of learning formats and contents on global citizenship need to be developed in the future. GCED needs to be more deepened & expanded in public education and university education in Korea.

Yiu Chi LAI

The Education University of Hong Kong

yiuchi@eduhk.hk

ABSTRACT

Mainland China and Hong Kong have individual educational systems within independent culture background; therefore, it is meaningful for researchers to compare the differences and similarities about the e-Leaning implementation among Chinese university learners of English in Hong Kong and Mainland China with different educational backgrounds. Meanwhile, it is useful for educators to learn the different aspects of e-Learning from those two places. It is also practical for educators to understand the problems of using e-Learning methods. This study aims to explore and compare the e-Leaning implementation among Chinese university learners of English in Hong Kong and Mainland China in recent years. Sixty-One Chinese university students of English were involved. The mixed-method approach would be adopted in the research. The study would mainly focus on the usage and Information, Communication and Technology (ICT) knowledge, learning engagement and learning strategies of Chinese learners of English. The findings would help Chinese learners of English to know the general situation of e-Learning implementation in Hong Kong and Mainland China. The purpose of this study is to enhance students' capability of using e-Learning methods to support their lifelong learning.

Key words: e-Learning implementation, Chinese university learners of English, comparison in English language education

INTRODUCTION

As teaching and learning process gradually assisted by the Internet, web-based and computer-assisted learning methods such as MOOCS, Distance Learning and e-Learning began widely popular among the education industries in the world. Based on this general conception of e-Learning development, this research would like to make a clear comparative map about e-Learning implementation in Hong Kong and Mainland China.

English as a global language is an important medium and opportunity to connect the native and non-native English speakers around the world. To get higher scores for English test, Chinese teachers and parents would encourage students to crazily learn English after in-class learning. Chinese students always spent more spare time on going to extra-curricular English tutor center on the weekends and holidays. However, the level of English performance of Chinese learners were not balanced to their work in the reality, for example, Yang (2011) documented the poor

English level of nurses in Mainland China.

The Hong Kong education system was influenced by Western education system especially British education system for more than one hundred years and the policy about bi-literacy and tri-lingualism became popular in recent years, so Biggs (1996, 1998) indicated Chinese students in Hong Kong successfully learnt in Western education systems and outperform their Western peers, therefore it is reasonable for researchers to find the differences and commons about e-Learning implementation in Hong Kong and Mainland China based on policy-making reason. Szeto (2013) found only little empirical case studies about e-Learning development in Asia and only little studies in e-Learning implementation in Mainland China. Meanwhile, very little researches compared the e-Learning implementation in Mainland China and Hong Kong. Some researchers also found Mainland Chinese learners met with more difficulties in online learning process than local Hong Kong students. Based on Li and Lê (2006) research, Mainland China and Hong Kong have the common educational prospect which is education is the most effective way to develop personal growth, career and competitiveness. Different teaching methods would be another factor. In Mainland China, teachers always used didactic methods during traditional in-class teaching process (Wang, et al., 2009; Zhao, McConnell & Jiang, 2009), but teachers would choose a mixed method within didactic and reflective approaches to teach students in Hong Kong (Botelho, et al., 2010; Mcnaught, 2009). Meanwhile, the different curricular design, previous learning experience and learning strategies about English e-Learning course for Chinese university students would be factors to compare e-Learning implementation in Hong Kong and Mainland China.

The purpose of this study is to show the overall e-Learning implementation in Hong Kong and Mainland China and to enhance the capability of using e-Learning methods for Chinese learners of English in Hong Kong and Mainland China in a narrow research scale. The two research questions will be discussed. Firstly, what are the differences of the level of usages and knowledge of ICTs among Chinese learners of English in Hong Kong and Mainland China. Secondly, what are strategies for English e-Learning of Chinese learners in Hong Kong and Mainland China already were extant and would be suggested to apply in the future. The findings would help Chinese university students of English both in Hong Kong and Mainland China to understand their e-Learning capacities for their lifelong learning.

LITERATURE REVIEW

THE BASIC STATEMENTS FOR E-LEARNING DEVELOPMENT AND CHINESE LEARNERS

Reviewing the previous researches, Capper and Potashnik (1998) mentioned e-Learning technologies has been observed which try to cover the educational needs of people worldwide and e-Learning still is a debatable term, but Triaccra et al. (2004) pointed out e-Learning was a type of online learning and both Ellis (2004) and Triaccra et al. (2004) believed that some level of interactivity needs to be included to make the definition of e-Learning truly. Moore. et al. (2011) summarized all forms of e-Learning as applications, programs etc., can eventually provide a learning opportunity for individual. Sandars (2006) also agreed that e-Learning applications have been developed with an extensive usage of electronic media. For instance, Andrewartha and Wilmot (2001) found a significant improvement in students' performance in an online course comparing with an in-class course, but

Bernard et al. (2004) showed that no significant difference in students' performance in online and classroom course. Thompson (2005) investigated Chinese graduate students' experience and attitudes on taking online course in the USA. The findings showed that Chinese learners interestingly using online learning methods although they were not familiar with whole function of the online learning platform. Egan and Gibb (1997) showed e-Learning system can help students to create curiosity and increase motivation to learn while Yalman et al. (2016) mentioned students' attitude had no significant difference to e-Learning management systems. Blackmore (2008) reported that students felt satisfied in an online course as same as a classroom course, which Yalman et al. (2016) also agreed with in their research about Turkey university students' attitude of e-Learning management system that students felt more satisfied when they individually completed e-Learning assignment than group e-Learning assignment. Yi (2013) mentioned Chinese learners in the universities and colleges in the USA preferred online discussion and other learning activities which could help Chinese learners to more contribute on their learning outcomes and to follow the local students. However, Chinese learners would become anxious than before since they would worry about their online learning performance. Thus, the author suggested cultural background is one of the factor which could help researchers to better understand the Chinese learners' online learning performance. Thus, how to find the balance in the traditional classroom learning environment and e-Learning environment for education to help students to get better learning outcomes becomes another vital question for the future studies. To find more evidence to support this study, next section will discuss e-Learning implementation in Hong Kong and Mainland China.

E-LEARNING IMPLEMENTATION IN HONG KONG AND MAINLAND CHINA

Based on the findings from Biggs and Watkins (1996) that Chinese learners can be found in different geographical locations and political systems such as Mainland China and Hong Kong. Considering the review of book titled *Comparative Education Research--Approaches and Methods* edited by Mark et al. (2014), policy makers, international agencies and academics could be the three main groups which would influence the education development. Individual educational policy-makers and decision-makers would be the important role to influence the e-learning policy development. In the Mainland China, based on the research by Jiang and Zhao (2010), only six famous Chinese universities set up the first education network transmission in 1994. By 2008, the number of network centers had reached over 2000 with almost 30 million users. Based on the developments, Chinese colleges and universities moved into new time of e-campus which means e-learning in Chinese universities would delivered by conventional model, blended model and distance model. Distance model is the main model used by Chinese universities and colleges for a long time. Chinese universities and colleges had already constructed the infrastructure for ICT in general. However, leading phenomenon about e-learning methods in the Mainland Chinese universities was didactic teacher-centered methods.

However, Szeto (2013) found the contrasted situation in Hong Kong. The mixed traditional in-class learning and e-learning methods became more and more popular in all Hong Kong educational institutions. Based on Chan's researches (2009), Hong Kong launched the "IT in Education Strategy" in 1998 which could assist students to use ICT methods to learn in various ways. In 2010, Hong Kong official records shown the number of e-learners increased 18%. In Hong Kong, not only higher education, but also primary and secondary school, aimed to enhance

their students' digital literacy by different curriculum designs, workshops and diverse competitions. Jiang and Zhao also believed ICT will play a more important role for students in the future learning and living.

Another relevant example is Kong et al. (2016)'s research about comparison among Singapore, Hong Kong, Taiwan, and Beijing for e-Learning in school education within three stages which includes five years for one stage in a table. Since this study focus on e-Learning in Hong Kong and Mainland China, thus only quoted the content from the table about Hong Kong and Beijing to support this study. The authors found in Hong Kong, all the ICTs plans are territory-wide which indicated that the ICTs plans are valued highly by Hong Kong educational policy-makers which could create a good external environment for Hong Kong students to develop their capabilities of using ICTs. However, the scales in Beijing from 2001 to 2010 only could know policy-makers had these e-Learning plans but could not be figures out if the Beijing Plans could influence inside of Beijing and other places in Mainland China and how deep the level of Beijing Plan is. Authors only indicated that Beijing Plan could be a city-wide strategy from 2011 to 2015 in Beijing which showed the clear distance and different degrees of e-Learning implementation among Hong Kong and Mainland China. In the next section, e-Learning implementation in English language will be illustrated to support a clear picture about the relation between English language learning and e-Learning methods for this study.

GENERAL SITUATIONS OF ENGLISH LANGUAGE E-LEARNING IMPLEMENTATION AND CHINESE LEARNERS

In the recent studies, e-Learning offers the online delivery of information, communication, education and training (Sloman, 2001). Language MOOCs are recent phenomenon, and consequently little rigorous research exists to date (Hockly, 2015). In this section, Australia and three countries and Hong Kong from Asia would be cited as examples to illustrate e-Learning implementation in English language learning.

In Australia, Chen et al. (2008) investigated the adaptation process of two Chinese learners of English in Australia to their online learning. They pointed out that Chinese learners were difficult to adapting a Western learning environment because of culture shock. They discussed the limitations of the research and suggested subjective and objective knowledge should be alternative for each Chinese learner which should not simply communicate the knowledge for online lecture design.

In Asian, Hong Kong, Taiwan and Thailand would be cited as examples to illustrate e-Learning implementation in English language learning. Two examples in Hong Kong would be explained in the following part. Felix and Yvonne (2016) introduced the "Online Learning Platform for University Chinese Grammar" launched by Chinese University of Hong Kong which could help student to independently learn and improve the undergraduates' Chinese language acquisition. Most of feedbacks from the users were positive and the suggestions are the more detailed examples and videos would be designed for future development. Similarly, Tang et al. (2015) did one qualitative study for Chinese nursing students in Hong Kong by group interview, they found after learnt the online clinical English course, Chinese nursing students in Hong Kong liked to learn clinical English knowledge with higher levels of learning motivation. Most of participants agreed online clinical English courses were effective to

support the development of the clinical English knowledge and career development. Meanwhile, they also found course designs, adequacy of support and peer influence were important factors which would influence the students' learning outcomes and their learning motivations. However, the relation among students' proficiency in computers technology, the previous experience with technology and online learning did not clear evidence if they could be factors. In Taiwan, Fang-Chuan et al. (2015) researched how e-learning strategies influence on the second language vocabulary acquisition by eight e-learning strategies within two modes via MYEVA e-Learning software. The authors found mixed-modality e-learning strategies in preference mode for the new words more deeply stimulated students than basic mode strategies. However, it would product same learning outcomes in both modes for the words which were already learnt and knew by students. Banditvilai (2016) illustrated how e-learning programs enhance the language skills for Thailand learners of English in Thailand and results of the research were e-learning programs could increase students' motivation to autonomously learn.

In conclusion, generally language learners had positive attitudes and high motivation towards the online language learning. Similarly, Hockly (2015) also researched the developments in online language learning and indicated economic development has helped online learning to become mainstream and students will happily learn alone though online content. This example could support to help language learners to improve the quality of language e-learning method, it is important to figure out the relation among English e-learning methods, students' attitude for learning and learning motivation (Cinkara & Bagececi 2013; Hotho 2000; Ushida 2005). However, more and longer testing should be performed to give the way for long-term use in sustainable instructional technology design for English e-learning methods in the future (Kenndy & Levy, 2009).

PREVIOUS STUDIES ABOUT E-LEARNING IMPLEMENTATION OF CHINESE UNIVERSITY LEARNERS OF ENGLISH IN HONG KONG AND MAINLAND CHINA

Shen and Suwanthep (2011) have illustrated significant gains about the English-speaking performance of Chinese learners of English on the English e-Learning courses. Since most of Chinese learners learnt English by Chinese-medium instruction in Mainland China and some areas of Hong Kong, more and more online English learning platform by native-English-medium instruction were provided for Chinese learners of English. As the individual and assisted learning platform, English e-Learning platform developed various tasks and support to different users. Generally, Nicholes (2016) gave the insight about the test performance of Chinese learners of English by impact of language-learning software. He cited Chinese university learners of English learnt more in output aspects which are writing and speaking via language-learning software but for input aspects like vocabulary learning they quickly improved during the freshman and junior periods until senior plateau (Cui & Wang, 2006; Tan, 2006). In his findings, female participants showed significant difference from male participants in main, pretest and posttest scores and average using time of the software out of class during the study. In the contrasts, Nisbet, Tindall and Arroyo (2005) agreed that gender of Chinese university learners of English was not significant difference in English language e-learning strategies research which Yalman et al. (2016) also agreed with gender of Chinese university learners of English was not significant difference in their research about Turkey university students attitude of e-Learning management system.

As for the attitude to Chinese learners of English e-learning methods, Ku and Lohr (2003) explained that Chinese learners would become more confident and greater assertive in online learning environment by stating their views than in a face-to-face learning environment. Thompson and Ku (2005) also agreed that Chinese learners were good participants in online lecture with lower level of absence. Two specific examples from Hong Kong and one specific example from Mainland China would be explained in the following sentences. Yuen et al. (2009) reviewed the ICT implementation in Hong Kong education system and discovered five major problems which were technological problems communal involvement and competition, teachers not being keen, problems of system design and features and efficiency of administration and support, which is very helpful to this study to design the questionnaire and questions for interview. Tang et al. (2016) investigated the online independent vocabulary learning experience of twenty Hong Kong undergraduates from different disciplines by VLearn e-learning platform within two research stages. They found the memory strategies for new words is often used by Chinese university students of English in Hong Kong who were not familiar with all the functions provided by VLearn e-learning platform during their English vocabulary online learning periods.

In Mainland China, English test performance has tight relation with students' learning and future career. Thus, Zhao (2009) evidenced good grades in conjunction with "a National Standard English Certificate" contribute to Mainland Chinese graduated finding the jobs they want and making more money. Wang and Morgan (2009) also reported a competitive job market underscores the importance of higher education and particularly of English test performance in China. Zi-zeng (2011) introduced the research about the perceptions of Chinese learners about collaborative English e-writing course. He found students with higher English e-writing abilities like this collaborative English e-writing course very much which could help them to be more confident, students with lower English e-writing abilities also like this collaborative English e-writing course very much since they could get great progress although they would have lost confidence. He pointed out most tests for e-learners of non-English majors in China still focus on students grammatical and vocabulary abilities which is possible reason to the lower learning quality of Chinese e-learners.

After knowing the detailed development about the e-learning implementation for Chinese learners of English in Hong Kong and Mainland China, the methodology for this study would be discussed in the next section.

METHODOLOGY

THEORETICAL MODELS FOR THIS STUDY

The mixed-method approach would be adopted in the research which includes quantitative research method by questionnaires and qualitative research method by interview. For questionnaire design, two parts will be discussed. On the one hand, the questions in the questionnaire, based on the research about ICT Usage of Pre-service Teachers: Cultural Comparison for Bosnia and Herzegovina and Turkey by DEMIRLI (2013) which was the author utilized

the Likert-type Scale did the quantitative analysis to the research and also analyzed the data by T-test, Correlation analysis and stepwise Regression analysis, in order to know e-Learning implementation of Chinese university learners of English in Hong Kong and Mainland China in this study, the similar method for question design would be utilized. There are 18 questions in total. Three purposes for the question design are illustrated. Firstly, learning the basic ICT usage and knowledge of Chinese university learners of English in Hong Kong and Mainland China. This part includes question 1st to 4th.

Table 1. The Design of Questionnaire (1)

Table 1.html

Secondly, finding out outcome-based e-learning of Chinese university learners of English in Hong Kong and Mainland China.

Table 2. The Design of Questionnaire (2)

Table 2.html

Finally, finding the relation between students' habits and students learning outcomes among Chinese university learners of English in Hong Kong and Mainland China.

Table 3. The Design of Questionnaire (3)

Table 3.html

On the other hand, selection criteria of the questions in the questionnaire. Based on Bates' ACTION model of e-Learning (1995) within seven aspects, the access, interaction and user-friendliness, organizational issue and speed of course development would be helpful to design the choice of questions. Meanwhile, bases on Alexander's four-level model of e-learning (2001), online presentation and assessment, students how to express their thoughts and interactive learning would be factors to design considerations.

Another theory is utilized for the interview design. The semi-structured interview will be used for this study. Brophy (1998) created one model for questioning environment to support thinking which was called QUEST. Four stages were included in the model. Based on first stage named problem definition, the students' e-learning strategies would be asked to know the difference of thinking structure and problem-solving skills in Chinese university students of English in Hong Kong and Mainland China. Based on the second stage named exploration and the third stage named discovery, how students evaluate the present e-learning methods and platform would be asked to know the Chinese university students' engagement of English e-Learning in the interview. Based on the last stage named reflection and justification, the suggestions and advices of Chinese learners of English via e-learning methods also would be asked in the interview. (See the Appendix)

Table 4. The Design of Interview Script

Table 4.html

PARTICIPANTS

In this study, sixty-one Chinese university learners of English in Hong Kong and Mainland China would participate. Considering the different cultural and educational background, they will be divided into four different groups which are local Hong Kong students, local Hong Kong students who are studying or have studied in Mainland China, local Mainland Chinese students, and Mainland China students who are studying or have studied in Hong Kong. For the second group and fourth group, participants will describe their learning experience within detailed periods. The major and gender also are considered. For the questionnaire, they need to finish 18 questions about what the difference of the level of usages and knowledge of ICTs among Chinese learners of English in Hong Kong and Mainland China is. To qualitatively know how depth of engagements of Chinese learners of English to English e-Learning courses in Hong Kong and Mainland China is and what strategies for English e-Learning of Chinese learners in Hong Kong and Mainland China already were extant and will be suggested to apply in the future, ten of them would be interviewed.

FINDINGS AND DISCUSSION

FINDINGS FROM THE RESULTS OF QUESTIONNAIRES

Generally, e-Learning implementation in English learning among Chinese university students in Hong Kong are widespread than in Mainland China. The difference of the level of usages and knowledge of ICTs among Chinese learners of English in Hong Kong and Mainland China was shown in the Figure 1. The time of staying in Hong Kong would influence Mainland Chinese students' attitude to English e-learning methods. The background of majority of participants were non-English native speaker and female.

Figure 1. The background of majority of participants

48.57% Chinese learners of English in Hong Kong and Mainland China believed communication is vital skills for the English e-learning methods. However, 62.96% local Mainland Chinese learners of English thought communication by English are relevantly difficult. 69.23% local Mainland Chinese learners of English believed

mobile learning apps are helpful to their English learning. However, over half of all Chinese learners of English in Hong Kong and Mainland China wanted to know more mobile English apps. 46.88% Chinese learners of English in Hong Kong and 53.13% Chinese learners of English in Mainland China always need to make presentation. However, 40.63% Chinese learners of English in Hong Kong and 59.38% Chinese learners of English in Mainland China agreed that they spent more time to prepare English presentation by presentation software. (See Figure 2.)

Four most used ICTs	<ul style="list-style-type: none"> • Accessing, • Word processing, • Using mobiles learning apps (making presentation), • Communication.
Four least used ICTs	<ul style="list-style-type: none"> • Using educational CD, • Using mobile learning apps (Using learning management system such as MOODLE), • Making presentation, • Communication.
Four ICTs knowledge are totally familiar with by stakeholders	<ul style="list-style-type: none"> • Internet, • Email, • mobile apps for English learning, • word processing (Presentation software)
Four ICTs knowledge are totally unfamiliar with by stakeholders	<ul style="list-style-type: none"> • Graphics(Animation), • MOODLE, • Presentation Software, • mobile apps for English learning

Figure 2. The Difference of the Level of Usages and Knowledge of ICTs among Chinese University Learners of English in Hong Kong and Mainland China

Based on the study result, English e-Learning method was more interesting for Chinese learners of English in Hong Kong. Mobile English learning methods were more popular for Chinese learners of English in Hong Kong. For Chinese learners of English in Mainland China, digital literacy should be enhanced for future English learning. They prefer more e-resources provided for their English learning. Multiple English practice including online practice which were not only helpful to the English learning but also to enhance to the digital literacy would be considered for English course design in the future. Gender could influence the English e-Learning methods implementation for Chinese university students in Hong Kong and Mainland China (see Figure 3).

		N	Marginal Percentage

Category:	Discussion:
Local Mainland female Chinese Students major in English☆	1. Although students are familiar with mobile English learning devices, they do not agree that social networking service would help them to smoothly communicate with supervisors (Q10 & Q11). ☆
Local Mainland male Chinese Students major in non-EnglishΔ□	2. Mobile learning experience are not significantly different with that learners are not familiar with English learning via mobile device (Q10 & Q15). ☆
Local Mainland female Chinese Students major in non-EnglishΔ○	3. Students used note-taking apps would not influence the memory for English course contents (Q9 & Q13). Δ
Mainland female Chinese students studying/studies in Hong Kong major in non-English☆□○	4. Online English practice are not significantly different with improving the digital literacy for students (Q14 & Q16). □
	5. Students would like to save their files on cloud-based storage not because of their digital literacy (Q8 & Q16). □
	6. Although student are not familiar with mobile learning devices, they do not agree they could practice English online without shyness (Q10 & Q14). ○

Figure 3. Learning habits and students e-learning outcomes of Chinese university learners of English in Hong Kong and Mainland China

FINDINGS FROM THE RESULTS OF INTERVIEWS

Before the formal interview, I did the pilot for interview. I found the fourth, eighth and eleventh questions were different to be understood for interviewees, and thus I revise these three questions. The qualitative analysis would be discussed in the following parts.

STUDENTS' E-LEARNING STRATEGIES

After coding the results from ten interviewees, students' e-learning strategies would be summarized as following table.

Table 5. Students' e-learning Strategies

Questions	Findings	
	In HK	In Mainland China
1 st --planning a presentation	Microsoft PowerPoint-common software--67%	
	Google Drive	
2 nd & 3 rd --Find online resources & search engine	YouTube is best choice for online video records --33%	
	Google--native English resources--global and accurate	BaiDu
6 th English learning experience with e-learning method	1. Different e-learning methods especially for English listening and vocabulary. 2. The charge --one of important factors 3. Some assignments would be helpful for improving the English.	

Interviewees also mentioned one of the popular and creative software for s Prezi. Only the Chinese learners of English from Hong Kong could use the as the cloud storage way to plan the presentation and share the different ideas with other group mates when they have the group assignments. 33% interviewees have no typic software or website to search the online video records and them just when they needed. Chinese learners of English from Mainland China are forbidden to use Google in Mainland China. If they would like to use Google, they need VPN to be the supplementary. Meanwhile, all Chinese learners from Mainland China think it would be better for their academic development if they could use Google in Mainland China.

ENGAGEMENT AND EVALUATION

The second and third stages would focus on the engagement and evaluation of students English e-learning. The findings would be summarized as following Table.

Table 6. The Engagement and Evaluation of Students English e-Learning

Questions	Findings	
	In Hong Kong	In Mainland China
5 th --writing English essay by typing		Less opportunities to complete their English writing assignment by typing.
7 th --practice your English online	16% interviewees agreed that practicing English online is more helpful since it is convenient for students to review the previous study records.	33% interviewees agree it is more helpful to practice your English online since it is passive and get the feedback immediately
11 th --the big three differences for English e-learning	<ol style="list-style-type: none"> 1. Applying the theories in the reality and changing students' awareness that how to communicate naturally by English 2. Teachers in Hong Kong focus more on interactive with students and teaching materials. 	<ol style="list-style-type: none"> 1. Less chance to read the English books or articles in original version. 2. Sometimes they felt hard and anxious to express their opinions by English. 3. They sometimes felt confused because teachers are overlapping 4. Generally, they were not very confidently speaking English unless during the class teacher asked them to speak English.

90% interviewees do not think it is difficult to use English to analyze the data conducted by the SPSS for the research and they also agree some statistics terms are difficult to understand. Both Chinese university learners of English in Hong Kong and Mainland China agree that writing English essay by typing is easier than by handwriting, since it is easier to correct and keep the paper clear. Interviewees agree that online English has not so much motivation to keep on the learning process. Meanwhile, the issues of internet connection also would influence the students' English learning. Only 17% interviewees from Mainland China were neutral. They believed students were not shy when they utilized the online resources to learn English.

All interviewees support that it is significant for English learners to improve their digital literacy. There are some reasons. Firstly, it is helpful to students to utilize the digital resources to improve their English learning and offer opportunities to practice English. Secondly, it could show how students recognize the link between the digital resources and learning. Thirdly, it could be a good way for students to output the knowledge they learnt. Finally, it could be a method to development the professional knowledge and skills both for students and teachers.

SUGGESTIONS AND ADVICES

For the question 8th and 9th, 84% students believed it is effective e-learning way to learning English when teachers provide some e-resources about English learning and opened online discussion forum. Students think they could learn different ideas from other students and they could point mistakes out for each other. They believed that online discussion forum could help them to save much time on group discussion and assignments. Only 16% students prefer individual consulting chance for English e-learning since they are lazy to download e-resources from the online forum and they think individual consulting will be better to learn from teachers immediately.

For the future English study, students hope there would be some English learning apps with learning reports which could assist their listening and reading practices. As for English writing, students need more detailed guidelines and samples. Chinese students of English from Mainland China hope the issues on internet authority limitations would be solved in the future.

LIMITATION

After reviewed the previous research, five potential limitations would be discussed. First, compared with aforementioned researches, the sample size in this study is a little small. Second, this study is a single-handed study which means it is a little bit difficult to make each aspects perfect. Third, dividing disciplines without detailed subjects. Participants would be divided into two groups by their majors. One is English, the other is non-English. However, for students whose major are not English, they should have divided again by the certain subjects such as mathematics, Chinese, and physical and so on. Fifth, no region factors will be involved. Since each province has their own educational mode in Mainland China although all of them have one Chinese educational system, when separating the participants into four main groups, the researcher did not consider the different region factors. Finally, costs and time. Considering some participants in Mainland China would take longer time to finish the questionnaire produced by Google Form because of accessing Internet authority limitation, this study utilized the Sojump made in China which could be used in Hong Kong and Mainland China to conduct the research data. However, it is a little bit uncomfortable to adapt the different interface and would take longer time to finish the questionnaire.
